That night, shortly after we had retired, the wind came up, and gathering force with each succeeding gust, it soon took on the dimensions of a small hurricane. The trees swayed and creaked under the mighty influence; the tent strained at the ropes as though anxious to free itself and float away on the wings of the racing gale, while the waves threw themselves with tremendous impact upon the rocky shore. All night long the wind howled, and when the morning broke, it was still blowing. So strong were the gusts that it seemed rather uncertain whether we would be able to get breakfast or not; but Elliott, in his own ingenious way, soon had a wind-proof fireplace constructed, which enabled him to cook without mixing miscellaneous pieces of leaves, dead wood and other incredible atoms into the food; and then we rigged up a wind shield for the table. After the morning meal, Farber, with his customary sarcasm, suggested that it would be a good time for Beck and me to go out on a sail-stretching trip; but one glance at the angry waves sweeping down the lake was enough to check any enthusiasm we may have had in that direction, and as it was far more comfortable inside the tent, we beguiled the morning hours in a game of poker.

There is a psychological side to poker that simply baffles all attempts at explanation. The one that feigns the most ignorance of the game usually gets away with the largest stakes, and the man that plays most cautiously is sure to suffer the greatest loss. And there was no brilliant exception to this rule that morning. How long the game would have continued heaven only knows, but it came to an abrupt end after Farber, who had been endeavoring for two hours to get something better than a pair of nines, suddenly flashed three queens on Elliott, who was the only one in. The latter said he had only two pair, and Farber in an uncontrollable burst of glee, started to rake in the pot, when Elliott's two pair manifested themselves in the shape of four kings. Then Farber said he had a wife and several small children dependent on him at home and withdrew from the game.

After dinner, Elliott and I paddled down to Burleigh for the mail, and on the return trip, we got in back of some islands, where the water was comparatively smooth, and managed to hook a few bass, for which our appetites were sharpened to a fine edge by the paddle against a fierce headwind. The wind, increasing along toward sundown, made it dangerous to build the customary bonfire, so we retired to the tent for our evening smoke, and as we sat there puffing our pipes, and listening to the raging storm and the pounding of the surf, some one casually mentioned the fact that he had noticed a number of good-sized black snakes crawling around the island that day, which put Elliott in a reminiscent mood. He said that not many years ago he spent a winter logging in the Georgian Bay district, and one night, in company with two others, while going down a river in a double-oared boat to visit another camp, the man in the bow of the boat suddenly gave a low startled cry. Instinctively the other two rested on their oars, and directing their gaze toward their companion, were horrified to see two small green balls of fire about two feet above the water and not over a hundred feet away, coming toward them. In a flash they put the boat around, and straining at every nerve and muscle, they made for home as fast as two strong men can row, but at every sweep of the oars it seemed as though those glittering eyes were gaining on them. Fortunately their camp was only a few hundred feet away, and by the liveliest kind of work they reached it just as the monster seemed to raise half his body from the water and dart forward in a final effort to strike the boat.

"You can better believe," said Elliott in conclusion, "that we didn't lose any time in getting to the cabin, and we didn't come out all night again either."

"What was it?" I asked innocently.

"Snake!" replied Elliott, with some asperity, "and twenty-five feet long if he was an inch, with a body as big around as a young sapling."

Now, I don't like to contradict a snake story any more than I do a fish story, and as I had heard Elliott spin that same yarn two years before, using the same locale and details, I recognized that to question him further would simply inspire within his truthful breast some sort of vague unrest, that, while sedulous in attention, we were not credulous in retention. And satisfied that this story had met with the profound respect due and accorded to old age, he again lit his pipe, actually and figuratively, and gave us a few more personal memoirs of logging days, in the course of which he told what a predilection snakes had for a warm place on a cold night, and especially how fond they were of crawling in under tents and anchoring alongside the campers—that often he had awakened in the morning and found a six-foot snake reposing peacefully and unconcernedly by his side. And with such naïveté did he relate these interesting anecdotes, that at the conclusion of the entertainment, I was not quite certain whether I would lodge at the tent or put up at Burleigh Falls Hotel for the night. If that hostelry had been a mile or two nearer, I am reasonably sure that my name would have gone on the register.

The next morning the wind continued unabated. We had already begun to chafe under the restraint of being cooped up on the island, and Beck dared me to try out the lateen in the gale. I accepted the proposition, and Farber allowed that he would go down to see the fun. We towed the canoe around to the lee of the island, I slipped the gaff ring on to the mast pin; Farber, the imbecile, shoved us off, the jawhook slipped the mast, a puff of wind hit the sail, the main sheet was free, and about the most ridiculous looking craft ever seen was ours. That sail was carried forward and draped itself around the mast in loving embrace, and every time the wind got at it, the little canoe trembled from stem to gudgeon. Finally Beck got it headed back to the

island, where Farber was doubled up in a paroxysm of laughter. He seemed a little disappointed because we didn't capsizes, but, barring that, the programme was all that could be desired. Then we made another start, this time attending to the shoving off process ourselves, and catching the wind dead astern, we flew down the lake at racehorse speed. Swinging out into the main channel, we discovered the Ogeemah, a big lake steamer, bearing down on us not a hundred feet away. Directly in her path we laid our course, while hundreds of excursionists crowded forward on her decks to view the race. Over the heaving billows went that canoe, leaping forward with the agility of a greyhound propelled by the mighty force from the cave of Æolus, and at every bound she fell slap into the waves, jarring skipper and crew in lively fashion. A stone logging crib rose suddenly in our course and seemed in grave danger of being split in twain, but the trained eye of the man at the helm, missed it by a fraction of an inch and no time was lost. By it we flew, the sail bellying out in a mighty effort to do or die, and tugging like a demon at the main sheet, which I had twisted tightly around my hand, not daring to snub it to the thwart lest a sudden gybe should knock us over. Presently the deep-throated notes of the Ogeemah's whistle resounded on the morning air.

"What does that mean—Burleigh Falls, or get out of the way?" I asked, turning half around.

"Blamed if I know," yelled the skipper, "and care less. Trim in on the sheet a little."

I looked back. The Ogeemah was still a good hundred feet away. I trimmed in slightly, and the little craft seemed fairly to skirt the troubled bosom of the lake. Directly for the narrows that lead to Burleigh and which would mark the finish line, she poked her razor-edged prow in open defiance of the measured panting of the monster following swiftly in her wake.

"Get ready to douse sail," yelled the skipper, as we drew near the narrows and prepared to hike under cover. "Be lively, now! Slack away! Steady, there! Now drop the jaw." And quickly he brought the little shell up into the wind. Down went the sail and up went our caps on the ends of the paddles. We had outstripped the fast Ogeemah.

It took us the rest of the forenoon to paddle that canoe back to Squirrel Island, and after dinner it was a clear case of an afternoon's rest.

It was now getting along toward the fag end of our camping trip, and so the following morning (Saturday) we packed up and made an early start for Clear Lake, the scene of our last camp. The heavy wind still prevailed, but we were going with it, so it made no material difference. At Burleigh, of course, we had to portage, and as it was down-hill work, Elliott opined that we might just as well do it ourselves. He said the proper way was for each man to put one end of the canoe on his shoulder and stroll down hill, and then come back and get the duffle. And by way of illustration, he and Farber started off with their canoe. So Beck and I tried it, and we didn't get any further. When I at last got one end of the canoe on my shoulder, it felt as though it was made of pig iron (the canoe, not the shoulder). We walked about ten feet—not more than that—and every foot seemed a mile, and when it became a case of having my collar bone sawed in two or my legs buckle under me, I very gently and very firmly refused to become a party to my own maiming and forthwith deposited my end of the boat on the rocky ground with just a little more force than elegance. When the idyllic pastime of canoeing resolves itself into horny-handed labor, all the gentler instincts of my soul rise in solemn protest. I am no Atlas. So when Farber and Elliott came back I said we would carry the duffle down—it would necessitate two or three trips, but we didn't mind—we liked exercise—and they could tote the canoes.

An hour or so was spent at Burleigh taking snaps at the scenery and schnapps at the hotel, and then we shoved off for Clear Lake. Going down the splendid reach of water that stretches from Burleigh to Stony Lake, by stepping a paddle well forward and bending a raincoat over it, we were able to skim along faster than our companions could paddle. Farber said, why not use the sail, but we had no consuming passion for breaking out a lateen rig with a boat full of provisions.

In Clear Lake, however, we bucked into the nastiest sea ever experienced by any of us. The waves were rolling in long, foam-crested combers, and the wind was making it lively for everything it could reach. And for the first time in my life, the charms and pleasures of canoeing did not appear to me as they had so often done before. It is all very well to float gently and lazily along the winding course of some romantic stream 'neath the great overhanging trees, whose interlacing branches cast fairy shadows in the pellucid waters; it is all very well to dip your paddle nonchalantly by the side of the canoe and feel the bark glide forward as though propelled by some unseen power, but it is quite another thing to be out in the middle of a lake with the water boiling all around you and every other wave climbing into your lap. You glance at the landscape and pick out some object by which to mark the progress of the boat. You paddle industriously for ten minutes and ten look around to see how far you have gone, and you find yourself still abreast the mark. Then you look back at the man in the stern, as much as to say, "Well, what's the matter with your working a little?" And the only response you get from him is advice in no uncertain language to face about and dig in. Half the time, as you dip your paddle, it sinks into the great trough of the sea, and the lurch you give nearly upsets the canoe. It is like going upstairs in the dark and forgetting where the last step is, your foot suddenly plumps down with great force and you clutch wildly at the nearest thing to save yourself.

Somewhat in this manner, and by dint of hard work, we slowly made our way across Clear Lake and ran the noses of the canoes upon the sandy beach. And here, on the grassy plot of an eminence overlooking the lake, near the blackened ruins of what was once a handsome cottage, we pitched the tent for the last camp of our outing. A few yards away a sparkling spring scintillated in the sunlight, and for the first time in a week we enjoyed the luxury of a cold drink.

And as we looked about, involuntary expressions of rapture escaped from our lips on the beauty of the scene; the clearing on the edge of the forest, carpeted with closely cropped grass; the handsome white bark of the birch trees and the magnificent expanse of Clear Lake stretching away to the south and east, fringed on all sides by dense woodlands, made a picture worthy the brush of a master. But some day all this will be changed. Where now stand the silent sentinels of the forest will be many cottages, and the thick, and tangled underbrush, together with the stones that line the beach, must give way to handsome lawns and ample docks. And where to-day are seen the vagrant sails of rude design, and boats that tell of the craft of long ago, will be noticed the splendid models of the present age.

Sunday morning broke fair and warm. The heavy wind that had for three days raged and roared, had departed for other regions, and hardly a breath of air was stirring as we lazily emerged from the tent at the good old Sunday hour of 9 o'clock. Elliott said it was against the law to fish on Sunday in Canada, but nevertheless went down to the old broken pier, and soon came back with a couple of 2-pound bass for breakfast. There was something positively uncanny about that guide. He would take a bit of a worm or a chub and go and fish right where we had been fishing for hours without getting a strike, and in a minute or two yank out a big black bass. Farber and I fished on every side of that pier, and even up and down the lake for quarter of a mile, and caught nothing but sunfish and perch, and yet Elliott took a couple of worms and came back with two large bass. We asked him to let us in on the scheme, and after pledging us to strictest secrecy, said it was "personal magnetism," information which of course we will treasure all our lives.

After breakfast Farber and Beck, following a time-honored custom, went in bathing. Elliott sneaked off to the other side of the lake, while I busied myself in elaborate preparations for the removal of a six days' growth of beard. With the aid of a little hot water and American family soap, a razor that Farber swore by and the rest of us at, and a two by four pocket mirror hung up in a tree, I was enabled to cut down the hirsute adornment quite materially, and at the same time preserve enough of my features to be recognized when the gang got back.

That noon, just as we were gathering around the festive board for the last al fresco meal, and in fitting acquiescence of the demands of the occasion, who should step calmly out of the thicket and interpose her ample form on our front yard but a gentle, sad-

eyed mooley cow. In an instant the guide was at her side, and a few moments later a large earthen bowl filled to the brim with rich warm milk, graced the center of the dinner table. For a long time we lingered over the meal, loath to think it must be the last, recounting the varied experiences, and congratulating ourselves on the success and enjoyment of the trip. We had been favored with fine weather; no mishaps had been met with; our health perfect; Farber had not had a touch of hay fever, and, all things considered, we were elated over the outing. And, to the man who would break away from the cares and trials of a busy life, even though for but a few days; to him who would seek the rejuvenation that comes from the free and generous hand of nature, let him do as we did. Let him go and dwell among the pines—beside the stream—amid pleasant surroundings that charm the eye and satisfy the soul; let him feel the health-giving breezes play upon his sun-kissed brow, and enjoy the blessings of a keen appetite, waited upon by perfect digestion; let him lie down under the great starry dome of heaven, and be lulled to tranquil slumber by rushing waters mingled with the piping of the birds of night, and he will come back flushed with health, and with mind and conscience as serene as the coming of the dawn.

Meeting of the A. C. A. Board of Governors.

THE regular stated meeting of the Board of Governors of the American Canoe Association was held at the Irondequoit Canoe Club house, Irondequoit Bay, N. Y., on October 15 last. President Robert J. Wilkin, of the Atlantic Division, presiding.

There were also present Commodore C. F. Wolters, John N. MacKendrick, of Northern Division, W. W. Crosby, proxy for Paul Butler, of Eastern Division, and Charles P. Forbush, of Central Division. No word was received from H. C. Morse, of the Western Division. Mr. Forbush acted as recorder.

Reports were received from Mr. Butler and Commodore Wolters regarding matters referred to them.

The president reported that there were balances of \$374.13 in the Reserve Fund and \$435 in the Permanent Life Membership Fund.

An apparent deficit of about \$230 appeared in the report of the administration of 1904, but it was thought this would be offset by a sale of assets on hand, and this was authorized.

Frederick G. Mather, of Albany, N. Y., was unanimously elected treasurer of the association.

The following resolution was then passed:

WHEREAS, The Board of Governors estimate the prob-

able receipts of the secretary-treasurer for 1905 to be as follows: Atlantic Division, \$60; Central Division, \$175; Eastern Division, \$100; Northern Division, \$15; Western Division, \$10; camp dues, \$150. Total, \$510.

Resolved, That the commodore may expend 85 per cent. of this amount for all expenses of the year, and he shall pay 15 per cent. remaining to the Board of Governors. In the event of his receipts being in excess of this estimated amount, he may expend all of such excess as he may deem best for the association. In case the receipts from all sources do not amount to such estimated figures, namely, \$50, or if, in his judgment, an exigency exists requiring an expenditure that would exceed such apportionment or allowance, he shall, before incurring the same, obtain the consent of the Board of Governors in writing.

The matter of the disposition of the canoe and sneak-box in which the late Nathaniel H. Bishop had made his voyages from New York to the Gulf of Mexico, was referred to the president of the board with power.

Meeting of the A. C. A. Executive Committee.

The annual meeting of the Executive Committee of the American Canoe Association was held at Rochester, N. Y., Saturday, October 15. The reports of officers and committees, Board of Governors, and Division officers were received and accepted. The proposed changes in constitution as published were accepted. It was voted to turn over a larger percentage of the dues to A. C. A. treasury, and also to increase the camp dues to \$2 for members and \$3 for visitors. The changes in constitution now provide that the treasurer receive all funds, also applications for membership. He will publish names and send certificates of membership to new members when elected. As some of the Divisions think they can keep a better interest and collect more dues through Division pursers, it was decided that vice-commodors may apply to commodore to direct Division pursers to collect Division dues. The Eastern Division tried this plan this year, and it proved very satisfactory.

FOREST AND STREAM, Sail and Sweep, and Canoeing were voted the official organs for 1905. Sugar Island was selected as the place, and August the time, for holding 1905 meet. The exact date will be supplied later. H. Lansing Quick, R. J. Wilkin, and W. W. Crosby were appointed committee on revision of constitution and by-laws to conform to amendments passed at this meeting. Harvey M. Stewart, Rochester, N. Y., was elected secretary, and Frederick G. Mather, Albany, N. Y., was elected treasurer.

JOHN S. WRIGHT,
Secretary-Treasurer.

YACHTING

Gas Engines and Launches

(Continued from page 372.)

BY F. K. GRAIN.

Gasolene—Continued.

Most of the vaporizers now in use on the two-cycle engine have a slow-down device consisting of a threaded stem butting against the stem of the valve. The effect of screwing down is to reduce the lift of valve acting as a throttle. While this device is very efficient to a limited range, when adjusted to run steadily for any length of time at a very slow speed, it also requires that the gasolene be reduced, as the effect of this slow-down is to reduce the amount of air, the gasolene remaining almost constant. Consequently, if the gasolene is not adjusted, it eventually means the flooding of the engine. In very cold weather a pipe should be led from a small drum surrounding the exhaust pipe to the vaporizer. This will furnish hot air and prevent freezing of the vaporizer, the rapid suction of the engine setting up a refrigerator process. In regulating the gasolene supply, do not be heavy-handed, especially with a two-cycle engine which requires a number of revolutions in order to feel the effects of any change at that point. It is very seldom the case that the engine will act the same after being run a few minutes as it will on the start, owing to the change in temperature and the mixture not being true; therefore be very cautious in regulating; taking it slowly and watching the effect on the engine. The lead of the igniter will also effect the adjustment of gasolene, the effect being different in different engines at different speeds. We have seen a great many engines that have also suffered and have been condemned by the owner for these very reasons, that they would not let the engine alone or give it a chance to regulate itself. Where an engine is working well, we say, by all means let it alone. If you want any advice, write to the makers of the engine and keep away from the would-be expert.

Probably the next and most serious trouble for the novice, is to account for the different and peculiar noises which will develop. It is probable that the worst of these is a hard pounding, sounding almost as if the piston had worked loose and was trying to knock the cylinder head off. It will also sound as if the bottom of the boat was being knocked out. In ninety-nine cases out of one hundred this is caused by the fly-wheel being loose. To remedy this, drive in the key of the fly-wheel. It may be that the noise will still continue mildly; in this case the key has either been driven up so that it bottoms against the shoulder of the key-seat or the key is too small; in the latter case it can be made, to fit by fitting some slips of very thin metal, such as tin, etc., under the key. This pounding can also be traced to any of the revolving parts, but of course will not make the severe noise the fly-wheel will. It sometimes happens that a pounding in an engine

will be located seemingly at the propeller shaft; in this case it is generally caused by the rudder, which, being loose in the rudder port, has a tendency to lash by the action of the water from the propeller wheel. This will only happen when the boat is running straight away; as soon as the rudder is turned, the pressure thereby being increased, this noise will cease. When there is a decided squeaking in the cylinder, it can be generally traced to want of oil, but in some cases an insufficient supply of gasolene or poor mixture will produce the same results. A slight pounding with a metallic ring is invariably caused by insufficient gasolene. This is especially the case in the four-cycle engine. Pounding in an engine is often laid to the connecting rod being worn in the crank boxes. While this may produce considerable noise at first, when the engine reaches its speed it has very little effect, and is hardly noticeable. Of course we have not made any mention of the sharp explosions with an escape of considerable amount of smoke from the exhaust and all around the valves, sometimes resulting in the quick stopping of the engine. This is what is known as back-firing, usually caused by insufficient gasolene, and resulting in a slow-burning mixture which ignites the incoming charge, resulting in a strong impulse when the piston is at its lowest point. The remedy is to feed more gasolene. In some engines, especially the two-cycle type, this is a very common occurrence, and is caused by proportions of the inlet and exhaust ports, and the location of them being incorrect. Of course, in cases of this kind, it is very difficult to get the correct regulation of the gasolene. In some cases the effect of the poor designing will result in the overheating of the exhaust ports and passages extending also to the exhaust pipe. This will cause the charge to ignite immediately on entering the cylinder. It is a serious defect, as the engine, of course, is liable to ignite at any point, and often results in injury to the operator when handling the engine. On all engines we have a number of joints which require a packing of some kind, usually of a very thin material. We have on the market to-day a thin asbestos cloth, through which is woven a fine soft copper gauze; this is unquestionably the best packing that can be used. The next best thing to this is drafting paper of good quality, giving not only the paper, but the surfaces to be joined, a liberal coat of shellac, and making the joint while the shellac is still moist. All pipe joints for gasolene or gas should also be made with the shellac; where this is not obtainable, ordinary brown soap will answer the purpose, neither of these being affected by gas or gasolene; but avoid all kinds of lead, as they are dissolved by the gases. Owing to gasolene being a hydrocarbon, it is therefore necessary to use the cylinder oil and grease on the bearing of the same nature. The cylinder oil should be moderately heavy and of high fire test, otherwise it will be consumed, and in many cases causing the cylinder to score and cut; it is therefore poor economy to buy cheap oil, as the results obtained from the use of the best oils will much more than offset any dif-

ference in price, particularly as the consumption of the best oils will be astonishingly less than with the lower grade. Steam engine cylinder oil which usually contains a large amount of animal and vegetable oils should never be used on a gas engine, as it is sure to result disastrously to the machine. It is not necessary to buy but the one kind of oil, as the same oil employed in the cylinder will answer for all purposes. In the two-cycle engine, where the accumulation of the oil in the base is employed to lubricate the crank, it should be drained out frequently and the crank case flushed out with gasolene, as the small particles of sand left in cleaning the casting will from time to time settle in the crank case, and, of course mixing with the oil, will be thrown on to the crank-pin, causing the brasses to wear rapidly. To prevent rust on the small igniter parts, cylinder oil, however, is not sufficiently adhesive, and we recommend keeping all the bright parts thoroughly greased with vaseline, which should be put on with a brush.

Gasolene Pipes.

Another source of trouble is in the location of the tank. This in many cases is placed so low that if the boat is loaded by the head the gasolene will not flow to the vaporizer when the tank is about exhausted. A source of a great deal of annoyance is the practice of running the gasolene pipe around under the lockers, especially where the tank is somewhat low, as in this case the pressure of the gasolene is influenced by the rolling of the boat or over-loading on either side. In some cases we have seen the gasolene entirely shut off when the boat is out of trim. The gasolene pipe should in all cases be led down as close to the keel as possible.

Installing Propellers.

Care should be taken in lining up the engine, as where the engine is out of line with the propeller shaft it will buckle the shaft, causing a great deal of friction, which friction will increase with the speed of the engine. In the majority of cases the smaller sizes of marine engines are installed at a considerable pitch or incline, and there being more wood under the forward part of the engine, which of course will swell with the dampness, the inclination is to throw up the front end of the engine; therefore an engine should always be relined after it has been in use for a week or two.

This is especially true and should be carefully looked after where the propeller shaft is very short. The propeller shafts in the smaller sizes of engines are generally made of bronze, especially where used in salt water; also the stern bearing or stuffing box, which in small boats is generally combined in one and placed on the outside of the boat. On the larger boats, where it is inconvenient to haul the boat out owing to its size, it is customary to use a stern bearing on the outside with a stuffing box on the inside. In this case a steel shaft is used, being bushed with brass or bronze where it runs through the stuffing

box and the stern bearing. In order to prevent its rusting between these points, it is thickly coated with red lead and wound with marlin, also thoroughly painted. This is a very effective rust preventer, and is not affected by the action of the brass in the salt water.

A method of fastening the propeller wheels to the shaft up to 20 inches in diameter of propeller is by tapering the end of the propeller shaft and boring the wheel to correspond with a lock nut on the outside. This method is generally very efficient. On the larger wheels this same practice is followed, only there is a key inserted to prevent any possible slippage. In putting on the stern bearing and stuffing box, great care should be exercised to have them perfectly true and in line.

Boston Letter.

Boston, Oct. 31.—While it is not expected that there will be any changes of note in rating rules during the coming winter, everything points to a most active season among the popular classes, already established in Massachusetts Bay, during the next season. At present it looks as though the greatest activity will be in the 22ft. class, in which there is a possibility of a dozen new boats being built. It may be said that the increased activity in this class is due to the great rivalry that existed in races during the season of 1904, for there are still many features about the rules governing the class that appear as inconsistent to racing men now as they did when the class was first formed. The main thing has been that those who have built boats under the rules have been satisfied with the boats, and the great interest they have shown in racing them has given others confidence and desire to compete in the class. It is quite probable that if a 25ft. class calling for yachts of normal dimensions were in existence, it would prove as great an attraction, at least, as the 22ft. class; but to re-establish a normal 25ft. class is considered a very hard task at present, for the conditions governing length, sail area, and displacement of the 22-footers make it difficult to produce a normal 25-footer which would be calculated to beat them under all conditions, and yachtsmen are averse to building for a class in which yachts cannot beat yachts of a smaller class, boat for boat. So the 22ft. class has found favor at the expense of a 25ft. class, and probably of a 21ft. class.

Because there is a possibility of the greatest activity in the 22ft. class, it is not expected that it will be the largest in point of numbers. The 18ft. knockabout class will probably be the largest to race in the Bay, and it looks as though this class would retain its popularity for many years to come. It is not expected that there will be any great number of new 18-footers built, as compared to other years, while the possibility of a dozen new 22-footers puts that class in the front rank, so far as development is concerned this year. Mr. Sumner H. Foster, who was the organizer of the 22ft. class, is expected to have a new boat designed by Mr. B. B. Crowninshield. Mr. Foster has made no positive statement to this effect, but he does not deny the assertion, and it is known that he is desirous of building a new boat. Mr. Herbert H. White, who has raced Medric for the past two seasons, is not content to rest his chances with one yacht, but is said to have given orders for two, one to be designed by Mr. E. A. Boardman, and the other by Messrs. Small Bros. Mr. H. L. Bowden, who owns the champion 18-footer, Hayseed, will have a 22-footer from designs of Messrs. Small Bros. Mr. George Lee, who owns Peri II., will have a new one designed by Mr. E. A. Boardman. Mr. C. C. Hanley, who has for years been a successful builder of centerboard boats, is said to have undertaken a keel 22-footer for Mr. A. C. Jones, and it is also said that he has guaranteed to beat the class. Commodore B. P. Cheney and Mr. Charles D. Lanning, are credited with believing that this year's champion, Clotho, is still fast enough, although it would not be in the least surprising if they should have a new boat. There has been talk of a 22-footer for Messrs. F. Wright Fabyan and Thomas M. McKee, former owners of the champion 25-footer Firt. Mr. Gordon Prince is a prospective owner of a 22-footer, while still another is Mr. E. W. Hodgdon, who owns the 25-footer L'Aiglon.

At the recent meeting of the Y. R. A. of Massachusetts, it was voted that an Association Judge be proposed at the spring meeting. It is the intention to appoint one judge, who shall attend all races given for Association percentage, who shall act on the board of judges and see that the rules of the Association are enforced, and that a report of the race is properly forwarded to the secretary of the Association. It is believed that this proposal will be favorably acted upon at the spring meeting of the Association. Race committees in Massachusetts Bay are noted for their efficiency, but it often happens that a club giving a Y. R. A. open race has few Y. R. A. boats in its membership, and as such clubs do not usually give more than one such race in a season, very often the members of their regatta committees have no opportunities for becoming familiar with the boats that follow the different circuits. The presence of an official judge, appointed by the Association, will tend to prevent natural mistakes. The forwarding of the full report of a race, giving decisions on protests, will enable the secretary of the Association to give the standing of any boat in any class at any time. Two amendments regarding starts were proposed for consideration at the spring meeting.

At a recent meeting of the Eighteen-foot Knockabout Association, some measures were passed regarding articles of equipment, but there were no changes offered in the general rules governing the class. An amendment compelling owners of 18-footers to sail on their boats in a certain number of races was not carried.

The steam yacht Narada, owned by Vice-Commodore Henry Walters, of the New York Y. C., is at Lawley's, where she is being generally overhauled. The 90ft. schooner designed by Mr. A. Cary Smith for Mr. F. F. Brewster, is being laid down. A 6ft. cruising gasoline launch, designed by Mr. Fred. D. Lawley for Mr. J. H. Proctor, is about finished. This is a very finely proportioned boat with unusually good accommodations for one of her length. A 43ft. schooner, designed by Mr. Fred. D. Lawley for Mr. Bancroft C. Davis, is about finished.

JOHN B. KILLEEN.

Match Race for Motor Boats.

THE match race between the motor boats XPDNC, Vingt-et-Un and Challenger, took place on Saturday, October 29. The course was from the Columbia Y. C., foot of West Eighty-sixth street, New York city, to Poughkeepsie and return, 136.6 statute miles, the longest course ever raced over by motor boats in this country.

The race was for a \$1,000 cup, and XPDNC, Mr. Frank Croker's new boat, won, Vingt-et-Un II. was the only other one of the trio to finish, as Challenger was disabled. Challenger was sure to have given XPDNC a hard go, and it was very unfortunate that she broke down.

Mr. Frank Croker steered XPDNC, Mr. Clinton H. Crane had Vingt-et-Un II.'s wheel, and Mr. Proctor Smith had the helm on Challenger.

Messrs. J. H. McIntosh and W. H. Ketcham had the race in charge, and owing to matters over which they had no control, the start was delayed two hours, and the contestants did not get away until 12:05. XPDNC crossed 20s. after the signal, or 12:05:20, Challenger at 12:07:20, and Vingt-et-Un II. at 12:16:25.

The tide was running flood, and with this aid the boats moved very fast. Challenger, although some distance behind XPDNC from the start, closed up a little on her. A close race between these two boats was assured until Challenger hit a piece of sunken timber off Haverstraw, breaking her propeller, and then she withdrew.

A towboat was anchored about 500 yards south of the Poughkeepsie Bridge, and this craft served as the upstream mark. XPDNC rounded this mark at 2:35:50, and Vingt-et-Un II. at 3:24:30.

The fuel tanks on Vingt-et-Un have not a large capacity, and it was necessary for this craft to stop going up and coming down to replenish her supply of gasoline. The supply boat was anchored off Highland Falls, and although every effort was made to avoid losing time, still Vingt-et-Un II. was heavily penalized by these stops, and lost more than half an hour thereby.

The boats bucked the tide on the downstream leg. XPDNC beat Vingt-et-Un II. 48m. 40s. on the upstream leg, and 9m. 30s. on the way back, a total of 58m. 10s.

The tables which follow give all the times, averages, distances, etc.:

Up River Leg—68.3 Statute Miles.			
Start 12:05:	Finish.	Elapsed.	
XPDNC	2 35 50	2 30 50	
Vingt-et-Un II.	3 24 30	3 19 30	
XPDNC averaged 23.62 knots, or 27.17 statute miles, and Vingt-et-Un II., 17.86 knots, or 20.54 statute miles.			
Down River Leg—68.3 Statute Miles.			
Start.	Finish.	Elapsed.	
XPDNC	2 35 50	5 16 50	2 41 00
Vingt-et-Un II.	3 24 30	6 15 00	2 50 30
XPDNC averaged 22.12 knots, or 25.45 statute miles, and Vingt-et-Un II. 20.90 knots, or 24.04 statute miles.			
Start.	Finish.	Elapsed.	
XPDNC	12 05 00	5 16 50	5 11 50
Vingt-et-Un II.	12 05 00	6 15 00	6 10 00
Challenger	12 05 00	Disabled.	
The actual times of starting were: XPDNC, 12:05:20; Challenger 12:07:20; Vingt-et-Un II. 12:16:25.			
Over the whole course, XPDNC averaged 22.86 knots, or 26.20 statute miles, while Vingt-et-Un II. averaged 19.26 knots, or 22.15 statute miles.			

XPDNC was designed and built by the Herreshoff Mfg. Co. for Mr. Frank Croker. She is fitted with a Mercedes motor. A full description of this boat has appeared in these columns. XPDNC rates 79.7. XPDNC is a contraction of Expediency.

Both Challenger and Vingt-et-Un II. were designed by Messrs. Tams, Lemoine & Crane, and both are fitted with Smith & Mabley engines. Challenger rates 88.35, and Vingt-et-Un II. 79.35.

Forty-foot Waterline Cruiser.

IN this issue there appears another of the designs that was submitted in our designing competition for a 40ft. waterline cruiser. The design, which was one of the best sent in, was made by Mr. Martin C. Erisman, of Mariners Harbor, S. I., and the drawings were honorably mentioned in the awards.

The conditions imposed in this competition, namely, a cruising centerboard yacht of 40ft. load waterline, drawing not more than 6ft. with board hoisted, a minimum freeboard of 3ft. and the mast and gaff of both the yawl and cutter rig to be interchangeable. The high freeboard, it was thought, would give fairly long ends, making the boat graceful, and at the same time give plenty of buoyancy in a seaway, and keeping the boat from picking up green water as a shorter and sharper boat would. The keel has been kept long to give a good distribution of ballast and make the boat easy. The lateral plane has not been excessively cut, insuring good windward qualities when beating up narrow and shallow channels. The yawl rig is ample to drive the boat along while cruising, also its sub-division would put it within the power of a very small crew to handle in any weather. The cutter rig is somewhat larger and is intended for racing or club runs, giving the boat plenty of driving power. The cabin arrangement has been kept as simple as possible and to insure satisfactory accommodation for three persons aft. The lighting and ventilation has not been overlooked, large skylight and air ports, all to open, being provided. It was thought that it was best to restrict all plumbing to the toilet room, and make it of sufficient size as to be ventilated in a proper manner, therefore the fixed basins in the staterooms have been omitted, as they are small and in the way, and not absolutely necessary where a good sized toilet and wash room has been provided. Throughout the boat, in the owner's quarters, the minimum headroom is 6ft. 4in. The storage space is ample, and care was taken to make these spaces as large as possible.

The cabin is splendidly arranged, and the plan has much to recommend it. The companionway leading from the cockpit below is placed off center on the port side, giving access to a small lobby. On the starboard side a door opens into a toilet room fitted with Sands' patent or equal underlined water closet, a 10x15in. porcelain wash basin, all properly plumbed from tank under cabin floor. Toilet contains a large locker for linen, etc. Under the wings in racks being more storage room. Good ventilation being secured by means of one 12in. port and a 15in. square hatch cover in the deck. The floor is fitted with a portable elm

grating left bright. On the port side of the lobby is situated a small room for charts, oiler, boots, traveling bags, etc., which would take up room in the cabin and be always in the way. Forward are situated two staterooms, 7ft. 5in. long, similar in every respect as to furniture and space. The berths provided are large and comfortable, placed partly under the wings, and supplied with either springs or pneumatic mattresses, a seat on forward end with lifting top, at the after end of the state room drawers and dressing table in addition to a hanging locker at the forward end of berth. One large and two smaller drawers under the berth. Ventilation for these quarters is by means of two 12in. ports and a skylight for each stateroom. This skylight also providing light and air to the passage. Sliding doors give access to passageway.

Further forward is situated the main cabin with a length of 8ft. in the clear. On the starboard side is situated a berth, transom seat and lockers. To port transom seats and lockers, these last to be wine lockers and book cases. At the forward end of the saloon are two buffets for glass, dishes and silverware. The dining table is permanent, fitted with extension leaves, and to the after end leads a 4in. brass pipe, connecting centerboard box and the deck, through which operates the centerboard pennant. From the saloon forward on the port side a door leads to the galley, containing ice-box, stove, sink, table and racks; an overhead hatch gives the cook access to the deck without coming through the owner's quarters aft. Port lights are fitted and give good ventilation to this part of the boat. On the starboard side and entirely separate from the galley is situated the captain's room, containing a berth and lockers; egress and access is had from a hatch in the deck off the center line. Forward again is a bulkhead across the ship, on the forward side of which is located the forecabin for two men, also a water closet for the use of the crew.

The dimensions are as follows:

Length—	
Load waterline	40.00ft.
Over all	63.00ft.
Breadth—	
At deck	15.00ft.
L.W.L.	14.30ft.
Draft—	
Hull	6.00ft.
C. B.	9.5ft. to 10.50ft.
Freeboard—	
Forward to top planksheer.....	4.53ft.
Least	3.05ft.
Aft	3.35ft.
Overhang—	
Forward	10.60ft.
Aft	12.40ft.
Displacement	47,966 lbs.
C. B.—Aft No. 5 section.....	1.64ft.
Lead Ballast—	
Outside	14,060 lbs.
Centerboard	1,690 lbs.
To trim	1,750 lbs.
Total ballast	16,500 lbs.
Area—	
Midsection	33.86 sq. ft.
L.W.L. Plane	303.10 sq. ft.
C. L. W. Plane aft No. 5.....	2 sq. ft.
Sail area per sq. ft. midsection—	
Yawl	52 sq. ft.
Cutter	60 sq. ft.
C. L. R. aft No. 5.....	2.52 sq. ft.
Lateral Plane (total area).....	192.7 sq. ft.
Sail area—	
Yawl (lower sails).....	1,766 sq. ft. total 4,630 sq. ft.
Cutter (lower sails).....	2,030 sq. ft. total 4,836 sq. ft.

A. P. B. Association Meeting.

THE American Power Boat Association held a meeting Friday evening, October 28, at the new Hotel Astor, Longacre Square, New York city. The amendments to the racing rules suggested by the Executive Committee were adopted.

Section 2 of rule 3 was amended by adding the following:

In boats having flat or "torpedo boat" sterns the knuckle shall be taken as the after point of the load waterline.

Section 3 of rule 3 was amended by adding the following:

The measurer shall, at the time of measuring, mark the forward and after ends of the waterline, and also the waterline on each side of the boat at the point where the midship section is taken. Such marks shall be made in a plain and permanent manner by a horizontal stripe one-half inch in width and three inches in length, the lower edge to be on the waterline.

Section 4 of rule 3 was amended by striking out the following words:

To be calculated by standard formula for indicated horsepower, and substituting therefor the following:

"The horsepower shall be obtained by dividing the total number of square feet of heating surface of the boiler by 2 7-10."

The last paragraph of section 4 of rule 3 was amended so that it now reads as follows:

R to be taken from owner's written certificate, which shall be subject to verifications by the measurer.

All boats, other than steam and electric, whose engines turn more than 500 revolutions per minute shall carry revolution counters, fitted to the engine, so as to be immediately available for measuring. Revolutions on all boats shall be the maximum number of revolutions per minute, taken on a mile run at the boat's highest speed.

Rule 3 was amended by the addition of the following paragraph, to be numbered 8:

8. If from any peculiarity in the build of a yacht or other cause the measurer shall be of the opinion that the rule will not rate the yacht fairly, or that in any respect she does not comply with the requirement of these rules, he shall report the circumstances to the Race Committee, who, with the measurer, after due inquiry, shall award such certificate of rating as they may consider equitable, and the measurement shall be deemed incomplete until this has been done.

NEW AUXILIARY YAWL.—Mr. James McIntyre, of Neponset, Mass., is building from his own design an auxiliary yawl. The boat is 50ft. over all, 30ft. waterline, 16ft. breadth, and 5ft. draft. The centerboard will house under the cabin floor. She is equipped with a 20 horse-power motor, and with this power a speed of 9 miles is looked for.

LINES, CABIN AND SAIL PLANS OF FORTY-FOOT WATERLINE CRUISER—HONORABLE MENTION DESIGN.

Designed by Martin C. Erismann, Mariners' Harbor, Staten Island.

Around the Globe in a 35ft. Boat.*Editor Forest and Stream:*

Captain Arthur L. Napper, who brought William K. Vanderbilt's yacht *Tarantula* to this side from Europe, and a young companion named Langford, started a few weeks ago from Brighton, England, in a 10-ton cutter on a voyage of about 40,000 miles that will last from fifteen months to two years, depending on how often and how long they stop at the different ports they touch at. The first paper to give me an account of this, gave it as its opinion that these two men were as many fools. There can be two opinions about that; the man who crosses, or tries to cross, the Atlantic in a 15 or 18-foot canoe might be considered a fool; I might so consider him myself, though I would not say so. Some who have tried to do this have succeeded. One of the last who departed in a canoe for Europe, taking a young woman

with him, has, so far as I know, never been heard from. But a 35-foot boat is not a canoe, and this boat, from what little I can learn about it, stands a fair chance to circumnavigate the globe, barring accidents that are as likely to happen to a 300-foot boat as a 35-foot one. It may return two years from now to the port it sailed from. Captain Slocum a few years ago started alone in a boat not much larger than this one, and as far as he went seems to have had no trouble as far as the boat was concerned; all his trouble came from quarrelsome or thieving natives. Two young men with two good magazine guns—and I would not sail without at least two of them—need never have any serious trouble from natives. The character of all the natives on each of these South Sea islands is pretty well known now, and the few of them on which the natives are chronically hunting for a fight (there are still a few such, but not many), can be given the go-by. Captain Slocum's only

mistake, according to my idea of his voyage, was in going alone. You want to be able to stand watch and watch, and not have to leave the tiller lashed and the boat to sail itself when it is your watch below.

This boat, the *Brighton*, is rated at 10 tons, and the Captain has had it rebuilt and fitted with rather short, heavy masts, so that one man can handle the sails with ease. He has a small flat-bottom tender that he will carry on deck in order to get rid of davits, and he has a storm anchor made of a long spar with a large canvas hung to it, having lead weights to its lower edge; this he can heave astern while a gale is on where the water would be too deep to use the regular anchor.

The Captain is only 35 years old, and his mate is still younger. Both of them have been to sea since they were small boys; the Captain first went as a cabin boy when 12 years of age.

Captain Slocum went short of supplies at times. These

men need not; they can carry at least six months' supplies of everything that cannot be got at every port no matter how small it may be that they call at, and water can be got almost anywhere.

The first leg of their run will take them down the south Atlantic Coast past the Canary Islands to Cape Town, South Africa; from here they have clear water, with no place to stop until they get to Freemantle, Australia, 5,000 miles from Cape Town.

From Freemantle they can keep on down the eastern side of Australia to Hobart Town, Tasmania, another long run. This town is seldom heard of, but it is a large one, and here anything that can possibly be needed can be got, and this is about the last place that it can be got short of Valparaiso, Chile.

From here they have the whole South Pacific to lay a course in. I would lay it to Pitcairn's Island from here.

They intend to touch at Valparaiso, and from there run down and double Cape Horn. I would go through the Straits instead, and no doubt so will they. Next, when they have got far enough south, they can run in to Buenos Ayres, the largest city in South America, and one of the finest in the world. Next, after running up to Rio, they can lay a course for the West Indies, calling at San Juan, then run across to the Canary Islands, and follow the old route home.

These men may be foolhardy, but if I were the Captain's age once more, and was given a chance to go with him, it would not take me a year to decide whether to go or not.

CABIA BLANCO.

Lloyd's, and What it Means.

THE Commercial Intelligence, of London, England, in its issue of Sept. 14, 1904, contains an interesting interview with Sir Henry Hozier, secretary of Lloyd's, in which he details the history of the establishment.

Like most great and enduring enterprises Lloyd's had a small beginning. It is now to the world of shipping and marine insurance what the house of Rothschild is to the banking world.

Lloyd's dates from the latter part of the reign of Queen Elizabeth, and had its origin in a small coffee-house in Tower street, kept by Edward Lloyd. He was an enterprising man, and through his business contact with seafaring men and merchants enlisted in foreign trade, foresaw the importance of improving shipping and the method of marine insurance. He was the founder of the system of maritime and commercial intelligence which has been developed into its present effectiveness. Before the time of Edward Lloyd maritime insurance in England was conducted by the Lombards, some Italians, who founded Lombard street, but after Lloyd embarked in the business Britons conducted marine insurance in London.

The subjects of marine insurance are the ship, the cargo, and the freight, all of which may belong to different parties. In time of war there is what is termed the maritime risk—danger from accident, collision, and stranding—which is distinctly separate from the risk of capture and seizure by an enemy. This class of marine insurance had its inception in the conditions arising during the seven-year French-English war of 1757 to 1763.

Lloyd's moved to Pope's Head alley in 1770, and in 1774 removed to the present quarters in the Royal Exchange. In 1871 Lloyd's was incorporated by act of Parliament. This act defined the objects of the society to be: (1) The carrying on of the business of marine insurance by members of the society; (2) the protection of the interests of members of the society in respect of shipping, cargoes, and freights; (3) the collection, publication, and diffusion of intelligence and information with respect to shipping.

The corporation of Lloyd's and the committee of Lloyd's, who are the executive body of the corporation, and the secretary of Lloyd's, have practically nothing to do with marine insurance in the way of taking risks or paying losses. Their duty in this respect is to afford marine insurance brokers who wish to effect insurances a place of meeting with those who undertake the risks.

In the interview referred to Sir Henry Hozier expressed his views on contraband of war and the question of an international treaty affecting the same, as follows:

"In my opinion we ought, as a maritime power, to be very cautious in entering into any treaty or agreement on that subject. My opinion of treaties is that they hold good just so long as it suits the stronger power, and in case of a great naval war we ought to be as unfettered as possible. The whole question can scarcely be satisfactorily solved by a conference, and will continue to arise whenever a naval power is at war. Moreover, that power will always put its own interpretation on what constitutes contraband of war."

The Royal Tay Y. C.

THE Royal Tay Y. C. has its headquarters at West Ferry Bay—a charming spot some three miles to the east of the city of Dundee, on the east coast of Scotland. The club house, small, but neat, is built only a few yards from the river side, and from the windows an uninterrupted view is obtained of the racing courses. The accommodation consists of reading room, dressing room and lavatory, with veranda in front. The River Tay is one of the largest rivers in Great Britain, and is said to discharge more water than any other river in the kingdom. It rises on the Western Highlands, and after a course of some 119 miles through the most beautiful and picturesque scenery, flows into the North Sea, a few miles below Dundee. Owing to its great body of water and to the configuration of its lower reaches, the currents in the tidal waters are very strong.

Below Dundee the river contracts to about a mile in breadth, while above Dundee the breadth is about three miles, which gradually decreases until the city of Perth is reached, some twenty-five miles higher up. The tidal stream is felt two miles above Perth. The rise of tide at Dundee is 11½ feet at neaps, and 14½ feet at spring tides. The bed of the estuary is com-

posed entirely of sand, and extensive sandbanks are to be everywhere met with, where at low water any fine day herds of seals are to be seen basking in the sun. Below the eastern extremity of the shore on the Fife side a line of sandbanks extends seaward for five miles, and forms a dangerous impediment to free navigation. All this is necessary to show why the estuary of the Tay is in many respects ill-adapted for yachting, but the enthusiastic yachtsman is in no way discouraged by difficulties; they render his sport more exciting, and those who shape their course in such a way as to take the swift running tide in their favor, secure a natural power equal to many horse-power of mechanism. The shallowness of the Tay estuary is another obstacle to yachtsmen which can of course only be surmounted by a restriction of draft in their vessels. Above Dundee at low water the navigable channel is restricted to a breadth in places of not more than a hundred yards, and although merchant vessels of the largest size can reach Dundee, the bar at the mouth of the river is too shallow to permit of the entrance of a modern ship of war of any great size.

The club was founded in 1885, and at first went under the name of the Tay Corinthian Sailing Club. The membership was at first small; but the members and yachts increased, and some years afterward the more ambitious title of the Tay Corinthian Y. C. was adopted. In 1891 the club obtained a warrant from the late Queen Victoria for permission to style itself The Royal Tay Y. C. The burgee of the club is the Scottish red lion rampant in a yellow shield, surmounted by a crown on red ground, and the ensign is the national red ensign. The membership is at present seventy-five, and the annual subscription is £1. The management is in the hands of a committee of three flag officers and nine other members. Races are sailed under the Y. R. A. rules and measurements, but owing to the diversity of type of the yachts, handicap races are frequently arranged and are more popular than those sailed under the Y. R. A. time allowances. A one-design class of yachts of about 19ft. L. R., called the Seabird Class, named after British sea birds, was formed some years ago and has afforded good sport. The other classes are 18ft., 24ft. and 30ft. L. R., and ten tons—old measurement.

Races for Canada Cup Defender.

THE Rochester Y. C. has very wisely decided to hold open trial races for the selection of a defender for the Canada Cup, and other organizations will be invited to participate.

The secretary of the Chicago Y. C. has received a letter from the secretary of the Rochester Y. C., on this subject and the following is a copy:

Rochester, N. Y., Oct. 22, 1904.

Secretary Chicago Yacht Club, Chicago, Ill.:
Dear Sir—The challenge of the Royal Canadian Yacht Club for the Canada's Cup has been accepted by our club, and the date of the first race fixed for Aug. 12, 1905.

The race is to be sailed in the 30ft. class under the Y. R. U. rules.

It is the purpose of the Rochester Y. C. to hold trial races to select the defender of the club. These races will be sailed on Lake Ontario off Charlotte, the details of which will be arranged later. The Rochester Y. C. cordially invite the Chicago Y. C. to send one or more yachts to participate in these trial races.

We would like to know at your earliest convenience whether your club will enter a yacht, so that the details can be better arranged.

In sailing these trials, our club expects to follow the same general plan as the one used at Chicago. Yours very truly,
L. G. MABBETT, Cor. Sec'y.

YACHTING NEWS NOTES.

For advertising relating to this department see pages ii and iii.

LAUNCH FEARLESS SOLD.—Mr. Clifford V. Brokaw, New York City, has sold the launch Fearless to Mr. Henry T. Bragg, Yonkers, N. Y., through the office of Stanley M. Seaman, New York. The same agency has sold the sloop Tiger for Mr. Ralph L. Crow, of New York city, to Mr. H. S. Hollis, of Bermuda. The boat was shipped by steamer last week to its new owner.

REMOVAL NOTICE.—Messrs. Cousens & Pratt, the Boston sailmakers, have removed from their old quarters on Atlantic avenue in Boston, and are now located at the yard of George Lawley & Son Corp., South Boston, Mass.

TWO NEW LAUNCHES.—R. B. Fordham, of Greenport, L. I., is building two launches. The larger of the two is for Captain Charles B. Crane, and she is 37ft. over all and 10ft. breadth. The smaller boat is 29ft. over all and 7ft. breadth. The name of the owner is not given out.

CRUISING LAUNCH NANCY ANN.—There was recently completed at Morris Heights the cruising launch Nancy Ann. She was built for Mr. W. L. Moody, of Galveston, Texas, and is 65ft. over all, 63ft. 6in. waterline, 12ft. breadth, and 2ft. 6in. draft. She is fitted with two six-cylinder four-cycle Speedway gasoline motors, which will drive the boat at a speed of 14 miles. Nancy Ann is of wood construction, the frame being of white oak and the planking of cedar fastened with copper. Her interior fittings, which are most roomy and attractive, are of mahogany throughout.

NEW SPEED LAUNCH.—There is building at Willard F. Down's yard, Bayshore, L. I., a high speed launch from designs made by Mr. Henry J. Gielow. The boat is for a member of the New York Y. C., and is 45ft. over all, 43ft. waterline, breadth 5ft. 7in., and draft 3ft. She has an oak frame, and is double-planked. The inner skin is of white cedar, and the outer is of mahogany. Two cockpits have been arranged for. The forward one will contain the engine and the steering gear, while the after one is for the owner's and guests' use. The boat will be equipped with a four-cylinder, four-cycle Walter motor and a Gielow propeller, which will be driven 800 revolutions a minute. Enough fuel will be carried in the tanks to drive the boat 300 miles at a 22-mile clip, 400 miles at 18½ miles an hour, and 550 miles at a 14-mile speed.

ONONTIO ESTABLISHES NEW RECORD.—Commodore Harrison B. Moore's power boat Onontio was tested over a Government course on the Hudson River on Saturday, October 29, and established a new record for power boats. Onontio covered the nautical mile in 2m. 26s., which is at the rate of 24.66 nautical or 28.36 statute miles an hour. The Government course begins just above the Columbia Y. C. house. One range is at the foot of Eighty-ninth street and the other is a little south of the boat house belonging to Columbia College. Onontio enters and leaves the water quite as cleanly as any of the high speed boats that have been in evidence up to the present time. Her wake was absolutely smooth, and she made apparently no disturbance whatever. Onontio was designed by Mr. Henry J. Gielow and built by the Electric Launch Works at Bayonne, N. J. She is a double-planked boat 60ft. over all, 58ft. waterline. Her power consists of a Craig motor of 175 horse-power. The motor is a beautiful piece of work, and runs without a hitch. The motor was built by Mr. James Craig, Jr., and reflects great credit upon him both as an engineer and a mechanic. Onontio is the Iroquois word for Big Chief.

A PAPER BOAT.—Out of the sheets of an Austrian daily paper an ingenious Viennese engineer has lately constructed for his own use a small yacht, 15ft. long, decked all over, and provided with a centerboard. In the making of the hull, deck, masts, sails and rudder, several thousand copies of the journal were used—each plank requiring no fewer than 2,500 leaves—and enormous pressure had to be employed before the necessary solidity could be obtained. The inventor has already made several excursions on the Woerth See, and even in squally weather his boat is said to have behaved admirably.—London Tid Bits.

Rifle Range and Gallery.

Fixtures.

Nov. 8.—Greenville, N. J.—Annual 100-shot championship at Armbruster's Park.

National Rifle Association.

At meetings of the National Board for the Promotion of Rifle Practice and the directors of the National Rifle Association, held in Washington, D. C., Oct. 22, it was decided that, as there are many riflemen throughout the United States who cannot obtain Government rifles, and who therefore cannot qualify for the National Marksmen's Reserve, the National Board, modification of the rules be made. As altered, they are as follows:

"That rifles of private makers conform in all respects to the following:

"A—The piece must be capable of using the standard Government cartridge.

"B—It must be the same length and weight.

"C—It must have sights similar to those adopted by the War Department, when viewed and stamped by the National Rifle Association, shall be permitted to be used by clubs duly affiliated with the National Rifle Association for qualifications as national marksmen."

The directors of the National Rifle Association at their meeting voted to appoint an official viewer, to inspect and stamp such rifles, and to issue a certificate at a charge of 50 cents.

This offers a new field for private manufacturers of a military type of repeating arms. Schools and colleges may choose from the variety of arms those that are best adapted for their use.

Concerning the national matches to be fixed for 1905, the National Board, at its meeting in January, will receive applications from such associations as may desire them. A special legislative committee, with membership the same as that of the committee of the National Rifle Association, was appointed. Its mission is to frame bills to obtain appropriations from Congress to further rifle practice. The rules of the national competition were changed concerning the time allowance at 800, 900 and 1,000 yards, two minutes to each shot being allowed. No time allowance can be carried over from one stage to another. The allowance of one minute for each shot at the short and mid ranges still obtains. Individual membership was abolished. Annual members may have their dues, already paid, credited to them for a life membership on payment of the balance of the \$25 fee. The formation of clubs and their affiliation with the national club is desired. Representation was provided for in classes as follows: State associations, 6 votes; regiments, 4 votes; clubs, separate companies, troops, battalions, squadrons and batteries, 2 votes.

Cincinnati Rifle Association.

CINCINNATI, O.—The following scores were made in regular competition at Four-Mile House, Reading road, by members of the Cincinnati Rifle Association, Oct. 23. Conditions: 200yds., off-hand, at the 25 ring target. Payne was declared champion for the day with the good score of 230. He was also high on the honor target with 72 points. He again fired 100 shots for record and succeeded in eclipsing his former record by 8 points, scoring 2191, which creates a new record for the range. The scores:

Payne	230	223	222	217	217
Odell	219	215	213	210	205
Bruns	217	215	214	206	198
Nestler	215	212	212	211	211
Freitag	213	201	197	197	185
Drube	203	189	182	173	...
Topf	186	175	172	166	163

Massachusetts Rifle Association.

At the regular weekly shoot at the Walnut Hill range the following scores were recorded:

Long-range match, 1000yds.: F. Daniels 41, Louis Bell 33, B. E. Hunter 32, H. E. Comey 20.

Mid-range match, 500yds.: R. L. Dale 41, E. Forrest 40, H. E. Comey 35.

Offhand match, 200yds.: R. L. Dale 230, A. Nieder 219, T. Carlson 213, F. C. Fitz 211, M. Alden 210, J. B. Hobbs 205, W. A. Stevens 192, S. D. Martin 190, M. T. Day 185, A. W. Hill 183.

Military revolver match, six shots in one minutes:
F Hitchcock 555555—30 455555—29 455555—29
545555—29 555554—29

Zettler Rifle Club.

At the gallery shoot on Oct. 25 the following scores were made, five scores of 5 shots: L. P. Hansen 1221, R. Gute 1220, C. Zettler, Jr., 1207, R. Busse 1203, O. Smith 1200, C. G. Zettler 1200, B. Zettler 1181, H. Zettler 1186, G. Ludwig 1173, A. Begerow 1163, T. H. Keller 1149, T. J. Herpers 1141.

Independent New York Schuetzen Corps.

In the first gallery practice shoot of the season, held on the Zettler ranges, Thursday, Oct. 27, competition was keen for first place. At the close of the shoot Gus Zimmerman and R. Gute tied with a total of 488.

Ten-shot scores, on the 25-ring target, at 75ft., follow: Gus Zimmerman 243, 245-488; R. Gute 243, 245-488; Lambert Schmidt 242, 243-485; H. D. Muller 239, 241-480; F. Liegibel 236, 235-471; A. Begerow 238, 233-471; Joe Bittschier 228, 232-460; Wm. Soell 227, 231-458; Geo. T. Zimmermann 227, 229-456; Jacob Schmid 232, 223-455; John Facklamm 228, 225-453; Bruno Eusner 221, 221-442; Henry J. Behrens 209, 223-432; J. Geo. Bauer 209, 211-420; F. C. Halbe 204, 209-413; Geo. Nienaber 203, 210-413; E. Gartner 189, 215-404; A. Roater 193, 193-386.

Rifle Notes.

On Election Day, Nov. 8, there will be a long-range match between teams, under Palma Trophy conditions, on the old State rifle range at Creedmoor, L. I. Match to start at 10 o'clock.

General orders have been issued authorizing the use of a .22cal. barrel fitted to the Krag action for use by the National Guard for gallery practice on the various armory ranges, New Jersey, Pennsylvania and Washington having adopted this system.

The Quartermaster General will issue to each regiment twenty barrels, and to each signal corps and troop five barrels.

The reduced cost of armory practice by the use of rim-fire ammunition, in connection with the amount of labor saved in cleaning shells, etc., should certainly bring this branch of practice rapidly to the fore. The barrels will be in every particular like the regular .30cal. barrel, except as to caliber.

Trapshooting.

If you want your shoot to be announced here send a notice like the following:

Fixtures.

Nov. 8.—Bound Brook, N. J., Gun Club all-day shoot; merchandise prizes. F. K. Stelle, Sec'y.
Nov. 17-19.—Tampa, Fla.—Tampa Bay Rod and Gun Club, \$400 added. J. A. Hansbrough, Sec'y.

1905.

June 8-9.—Dalton, O., Gun Club annual tournament. Ernest F. Scott, Capt.

DRIVERS AND TWISTERS.

Club secretaries are invited to send their scores for publication in these columns, also any news notes they may care to have published. Mail all such matter to Forest and Stream Publishing Company, 346 Broadway, New York. FOREST AND STREAM goes to press on TUESDAY OF EACH WEEK.

Up to Saturday of last week, there were about twenty entries in the World's Fair Handicap, to be held this week at St. Louis.

On Saturday of this week the Montclair Gun Club and the Rahway, N. J., Gun Club have arranged to shoot a match at Rahway.

Through their captain, Ernest F. Scott, the Dalton, O., Gun Club announces the dates, June 8 and 9, for their annual tournament of 1905.

Elsewhere in our columns will be found the announcement of a memorial fund now opened for contributions, the purpose of which is to erect a monument to the late E. D. Fulford, as a tribute of esteem on the part of his friends. The committee in charge are Messrs. T. H. Keller, Frank E. Butler, J. A. R. Elliott, J. S. Fanning and James T. Skelly.

At the shoot of the Delaware Trapshooters' League, at Middletown, Del., Oct. 27, Mr. J. M. Hawkins made high average with a score of 183 out of 200. Mr. Edward Banks was second with a score of 179; third was a tie between Messrs. J. A. R. Elliott and W. M. Foord, on a score of 178. The Wawaset team No. 1, of Wilmington, won the five-man team championship, and Mr. W. M. Foord won the State championship.

The programme of the Bound Brook, N. J., Gun Club fall tournament, to be held on Nov. 8, provides ten merchandise events, a total of 200 targets, with a total entrance of \$5. The first programme event will begin at 10:30 A. M. A gold medal to the professional making high average. Amateur high averages: First, silver loving cup; second, gold medal; third, silver medal. Ship shells to Dr. J. B. Pardoe, Bound Brook. Mr. F. K. Stelle is the secretary.

On Monday of this week the firms interested in the gun trade and other forms of business met at 312 Broadway, New York, in response to a call issued by Mr. P. G. Sanford, of the Winchester Repeating Arms Co. The purpose of the meeting was to take action in respect to the decease of their former business associate, the late J. H. Lau. The resolution adopted is published elsewhere in our columns. Few men had so completely won the esteem and confidence of their associates. Expressions of esteem for his sterling uprightness, his amiable character, his unvarying generosity, were freely uttered at the meeting, and there was a profound regret manifested by all, such as occurs only when a good man, universally beloved, has passed away into eternity.

The test case against the pigeon shooters, Messrs. R. F. Harned, of Merchantville, N. J., and Charles W. Davis, of Philadelphia, who were convicted of pigeon shooting in contravention of the laws of New Jersey, is likely to be prosecuted with vigor. The following is from the Newark Sunday Call, and bears on the case: "The president of the New Jersey S. P. C. A. wrote to Samuel A. Atkinson, public prosecutor of Burlington county, last week, and suggested that Attorney-General Robert H. McCarter be requested to join in arguing the anti-pigeon shooting law before the Supreme Court. It was in Burlington county courts that two

members of the Riverton Gun Club were convicted of violating the law. Their counsel, Lindabury, Depue & Faulks, took an appeal to the Supreme Court, and will contend there that the law is unconstitutional. Mr. McCarter believes the act is sound. Furthermore, he is opposed to the shooting of pigeons from traps. It will therefore be gratifying to the humane people of the State to know that Mr. Atkinson on Thursday asked the Attorney-General to join him in upholding the act in the courts, and that Mr. McCarter cheerfully replied that he would be glad to do so."

BERNARD WATERS.

J. H. Lau.

A NUMBER of the leading houses of the sporting goods trade met on Monday of this week in pursuance of the following call:
New York, Oct. 28, 1904.

The Forest & Stream Pub. Co., 346 Broadway, New York:

Gentlemen—A meeting of the members of the gun trade of the city of New York will be held at the office of the Winchester Repeating Arms Co., 312 Broadway, on Monday, Oct. 31, at 11 A. M., to take suitable action on the decease of our former business associate, Mr. J. H. Lau. Your presence is earnestly requested. Yours very truly,
P. G. SANFORD.

There were quite a number of firms represented at the meeting. Their action is expressed in the following:

At a special meeting of the gun and sporting goods trade, held Oct. 31, the following minute was adopted:

It becomes us, as representatives of the trade with which Mr. J. H. Lau was for so many years identified, to give expression to our sorrow at his death, our sense of loss as a guild at his taking from us, and our sympathy with those who survive him in business and in the family.

Mr. Lau had been a member of our trade longer perhaps than any one now engaged in it. The oldest of us in point of service recalls his face and figure as among the earliest recollections of their business career.

A man stalwart alike in figure and character, firm in his convictions, courteous and kindly in his address.

Our loss was that in the hurry and pre-occupation of the day, we missed the opportunity of closer and more frequent intercourse.

His sterling character and upright example are a goodly heritage.

Resolved, That this expression of our sorrow be conveyed to the bereaved family, and that it be duly published.

Joseph Gales, Sec'y.

George G. Moore, Chairman.

The firms represented at the meeting were as follows: Schoverling, Daly & Gales, 302 Broadway; H. & D. Folsom Arms Co., 314 Broadway; A. H. Funke, 83 Chambers street; H. H. Kiffe Co., 523 Broadway; T. J. Leary, 833 Madison avenue; Geo. C. Moore, 4 Warren street; C. J. Godfrey, 28 John street; Von Lengerke & Detmold, 318 Broadway; J. Stevens Arms & Tool Co., 98 Chambers street; The Shooting and Fishing Pub. Co., 150 Nassau street; The Forest and Stream Pub. Co., 346 Broadway; Wm. M. Odell Co., 302 Broadway; Mr. Worleman, 97 Reade street; U. T. Hungerford Co., 497 Pearl street; M. Hartley Co., 313 Broadway; F. Bannerman, 579 Broadway; Abercrombie & Fitch, 314 Broadway; Wm. P. Howell, 582 Mott avenue, Bronx Borough; John P. Dannefelser, 9 Chambers street; J. B. Crook & Co., 1166 Broadway; New York S. G. Co., 61 Nassau street; Peters Cartridge Co. (T. H. Keller, manager), 98 Chambers street; Iver Johnson Arms & Cycle Works, 97 Chambers street; M. W. Robinson Co., 79 Chambers street; Charles Parker Co., 32 Warren street; Winchester Repeating Arms Co.

IN NEW JERSEY.

Montclair Gun Club.

MONTCLAIR, N. J., Oct. 29.—A very jolly crowd of some seventeen men faced the traps at the regular weekly shoot to-day. The weather conditions were all that could have been desired, and yet the crack shots of the club did not equal many of their past performances. Mr. Fanning, who was the guest of the club, was experimenting with a new single-trigger gun. This may account for his falling down in events 3 and 4. Mr. Kendall was trying a new load; and so on, down the list.

With to-day was concluded the shoot for the Mullerite watch fob presented by Messrs. Schoverling & Welles. Mr. Geo. Batten was the winner with a score of 47 out of a possible 50, made on Oct. 15.

On next Saturday the club shoots a team race with the Rahway Gun Club at Rahway. Scores:

Tietjen's Shoot.

Richard Tietjen's place, although not very well known to many of the followers of trapshooting in and about New Jersey, is in fact one of the best-equipped places for a sportsman to spend a day of recreation and pleasure. It is located in Moonachie, N. J. It is surrounded by some of the best duck and snipe meadow that the State affords. Dick Tietjen and his brother Hen are sportsmen of the right sort, and take every opportunity that business affords to guide their visitors through the meadows and to the best ponds in season. A few weeks ago the writer had occasion to visit them on business, and while there met many well-known New York sportsmen and some from New Jersey. Prominent among these were Mr. Henry Pape, who has many of his fine dogs boarding with Mr. Tietjen; Mr. Sitzler, of Hoboken; L. Gille, of Jersey City; Gen. Zitzle, of New York. Other well-known business men indulged in trapshooting after a successful hunt. The game brought in by these parties had black duck, teal, mallard, wood duck, English snipe, woodcock, crow duck, mudhen and rail birds.

During the afternoon's jollification it was suggested that a game dinner and prize shoot would be a most appropriate day's entertainment for all. This was no sooner said than arranged. About twenty-five names were booked and invitations forwarded.

Thursday, Oct. 27 was selected as the date, and sure enough a good party showed up. Practice shooting was indulged in until dinner call.

Mr. Sitzler, assisted by Mrs. Tietjen and Miss Annie Tietjen, proved to be chefs of no little experience, for seldom, if ever, has a game dinner of venison, duck, snipe, woodcock, etc., been served nicer or better than on this occasion. The potato balls, as large as one's head or pretty near it, were flaky and fine. The

venison was tender and very palatable, while the ducks, etc., fairly melted in one's mouth. The boys did justice to the good cooking.

Afterward speech-making and shooting experiences were in order and indulged in until the early hour. Many of the party, however, were called away early on account of business; therefore few took part in the prize shoot.

Practice shoot and prize shoot scores:

Practice shoot, 25 targets: J. Boehmer 13, L. Gille 10, C. Mahlone 9, L. Sitzler 16, S. Fichtel 13, C. Von Lengerke 19, J. Remheor 12, S. Telfic 13, J. Coons 0.

Prize shoot, 25 targets, handicap allowance: L. Sitzler (6) 20, C. Mahlone (13) 15, R. Tietjen (6) 21, L. Gille (12) 25, S. Fichtel (19) 25, J. De Pauro (15) 19, C. A. Heydolph (15) 17, S. Telfic (14) 19, J. Coons (16) 22, Carl Von Lengerke (0) 18.

L. Gille and S. Fichtel tied for first and second prize, which was decided by toss. Mr. Gille won first, a handsome rod presented to Mr. Tietjen by Messrs. Von Lengerke & Detmold, Mr. Fichtel taking second, a useful gun implement. It was decided to hold another prize shoot next month.

CHIP.

Mountainside Gun Club.

Orange, N. J., Oct. 29.—Fine weather impelled a few shooters to meander toward the Mountainside Gun Club grounds, West Orange. All the events were at 25 targets. The scores follow:

First event: Abram Mosler 18, Harry Howlett 18, Mr. Gilmour 13, F. B. Miller 11.

Second event: Mosler 19, Howlett 18, Gilmour 10, Miller 12.

Third event: Dr. Marcus Newcomb 13, Mosler 20, Howlett 20.

Fourth event: Dr. Frank B. Lane 14, Gilmour 4, Dr. William B. Graves 6.

Fifth event: Dr. Newcomb 12, Dr. Lane 15, Joseph McDonough 21, Mosler 23.

Pattensburg Gun Club.

Pattensburg, N. J., Oct. 29.—The scores made to-day at our regular monthly shoot, for the medals follow. The medals were in the hands of H. P. Milbern and H. B. Gano, they being the winners last month. To-day they did not seem to be in quite good condition. Nate Stamets came out with a new gun, and made a good score for the first time with it. There seemed to be a nervous feeling among some of the shooters, as we notice a drop in their record. The contest resulted in C. W. Bonnell taking the first (gold) from H. D. Gano. H. L. Gano took the second from H. P. Milbern. Still another interesting occurrence is near. The Hunter medal next month is the end of the year's contest. This shoot brings four in close connection for it next month. It will decide the year's wonder. The scores as they stand are 191, 194, 198, 199, A. E. Holbrook being top man at present, and looks as if he would be able to take the jewel.

This has made it very interesting for our club the whole year, causing a regular turnout at each monthly shoot, with a wish to compliment the Hunter Arms Co. for the jewel given by them a year ago.

Medal shoot:

P. H. Gano.....	011111011111011111101011—20

Indianapolis Gun Club.

INDIANAPOLIS, Ind., Oct. 22.—To-day was the last contest for Morrison cup, which resulted in a tie between Mr. Thos. Parry and Mr. C. H. Finley. The tie will be shot off next Saturday, each contestant shooting at 50 targets each.

The following, at a total of 300 targets, is the result of the six high scores for those who qualified for cup, distance handicap in yards: Parry (18) 274, Finley (18) 274, Gregory (17) 268, Anderson (16) 255, Bell (18) 254, Dickman (18) 244, Medico (17) 244, Moore (17) 239, Moller (18) 234, Dixon (17) 227, Armstrong (16) 208, Hice (14) 192.

Thirty-eight members took part in this cup race, but only twelve shot six, the required number to qualify. The shooting of Mr. Parry was considered the best done on our grounds for some time, he scoring 96 out of the first 100; and all from the 18yd. mark. His score to-day for Morrison cup was 48 out of 50.

Practice events, total shot at and broke:

	Shot at.	Broke.		Shot at.	Broke.
Parry.....	150	36	Hice.....	50	20

Bell.....	65	71			

Ossining Gun Club.

OSSINING, N. Y., Oct. 29.—The appended scores were made at the regular bi-monthly shoot of the Ossining Gun Club. Events Nos. 6 and 7 were handicaps for cut-glass and silver cups. A. Bedell won the first with a score of 18 from 18yds. The second stood a tie between E. Ball and Bedell, the former winning on a toss-up. W. H. Coleman and G. W. Anderson arrived too late for the prize events. Birds were thrown 70yds., which made it rather difficult for back-liners.

Events:	1	2	3	4	5	6	7	8

G. W. Anderson, 16.....	5

Norwich, Conn., Shooting Club.

The last prize shoot of the season was held on Saturday, Oct. 29. The ammunition case given by Eaton, Chase & Co. was won by I. P. Taft with a score of 90. J. A. Mitchell and A. R. Aborn were second with a score of 89. The \$5 offered by the club to any member making a straight score in a regular 25-bird event has been won by Taft, Noble and Mason. Mr. Taft has broken straight four times. The silver spoons given by Mr. Archibald Mitchell have been awarded as follows: Taft 2, Noble 2, McCord 2, Gates 1, Prest 1, Mason 1, Aborn 1, Amberg 1, and there is an undecided tie between Mitchell & Aborn for one of the October spoons.

I. P. TAFT, Sec'y.

Mrs. Nellie Bennett was visiting at Colorado Springs last week, and the boys entertained her at the traps. Scores: Mrs. Bennett shot at 85, broke 40.

WINCHESTER

RIFLES, REPEATING SHOTGUNS AND AMMUNITION

SHOOT a Winchester Rifle or Shotgun, or Winchester make of Ammunition once and you will shoot it always. Winchester rifles, shotguns and cartridges of all kinds are so well and favorably known by intelligent sportsmen the world over, that an explanation of the reason they are so much superior to all other makes upon the market is unnecessary. If you buy other makes, you may get satisfaction; but if you buy Winchester make of guns or ammunition, you are sure to get satisfaction. The experience, skill and quality of materials embodied in their manufacture are the best guarantee that Winchester guns and Winchester make of cartridges represent today the highest development in gun and ammunition making. Whatever your preferences may be, some of the twelve different models of Winchester guns will surely suit you; for they are made in all styles, calibers, gauges and weights. Use Winchester guns for all kinds of shooting and Winchester cartridges for all kinds of guns.

WINCHESTER REPEATING ARMS CO., - - - NEW HAVEN, CONN.

Where to Hunt Game in the South

WHERE to hunt game in the South is becoming more and more of a problem each succeeding year. Not by any means on account of the scarcity of game, but owing largely to the increasing tendency of sportsmen to form clubs, and reserve the shooting privilege of large sections of country. In this way places where sportsmen have formerly found good shooting are no longer open to them, consequently they must cast about for new territory, new guides, and new accommodations while in pursuit of their pleasures afield. And it is well to add here that the shooting preserves, while in a way numerous, cover but a very small fraction of the vast bird country throughout the Southern States, and for many years to come can the individual or parties of hunters find good shooting and good accommodations in the South. The most serious and really only perplexing problem is just where and with whom to shoot. For the accommodation of its patrons the Seaboard Air Line has at considerable expense and time taken up this matter in behalf of the sportsman, and publish the following list of places where they know birds can be found and good accommodations had, and in many cases, for those not owning their own kennel, dogs may be secured as well.

NORTH CAROLINA.

North Carolina presents a great variety of country. There are many miles of open pine woods in which the shooting is very fine. Quail, of course, is found most generally, but in many places wild turkeys are still numerous. In the following summary only the best points have been selected. It will be observed that these places are located with reference to their distance from some central point. At Seaboard, sixty-nine miles from Portsmouth, Va.—Shooting good. Country rolling. Quail numerous, turkeys and deer in the swamp lands. Guides, from \$1 to \$1.50 a day. Horses, \$2 a day; there are no dogs for hire. Board, \$1 a day. At Gary's, seventy-six miles from Portsmouth—Quail, rabbits, squirrels, and turkeys abundant. Guides—J. F. Lifsey, E. G. Garlick, at \$3.50 to \$5 a day, furnishing dogs and team and board where desired. Horses, \$2 a day. Board, \$1.50 a day. At Weldon, seventy-nine miles from Portsmouth—Shooting good. Quail, turkeys, ducks, squirrels and deer. Guides—Henry Grant, "Billy" Clanton, William Roberts, Ben Pope, and J. T. Evans will act as guides at reasonable rates. They will also furnish dogs. Horses, \$2.50 to \$3 a day. Board, \$1 per day up. At Gaston, ninety-one miles from Portsmouth—Quail, squirrels, rabbits, and frequently wild geese are abundant. Guides—J. J. King and Sam Shaw, at \$1 a day. Horses, but not dogs, \$1 to \$1.50 a day. Board, \$1 a day; \$5 a week. At Littleton, ninety-nine miles from Portsmouth—Quail very numerous this season; also turkeys, geese, and ducks. Guides—George Kirkland, J. J. Myrick, J. H. House, or John Reed, at \$1 a day or \$5 a week. Guides will also furnish teams and dogs. Board, \$1 a day; \$5 a week. Judge Gummerie, of the New Jersey Supreme Court, is a regular hunter here every fall. At Roxabel, eighty-one miles from Portsmouth—Quail are abundant, and in the Roanoke River bottoms turkey and deer are plentiful. Guides at reasonable rates. At Norlina, ninety-eight miles from Richmond, Va.—Quail, turkeys, squirrels, and rabbits. Guides—F. B. and F. P. Wiggins will act as guides at reasonable rates. Mr. F. B. Wiggins can furnish two or more dogs. Horses, \$1.50 a day. Board, \$2 a day. At Henderson, one hundred and fourteen miles from Richmond. On the ridge between the Tar and Neuse rivers—Shooting excellent. Quail, turkeys, squirrels, rabbits, foxes, and a few deer. The quail shooting is especially fine, and will be better than usual this season. The country is level and open, with enough cover to protect the birds. Board, \$5 to \$10 a week. Guides—R. J. Southerland and Mr. June Clements will take charge of parties at reasonable rates, furnishing horses and dogs. Henderson has an established reputation among sportsmen, and is visited every season by Northern hunters. At Manson, one hundred and three miles south of Richmond—Quail shooting unusually fine; also turkeys and squirrels. Guides—J. H. Bullock and C. M. White. They also furnish dogs. Horses, \$1 a day. Board, \$2 a day. At Middleburg, one hundred and six miles south of Richmond—Quail, turkeys, deer, and partridges. Guides—Alfred Plummer can furnish board, guides, and dogs at reasonable rates. At Franklinton, one hundred and thirty miles from Richmond, Va.—Quail, turkeys, and squirrels abundant. Guides, \$1.50 a day; they supply dogs. Horses, \$1.50 and \$2 a day. There is a good hotel at which board can be had at \$2 a day or \$10 a week. At Raleigh, the capital of the State, one hundred and fifty-seven miles from Richmond—This is a good point from which to go to less populous sections. At Osgood, thirty-seven miles south of Raleigh—Here the country becomes less rolling, but the shooting is as fine as it is in the northern part of the State. Quail, turkeys, and squirrels plentiful. Guides, \$1 a day. Board, \$1 a day. Teams at reasonable terms. At Lakeview, sixty-two miles south of Raleigh—All the land in this section is posted and under the management of the Lakeview Townsite Company, which readily grants permission to sportsmen from a distance. Quail and turkeys are very plentiful. Last spring the Lakeview Company planted a large number of small patches of peas, inclosing them so they would benefit the partridges and other wild game. Competent guides may be obtained at from \$1 to \$2 per day. Board, \$2 per day at hotel; \$5 to \$10 per week in boarding houses. At Southern Pines and Pinehurst, two hundred and twenty-five miles from Richmond—At Pinehurst there are 35,000 acres of land over which the shooting privileges are owned by the management of Pinehurst. Probably the finest quail shooting in the country is found here, as the birds are cared for scientifically and are protected for the benefit of guests of the place. There is maintained a kennel of hunting dogs for the use of guests of Pinehurst. Twenty of the best trained dogs in North Carolina were purchased for this purpose, and are kept in good condition under charge of Mr. Gray. Competent guides always to be had by day or week. At Aberdeen—Mr. H. H. Powell, one of the best known hunters in North Carolina has the

shooting privilege over 5,000 acres of ground. Mr. Powell acts as guide, and being familiar with the country, knows where the game can be had, and makes it easy for those desiring sport to have plenty of it. Mr. Powell has a comfortable home for those who desire to hunt over his grounds. At Hamlet, two hundred and fifty-four miles south of Richmond—This is one of the best points in North Carolina from which to arrange hunting expeditions. There is an excellent hotel here, and within a radius of twenty miles there is some of the best shooting in the State. Guides and dogs can be had here to hunt the adjacent country. At Rockingham, near Hamlet—Quail very abundant this season; also turkeys. Guides not needed. Teams can be hired reasonably, but hunters must bring their own dogs. There is a good hotel here; rates \$1 to \$2 a day. At Polkton, thirty-three miles from Hamlet—Here is a famous shooting country. In addition to the quail and turkeys, there are plenty of foxes and of fox hunters. Guides can be had cheaply, and teams also at low prices. Good board, \$1.50 a day, or \$5 a week. Guides—Sam Hubbard, William Bryant, Prince Henry, and James Willoughby. At Peachland, thirty-seven miles from Hamlet—Quail very abundant. Guides can be had at nominal prices, and so can dogs and horses. Board, \$1.50 a day; \$10 a week. At the Rutherfordton Branch, between Shelby and Rutherfordton, is some of the best quail shooting in the country. The line here runs into the foothills of the North Carolina mountains. It is a rich grain country, and the birds are numerous and in fine condition. Board can be had at almost any of the stations of the Seaboard Air Line Railway, and agents of the road at Lincolnton, Shelby, Ellenboro, and Rutherfordton will gladly furnish information to prospective visitors. At Lumberton, forty-three miles from Hamlet—Quail, turkeys, and squirrels abundant. In the swamps deer are found. Horses, from \$1 to \$2 a day. Board, \$1 to \$2 a day; less by the week. At East Arcadia, also near Wilmington, and in one of the best sections for game—Quail, wild turkeys, woodcock, ducks, and squirrels plentiful; and in the swamps bears, deer, mink, otter, and other wild animals rarely found to-day, within reach of sportsmen. Board can be had at reasonable rates, and guides and horses can be hired. Guides—T. J. Johnson and R. H. Grant, of Wilmington. Board at the Wilmington hotels from \$2 to \$3 a day.

SOUTH CAROLINA.

Much the same conditions exist in South Carolina as in her northern neighbor, though the State does not afford an equal number of excellent hunting and fishing points. Between Hamlet and Atlanta, however, there is both good shooting and fishing, and in some other regions of the State the conditions for both are fine. At Greenwood, between Hamlet and Atlanta—Quail are abundant, and so are squirrels and rabbits. Guides can be had if needed, and teams may be hired at reasonable prices. There is a good hotel here, where hunters will be well taken care of. At Abbeville, about fifteen miles beyond Greenwood—The quail shooting is especially fine; it is a common thing to bag seventy-five in a day. The local sportsmen will act as guides at nominal cost, and will furnish horses and dogs. Board may be had very cheaply. At Calhoun Falls, a little beyond Abbeville, is another good point for either fisherman or hunter. Camden, three hundred and twenty-seven miles from Richmond—Good shooting and hunting on the Wateree River. Quail shooting is especially fine, and guests at the three large tourist hotels here have full benefit of the sport. Guides, dogs, and horses may be had at reasonable prices, and local sportsmen always may be counted on to accompany visitors. In season doves are also abundant. Fox hunting is a favorite sport, and there are several good packs of hounds in the town and immediate neighborhood. This sport is enjoyed here under favorable conditions rarely found in this country. Mr. A. J. Boykin, of Camden, has excellent hunting grounds within five miles of station. He acts as guide, and supplies dogs, board, etc.

GEORGIA.

At Stillwell, twenty-four miles north of Savannah, low, flat country, near the coast—Quail, doves, turkeys, snipe, woodcock, ducks, wildcats, deer. Board can be had here, but it is well to go to Savannah, and there make arrangements for guides and equipment. At Dorchester, twenty-five miles south of Savannah, near the coast—Quail, turkeys, and squirrels. Guides—Patrick James, Summer Lambert, C. A. Tate, \$1 a day. Horses, \$1.50 a day; no dogs. Board, \$4 a week. At Clio, thirty-two miles north of Savannah—Quail, turkeys, and deer abundant. Guides and dogs at reasonable rates. Board \$1 a day; \$5 a week. At Riceboro, about thirty miles south of Savannah—Quail, doves, turkeys, plenty of deer. No guides. No boarding-houses; but an ideal spot for operations from Savannah. At Darien, ten miles further south—Quail, turkeys, and deer plentiful. Guides, \$1 a day. Horses, \$1.50 a day; no dogs. Board, \$1 to \$2 a day. At Everett City, fifty-six miles south of Savannah—Splendid hunting—quail, doves, turkeys, ducks, squirrels, deer. Guides can be had if desired, but they are unnecessary. Board, at Brunswick, \$1.50 a day up. At Townsend—The same conditions prevail here and at White Oak, Woodbine, Colesburg. At Collins, sixty miles from Savannah—The quail shooting here will be unusually good this season. Guides not needed. Board, 75 cents a day. At Ochopee, sixty-eight miles from Savannah—One of the best points in the State. Quail, doves, turkeys, ducks. Guides—N. B. Jarriel, E. J. Giles, R. A. Giles, \$1.50 a day. Horses and dogs at reasonable prices.

FLORIDA.

East of the Rocky Mountains there is no such hunting as in Florida, and the fishing is equally fine both in the fresh-water streams and lakes and in the fishing on the coast. The tarpon, the king of all game fish, has his true habitat in the waters just south of Tampa Bay, on the west coast of Florida. Fishermen have come here in such numbers from this country and from England, that it has

paid to maintain a good hotel at Sarasota. For shooting, it may be said, in brief, that at any point a very few miles distant from centers of population, quail are to be found. In Florida one can find quail as easily as he can find English sparrows in northern parts; but the presumption is that the sportsman who goes to Florida has larger game in view. Probably, however, the finest sport with the gun obtainable in civilized lands is quail shooting, and this is found in absolute perfection in Florida. At Live Oak, eighty-two miles from Jacksonville, is a splendid point for both fishing and shooting. All kinds of fresh-water fish native to these parts are here in abundance. The quail shooting is unsurpassed. Guide—W. R. McGregor, \$1 a day. Horses, teams and guides are usually furnished by livery stables, \$3 a day. Board, \$1 to \$2 a day. At Hampton Springs—With this as the central point, he can get whatever kind of game he wants. Below Hampton Springs, Fenholloway River affords fine fishing, bass, perch, and bream being plentiful. Quail, turkeys, and squirrels abound in the hammocks (heavily wooded tracts) and deer are also plentiful. Frank King and George Lee, of Perry, Fla., are competent guides, whose services can be had for \$2 per day. Cook's Hammock, through which the Steenhatchie River runs, and the adjacent territory, abound in game; quail in the open woods, turkey, deer, bear, panther, and wolves in the hammocks and swamps. Along the coast ducks and geese are plentiful. Rookeries of sea and plume birds are found which are of interest to ornithologists. At McClenny, twenty-seven miles from Jacksonville—Fine fishing. Quail, doves, and squirrels plentiful. Guides can be had at reasonable rates. Board, \$2 a day. At Madison, one hundred and ten miles from Jacksonville—Good fishing and splendid hunting. Quail, turkeys, ducks, deer, and bear plentiful. Guides will be furnished by D. H. Mays & Co. and Thomas McLeary, from 50 cents to \$1.50 per day. Teams and dogs can be hired cheaply. Board, \$1.50 to \$3 a day. At Monticello, one hundred and forty miles from Jacksonville—Fine quail, dove, duck, and snipe shooting. Guides can be had at all times at reasonable rates. Board, \$2 a day; \$12.50 a week. At Ward City, sixty miles from Jacksonville—Fishing and hunting fine. Quail very abundant, squirrels plentiful. Fine hunting country. Guides, \$1 a day. Neither horses nor dogs for hire. Board, \$2 a day. At Chaires, twelve miles from Tallahassee—Fishing fine when river is at right stage. Fine quail, turkey, and squirrel shooting. Deer also plentiful. Guides—No trouble to secure guides. Board very reasonable. At Gainesville, seventy miles from Jacksonville—Fishing and hunting good. Quail and ducks the principal game. No regular guides, but good livery service at \$2.50 and \$3.50 for team. Board, \$7 to \$10 a week. At Tallahassee, one hundred and sixty-five miles from Jacksonville—Trout, bream, mackerel, bass, bluefish, etc. Deer, turkeys, ducks, snipe, woodcock, quail, and doves all abundant. Guides furnished by livery stables at \$3 to \$4 a day with team. Horses, \$1.50 a day; dogs, \$1. Board, \$2.50 and \$3 a day at hotels; \$7 to \$12 a week in boarding-houses. At St. Marks, twenty miles from Tallahassee, on the Gulf—Splendid sea fishing, as well as fresh water. Fine duck and goose shooting as well as quail. Guides—Ernest Oliver and Carey Turner, \$1.50 a day. Board, \$1 to \$2 a day. At Fernandina, thirty-four miles northeast of Jacksonville, on the coast. Excellent sea and fresh-water fishing. Quail, ducks, and some deer. Guide—Crockel Holzendorf, \$1.50 a day. Teams at reasonable prices. Board, \$1 a day and up. At Yulee, twenty-four miles north of Jacksonville. Fine fresh and salt-water fishing. Quail, turkeys, deer, and squirrels. Guides—John White, J. J. Edmondson. Horses, \$2 a day. Deerhounds can be rented. Board, \$1 a day. At Waldo, on main line, fifty-six miles south of Jacksonville. Good fishing and excellent quail shooting. Board, \$2 a day; \$6 to \$10 a week. At Ocala, in the heart of the best hunting section in the State—Quail, duck, turkeys, deer, etc., can be found in abundance. Guides—Henry Livingston, Ocala; W. H. Hopkins, Orange Lake, \$1 to \$1.50 a day. Can furnish team at \$2.50 to \$4 a day. Board, \$1 to \$3.50 per day. At Wildwood, one hundred and twenty-eight miles south of Jacksonville. Trout, speckled perch, bream, etc., abundant. Quail, turkeys, and deer abundant in the neighborhood. Guides—L. W. Cook, Jeff Walker, 75 cents a day; \$3 a week. Board, \$1 to \$2 a day. At Leesburg, eleven miles from Wildwood—Splendid bass fishing, quail and duck shooting. Guide—G. E. Winter. Horses and dogs can be hired. Board, \$1 to \$2.50 a day. At Tavares, twenty-two miles from Wildwood. Fine fishing and shooting—Quail, ducks, squirrels, deer, and bear. Guides can be had at \$1.50 per day. Horses, \$1 a day. Board, \$1 and \$2 a day. At Oviedo—Splendid fishing; perch, bream, trout. Quail, turkeys, and deer abundant. Board, \$1 a day. At Mohawk, short distance from Tavares—One of the best points in Florida, where, at the Jolly Palms Hotel, there is a sportsman's resort with everything necessary to make an expedition enjoyable. Fine fishing in lakes and streams, and all kinds of large and small game close at hand. Lake Weir, a fine fishing point, is three miles distant.

At Lacoochee, fifty miles north of Tampa. Fine fishing, trout, pickerel, etc. Quail, turkeys, and deer abundant. No professional guides. Horses and dogs can be hired. Board, \$1 a day. At Abbott, thirty-eight miles north of Tampa—Trout, bream, perch, etc. Quail, turkeys, and deer in abundance. Quail more plentiful than ever before. Guides—J. A. Turner and John Smith. Board, \$4 to \$6 per week. At Braidenton, on the Manatee River, about sixty miles below Tampa—Fishing fine in the river and bays along the coast. Bird shooting fine, also good duck and snipe shooting. The fishing in Sarasota Bay, a few miles below here, is the finest on the Florida coast. This is the home of the tarpon, which is caught here in greater numbers than anywhere else. There is a good hotel at Sarasota, and boats may be hired.

For further information address: W. E. CONKLYN, General Eastern Passenger Agent, Seaboard Air Line Railway, 1183 Broadway, New York.

U.S. AMMUNITION

UNITED STATES CARTRIDGE CO. LOWELL, MASS.

Agencies:

497-503 Pearl St., 35-43 Park St., New York.

114-116 Market St., San Francisco.

When the Pastime Gun Club, of Detroit, Mich., met last week there was some hot shooting. Wolf and Tolsma tied for the trophy. Wolf won the Class A medal, and the Class B went to Whitmore. White won the Class C, and Hannebauer the Class D.

Cedar Lake Shoot.

Cedar Lake, Ind., Oct. 24.—This summer resort has often been the scene of a target tournament on the Binyou side of the lake, but Saturday and Sunday were the first times that the attention of the management and shooters was called to live-bird shooting as a pastime. The attendance was limited, yet those present shot through both days, and as they were the well-known jovial bunch—Marshall, Boa, Clark, Binyou, Burnham and Barto—a good sociable time was the result. Each took turns in winning first by going straight, whether it were a 25-bird or a 7-bird event. Boa was “pumping” lead fast, and had some sport with Marshall. Binyou fooled ’em in the 25-bird event. Scores:

Event No. 1, 7 live birds, \$7.50 entrance:
Marshall 2222200—5 Binyou 1122222—7
Boa 2202200—4 Burnham 0222222—6
Clark 2221221—7 Barto 2222222—7

Event No. 2, 25 live birds, \$25 entrance:

Cincinnati Gun Club.

Cincinnati, O.—Oct. 29 was a perfect day. The main event was a series of five 20-target events, 10 cents entrance in each. Ties were shot off in next event. Leever won first and second events, Harig in the third, and Don Minto in the fourth and fifth.

The cup race has now eighty-seven entries. Farn is still high with 25. Gambell scored 13, Peters 19, and Medico 15 to-day in an effort to tie him.

Don Minto was high gun in the 100-target event, breaking 90, and at practice he broke 47 out of 50.

Randall and Charles Peters leave for St. Louis to-morrow, and will attend the World's Fair shoot at live birds and targets.

Prize shoot, five events at 20 targets each, 16yds.:

Shot at. Broke.		Shot at. Broke.

Myers 100	67	Gambell 40	29
*Roberts 80	65		

*Shot for the prizes.

Death of Allen Temple.

Another of Cincinnati's well-known sportsmen has passed away. Allen Temple, born Oct. 25, 1841, died at his brother's residence, Eight Mile, Ohio, on Oct. 26, and was laid to rest on the 29th. He was an enthusiastic angler, and spent many seasons in Michigan, Wisconsin and Canada. He was an old member of that bunch of jolly anglers known as the “Kingfishers,” and was the hero of “Old Temp's Dream,” written by J. H. Hickman (Kingfisher), who was his intimate friend. He served in the 39th Ohio Volunteer Infantry during the Civil War; was appointed clerk in the post-office on March 14, 1880, and was in the mailing division up to last June, when he was taken sick. He left many friends behind him to regret his loss, and who bear testimony to his character as one of the truest-hearted sportsmen who ever lived.

Notes.

About two hours' ride from Cincinnati, over the Big Four road, is the town of Sumner, Ind. On Doc Vincent's invitation, several of the Cincinnati boys visited that burg on Oct. 28, and a royal good time they had. Among the party who left the Queen City at 6:30 A. M. were Gus Dick, Arthur Gambell, Dan Pohlar, Lou Pfeiffer and Kramer. They were met at the station by Doc, who had everything fixed up for the comfort of his guests. A big crowd was at the grounds. The forenoon passed quickly in sweep-stake shooting, the last events being three four-man team races at 15 targets each. Gambell's team won each one by a small margin and had only 4 to spare in the aggregate total of the three.

R. L. Trimble won high honors at the shoot of the Central Covington, Ky., Gun Club on Sunday, Oct. 23, breaking 72 out of 80 targets.

The weather on Oct. 22 was not the best for enjoyment of shooting at the trap. This was probably the cause for the very light attendance at the grounds of the Dayton Gun Club. Then the holder of the medal failed to have it on the grounds, so the handicap event was not shot.

The Rohrer's Island Gun Club, of Dayton, O., brought to a close on Oct. 26, what has proved to be an unusually successful season, and the last medal shoot of the series was the best of the year. This event was attended by over one hundred shooters and spectators. The day was cool and clear, with no wind. The medal match for club members only was shot early in the forenoon, and was won by H. Lockwood, after shooting off five ties. J. Donohue stayed in to the last.

The Welfares and Tipp are now tied with Rohrer's, and the deciding matches will be shot soon, probably with Tipp on Nov. 4, and with the Welfare on Nov. 5.

J. Pease, of Vandalia, O., announced that the Vandalia Gun Club would hold a turkey shoot on the Tuesday before Thanksgiving, and invited all shooters to attend.

The October medal shoot of the Preble County Gun Club was held at Eaton, on Oct. 27. C. W. Matthews won the medal with a score of 20 out of 25. He already holds some half dozen shot-gun and rifle club medals.

The third monthly amateur shoot of the Dayton Gun Club will be held on Nov. 11.

The turkey shoot to be held at Vandalia, O., on Nov. 22 will be with rifles, at 100yds., offhand.

Supt. Clark, of the Dayton Gun Club will arrange a trap shoot for turkeys during Thanksgiving week. Bellbrook, Salem, Six-Mile House, and Locust Grove gun clubs will probably do the same.

Garfield Gun Club.

Chicago, Ill., Oct. 29.—The appended scores were made on our grounds to-day on the occasion of the twenty-seventh trophy shoot of the season. Dr. Meek won Class A trophy on 23, Ford won Class B on 21, and Horns won Class C on 18.

After the trophy shoot, Stone and Snyder captained two teams formed by choosing sides. Stone's team captured all three matches. One of the match events was shot on doubles.

The day was unpleasant, being too chilly for comfort or good scores. Attendance was fairly good, considering the season and weather. Eighteen shooters lined up for the afternoon's sport.

Middletown Tournament.

MIDDLETOWN, Del.—The first tournament of the Delaware State League, held here on Oct. 27, was a success in every way. Fifty-five contestants participated in the competition. The tournament was held under the auspices of the Middletown Shooting Association, which made full preparation to meet the requirements of the tournament. The visitors were much pleased with the treatment accorded them.

Mr. William M. Foord, of Wilmington, won the State championship with the excellent score of 91 out of 100. The prize was a beautiful loving cup.

The five-man team trophy contest was won by No. 1 team of the Wawaset Gun Club, of Wilmington, with a score of 200 out of a possible 250. Seven teams competed.

High individual average in the team contest was made by Mr. J. B. McHugh, of the Wilmington Gun Club. He broke 47 out of 50 targets.

For the entire programme, 200 targets, Mr. J. Mowell Hawkins made high average. He broke 183 out of 200. Edward Banks was second with 179, and Messrs. J. A. R. Elliott and W. M. Foord tied on 178 for third.

Mr. Luther J. Squier managed the tournament skillfully and with satisfaction to all. He also attended to the exacting duties of the cashier's office, and consequently he was too busy to participate in the competition, so that while the tournament was a gainer by his management, it lost the participation of one of the very best shots.

Events 5 and 6, team racc. Events 7, 8, 9 and 10, State championship:

Wawaset Team No. 1—Foord 42, McKelvey 41, Miller 35, Jones 35, Graham 45; total 200.

Dover Team—Richardson 42, Faulkner 34, Steele 42, Deed 40, John Evans 34; total 192.

Wawaset Team No. 2—Melchoir 30, Martin 32, Tuchton 36, Buck 41, Bead 36; total 175.

Blue Ball Team—L. Evans 41, C. H. Simon 21, H. L. Simon 30, W. N. Potter 35, Ewing 23; total 150.

Maryland Team—Kirk 40, Booker 31, George 37.

Maryland Team—Kirk 40, Booker 31, George 37, Seward 38, Godwin 27; total 173.

Wilmington Team No. 1—Springer 33, McHugh 47, Rogers 39, Lobb 44, G. Simon 32; total 195.

Middletown Team—Stephens 33, Brice 33, Barnard 44, Duryea 42, Poole 24; total 176.
 Wilmington Team No. 2—Kindell 33, Hartlove 31, Thompson 30, Longland 28, E. Simon 37; total 159.
 DuPont Team—Elliott 44, Banks 44, duPont 41, Skelly 45, Hawkins 47; total 221.

Raleigh Tournament.

RALEIGH, N. C.—Our fourth annual tournament closed with the best attendance and the most successful yet held. While the attendance was not quite as large as we expected, the enthusiasm and good shooting made up the difference.

The trade was represented by six as jolly sportsmen as sent out by the different companies. Walter Huff always wears a smile, especially when the ladies were around, and you could see he cornered off most any old time with one of North Carolina's fairest daughters. J. Mowell Hawkins, Emory H. Storr, Neaf Apgar, Col. J. T. Anthony and Mr. Ellyson were the others.

We had amateur shooters from nearly every club in the State. A magazine trap was used, and I never saw one work so well. Very few targets were broken.

The sliding handicap was used, and it always gives entire satisfaction. No one can kick on his own handicap.

Geo. Lyon, of Durham, had the trade representatives distanced in each day's shoot, and when you are ahead of Huff and Hawkins you are going some. He is the best trap shot in our State.

James I. Johnson, president of our club was second high amateur. Killett, of Wilson, was third. Walter Huff was high for the trade representatives.

The last, or special, event on the first day's programme was at 25 targets for premium of a twenty-year life policy, given by the Prudential Life Insurance Company. It proved to be the most exciting and interesting race of the tournament. Nearly every amateur was entered for the event, but Lyon G. Whitaker and Ellington tied on 25. Lyon dropped out in the next 25, and Ellington and Whitaker went straight. For a third time they tied on 24, and a fourth time on 23, making 97 out of 100 shots. This was good shooting, and would have continued, but darkness broke up the fun. It was shot off in the Lyon trophy race, Ellington winning by one target over Whitaker.

Twenty-three were entered for the Lyon trophy, which was won by Geo. Lyon; score, 96 out of 100. He gave this trophy to our club last year, and it was won on 93 by Whitaker. It must be won twice in succession to become the property of winner.

The weather was exceptionally fine for both days, and no reason why some of the shooters did not do better; but when you come with a sliding handicap, it is more difficult shooting.

Messrs. Todd and Barnes rendered valuable assistance in running everything right up to date, and we thank them very much for so kindly assisting us.

Scores for both days, Oct. 19 and 20:

Trade representatives, average on a total of 360 targets: Huff 336, Hawkins 325, Anthony 323, Storr 319, Apgar 316, Ellyson 301.

Amateurs, scores on a total of 360 targets: Geo. Lyon 340, Johnson 327, Killett 326, Todd 324, Walls 317, Ellington 315, McKnight 314, Whitaker 309, A. Lyon 307, Slater 303, Simms 302, Harris 293, Twin City 273, Daightridge 284, Webb 302.

Other totals: Gore shot at 340, broke 264; Barrett 260, 230; Gowan 200, 170; Stewart 200, 170; Fleming 200, 138; Welch 200, 160; Pearce 235, 194; Jordan 150, 110. R. T. GOWAN.

Recreation Rod and Gun Club.

MORGANTOWN, W. Va., Oct. 28.—The Recreation Rod and Gun Club of this city, held its thirtieth regular weekly shoot at Recreation Park, to-day with twenty-two guns out. With this shoot the club closes the season of 1904, and will open up for 1905 on Friday afternoon, April 14, 1905.

Mr. H. C. Watson, of the U. M. C. Company, was present and tied the ground record of 97 out of 100 established by Mr. L. Z. Lawrence on Sept. 30.

The club championship medal was won for the week by W. N. Dawson, with 92.9 per cent., and the president's cup was won for the week by Elmer F. Jacobs, with 22 out of 25.

The Consolation event offered for club members who have not won any of the prizes during the season, was won by Dr. Page A. Gibbons, with a score of 22 out of 25.

A feature of the shoot was 100-target race between members of the team which has represented the club against other clubs in the series of intercity races during the season. The scores:

Event 1, 10 targets, practice: Price 7, Dawson 9, White 9, Jacobs 8, Geo. F. Miller 7, Deussenberry 6, H. C. Watson 9, L. P. Smith 4, Christy 9, E. R. Taylor 7, Van Voorhis 4, Jas. H. Smith 8, S. E. Taylor 3, Sivey 6, Hayes 6, Cobun 7.

Event 2, president's cup: Price shot at 21, broke 19; Dawson 20, 19; White 22, 21; Jacobs 25, 22; Geo. F. Miller 20, 10; Deussenberry 19, 13; H. C. Watson 20, 19; L. P. Smith 17, 10; Christy 25, 18; E. R. Taylor 19, 12; Van Voorhis 21, 15; Jas. H. Smith 28, 12; S. E. Taylor 20, 12; Sivey 20, 14; Hayes 17, 10; Gibbons 18, 14; Cobun 19, 14.

Event 3, Club prizes, 25 targets: Price 22, Dawson 23, White 22, Jacobs 20, Geo. F. Miller 15, Deussenberry 18, H. C. Watson 25,

L. P. Smith 16, E. R. Taylor 18, Van Voorhis 20, S. E. Taylor 13, Sivey 15, Hayes 11, Gibbons 19, Hervey 13, J. L. Smith 18, Cobun 19.

Event 4, Consolation prize, 25 targets: L. P. Smith 16, Ramage 14, Christy 17, Hayes 13, Gibbons 22, Gilbert B. Miller 13.

Event 5, 100-target race: Price 84, Dawson 92, White 79, Jacobs 91, Geo. F. Miller 73, Deussenberry 68, H. C. Watson 97, Cobun 62.

Dawson high gun in Class A, Deussenberry high gun in Class B, Van Voorhis high gun in Class C.

Event No. 6, club team race, nine men, 15 targets to a man:

Price, captain, 14, White 11, Gibbons 8, Cobun 10, Van Voorhis 8, Hayes 9, L. P. Smith 13, J. L. Smith 11, S. E. Taylor 11; total 95.

Dawson, captain, 14, Jacobs 13, Watson 14, Deussenberry 9, Geo. F. Miller 13, Sivey 6, E. R. Taylor 13, Christy 12, Hervey 8; total 102.

ELMER F. JACOBS, Sec'y.

Fulford Memorial Fund.

NEW YORK, Oct. 29.—*Editor Forest and Stream:* Will you kindly allow us space in which to put before your readers as briefly as possible our excuse for appearing in print. All of them are unquestionably aware that on Saturday, Oct. 15 last, there passed away at Utica, N. Y., one of the very best shots and one of the most whole-souled fellows in the trapshooting world, a man of whom we believe it may truthfully be said that there was neither man, woman nor child who could be reckoned as other than his friend. We refer of course to E. D. Fulford, whose career as a trapshooter during the past twelve years has been an exceptionally brilliant one.

It has been suggested that very many of those whom he delighted to reckon among his friends would appreciate an opportunity of showing the esteem in which they held him. With that end in view the committee named below has been appointed, which shall be known as "The E. D. Fulford Memorial Fund Committee," to whose care has been entrusted the erecting of such a monument as shall suitably express to others who did not know him as well as we did, just how high in the estimation of his friends the late Mr. Fulford stood.

Several subscriptions to the fund have already come to hand, and will be duly acknowledged. In order to simplify matters, it may be as well to state that we have decided to ask Mr. James T. Skelly to act as custodian of all moneys received for the fund. Although we have received from him no formal acceptance of such a post of trust, we understand that he will act as above, and we therefore request that all checks, postal orders, etc., relating to the fund be made out in his name, and be forwarded to him, "care of E. I. duPont Company, P. O. Drawer 1001, Wilmington, Del."

Thanking you in advance for granting us space in which to set forth the above, we remain,

THE E. D. FULFORD MEMORIAL FUND COMMITTEE.
 T. H. Keller, Peters Cartridge Company, Chairman.
 Frank E. Butler, U. M. C. Company.
 J. A. R. Elliott, Winchester Repeating Arms Co.
 J. S. Fanning, Lafin & Rand Powder Co.
 James T. Skelly, E. I. duPont Company.

Mullerite Gun Club.

THE Mullerite Gun Club held its first shoot on the grounds of the Richmond Gun Club, of Concord, S. I., on Oct. 26. The shoot was very successful, but Tribune trap, run by motor, was throwing targets hard and right into a 60-mile-an-hour gale; therefore low scores:

Events:	1	2	3	4	5	6	7	8	9	10

ROCHESTER, N. Y., Oct. 29.—The following scores were made at the Rochester Rod and Gun Club traps, Wednesday, Oct. 28, for the Hunter Arms Co. cup:

Broke. Hdp. Tot'l.			Broke. Hdp. Tot'l.		
Rickman	19	6 25	Norton	21	3 24
Borst	15	7 22	Stewart	22	0 22
Jenkins	16	4 20			

New York Athletic Club.

TRAYERS ISLAND, Oct. 29.—The regular weekly shoot took place to-day, including the last competition for the October cup. Today's winner, Dr. De Wolfe, shot off the tie with the previous winners, Messrs. Elias and Schroeder, the cup honors going finally to Mr. Schroeder.

Mr. H. W. Gleffer, of Pittsburg, a non-resident member, does not regret bringing his gun along on his New York business trip. Three beautiful cups were his property at the end of the day's shoot, one particularly fine cup being won by a single point in the 100-target contest. The scores:

Special cup matches. No 1 was at 25 targets; Nos. 2 and 3, 50 targets each:

Event No. 1.				Event No. 2.				Event No. 3.

Grafton Rod and Gun Club.

GRAFTON, W. Va.—The Grafton Rod and Gun Club held its first annual tournament on Wednesday, Oct. 26, and had a fair turnout, although the threatening weather and the fact that the open season is now on, cut down the attendance to a considerable extent.

The day turned out good, and all present thoroughly enjoyed the shooting.

The trade was represented by Messrs. H. C. Watson, Garland and Davenport.

Amateur high average for the day was won by Mr. Kinney with 84.2. Merchandise event, quail shoot, was won by Mr. Wiedebusch with 18 out of 20.

In the team shoot Fairmont and Grafton were the only teams entered, and the race was won by Fairmont with 86 to Grafton's 78 out of 125. The scores:

	Shot at.	Broke.		Shot at.	Broke.
Watson	190	143	Walker	165	75
Garland	190	150	Rogers	165	90
Davenport	190	136	Smith	100	70
Jacobs	190	152	Kinney	165	139
White	165	136	West	165	123
Wiedebusch	165	134	Hibbs	165	115
Lilly	165	124	Leachman	165	87
Donally	165	121	Powell	95	54
McNeilly	165	110	Musgrove	165	69
Phillips	100	75	Leps	95	56
Warden	165	110	Coogle	20	12
Stuck	165	69	Bailey	105	53

Team race, five-man teams, 25 targets each man: Fairmont 86, Grafton team 78.

PUBLISHERS' DEPARTMENT.

World's Fair Scenic Route.

BECAUSE of its magnificent mountain, river and cañon scenery, its famous battlefields, and points of interest, and because of its superior equipment and physical condition, providing all the comforts and safeguards of twentieth century travel, the Chesapeake & Ohio is unquestionably the most attractive route between the Atlantic Seaboard and the Mississippi Valley. World's Fair and through tickets by this route allow stop-over at Virginia Hot Springs and Greenbrier White Sulphur, the two most fashionable and famous mountain resorts in the country. Solid trains Washington to St. Louis, with New York connection via Pennsylvania Railroad.—Adv.

Wild Rice

planting as a provision of duck-drawing food has been carried on in many sections. It is one way to increase the shooting. Messrs. Northrup, King & Co., of Minneapolis, whose advertisement appears elsewhere, have supplied seed which has been successfully grown.

MONOLOGUES OF KIAH.

It was near the hour of midnight when the loquacious Hezekiah—or, Kiah in affectionate diminutive—after sundry restless tossings about in his cot, began his habitual nightly monologue just at the moment when his companions were passing into sleep. For the while his fancies dwelt on dogs. He loudly began thus: Did you see that lean but well-bred foxhound that prowled around our camp all day? No! Well, you needn't be so snappy about it, anyway! I wish you boys had seen him. He reminded me of the hounds of my pack which I had during the two years that I lived in Virginia; and that's a fine country to live in, by the way. In Old Virginny I passed some of my life's happiest days. Folks there, it seems to me, are more amiably responsive, more sociable, gentle, considerate, kind-hearted. Who cares, did you say? The sweet communion of thought, the heart-to-heart talks among friends which are so much of all that makes true sportsmanship, seem to be denied me in this camp. Never mind! I began to tell you about the pack of hounds I once owned. My friends and I had many and many a grand chase with that pack of black-and-tans; but there was one grand chase, a chase of chases, that for brave dash, fierce pursuit, masterful strategy, and plucky endurance, looms up in memory and overshadows all the others. The chase lasted three days and nights, during which the dogs must have run at least 300 miles. In that pack were some of the wisest hounds that ever circumvented the wiles of the most cunning fox. I might justly term them a pack of canine Hawkshaws; that is, all excepting one which we called Hot Air. Bugle was the leader of the pack, and he, like the others, was a sloppy looking hound when idling about the yard; yet he, like the others, was a perfect demon in fierce energy and cunning when on the trail of a fox. Bugle was the leader by virtue of excellence. Whenever he gave sonorous tongue on a trail, be it ever so old or so cold, every hound rallied to him as they always do to a true leader; all but one—Hot Air—an extraordinary hound. Hot Air was the biggest sham of a hunter that ever ran with a pack of good dogs. Strange to say, nearly every man, after once accompanying me on a fox chase, proclaimed Hot Air as the leader of the pack, and the best foxhound that ever struck a trail. Of course you all know that in every pack there are hounds which will babble on a cold, blind trail or a false scent, but Hot Air would also babble on a mere idea, and yet proudly and brassily assume all the airs and graces of leadership. In external appearance Hot Air was quite the antithesis of his fellows. He was a large, symmetrical hound, which, in weather good or bad, had a rich-looking coat, glossy as a mirror. So well did he keep himself groomed, that I never saw a hair out of place much less two hairs crossed. Hot Air was conscious of his dainty loveliness, for hounds have a lot of overflowing vanity. Even when alone, he had certain graceful flourishes of movement. I firmly believe that dogs are reasoning creatures. In some of his doggish ways Hot Air seemed almost to be human. He carried his head high, even in his idle moments; chest swelled bravely, and he stood at magnificent attention or airily strutted along with disdainful touch of toe, his carriage being of mild hauteur or imperious haste, accordingly as he was idling or acting. At first sight, Hot Air was the favorite. He would look beamingly alike on friend or stranger, gently pirouette to show his charms of coat and figure, with some purrings, fawnings and waggings appended, till the recipient was convinced that Hot Air recognized true merit, and was the most intelligently obsequious hound that ever worshipped a man; that is to say, till he saw Hot Air kowtowing and wagging as industriously to the very next person who patted his head or glanced kindly at him. Hot Air, by virtue of sundry struttings, sweet posings, and heroic ululations at a time when all his fellows were sensibly quiet, established a belief in his leadership of the kennel; and also by virtue of interminable babblings, spectacular riotings, and much unobserved running cunning when on the trail, he convinced every newcomer that he was the leader of the pack, and the shining source of its chief merit. In many of his choice poses he was a vision of elegant beauty; as a worker, his reputation, through star acting in the center of the stage, was built upon the work of the hounds which ran true. To them he seemed to be a beautiful and harmless clown. They heeded not his babblings nor his pretenses of leadership; for they early in his career perceived that

his full cry was merely an invocation of the lime light, and that all his fantastic cavortings, ostensibly devoted to the chase, were, in fact, mere devices to parade his beauties of person. Still, much of it was an excellent imitation of the mannerisms of a real worker; and he gave tongue merrily on a mere fool idea with all the unction of a hound on a true trail; and he was never mute; from all this was derived his name, Hot Air. Some of my hunter friends, who were at first most insistent that Hot Air was true gilt on the peak of the superlative, affected amazement later that I tolerated such a queer babbler in the pack; yet to have disposed of him would have entailed no hardship, for he seemed to provide for much of his rapacious appetite by prowling around through the adjacent country and adding to his provender by securing gifts and pilferings. Occasionally, when some one of his one-time admirers cornered him in a sequestered nook, the ex-admirer without fail would give him a swinging kick amidships, rolling him over and over in twists endwise and sidewise; yet such was the buoyant vanity of Hot Air that, after limping a few moments and thawing out his smirk, he would mark time in sprightly manner, and pose again as a leader when the rest of the pack was absent or working. I had to describe Hot Air thus minutely so that you would understand all about the grand chase which I am about to describe. Hot Air, in one of his grandstand plays, met the fox alone. The fox charged on him—so I was told afterward by a farmer who saw the sad tragedy of the woods—and drove him out of the country. We never saw him afterward. But I am ahead of my story. It was a beautiful morning, and we made an early start. Hot Air, as we mounted our horses, was rehearsing with much vivacity. He strode about, gave immense bounds, suddenly ran alone far out in a straight line and back again, and he was the cynosure of all eyes. I had with me two dear friends from the North who had never seen a fox hunt according to the methods which obtained in Virginia. What? "How many miles did I say the chase lasted?" About 300. "How many days did it last?" Three days. "How far have I advanced on the chase?" Why, I've only just begun. "You're going home in the morning!" Well, I will not tell you another word of that fox chase, not if you stopped breathing. Good-night.

NEW FIELDS.

ONE by one the secret places of the earth are being exposed to view, and made more accessible. Time was when one only had to cross the Missouri River, and get away from the single railroad, to effectually bury himself for as long a time as he chose. Now the trans-Missouri west is, if not as thickly populated as the Mississippi Valley, at least quite as commonplace. It is but a few years since we used to hear of "darkest Africa," and there are even still living venerable men who can remember when the fate of Dr. Livingston, the African missionary, was a matter of burning interest to a large proportion of the civilized world. Now, however, the people travel in Africa by sleeping cars. It is true that Cecil Rhodes' hope for a railroad from Cairo to the Cape is not yet a fact, but one can go from Mombasa to the famous Lake Victoria Nyanza by rail, passing through the great game country made famous by many early writers on African hunting, within sight of the tremendous peak of Kilimanjaro, nearly 20,000 feet in height, through the land of the once dreaded Masai to the inland sea, on which there are two large steam yachts which will take him to all the points of interest.

This is travel made easy. The tourist who wishes to get into the heart of Africa has now only to take a comfortable mail steamer on one of three or four lines and go to Mombasa, where his real railway journey begins.

The game begins to be seen in abundance about 300 miles from the sea. Here, we are told, "herds of zebra gallop alongside the train, and the plains are dotted with ostrich, hartebeeste, gnu and many species of graceful antelope, who hardly raise their heads as the train steams by; lion, giraffe and rhinoceros are also frequently seen from the railway carriages." It was, we believe, during the construction of this line that the lions, when other food supply failed, used to visit the work trains and, entering the cars, carry off

the casual laborer or engineer to satisfy his hunger; but we conceive that few passengers have been treated in this inhospitable way by these noble denizens of the forest.

It is reported that the game here is enormously abundant and that such restrictions have been put on the killing, that it is rather increasing than diminishing in number. However numerous the sportsmen who have already visited this attractive region, it is conceivable that many men of leisure will want to make such a trip, which, if desired, can be continued down the Nile to Gondokoro, Khartum and Cairo.

DEER AND DAMAGES.

THE vexed question of farmers' damages for crop depredations by deer has been treated in a sensible way in Vermont, as is told in the report of Fish and Game Commissioner H. G. Thomas. There being no provision of public moneys for the purpose, a citizen of Rutland, Mr. M. E. Wheeler, generously placed in the hands of Col. W. Y. W. Ripley, of the same city, \$1,000, to be devoted to liquidating any just claims for damage by deer, the claims to be settled by the commissioner. While the claims have been numerous, few have been proved to be of a character meriting payment. Every claim has been subjected to careful investigation; and affidavits blanks have been submitted to the claimant to be filled out and attested before damages could be collected. While the customary claim is for \$100, of the affidavits sent to such round-sum claimants, only one was ever returned. This was for the destruction of \$100 worth of beans; investigation showed that the claimant had not had a dollar's worth of beans in his garden. Indeed, the actual results of the system go to show that the deer depredations in Vermont are so slight as to be negligible. Of all the claims made to the date of the report, only three had been allowed, for \$5, \$12.50 and \$5 respectively. Mr. Wheeler has consented to the use of the money for the general purposes of fish and game protection.

A CORRESPONDENT writes of a deplorable state of affairs existing in the neighborhood of La Salle, N. Y., where the dynamiting of fish is done openly, and the ducks are killed on their feeding grounds by means of motor launches. There is no good reason under heaven why such a state of affairs should be tolerated in La Salle or in any other township in New York. There is a game protective force amply sufficient, if set to the work, to put a stop to the dynamiting, the chasing of ducks in launches, and all the other illicit practices which have made a barren wilderness of land and water. We advise our correspondent to call on the authorities of Albany for an immediate righting of the situation. In such a demand should be found the remedy asked for. At this period, when the practicable ways of game protection have been demonstrated and are well understood, and when a large force of protectors has been provided whose special and particular duty it is to protect the game, it is intolerable that any locality should be abandoned to the devastation of the criminally inclined fishermen and shooters. There was a time, not so many years ago, when the whole scheme of protection and the methods of insuring it were tentative, and more or less of necessity ineffective. But that time has gone by. Experience has shown how the laws may be enforced. If they are not, somebody is to blame.

THE admirable record of work done the first year of its existence by the Audubon Society of North Carolina, as set forth elsewhere, is due almost wholly to the energy and industry of Mr. T. Gilbert Pearson, the secretary, who signs the report. Not only has this work been done, but so much energy has been put into the raising of money that the society is in a most satisfactory financial condition, having resources of over \$2,200. These gratifying results offer flat contradiction to the statements so frequently made that the Southern States care nothing for game protection. As a matter of fact, people in the South are very much like people everywhere else. And if they can be made to understand the importance of protecting the natural resources of our country they will take hold of it with abundant energy, and in fact are likely to feel more enthusiasm for the good work than people in the North and West. Mr. Pearson has shown what a single man can do. It were to be wished that more men like him were scattered about through the country.

THE SPORTSMAN TOURIST

The Optimism of Campers.

In all the literature of camping, how rare it is to find a writer who touches with more than a hurrying pen any of the daily discomforts of camp life. Of the disasters, such as the capsizing of a canoe, the burning of a tent, the loss of all the provisions, we hear enough. These things are too interesting to be passed over. But if we look for a true impression of a typical camping trip, we shall often find no mention at all of those constant discomforts which, small as they may seem to most of us, render camping anything but a life of ease. But as there are camps and camps, it would be well to define at the outset what may be considered a typical case of real camping, for we are not dealing with what is exceptional.

By real camping I mean an expedition in a real wilderness where cot beds, fresh milk, and cook-stoves are rarely seen, where a tent is the shelter, and there is sufficient moving from place to place to prevent the establishment of anything like a permanent camp, for in a permanent camp one can soon have nearly all the comforts of home. The family tent with its board floor erected for a season beside some charming lake or stream, with a farmhouse just over the hill, is not a camp in this sense; much less so is the Adirondack palace with all its semblance of rusticity. At the other extreme an expedition to a barren wilderness in the dead of winter is real camping, but hardly typical. We must seek our type somewhere between the two extremes. Let us have in mind, for instance, a canoe trip in Quebec or Maine, or a tramp trip in some wilderness where the waterways are impracticable. Bearing in mind some such conceptions as these, we shall rarely find a writer who gives anything like a true impression of the seamy side of camp life. Indeed, a man may camp for a week in the rain, and yet return to civilization with the assertion that he has had a glorious time—and so he has, if he is a true lover of the woods.

But the remark of Socrates that there is a necessary connection between pleasure and pain, applies to camping as well as to other human experiences. And yet, if one were to accept the expert testimony of the vast majority of writers on camping, he would believe the woods to be a place where all the luxuries of civilization are ready to the hand of the true woodsman; and if, being a tenderfoot, he should allow himself to be so far carried away by the enthusiasm of some camping friend as to accompany the latter on some woodland expedition, he would find himself roughly disappointed, and would doubtless return home about the third day—if he only knew the trail! But supposing him to be made of the right stuff, he would become, by the end of a fortnight, as enthusiastic a monomaniac as his friend. "To think," said a friend of mine, after his first trip, "that I have lived nearly thirty years in ignorance of the joys of camping!"

So far from finding in the writers on woods lore any mention of their every-day discomforts, we find the exact opposite—descriptions of the absolutely comfortable bed, the tent "dry as a bone," the hot and palatable meal which said old camper and writer on woods lore has enjoyed. My own rather long experience leads me to the conviction that such rhapsodies do more honor to the heart than the head of the old camper.

Excluding the oft-treated ludicrous attempts of the tenderfoot who, if left to his own devices, is uncomfortable, as a matter of course, and confining our attention to the operations and experiences of the expert, let us take a typical description of "how to make camp" from one of the best books ever written on the subject of the wilderness, "The Forest," by Stewart Edward White. In the fourth chapter of this book, after a refreshingly humorous description of the efforts of the tenderfoot, I read the following: "Look about you for a good level dry place, elevated some few feet above the surroundings. * * * You will want two trees about ten feet apart from which to suspend your tent, and a bit of flat ground underneath them. Of course the flat ground need not be particularly unencumbered by brush or saplings, so the combination ought not to be hard to discover." I have not infrequently searched for an hour for these prerequisites; but let us get on. After instructions as to the clearing of the ground, an operation for which there is often scant time, the passage continues: "Lay a young birch or maple an inch or so in diameter across a log; two clips will produce you a tent-peg. * * * If you are wise * * * you will" [I here condense] "cut them two feet long." This is all very good advice, but there are many localities in which a tent-peg is almost absolutely useless. Two years ago I voyaged by canoe through a region in which for two hundred miles, and in process of making upward of fifteen camps, we succeeded only once in driving four corner posts, to say nothing of tent-pegs. The country was a sheet of almost unbroken rock with a thin skin of soil, and we had to use rocks, logs—anything but pegs. Mr. White is not unaware of this, but note again the prevalent tone: "Occasionally [the italics are mine] in the North Country it will be found that the soil is too thin over the rocks to grip tent-pegs. In that case, etc." Now, the guileless tenderfoot, after reading this passage, would wend gaily forth in the conviction that pegging down a tent is, except "occasionally," an easy and expeditious operation.

Many of the minor discomforts of camping result from the lack of time to do things thoroughly. No true camper

ever spent all his time in making himself as comfortable as even his surroundings at the time would warrant. Assuredly hardly less than all his time would be needed to accomplish this result. Theoretically he might be very comfortable; actually he is quite contented with much less than the comfort that he might have. The time required to do things thoroughly is curiously underestimated by the expert. For example, our typical passage describes how to erect a tent, if not in the most thorough, still in a very thorough fashion, and then adds: "If you are a woodsman, ten or fifteen minutes have sufficed to accomplish all this." To this I would say that never in my experience have I seen even two men erect a tent in so thorough a manner in fifteen minutes. It would be better to allow them half an hour and tell them that a shower is coming, too!

After the fire and a dry tent, the bed is perhaps the most necessary part of the camp. Is the ordinary balsam bed actually comfortable? Listen to Mr. White, and he, I repeat, is typical: "Fell a good thrifty balsam and set to work pulling off the fans. * * * In the tent lay smoothly one layer of the fans, convex side up, butts toward the foot. Now that the rest on top of this. * * * Your second emotion of surprise will assail you as you realize how much spring inheres in but two or three layers thus arranged. When you have spread your rubber blanket, you will be possessed of a bed as soft and a great deal more aromatic and luxurious than any you would be able to buy in town." "More aromatic," yes. "As soft" and "more luxurious"? Two or three layers of balsam boughs have never made for me a "soft," much less a "luxurious," bed, even when the ground has been carefully smoothed beforehand. The bed may be soft at first, but after an hour or two of the sleeper's weight, the bones of the old earth can be all too plainly felt, as every camper knows, if he would but confess it. Possible it is to make a soft bed of balsam, but it requires many more than three layers, and you must freshen it every day if you would maintain its original resiliency.

The proper way in which to build a fire follows next on our programme of making camp. What Mr. White says here is gospel, and calls for no remark, but again the time element, "in fifteen minutes at most your meal is ready." Quick work, if anything more than bacon, tea, and crackers is prepared, and yet it might be inferred from the preceding list of supplies that a more substantial meal was in progress. Now if you are going to bake anything, such as bread, or boil anything, such as rice, you had better allow at least three-quarters of an hour, and a full hour will hurry you less. But Mr. White allows only "a little over an hour" for the whole series of operations of making camp, picking and spreading balsam, cooking and eating supper, and washing the dishes! In reality a party of four experienced campers, with the advantage of dividing the labor, will consume more time than this unless they are in a great hurry. One man, if he is merely human, can scarcely accomplish it all in less than twice the time.

But in all this description there is not even allusion to certain minor, but very real, discomforts. These center closely about the one word "fuel." In the woods one is, of course, never at a loss for fuel, but good fuel—that is, wood that will burn with a clear, bright flame, giving forth no smoke of any account, and scarcely any flying ashes—is by no means so easy to get. It can nearly always be had if you search long enough and persistently enough; but, unless you are in a permanent camp, you will rarely do this. Logically, then, you will do most of your cooking with wood that either plentifully besprinkles every open dish with ashes or sends forth a smoke so blinding that you crouch by the fire with streaming eyes, in vain trying to see what you are cooking. Who has not had the joy of cursing some especially cantankerous fire of this sort? I vividly remember one particular fire which made every member of the party—and there were six—weep as though all his friends were dying. It was raining hard, and with much pains we had raised our tent and built a large fire to dry the interior. The fire was about eight feet from the opening of the tent, and the wind was apparently blowing in just the right direction—from the tent toward the fire. But whenever that smoke eddied back into the tent, we were nearly suffocated. The fuel consisted of white birch and mountain ash; good woods enough, it would seem, but with the rain and wind the combination was—well, we gave it a strong name. At any rate, that smoke would have drawn tears from a wooden Indian.

As to floating particles of ashes in the food, or a film of midges over your cup of tea, Mr. White does not mention them because they are, or to be strictly accurate, the former is, a regular concomitant of meals in the woods. The tenderfoot who is really game, objects, I believe, more to the appearance of these things—the apparent uncleanness—than to the possible results on his internal organism. It is a discomfort chiefly to the eye—the æsthetic sense, if you will.

But the chief discomfort that can befall a camping party, is continuous rain. With the forest dripping, the constant hunt for anything approximating dry wood, the ground like a sponge, the necessity of eating nearly every meal in a tent crowded with kit-bags and duffle, life becomes one long soak, and it is a severe test to the man who is making his first trip. If you are out for only a week, it may rain practically all the time. This expe-

rience has probably befallen most old campers. It is better, indeed, to wear out Jupiter Pluvius, for even he at last grows weary, by staying out a month. You are then sure of at least some good weather.

There is, at any rate, one annoyance about which all writers on woodcraft have enough to say. The ubiquitous insect pest—be he mosquito, black fly, deer fly, midge, or what you will—is so constant a nuisance that he has usually received the distinction of a separate chapter. And he deserves it. But the increasing use of an inner tent of cheesecloth or tarlatan is lessening his power. By this device he can be absolutely prevented from using his weapon at night, and even "hees sing," to quote Mr. White's half-breed, may be so far removed as to cause no annoyance. By day these pests are rarely so troublesome to most of us that we need employ even our favorite fly dope. At any rate, we can carry on the fight with the gusto born of an undisturbed night's sleep. If a man can sleep well in camp, he can endure much.

Admitting, then, that a good camping spot is difficult to discover in the time ordinarily at your disposal, that very often you will find your house verily builded on a rock; that instead of the soft balsam you may be forced to make your bed of the wiry, sharp-tined spruce; that not infrequently you may make camp in the rain and snatch a hasty supper in your tent on ground oozy with moisture and in an atmosphere dim with insects—for they, too, like to come in out of the rain—admitting these and a score of like exigencies, some of which are sure to occur every day, it is evident that a camp without some sort of discomfort is a rarity. This is none the less true even if most of the discomforts might be obviated by sufficient care and time on your part. After all, you are in the woods for other purposes than the maintenance of your personal comfort at its highest possible point. If the trout are biting particularly well, you are not likely to cut short your sport because your bed happens to need a little more balsam or the fuel near camp is not quite so good as you could wish.

The indubitable fact is that even the old camper experiences every day discomforts of which he fails to give sufficient impression when he takes up his pen. And why this apparent lapse of memory, for is it not wilful perversion? The answer is not far to seek. All old campers are optimists—"hopeless optimists," a friend of mine calls them—in matters touching the woods. Three layers of balsam boughs really seem "soft and luxurious" to them. They do not object to a few ashes or a little bark in their food; it is "clean dirt." The pungent smoke of the camp-fire leaves no smart in their memories, whatever may be true of their eyes. Even veritable disasters, such as the wreck of a canoe, the loss of all the cooking utensils, and the like, assume a roseate hue in retrospect. They remember the ludicrous or the didactic, rarely the serious, aspect of such experiences.

Occasionally, however, we encounter a writer whose sense of truth is not smothered by his love of the forest. Charles Dudley Warner was a man of this sort. Loving the woods as well as any man, he was not blind to the fact that hardship and discomfort are the ordinary lot of the camper. His charmingly satiric descriptions of camp cookery and camp beds have been often quoted, and they are true to the life. But he has gone deeper and noted the prevalent attitude of campers toward their beloved mistress. "He who has once experienced the fascination of woods-life never escapes its enticement: in the memory nothing remains but its charm." These are the closing words of "In the Wilderness," and who can doubt their essential truth?

The old camper naturally becomes a confirmed optimist. He has learned to take nature in all her moods, her worst as well as her best, and to love her with a love that overlooks her vagaries for the sake of her surpassing virtues. He is like the lover in Horace who admired his sweetheart's wen simply because it was hers. Listen to the following confession of faith from a man* who knows nature thoroughly and loves her well: "Some of us do not believe that 'sad tales of privation and hardship' are often necessary. We go into that sort of thing voluntarily on the football team. Some of us have been in the wretchedest country of the north, with no dry clothes for two weeks at a time, often making some sort of camp in a swamp or on a cliff when caught by night, sometimes with not a thing to eat all day long, because the storms were too furious, or there was no time to stop to get food. Cold, wet, and hungry—this may sound like complaint and a sad tale, but it is not. Personally I would rather be there now than to have the best bed and board at the Waldorf-Astoria, although I dine there to-night. Give me instead a seat on the thick, wet caribou moss, with the sleet bounding off the tin platter that is washed sometimes, and on the platter some wood-rat stew with poplar buds on the side. For a relish a seal-oil salad of brake sprouts. For dessert a handful of spice cranberries picked on the spot, and for luxury a cup of hot tea without sugar or milk, and flavored with nothing excepting the sweet, pure, strong wind that almost puts out the fire of the willow sticks." Here speaks the true lover of nature; this is the creed of the true camper. We go to the woods on various pretexts, to hunt, to fish, to let the tired brain lie fallow for a time, but at bottom the confirmed camper goes because of that deep-rooted love

*Dr. Robert T. Morris in FOREST AND STREAM, March, 1904.

of nature which makes him happier in the unspoiled wilderness than anywhere else. What wonder that the discomforts are as nothing to him, that he views the wilderness through rose-colored glasses, that "nothing remains but its charm?" A. L. W.

Incident and Comment.

His Last Day on Earth.

THE following statement is given without any attempt to exaggerate it. I give it for what it is worth. Whether the man knew that this was his last day on earth, or only thought so, no one except himself could tell.

We had been following a band of Comanches who made their headquarters on the edge of the Staked Plains west of the Double Mountains in Texas ever since 1867, and while getting a few of them from time to time for years, never could capture their main camp.

We had driven them across the plains in 1871, and the following year had put in the whole summer hunting for them, and finally found them late in September, 1872, on the north fork of the Red River, a few miles above where McClellan Creek falls into it. We had got a large party of recruits that spring, and among them was a boy named Kelly from Pittsburg. On account of his having come from there, and his being only a boy (he was not yet 19 years), I took an interest in him, and when I had any chance to do it made his work as light as possible for him.

When we first came in sight of the camp that day, we were riding in column across the prairie, but on seeing the camp, two miles away, we formed our left front into line at a gallop. As I rode to my place on the left of the line—I was left guide—I found Kelly next to me. A corporal should have been here, but he was absent. When we had come down to a trot again after forming in line, Kelly held out his hand to me, and calling me by name, instead of rank, something that he had never before this done, he said: "I want to bid you good-by now; this is my last day here. I will be killed over yonder."

"Now, don't get scared, Kelly," I said to him. "None of us will be killed. Those fellows yonder could not hit a haystack. I know it; they have tried to hit me more than once."

"They will hit me, then," he said; "but you won't have to drive me in. I am going in."

"The 'file closers' were supposed to drive a man in if they saw him hanging back. I never had to drive but one man in anywhere, and he never had to be driven in again after that. I hated to do it then, but that is what I was there for. He would be in no more danger there than I would be; less, in fact, as he might be told to lie down, while I might have to keep standing."

We rode up to the very edge of the camp without being fired on. We had taken the camp by surprise. Then our troop was dismounted and sent in on foot. We were the only troop present who had magazine guns.

We drove the Indians out of the lodges and down the river bank into the water, where they made a stand behind rocks and trees, while we lined up on top of the bank and opened on them. Hardly half a dozen shots had been fired when Kelly fell with a ball through his breast. I dragged him down behind the bank under cover. He was not dead; in fact, he lived nearly 24 hours after this; so this was really not his last day here, after all.

The next man to fall was another recruit named Doras. He never knew what had hurt him, a ball going through his head killed him instantly.

These were the only men we lost, but about 130 of the Indians had spent their last day here before the trumpet sounded "Cease firing."

Cavalry Horses and Bugle Calls.

It is well known that an old cavalry horse will recognize the calls connected with him when he hears them sounded on the trumpet. He can often tell each call better than his rider can. One call that the horse never fails to obey is the water-and-stable call. He knows that if he don't know the others.

During the Boer war in South Africa, a herd of English cavalry horses were out on the plains grazing, when a dust storm struck them suddenly, starting them off on a stampede directly toward the sea. A trumpeter, who seems to have had all his wits about him, seizing his trumpet, sounded the "forage call," which corresponds with our stable call. The horses stopped the moment they heard it and came back, walking quietly, to be fed.

It might be supposed that the trumpeter would have been given the Victoria Cross, or at least the distinguished service order for doing what he did. He got nothing of the kind, but did get a confinement of ten days in barracks as a punishment for sounding a call without orders to do it.

These old horses never forget the calls, no matter how long it has been since they last heard them.

One day some years ago when I was passing an open lot in the outskirts of Chicago, I found a boy trying to play an old cornet. While the boy and I were at work on the cornet, an old negro ash hauler came along driving an animal that had once been a good horse, but was now only a collection of skin and bones. The horse stopped when he heard us and stuck up his ears. I came to the conclusion that he had once been a cavalry horse, and asked the old negro where he had got him. "From a farmer," he said. I could not find a "U. S." on the horse; he had probably been given his discharge so long ago that his brand had been worn off. But taking the cornet I sounded the stable call, and the horse began to dance.

"Hold fast to your lines, now, Uncle," I warned the old negro, "I am going to make that horse do some of the fastest running he has ever done since he left the cavalry." Then beginning with the call for the gallop, I next sounded the charge, and the old plug went plunging up the road at his fastest gait, dragging his wagon after him. I gave him the recall next, and he came down to a walk, much to the relief of the old negro. He said that this was the first time he had ever seen the horse run. He had never been able to get him to go faster than a slow walk before. "You don't feed him well enough to

get him to do much running," I told him. "That horse, when he did have to run, got his 12 pounds of corn and all the hay he could eat every day."

The town of Oil City, Pa., has a smart dog, a cocker spaniel. When he was still a puppy his master taught him to sit out on the front porch and wait for the local paper, the Oil City Derrick, to be thrown into the yard, then the dog would bring it into the house and get petted for doing it. Half an hour after he had brought in his own paper the other day, his master, when going into the sitting room, found a pile of six more papers here which the dog had collected out of other yards in the block. It took his master half an hour to hunt up the owners of those papers and return them.

CABIA BLANCO.

Floating Down the Mississippi

Done.

IF one has the feeling that he was born too late, a few weeks on the river is likely to increase it. Most of his time will be spent in listening to tales of old times. The market-hunters will describe the countless flocks of game birds, and wonder where they have gone to. Steamboat men will tell of old-time races and doings, and curse the railroads, in spite of the fact that modern towboats carry more stuff to New Orleans on a single trip than was done in six months of old-time traffic. The cabin boater mourns the days when there were a hundred cabin boats to the one of nowadays.

But the tourist of an observing turn of mind will soon note that however interesting the old times may have been, the present is not less wonderful from any viewpoint save that of numbers. The river is unchanged in nature; market-hunters are giving way to a clean breed of sportsmen; the view from the steamboats is far more varied now than formerly, the cities being larger, the plantations as picturesque, and the wilderness as wild. A vaster problem than any of the old days is presented year by year in the fact that the river bed is filling up, and that to meet this filling the levees have to be built higher. The narrowed course along the upper valley—to Cairo—thrusts the water past Arkansas against Louisiana, and the Mississippi promises to send its current in a new channel some time—perhaps soon. Cabin boat life is at a low ebb now, and yet there are thousands of old-timers on the river, and the people who hunt novel vacation pastimes have already turned their eyes to the wonderful journey of a thousand miles from Cairo to New Orleans, which is best made in cabin boats.

Probably there is no place more interesting from the viewpoint of a river observer on the Mississippi than the suburb of Memphis which is called Cockle Burr Ridge. Cockle Burr Ridge is the Memphis shanty boat town, and it gets the name from the weeds that grow there. Mrs. Haney said that many of the ever-changing population of the Ridge were not respectable, and that she did not approve of some of the doings there. "If a woman wants a man, I think she ought to marry him and live with him, don't you?" Mrs. Haney has been married several times, and her husbands either died or were divorced according to the church and law.

"There's always something happening on the river," Jesse said. "Lots of times you don't know about. Maw, what was that man's name up on the barge and his woman fell overboard and got drowned? I clean forgot."

"Why, it's Weston; he's right down in the slough now on a barge watching it for the lumber company. Weston said he was coming down last summer or last fall and his wife died, or I expect she's up to Cairo now, I disremember which, and he got this woman to keep house for him. He lived on a barge and they tied up about Island 40 somewhere, waiting for a load of logs. She went out on the stage plank and fell off in the river. Well, it was two, three weeks, maybe a month, and Charlie Weston he come along down in his boat and tied up on an evening to a sandbar, the water falling and night coming. He was feeling pretty tired, but he seen something out on the bar a ways and went out to see what it was. When he comes up to it, he sees 'twas a body, and a woman's. He give a good look and then went back to his boat and cut loose for the sandbar further down. He hung up all night. Next day he got here."

"I fell off the stage plank once myself. Lottie—she's Sam Cole's wife, was a baby then. It felt like I was going to sleep with a pillow or blanket over my face. I hugged her tighter and tighter, and I always did believe that if they'd found me, Lottie'd been in my arms yet. But my husband pulled me out. There's a sight of babies and children falls into the river. Mrs. Breller and her husband was waiting on some niggers in their store boat when she missed the baby. So everybody went to looking, and begun to wade around in the water for it. Pretty soon Breller's feet hit something soft in the yellow water and it was the baby—warm yet, but 'twant no use working over it, for it was dead. Mrs. Breller showed me the baby's clothes, and she cried over them. It was the only one they had, you see."

A negro cabin boatman with whom Carlos and I tied in the night before we got to Memphis—in Beef Island Chute—had two babies. "This chile done fell ovahboard once, and my husband he had to swim foh hit—he shore swum, he did!" the mother said. "Like to got drowned himself."

But for all that, considering the opportunities, the casualties among the babies of the cabin boats are few. One sees the little tots sitting beside the piles of ropes hanging their feet over the gunwales and rolling over and climbing to their feet, with just the cap of their knees holding them from sliding into the water; sometimes they slip, but their arms are strong, and they pull themselves up perhaps with a wet foot, but not minding it. At Fort Pillow, McKey's three-year-old insisted on going out to help get wood. The ground was frozen and the wind out of the north raw. Twice the boy had to be carried indoors to be thawed out, crying. But he came out the third time. With round, chubby, and streaked faces, the children are not the least interesting of the features of the river, but one hears only the tragic side of their lives. They are well provided for, however, and have dolls and candies and doll carts half full of big red apples. Around their lips is always a clean space from

quarter to half an inch wide, showing that they never lack for something to put between the lips. The streaks elsewhere around indicate that something is either juicy or sticky or bright colored. The candy of the valley towns which goes out to the children before or behind the levees looks like water-color paints. Of the stuff one buys in the stores, candy is the worst; it is made of flour, a little sweetening, and some deadly flavoring and coloring. No wonder "the babies eat so much of it they get sick."

There is a considerable glamor about cabin boat life when seen from a distance which appeals to people of romantic inclinations or imaginations. It is related of a very estimable lady of Memphis that she wished to learn something about cabin boaters, and came down to Wolf River to become acquainted with some "river heroines." She visited the heights of Cockle Burr Ridge, "where the women smoke cigarettes," as Mrs. Haney says. Mrs. Haney smokes a pipe, and is not in the cigarette-smoking class. The visitor found the place without any heroic embellishments. The casual view of a cabin boat town shows only sordidness and vilness unspeakable.

One hears men say that they cannot afford to travel. One can get to Pittsburg for \$15, build a cabin boat there, or buy it, for less than \$75. It costs nothing to float down the river except for food and clothes. Carlos, in his catamaran, left Toronto with \$42. He went to Montreal, and thence along the Great Lakes, to the Fox River, down to the Mississippi, and down to Montreal. He had \$2 left when he reached that place. In my own experience I have gone 3,000 miles, paid fifty dollars fares, and eaten for over five months on about \$140; this was a land trip, and far less comfortable than one in a cabin boat. Mrs. Haney allows fifty cents per day for the expenses of her son and herself, and saves money out of it. She lives better on that than many a backwoodsman.

If one has any knack at trading, he will get more money than he will spend simply by "swapping" and selling trinkets. If he has a camera he can make his way and secure a collection of plates of unrivaled interest. If he likes nature, a few dozen traps—three or four—will get him 'coons, 'possums, and other fur-bearing animals sufficient to pay expenses. He would find game birds—water fowl—in abundance at times, and could kill them. There are State laws which would interfere with hunting on shore to some extent, but inquiry along the way and *Game Laws in Brief* would cover this question.

But a river trip would be dangerous to some kinds of ambition. In its way, the river has an unequalled charm. It carries one with it, and there is no incentive to protracted labor. A very little chopping warms a cabin boat stove for a long while. The river and its banks are objects of ceaseless interest. It requires only a few weeks' manual labor to furnish a year's supply of food. If the women folks liked it, there would be ten times the number of river people living there now.

Mrs. Haney would not leave her cabin boats for anything. She has a daughter in South Memphis who does not approve of her mother being a shanty boat woman, and would like to have her come and live in town, and perhaps thinks inside "be respectable." But Mrs. Haney says she wouldn't give up her independence for anything. "I've owned seventy-five cabin boats, I expect," Mrs. Haney said one day, "and the boys is always laughing about me. They say maw never does get beat selling a boat."

The boats she lives in are always for sale—at her price. One could buy the little blue boat for sixty dollars or seventy-five, with all the fixings and trimmings, and "it ain't often you find as big a bed as that one, or as good a stove as this on the river; no, indeed." True for it, "the bottom doesn't leak a drop—look in there; why, you could blow the dust off the streamers;" but it's cottonwood, a fact not dilated on to would-be purchasers. Cottonwood makes a fine boat, but when it begins to rot it goes fast. "If this boat was good, pitchy yellow pine, I don't believe I could bring myself to sell it," Mrs. Haney said.

The ambition of most of the river people, especially of the confirmed ones, is to have a gasoline. They have in their minds just what they want, and in many instances get it; for the river people are not poverty-stricken. I have the bills of fish sent by a little red-and-white cabin boatman to Memphis, which day after day ran from \$3 to \$7 per shipment. A man living on the river must have a boat, and a boat is property. Jesse Haney paid \$20 and a \$5 skiff for a big new skiff that two men traveled down the river in. Haney wanted it for fishing in next spring. Frank Sparks, at Tiptonville, a market-hunter, retired, but now a hotel keeper, is putting up a gasoline boat to hunt from for fun, and use for profit, too, for he proposes to get out and buy supplies among the farmers and others in high water days.

I had been in Ash Slough only a day when I went to the Cossitt Library with a letter of introduction to Mr. Johnson, the librarian. I looked over the papers there for a time, and then Mr. Johnson introduced me to Robert H. Mitchell, who sees to it that the members of the Hatchie 'Coon Club, on the St. Francis, get their good times. While I was looking over the papers, a small, unshaven man addressed me, and made motions of inquiry in regard to my connection with *FOREST AND STREAM*, which he saw me examining with considerable attention. I forgot him in the interesting things that Mr. Johnson and Mr. Mitchell had to tell. Especially was I struck with the suggestion that I make a trip down the St. Francis River, and arranged my plans accordingly. I would put bag and baggage and boat on the cars for Pickett, and there start down the St. Francis on a 250-mile journey.

All the way down the river I had been warned to keep my eyes open. Repeatedly I was told that I would find men of the most desperate character along the way, and that they would not hesitate to do murder if a little money was the incentive. As my expenses were not large, I carried only enough to take me from town to town, so to speak, but nevertheless I took as much precaution as possible to prevent being knocked on the head.

I did not once think of crime in other than violent forms, and when the inquisitive man of the library joined me late in the afternoon on the main street of town, I accepted his company and proceeded to get as much information from him concerning the river as possible. He was an undersized, chinless individual, who

had begun to raise a beard in order to cover his deformity. His forehead was fairly well shaped, but his eyes danced about in a fashion that indicated the criminal character; but he was a glib talker, and knew the river so well that there were a hundred hints in what he had to say by the time we reached Bill Scarlet's ferry across the Wolf. He said he knew the river, and was used to cabin boating, but the way he got into the ferry skiff should have been a caution to me. He came down off the sawdust-pile on board with an awkwardness that liked to have upset the craft, passing me with a rough, gliding motion. My suspicions were well aroused, of course, and I watched out for the move of a highwayman. Doubtless had he been a highwayman I would have been an easy victim, for the man had a score of chances to draw down on me.

We went on board Mrs. Haney's boat, and Mrs. Haney got supper for us; a good, hearty meal it was, too. We ate, and afterward my visitor had numerous propositions to make. I told him frankly enough that I came down the river, and he wanted to go on down with me; upon which I told him I couldn't, for I was going over to the St. Francis; whereupon, in a burst of enthusiasm, he said that that was just the kind of a trip he'd been wanting to make for a long while. I shut that off by saying I was going alone, but if he wanted to, he could meet me at the mouth of the St. Francis in three or four, perhaps five, weeks. He said he'd probably do it.

"You see," he said, "it's just like this. My pardner is in New York, mixed up in a lawsuit. He told me he'd come to Memphis a month ago, and then we'd get a cabin boat and go down the river and have a time. We're both of us sports, and have been going together five or six years on the old river having a good time hunting. Too good a time, I might say, for we liked hunting too well, and that broke up our business, and we failed, resulting in this law business he's now at. You see, we had a bicycle business" (I was in bicycle knickerbockers) "up to St. Louis, and didn't attend to it, and had to go into bankruptcy proceedings, and things got into a bad mess, and we decided we'd just get out and take one of our little mind-resters on the river and forget dull care and have a good time like we've done before."

"Now, if my pardner don't come I want to go down the river anyhow, and I can't wait here forever, for it takes money to live," my visitor went on, "and if he does come he wants me to get somebody to go in with us on a cabin boat. We can get one down the river. Here's what he says."

Then he took three or four letters from his pocket. He had given me a name, but the envelopes were addressed to someone else, and instead of being postmarked New York, had a South Orange, N. J., stamp. I thought to myself that it takes only a good listener to make one of these fellows give himself away. According to him, the letter said: "Now you find a man, if you can, and if he's game, all right, let him come in, but make him cough up his share of the price of the boat, and then we'll know he means business."

"Now, we'd like to have you," the man said, flapping his head till the hair that covered his bald top was disarranged, and glancing into my face forty times a minute.

Meantime, Mrs. Haney went over to Lottie's and left us alone in her boat. She had over a hundred dollars of her son's savings on board, and had known me only four days, but in spite of her advice, trusted me so much as to tell about the money and where it was. It came nine o'clock, and the man started for home. I recalled a bunch of the busted-in-the-head yarns of the river, and kept my eye on the fellow. He kept ahead of me to the ferry, and as Scarlet was not there, I put him across. He went up the dark brown sawdust-pile, silhouetted against the broad, yellowish reflection which a lighted

city casts against its own bank of smoke. He had his shoulders humped up a little, and his hands in his trousers' pockets; a moment later, when I turned from sending the skiff out into the current, he was nowhere in sight, the blank, dark face of the sweet-smelling damp sawed wood having swallowed him up.

I went back to the landing on the island, tied the boat, and found another one loose; how it came so I don't know, and watched it settled against the side of the wagon ferry safely, and then went up to the boat, with the mean feeling that I hadn't treated the man right, for I would have liked traveling in a cabin boat.

I talked to Sam Cole when I got back about the fellow, and asked what he thought of a man who said thus and so, and looked so and so. "No good!" Sam said.

In the morning when I got up—I was on Carlos' catamaran—I happened to put my hand in my knickerbockers pocket, looking for my knife. I thought it was in my hip pocket, where I frequently carried it, the knife being a heavy hunting sort. I felt in the left front pocket, where I had several silver dollars. They were there. I ran my hand into my left front pocket, and found my knife there, but my pocketbook, containing fourteen dollars, wasn't. It wasn't in my bedding, either; nor was it anywhere around.

It dawned on me after a while that I had run into another good story, which was just my luck exactly. I laughed, felt silly, wondered, and went to thinking. At first it seemed that I had lost my St. Francis trip, and that hurt, and then I found I was in the way of some things to hear as regards some aggravating types of bad men, though not necessarily dangerous ones. But I had learned to "look a little out," and when I got some more money I shed the knickerbockers for corduroy trousers such as the rivermen wear. They are less comfortable, but a great deal less conspicuous when one must go up and down two-thirds the length of the street of a place like Memphis, which is such a promising city. I had an idea that came during the bit of a panic into which I had fallen on discovering my loss, and I took to thinking about statistics. I went to the library again, and took a look at the file of a local paper. I told Mr. Johnson what had happened, and he was sympathetic. He said one of the slickest men in Memphis had been taken in by a green farmer for quite a lot of money a couple of years ago. It was soothing to hear about the slick Memphis man being done by a game. I found the statistics interesting if not consoling. I hadn't been taken in by a new game—not by a long shot. If there is any one thing more familiar to readers of Memphis newspapers than the story of a stranger taken in by local confidence experts, the three months' file didn't show it. From two to five victims were recorded each week. RAYMOND S. SPEARS.

How Did She Know It?

WORCESTER, Mass., Nov. 4.—The other morning I stood on my lawn when a neighbor's cat walked by within ten feet of me, apparently without any fear. She changed her course slightly and was walking from me, when I discovered a half-eaten pear that some boy had thrown there, and stooped down to pick it up, with the idea of throwing it at the cat, which I did, with my eye all the time on the cat. She did not turn her head in the least, but the moment I commenced to stoop she commenced to increase her pace, and by the time the pear was half-way to her, she was going with all the speed a cat possesses.

The Happy Hunting Ground.

In the Happy Hunting Ground,
Just beyond the setting sun,
Pleasures rarely to be found
Fancy points out one by one;
Charmed with magic view and sound
Is the Happy Hunting Ground.

Winds in silent zephyrs move;
Mild the twilight's golden gleam,
Silence solemnly reproves
With touches gently all unseen;
Holds her sway in peace profound,
In the Happy Hunting Ground.

Skies peep through the smoky hues;
Sun with slanting, mellow rays
Glisten in the frost and dews
On leaf and blade, while each decays;
Shedding beauty all around
In the Happy Hunting Ground.

Towering peaks with hazy view,
Stalk out o'er the mountain waste,
Lifting still beyond the blue,
Where distances seem all effaced;
And dreamy ways and paths are wound
Through the Happy Hunting Ground.

Nooks and vales and deep ravines,
Rocks and hills and wooded trails,
Trackless wilds, slow mossy streams,
Each a welcome never fails,
For the eager traveler bound
For the Happy Hunting Ground.

Boundless wilderness to rove
Not disturbed by stunted art,
Gems and rarest gifts to prove
Lying close to nature's heart;
All is mystery profound
In the Happy Hunting Ground.

Soft the timid game shall tread,
Through the marsh and barrens wide;
Swift the whirr of wings shall spread
And toward the thickets glide,
Where the ferns and lichens brown
Hide them. Happy Hunting Ground!

There the feet, though numbed with toil,
Yet shall haste with speed away;
There the heart, though choked with moil,
Shall rejoice from day to day;
Join the chase with gun and hound
In the Happy Hunting Ground.

Thorn and brier shall not trip,
Hills be not too steep to climb,
Feet though weary shall not slip,
Darkness shall not stop the find;
Joys be not by sorrows drowned
In the Happy Hunting Ground.

Age shall lift his heavy hand,
Loose the limbs and clear the eye;
Time no more shall count his sands
'Gainst the daily passerby;
Jollity with joy is crowned
In the Happy Hunting Ground.

D. L. CREVELING.

NATURAL HISTORY

A Pair of Pet Cheetahs.

A SHORT time after my first arrival in Durban, Natal, South Africa, I made the acquaintance of a young colonist, who was clerking in an up-country store. He informed me that within comparatively a short distance of his place of business there was an old Boer woman who had in her possession a pair of young cheetahs which her sons had captured after shooting the mother and finding that she was giving milk. Whenever a Boer kills a female of the larger cat animals, he immediately tests her teats, in order to ascertain if she is giving milk. If such is the case, the vicinity is promptly searched, in order to capture the nurselings. Giving my newly-made acquaintance *carte blanche* to purchase the animals, he left with the promise, if possible, to fulfill my wishes. Some time elapsed before I received any communication from him, when my anxiety was relieved by the arrival of a letter, announcing the purchase of the animals, which would be forwarded by the first wagon leaving his neighborhood for Durban. A few weeks subsequent my solicitude was relieved by the arrival of an ox team from the Orange Free State bearing a rough wooden box containing the animals. They were immediately shifted into a cage which had been specially prepared for them.

Some little time elapsed before I succeeded in making friends with them, which delay I attributed to their having been accustomed to a female instead of a male attendant. Owing to their blunt, non-retractile claws, I did not fear being scratched, consequently had only to guard being bitten. By dint of a series of quiet, peaceful moves, I finally managed to pass my hands between the bars of the cage and fondle them without any indications of displeasure. My next maneuver was to place collars on their necks, preparatory to taking them out of the cage, which was a wearisome job, and required my entire stock of patience to make it a success. Attaching a small, stout cord to their collars by means of a snap-hook, and then

passing it through a ring secured to the end of a stout wooden rod, completed my preparations for their exit from confinement. I made my first essay with the male, as he seemed to be of a quieter disposition than the female, which was disposed to be nervous and flighty. Gently raising one of the bars of the cage, I quietly passed the cord, which had been previously attached to the collar, through the ring at the end of the rod and made it fast with two half-hitches, then gently coaxed the animal to step outside, when the bar was quickly dropped into its socket to prevent the female in her attempt to follow her fellow prisoner. Holding the rod firmly with both hands so as to keep the animal at bay, if he should attempt to leap on me, I anxiously watched his movements for a few moments after his exit. He crouched, whisked his tail, and seemed as if he was preparing to jump on to me. Grasping the rod with a firm hold, so as to keep him at a distance, I passed some apprehensive moments awaiting developments. Finally he purred and lay over on his side, as if he wished to be petted. Acting upon the manifestation, I grasped the rod firmly with my left hand and extended the other, as if I wished to caress him; whereupon he stretched himself out at full length and seemed to be anxiously awaiting fondling. His wishes were immediately granted, and in a short time I was kneeling alongside of him, and slipping the cord through the ring, the rod was dispensed with, and I never had occasion to make use of it afterward. He soon learned to trot by my side, and the slightest tension of the cord served to check any rapid movement.

My experience with the female was somewhat more tedious, as she was exceedingly nervous and timid; but by exercising great patience and vigilance, I managed to secure her confidence and good will. My next move was to take both of them from the cage at the same time, and train them to walk alongside of me, one on each side. They were disposed to frisk a little at first, but continual twitches with the neck cord gradually cured them, and

eventually they trotted along without the slightest attempt at romping. My next move was to introduce them into my house, so that they could prowling about the two rooms without being worried by the neck cords. They acted so quietly in their new surroundings that I concluded that it was not a new experience to them, but had been accustomed to the same privileges in the domicile of their former owner.

Of course such an unusual addition to my family was soon noised about the neighborhood, and there was a large increase of my usual number of visitors. Among them was a little girl, brought by her father, who lived close at hand, with the excuse that the child had nearly worried the life out of him by constantly expressing a desire to see my two big cats. I acknowledge that it was with some misgivings that my consent was given for the introduction, and, to guard against any mishap, I put the neck cords and rods into use. To my great surprise and gratification I found that there was no occasion for their employment. The animals seemed to look on the child as an old acquaintance, and but a short time passed before she was seated on the floor between them, and fondling them to her heart's content. In a twinkling it struck me that the animals had been accustomed to a similar companion before they passed into my possession. Holding my tongue as to my conclusion, I exacted a promise from both father and child that no mention should be made of the incident; in return for which she should have the privilege of constantly coming and petting the animals in my presence, and I can say that she constantly availed herself of the permission without ever receiving the slightest injury from the animals.

A short time subsequent the whole town was set agog by a story, told by a small boy, who lived a full half a mile from my domicile. He said that he was out in the bushes near his house when he suddenly came face to face with a spotted animal which was lying down under a vagrant banana tree. Opening his lips, in order to give

Some Animals I Have Studied.

XIV.—Two Dogs in Perfect Harmony.

AFTER all I doubt if any dog has ever revealed any quality more admirable than the ability and will to agree entirely with some other dog, causing him to appear gentle, merciful and just toward his comrade. In the case of Coallie and Gipsy, there exists a mutual admiration and respect that are sometimes pathetic, and always commendable. Coallie is the stronger, steadier, the more insensible to pain, and Gipsy knows it; but Gipsy is the swifter, has usually the better scent, possesses the better judgment, and Coallie is well aware of this, and their reliance upon, and confidence in, each other is the result. In addition, each is sure she can depend on the other to "stand by to the bitter end" in any struggle with a wild beast, and innumerable are the times that they have already tested each other's courage and loyalty. Indeed, there is a fond rivalry between them to find which may seize the most perilous position in any battle.

Though Coallie is not slow, Gipsy is so much fleetlier that she can carry a small rabbit and "run right away from" Coallie easily, and she used often to do so; but finding, about two years ago, that Coallie could not always catch a rabbit unaided, she began to "divide" with her. Often I have seen her catch a rabbit, and after teasing Coallie a while with it, perhaps eating a portion of it almost under her nose, suddenly drop it at my feet, seeming to say, "Now, Coallie, you just come here and watch on this side of the fence, and I'll run a rabbit right to you, so close you can catch it yourself," and Coallie would follow her to the spot indicated, and Gipsy would go outside, and in two minutes the rabbit would be in the bigger dog's grip. Too often has it occurred just as described for me to believe it accidental. There is every evidence, excepting spoken words comprehensible to man, that the whole affair has been thought out and prearranged. Signs sometimes speak more plainly than words. The smaller dog plainly appears to offer the proposition. The larger dog as plainly appears to receive it with favor, to comprehend it, to have faith in the former's knowledge and ability—in short, to trust her. And the quick-following consequences justify my opinion of the scheme.

If they are widely separated when hunting for rabbits, and Gipsy starts one, she generally soon picks it up. If I am near and gently ask for it, she will surrender it, though sometimes very reluctantly. If Coallie stirs up a rabbit she either soon trees it or loses it, generally; seldom does she catch one unaided; that is, compared to the number she doesn't catch; yet she catches more than ordinary hounds and curs. If she loses the rabbit, she calls Gipsy to help find it. If she trees it, she barks for me to come and get it out. If Gipsy is with her, Coallie watches the tree while Gipsy comes after me and guides me to the tree. Gipsy has come after me hundreds of times, I truly believe, whether I happened to be at the house or in the fields, or in some distant part of the forest, or at a neighbor's house. It matters not how far away (unless I'm entirely out of the neighborhood), she seems to know where to find me. Sometimes, when "in deadly earnest," they do not bark on the chase, and but for the little dog's habit of coming after me, the rabbit, when treed, would have to remain unclaimed. I have almost come to the conclusion that a dog enjoys chasing a rabbit more than catching him, and that whenever he barks sharply on the run he is in no hurry to capture the fugitive, if, indeed, he cares to at all. I would like to hear the opinions of sportsmen and naturalists on this subject. Many superficial observers declare that rabbits naturally out-run nearly all dogs, and seem to think that a rabbit is caught only under exceptional circumstances, as when worn out, sick, too playful, or intending to commit suicide. They cannot understand that the dog may be over-confident, and allow opportunities to slip by, thinking he can at any time easily overhaul the game after he has had all the sport desirable, or that he may not intend to really try to catch the rabbit, or that he may prefer to leave the rabbit for another day. I have often seen Gipsy play with uninjured rabbits just as a cat plays with a mouse, sitting and pretending to look another way until the rabbit would jump up and sneak off a distance of fifteen to sixty feet, then, when it "lit out" in earnest, she would fly at it and snatch it again. And after continuing this seemingly cruel sport for many minutes, she would finally kill the rabbit or just deliberately walk off and leave it free. Stranger still, I have known rabbits—not necessarily pets nor domesticated, either—which seemed to have formed a "treaty of peace" with certain dogs or with all dogs, and would come and play with them, or some one of them, every moonlight night for a week or more, or at some hour of the day, and perhaps every day; and, so far as I could distinguish, no such rabbit was ever caught by any dog, although the dog thus visited might pretend to be eager to take the bold, defiant, mocking old fellow.

There is a ravine sloping rapidly eastward on the southern half of my land that contains a number of never-failing springs and small pools, and which is called Turkey Hollow, as it is a favorite resort of these magnificent wild birds. They not only find rich picking there at all times of the year, for there are so many varieties of berries that there's never a day in the year, winter or summer, but ripe ones of some sort are to be found; and, in their seasons, there is also an abundance of nuts, acorns, and other seeds, besides grasses, but like often to roost there. Here happened an adventure which will serve to indicate the friendly rivalry between Gipsy and Coallie. We were hauling wood from a hillside between the house and Turkey Hollow. The dogs always go along, if allowed to, and while we are at work they hunt. Suddenly they began barking most excitedly, and after waiting to see whether they really meant it, we went to them, the distance being an eighth of a mile. We saw at once what was the trouble—flying squirrels. I've had one experience with flying squirrels so very extraordinary that I'm tempted to digress here, but it must wait. A white oak, evidently hollow, rose straight up from a flat spot in the depth of the ravine, and was unusually scarce of branches, being more like a round chimney than a tree in shape, although yet green. At a height of about 16 feet it was clothed with a circle of small, short sprouts,

which extended almost evenly from all sides like the spokes of a wheel, though some of them were crooked. Opposite this, eight or ten feet westward, was the gently-sloping top of a very tall pine sapling whose roots clung to the ground a great distance north, where the body was little more than six inches in diameter. It was very smooth. But after numerous frantic efforts to climb the perpendicular oak as far as the bunch of sprouts, where probably they had last seen one or more of the flying squirrels, the dogs ran to the butt of the pine, leaped on it, ran upward a few bounds, and fell off, or became discouraged and jumped off. In a minute they desisted and returned to the oak. We laughed at them, and then I said encouragingly: "Gipsy, you can climb it if you're careful. You're my climber. Come on, that's a good dog." And carrying her toward the butt of the pine till I came to a part of it I could easily reach, I placed her carefully on the trunk, steadied her a moment to give her confidence, and exclaimed: "Now go! Maybe the squirrel is up in the top of this." This time she ascended to a point almost opposite the oak's sprouts. Here, wavering, she turned, and came down at a run, leaping off in my arms.

Coallie had looked on intently, trembling with anxiety. Now she gave a joyful bark that seemed to say, "I'll do that, too, if I die for it!" and running eagerly to the butt she jumped upon it and bounded upward in a most daredevil style. Several times she slipped, but kept on undaunted. Further, further; higher, higher, higher, until at that part nearest the squirrels' supposed hiding place in the oak, and then she gave a mighty, panther-like leap, and hurled herself upon those frail sprouts in the oak. It was wholly unexpected, and the most foolhardy trick I ever saw any dog attempt for so unimportant a purpose. Of course we cheered her till the forest rang and echoed. But not content with her brilliant feat, she reared up—tip-toed, so to speak—and leaped up a few inches higher against the round, limbless, perpendicular trunk, several times missing her footing, when she fell back and precariously catching a limb with her forepaws. She seemed to say: "My scent tells me that the squirrels went higher, and now that I've come so far, I'd like to go on." She seemed no more timid than a thing with wings. I often think what an almost invincible creature a brave, intelligent dog would be if he could fly like a hawk; only man could successfully resist him—i. e., supposing other mammals remained as now. Finding she could get no higher hold, she actually crept clear around the trunk, stepping from limb to limb. Gipsy good-naturedly applauded her, as generously as we did, though she showed some signs of chagrin; for she generally far surpasses Coallie in all climbing feats.

I am sorry to say that Coallie's fine performance did not wind up with a graceful climax. She became so confident and vainglorious that she boasted thusly: "Huh! This is nothing! I feel as safe as on the ground. I could go to sleep up here," and she did lie down across a few of the slender, bending limbs, not by any means close enough together to form a safe-looking couch, curl up just as when on *terra firma*, and sleep, or pretend to. So far all right. But I now took it in my head that the inside of the tree might contain a lot of flying squirrels, or afford Gipsy a chance to climb to even a greater height than Coallie's (she has gotten several rabbits by climbing up inside of trees where the hollow happened to be the right size for her), so I chopped a hole in the side, near the ground, and told the little dog to enter. Coallie jumped up and began to bark at the first shock of the ax. In her eagerness she leaned far over and looked down. And when Gipsy crawled through the opening, Coallie danced about so recklessly that she soon fell through. She struck on her back (Gipsy is nearly as certain to alight on her feet as a cat), but though it knocked all the conceit out of her for three minutes, she was unharmed.

I wish I had kept account of the dangerous snakes killed by her since introducing her to the readers of FOREST AND STREAM. A few days ago she came home with a swelled head, for she is indifferent to the danger of being bitten, and even when a snake fails to bite her, she is almost sure to inflict the wound on herself in chewing the head, causing the poison tusks to break through the serpent's opposite jaw into her own flesh, usually into her lip. To-day, with her last wound barely out of sight, she ran to where Gipsy was barking. I was hauling rocks to mend a badly worn public road, but left the team with Chester, who remarked, "Gipsy says snake," and followed, arriving in time to see Coallie kill two of those short, greenish-mud-colored, concave-bellied, flat-headed, wide-mouthed, horrible smelling reptiles variously styled "spreadin' adders," "blowin' adders," "vipers," etc. It closely resembled the "hognose" described by Mr. Hay; but possesses real poison fangs, and never bluffs, but uses them with unvarying evil effect. Its bite never fails to produce great swelling, and as suddenly as the bite of a rattler—that is, almost immediately. And instead of trying to escape, after the manner of other serpents, it appears always eager to fight. It seems to me more to be dreaded than any other. There is a water-snake outwardly resembling it which has tusks somewhat like a boar's that are proportionately longer than the teeth of any other serpent I know of. The snakes despatched to-day were respectively about 28 inches and 32 inches in length, and very broad.

About the middle of August Coallie produced a new family, and two days later Gipsy brought forth her first. Coallie's pups were two or three times the size of Gipsy's. But after their eyes opened and they began to leave their nests and run about, the latter more than made up in intelligence what they lacked in bulk, and could "get all around" the former in any sort of a game. However, when it came to a clinch, those heavy young Coallies had a very great advantage, and sometimes the little Gipsies would cry, when the play became too rough.

Now, here we come to unmistakable evidence of thought, kindness, justice, on the part of the mothers. It was not merely that Gipsy interfered, for that might have been expected, but that she gently pushed off the larger pup. Stranger still, Coallie did the same whenever she happened to be nearer the wrestlers; pushed off her own pup, and not so gently, either, as Gipsy did. It seemed that she realized that she possessed a mother's authority. Once, after pushing one of her pups away from the little fellow he was teasing the second or third time in a few

a yell of horror, he suddenly remembered the advice given him by his grandfather, which was to look firmly in the eyes of any wild beast that he should meet unexpectedly, and quietly back out of sight and danger. Suppressing his desire to yell, he acted as had been enjoined by his ancestor, and managed to reach home without any mishap, where he fell into the lap of his mother, to whom he blubbered out his wonderful escape. Of course the occurrence immediately became the gossip of the town, and the local paper, issued on the following morning, had a leading article by a freshly arrived reporter, picturing in bitter terms the recklessness of allowing a crazy Yankee to keep dangerous wild animals in the vicinity, and naming one of my pet cheetahs as the cause of the boy's terrible experience. Of course I felt nettled at being the subject of such a scurrilous assertion, and ached for an opportunity to prove its falsity. As luck would have it, within a couple of days I was in a position to get at a true version of the whole affair. The father of the little girl who had made friends with my cheetahs was awakened early one morning by the youngster, who informed him that one of the animals was lying just inside of the yard gate. Hastily donning his clothing, he hurried out, and was surprised to find a large coach dog, whose chain had become entangled in the yard fence while evidently leaping over it, and therefore was kept as a prisoner. After breakfast he took the dog into town and hunted up its owner, who acknowledged that it had been missing for several days, and he had given up all hopes of regaining it, as it was a fresh arrival and not yet accustomed to its surroundings. The boy who had helped to start the false report was brought face to face with the dog and instantly recognized and acknowledged it as the cause of his wonderful story; but the truthful reporter failed, in the next issue of his paper, to give a correct version of the affair.

Some days subsequent the father of my little friend suggested a scheme which he thought would force both the public and the scribe to acknowledge their false positions. He proposed that on the ensuing Saturday the youngster and myself should each lead one of the animals down the main street of the town. I instantly agreed to the project, and forthwith began to rehearse for it with the companionship of the damsel. I gave her the male to handle, as I thought him more trustworthy and less liable to create a scene than the female, and in a couple of days felt every confidence in being able to make a success of the project. Both of the parents were present at each rehearsal, every morning and afternoon, and declared their intention to accompany us on our trip, one on each side, in order to prevent the interference of any meddler who might wish to create a scene. About 10 A. M. on the proposed Saturday my little companion and myself suddenly appeared on the road leading into town, and by the time that we reached the head of Main street quite a large crowd had assembled to greet us and satisfy their curiosity. I purposely put the little girl in the lead, and the hearty plaudits and complimentary remarks which she received fairly stunned her blissful parents, who marched closely alongside of us. Just before reaching the butcher shop from which the meat was obtained for my pets, the idea struck me to go in, take possession, and hold a levee for the benefit of the town generally. Acting upon the notion, the animals were placed upon the counter of the shop with the lassie seated between them, before the proprietor of the establishment could recover his consciousness. It required the services of two policemen to keep the crowd in motion, among whom I caught a glimpse of the reporter busily making notes of the occurrence. Finally observing indications of unrest with the animals, I feared that a sudden move by them would cause a panic among the throng. Beckoning the father of the child to my side, I requested him to see if he could engage one of the ox teams which had stopped in front to carry us out of town. He stepped outside and soon returned, saying that he had been successful. Whereupon I caught hold of the neck cords of both animals at a short grip, while the father helped the youngster down, and we passed out through the bewildered visitors and were seated in the wagon before they could recover from their fright. The span (colonial term for fourteen oxen) were put in motion, and we wended our way out of town, amid the applause of its pleased citizens.

In the next issue of the paper there was a florid description of the entire affair, ending with a retraction of the statements in the former issue. Henceforth the cheetahs held a reception nearly every afternoon, as many of the townsfolk drove out in order to satisfy the curiosity of themselves and friends whom they brought out with them. It did not take long for the matter to become a nuisance, for I had to be present constantly, as some of the visitors were inclined to annoy the animals, which nettled me; besides I feared that some of them would be hurt as a result of their bad behavior. Fortunately no one was hurt, although there were several narrow escapes. At odd moments, when I did not fear interruption, my time was taken up in using every device that I could conceive in trying to tame and domesticate my pets. I found that they paid no attention to dogs and fowls, but the appearance of a cat would cause a series of snarls and growls of so vicious a nature that in comparatively a short time I was no longer bothered by visits from the feline pets of the neighborhood. One morning, as I was leading them from their cage to the house, the male happened to spy the vibrating ears of a reclining calf which had been tied to a fence in a neighboring lane, and it required a stiff lug on my part to prevent him from making his way to his intended prey. This incident made me anxious for opportunity to try him with an antelope; but as the coast of Natal is heavily clothed with timber, I was unable to make the attempt, as it would have caused an absence of a day or two.

To my great sorrow, the day appointed for the shipment of my pets arrived, and it was with a heavy heart that I took them, with sundry other living natural history specimens, on board of the steamer bound for Europe. The little girl and parents accompanied us, and they had to use force in order to take her away from her favorites, who seemed to be aware of the situation, and when her father lifted her in his arms in order to take her away from the cage, gave vent to a series of growls and howls which were distinctly audible after our boat had been pulled some distance away from the steamer.

FRANK J. THOMPSON.

minutes, she exhibited a little anger, and scolded him so sternly that he sneaked off in evident chagrin.

The smaller puppies liked to play with the big ones, nevertheless, and soon became so active that they were amply able to defend themselves. Several times have I observed one of the little ones prone on its back begging its huge opponent to be gentler, suddenly hurl "the big ruffian" off, throw him backward, and roll him rapidly down hill, as a very active man rolls an empty barrel, pushing with the forepaws as if they were hands, and growling as if in unaffected rage.

These same little Gipsies can perform one feat I never knew any dog to succeed at: they can climb straight up a soft-barked tree, cat-like; but of course this power will soon cease when they get to digging.

L. R. MORPHEW.

Drumming Grouse.

JERSEY CITY, NOV. 1.—*Editor Forest and Stream:* L. F. Brown in this week's *FOREST AND STREAM* asks whether partridges drum in the fall months. I have heard them drum at that time of year, and on more than one occasion I have watched an old drummer at it on an old log near the farmhouse where I was stopping, in Sullivan county, New York.

I could never tell where the drumming sound came from, whether from hitting the log or his breast with the wings. I have heard it said that it was caused by the wings coming together over the bird's back. I believe, though, it is caused by striking the breast or sides. At different times I have heard the drum of a partridge while coon hunting late at night in the fall. I know a party in Sullivan county who will drum up a partridge, and I have been with him several times when he has done it. He would select for this performance a spot near a drumming log; and concealing ourselves as near the log as possible, he would imitate the drum of a partridge to perfection by striking his breast with his clenched right hand. Generally after two or three "drums" we would be rewarded by seeing the bird coming, almost on a run, and always along a log or on the rocks, never on the ground if logs or stones were near. I have seen them fly from one log to another rather than walk on the ground. The reason he gave for partridges answering to his drum, was that an old drummer "keeps" in that certain piece of timber, and hearing the drum of another bird in his section of country he comes forth to give battle and drive the intruder off.

I have seen one come within fifteen feet of where we were hiding, the bird strutting back and forth as if he were trying to locate where the sound came from. And what a grand picture that noble bird would make, his head, neck and shoulder feathers on end, his tail in full spread, and with wing-tips touching the ground, he, Sir Partridge, ruler of that certain bit of timber, stood ready to give battle to any intruder on his sacred domain. To kill partridge in that manner would be looked down upon by all true sportsmen, and properly labeled pot-hunting, and I sincerely hope the day is not far distant when the killing of moose in the calling season, using very nearly the same methods, shall be looked upon in the same light.

OTTO KEIM.

Editor Forest and Stream:

Mr. L. F. Brown's article anent the fall-drumming grouse, shows that he was the butt of his companions, and the victim of a practical joke. If he ever really saw a grouse drum, he ought to have seen that neither in the first four or five slow beats, nor in the subsequent faster ones, did his wings strike his breast.

THE OLD ANGLER.

ORANGE COUNTY, N. Y.—Oct. 29.—*Editor Forest and Stream:* I had always supposed that all partridge hunters and all country boys knew perfectly well that the ruffed grouse drums in autumn. Let me depose that this very day, on Shinnecock Mountain, five miles back of Storm King, I heard partridge drum at four different times during the day. I flushed and saw two partridges, and flushed and heard the roar of several others as they evacuated the premises. I had no gun or I would have killed something. I am sure of this, for we never miss the bird in these hypothetical stories of what we would have done "if."

How does the partridge drum? Well, now, why don't your anxious inquirer look it up in the books? Audubon would tell him. This is what Audubon says of the drumming bird: "It beats its sides with its wings in the manner of the domestic cock, but more loudly, and with such rapidity of motion, after a few of the first strokes, as to cause a tremor in the air, not unlike the rumbling of distant thunder."

But probably Mr. Allen Kelly, or some other distinguished "myth buster" will rise up and in "tongue unknown to script" explain to us that Audubon did not know a thing when he thought he saw it, and is old-fashioned and out of date and superseded as a back number anyway. So or not so, we cannot have too many records of original observation on such subjects, and I hope to see more in your columns.

By the way, I thoroughly enjoyed, and I suppose all your readers did, Mr. Kelly's letter in your issue of this week, which was of the nature of serving a writ of replevin on Mr. Seton for those "Monarch" bear stories. My sympathy is always with the man who has "lost a bear," and it did me good all through to see Mr. Kelly round up his stolen grizzly and the rest of his band of bears. But we must not be too harsh in our judgment of the animal novelists. When a writer makes an honest attempt, such as, according to Mr. Kelly, Mr. Seton made, to see actual wild bears at large in the wilderness, and fails to find them, what is he to do except take bears from books, Kelly's or other folks', and thus make his "intimate studies" in the only way open to him?

R. D.

Editor Forest and Stream:

The following from Nuttall (Montague Chamberlain's edition, Vol. II., page 32), has a bearing on the grouse question as showing that the drumming is done in the autumn as well as in the spring, and that when drum-

ming the bird does strike its body with its wings. Nuttall says:

"In the month of April the ruffed grouse begins to be recognized by his peculiar drumming, heard soon after dawn and toward the close of evening. At length, as the season of pairing approaches, it is heard louder and more frequent till a later hour of the day, and commences again toward the close of the afternoon. This sonorous, crepitating sound, strongly resembling a low peal of distant thunder, is produced by the male, who, as a preliminary to the operation, stands upright on a prostrate log, parading with erected tail and ruff and with drooping wings in the manner of the turkey. After swelling out his feathers and strutting forth for a few minutes, at a sudden impulse, like the motions of a crowing cock, he draws down his elevated plumes, and stretching himself forward, loudly beats his sides with his wings with such an accelerating motion, after the first few strokes, as to cause the tremor described, which may be heard reverberating in a still morning to the distance of from a quarter to that of a half mile. This curious signal is repeated at intervals of about six or eight minutes. The same sound is also heard in autumn as well as spring, and given by the caged bird as well as the free, being, at times, merely an instinctive expression of hilarity and vigor. To this parading ground, regularly resorted to by the male for the season, if undisturbed, the female flies with alacrity; but, as with other species of the genus, no lasting individual attachment is formed, and they live in a state of limited concubinage. The drumming parade of the male is likewise often the signal for a quarrel; and when they happen to meet each other in the vicinity of their usual and stated walks, obstinate battles, like those of our domestic fowls for the sovereignty of the dung-hill, but too commonly succeed. When this sound, indeed (according to Audubon), is imitated by striking carefully upon an inflated bladder with a stick, the jealous male, full of anger, rushes forth from his concealment and falls an easy prey to the wily sportsman."

If I am not in error in my recollection, other observers have reported practically the same thing in your columns in former years.

JOHN BLACK.

BEAUMARIS, ONT.—*Editor Forest and Stream:* I notice in your number for October 29 an inquiry as to whether partridges ever drum in the fall months. I felt certain that on several occasions I had heard them but, strange to say, while taking a stroll in the brush this afternoon I distinctly heard one, but did not see it. Two years ago I also recollect not only hearing one, but watching it for some time; this was between the 15th and 30th of September, and was an old bird, and I have no doubt but in all cases it is the old birds which drum in the fall.

J. H. W.

Editor Forest and Stream:

As Mr. L. F. Brown has asked if grouse drum in the fall, I will say that in Maine and New Brunswick they drum nearly as much in the fall as in spring. I have shot a great many when drumming in the fall. They usually drum more in the afternoon in the fall, and I have sometimes heard them drum all night. Only a few years ago I shot one at about 9 P. M. by moonlight which was drumming. I crept close up to his log, but it was too dark to see him till probably mistaking me for some animal, he flew up into a tree which brought him into the light so I could see to shoot. I once heard seven drum in one afternoon, and several times have shot three in an afternoon in the fall. My son shot two drummers last week.

MANLY HARDY.

The Woodcock in England.

HERE to-day and gone to-morrow is only too often the case with woodcock, but sometimes these birds will choose a certain wood and stick to it persistently without any apparent reason. Year after year they may be found in one particular spot, and nowhere else for miles around, although other adjacent coverts would appear to be equally well suited to their needs. It is when such a covert is known to hold 'cock that the sportsman can enjoy the shooting at its best. In settled weather the birds are likely to stay; but, since our climate is as erratic as a woodchuck's whims, it is best to lose no time in looking for them. Open weather and a full moon are the conditions most propitious for good sport. The birds, being nocturnal feeders, depend upon the moon for light, and on mild nights the worms work up to the very surface of the meadows and provide abundance, even for such a voracious appetite as that of a famished 'cock. Satisfied and snug in their dry beds, the birds will lie well next day, and can be flushed one by one at close quarters. After a dark night or in frosty weather, when the ground is too hard for penetration by their sensitive bills, the birds will be hungry, restless and wild. On a continuance of frost, they will work into the deep, sheltered corners of the covert, and diligently turn over the dead leaves or probe the soft mould in their search for insect food. Then, perhaps, suddenly they will be gone.

By using the plural in speaking of their movements there is some risk of conveying an impression that woodcock are gregarious, or at least moved by some feeling of sociability, which induces them to act in concert. Any such bond of friendship, however, certainly does not exist. A dozen 'cocks may haunt the same wood, but each is in reality a hermit, living and moving in total disregard and independence of his neighbor, ignoring even his very presence. But, following the dictates of nature, every bird leaves his hiding place for his feeding ground at the same time, probably sharing the same flat worm pastures, and returns at the same time in the small hours of the morning. But there is no sign of comradeship in their movements; each bird chooses his own course from the solitary resting place to the particular corner of the meadow which he considers yields the richest fare. Spasmodic and versatile in all other respects, the woodcock displays system and regularity in his flights. So methodical is he that every evening he takes the same line and emerges from the same opening in the wood, flitting silently out, and making straight for his feeding ground. It is by watching at dusk that the sportsman can discover the line

taken by each bird, and make sure of getting a shot at flight time.

A chance of a woodcock never seems to lose its charm—rarity of opportunity may in some degree account for it, for satiety in this bird is a thing unknown. If flushed in the daytime, he springs up, a startling apparition of rich brown, which slips noiselessly through the first opening in the treetops—beak down, shoulders up, and a large liquid eye shining like a big black bead, set well back in his curious head. There is no mistaking a woodcock; he is like nothing else.

At dusk he is no less startling, even though one be standing alert and expectant on the border of the wood. There is a touch of the uncanny about the bat-like bird as he silently flits out in the twilight with undulating wavy flight. Seen against the darkening sky for a moment, he looks twice his actual size. The next instant, unless the gun be thrown up smartly and held straight, he has vanished in the gloom.

Every sportsman remembers shooting his first woodcock, and the satisfaction with which he placed the coveted pin-feather in his hatband. How easy to recall every detail. First, flushing the bird from under a holly bush in the little wood; the subsequent discovery of his line of flight; the diplomatic bribery which induced the gardener to lend his muzzleloading "bird scarer"; the moments of anxious suspense and hopeful expectation at dusk, rewarded time after time by the same result; a deafening report, a bird flying serenely on, and a boy taking a sitting posture on the grass, the 'cock being eventually shot, perhaps, by some one else. Yet that first woodcock lives in the memory as no other bird can ever do.

The alleged decrease of woodcock in England is believed by many to be more imaginary than real—would that it were so! That the birds breed with us in greater numbers than formerly there can be no doubt; so any decrease must be in the migrants which reach these shores in October and November. The comparative mildness of recent winters would in some degree account for fewer 'cocks coming south, as the migratory instinct does not seem so strong with these birds as with many others. It is probably due to the many extensive areas of covert under strict preservation that woodcock breed more freely in England nowadays. And for the same reason—i. e., reluctance to disturb pheasant coverts—a good many 'cocks are never seen or shot where in former days they would have been the center of attraction, and would have gone to make up those bags we read of in our fathers' diaries—and which to-day, with a sigh, we pronounce to be impossible.—London Field.

As to Sleeping Ducks.

Editor Forest and Stream:

I once saw two black ducks fast asleep. There is no mistake about this. I was camped on an island in a meadow early in April. The meadow was open, but the pond above was still frozen solid. I had been out till late the night before shooting muskrats, and there were no ducks on the meadow. In the night it froze all over the meadow except a small place near my camp. On looking out very early in the morning, I saw something in the center of the open place which I knew was not there the night before. They proved to be two black ducks, which had dropped in during the night, and their heads were so flat that as one lay partly behind the other they looked like a short piece of a log. After watching them a while, I went to camp, got my gun and shot one with my rifle barrel. If those ducks were not sound asleep, then I have never seen anything asleep in my life.

M. HARDY.

NEW YORK, NOV. 2.—*Editor Forest and Stream:*—I accept Mr. Ackert's offer to show me two or more dusky mallards "all asleep together" on floating ice in the Hudson next March.

There can be but one opinion among sportsmen if he shot sleeping ducks without first making them fly. And it is interesting to note that with him, "duck-and-man telepathy" does not "work."

L. F. BROWN.

Birds in the Erie Museum.

A LADY here in Erie, Mrs. Brandes, has placed in the public museum several cases of the finest mounted specimens of birds that I have ever seen. There are five cases; but the one that will be the first to attract attention portrays a tragedy of the woods. A gray fox, which looks as natural as when alive, is in the foreground; he is sneaking off carrying a quail in his mouth, while another quail, probably this one's mother, sits fluttering in a branch above him. A handsome wood duck stands in among the grass in another case; he seems to be on the watch here, as if he were in his native woods. Another case has a fine English pheasant and his mate, two of the handsomest I have ever seen. Then there is a ringed gull, and then some English grouse. Next come two snowy owls that must be looked at very closely to find out that they are not still alive. A bird of paradise occupies another case, and there are several other specimens, all of them of the greatest interest.

CABIA BLANCO.

A Beaver Colony.

MONTREAL, Oct. 29.—From the Desbarats, Ont., Canada, news columns of the local paper I have cut out the following item, showing that in Ontario, at least, the game laws are respected: "The township council is up against a hard proposition. A colony of beavers have dammed a creek in the Center Line road, opposite Mr. Chas. Steinburg's farm, and the road is flooded and is now impassable. Mr. McMaster, of Roek Lake, nearly lost his team there last week. The dam has been torn away several times, but the beavers immediately repair the break. The council will have to close the road until spring or else crossway the dangerous part of the road. The beavers are protected by the game act, but the council is seeking permission from Game Warden Tinsley to destroy this particular colony."

GAME BAG AND GUN

With Grouse and Pointer.

On a certain Saturday evening in November of a certain year, the New York train stopped at a little station in Sullivan county, dropped two passengers and a trunk, chortled a bit, pulled out, and the excitement of the day was over for the gathered townspeople. Not so for D. and myself, who happened to be the two passengers. For on this our first trip after grouse, the real excitement would commence Monday morning, weather permitting, and whether or no on Tuesday. Adjourning to the hotel, we engaged rooms, had the trunk salvaged, interviewed the guide (whom we had previously engaged) regarding details, and turned in.

Monday morning dawned clear and cold, with a heavy frost on the ground, and of course we piled on all the heavy clothing available, and naturally regretted it before the sun went down.

Breakfast in our stomachs and a husky bit of lunch in our pockets, we started out to meet Eli and Spot, guide and dog. After a brisk half-mile walk up the railway track, we found them waiting for us, and without more ado started in to do business.

Under the first wire fence went the bunch, and straightening up on the other side, spread out, the dog nosing back and forth in front. Before many minutes passed we jumped a rabbit. I fired and D. fired. I fired again and D. fired again. Eli didn't shoot; I suppose to see what we would do. The rabbit? Oh, well, the rabbit got away.

With a "Go on, Spot!" to the dog, who had stopped head up at my first shot, Eli remarked: "Ye'll have t' do better 'n that when we git into the brush." We but-toned up our lips and tagged on.

Pretty soon the dog froze up in a hummocky field, and Eli said, "Rabbit." We got placed, in went Spot and out bounced Molly. As before—but what's the use? Eli didn't shoot; he simply said things. However, we were destined to square matters with him later.

On we went again in extended order through brush and woods for half the morning with never a point. Through swamps and over deadfalls, under 'em and around 'em. Eli's professional pride was touched to think that the morning was to be a goose egg, his remarks being pertinent and to the point. We were all working hard, and the dog was doing his best; but fate or a hoodoo was at work, and we began to scan each other for the Jonah. Nevertheless, we were soon to be introduced to our first grouse. Working along the side of a hardwood ridge, with Eli in the middle and D. and I forming the wings, we had just gone through, under and over a wire fence, according to our respective inclinations, when—wh-r-r-r-r! up popped a brown bird, and up jumped my gun. But why dwell. The hammers, of course, were down, and although Eli intimated that the bird roosted in a tree after going fifteen yards, I was too surprised to do anything except look the part. You probably know how it was yourself when your first grouse got up.

We seemed to have struck the place, for a little further on Spot came to a point; and it was a case of "gather round girls," with no "after you, my dear Gaston" business when the bird flushed.

In went the dog, and the minute the bird left the ground down she came with a broken wing. D.'s gun muzzle was oozing fumes, and it was score one for the tyros. Then we witnessed some intelligent work. The bird, able to run but not fly, had started back into the swamp laurel as fast as legs would take her, with the dog trailing close behind. A half minute went by, and no dog; a minute, and still no Spot. Eli called, whistled, and came to the conclusion that Spot had found the wounded bird and was pointing her. He told us that Spot would never break a point as long as the bird stayed, so there was nothing left but to go in and find him. We plunged into the mass of laurel, deadfalls, mud, and water, and after ten minutes' blind hunt found our dog. And there was a sight worth going a long way to see. Spot, flat on his belly, his back touching a moss-covered deadfall, ears up and eyes front, watching the bird, who had completely hidden herself from our eyes under a mass of roots and leaves.

With the first bird of the day resting in the back of D.'s shooting coat, we wandered on. Coming across a beautiful little stream which purled along with many a turn through rows of hickory and white birch trees, we, upon Eli's suggestion, decided to lunch.

As I sit here in my warm room, with the winter wind howling outside and the mercury hovering around the lower rungs of the Fahrenheit ladder, I can close my eyes and see that scene almost as vividly as when we were a part of it. Woods all about, the stream at our feet, and the blue sky overhead; Eli reclining against a stump, D. sitting on a log, smoking, and the dog snoozing away as though he had lived there all his life. It is such scenes as this which bind one to the woods and streams and make one wish to get away from the turmoil of town.

Lunch and a smoke over, we put the dog ahead and started on. By three o'clock we had tramped considerably over five miles, with never a point, and Eli was beginning to say things again. Coming out of the woods into a field in which there were a few apple trees, we filled our pockets, descended a hill, crossed the railroad and plunged into a swamp. Spot began to act anxious, and Eli said, "Look out for woodcock, boys." No sooner were the words out of his mouth than Spot froze up. He went in cautiously, but it proved to be only a warm spot. We floundered through the slough, seeing woodcock chalkings and borings galore. Leaving the swamp, we topped a rise swinging in an arc to the right. Mark! Away went the woodcock in a straight line from Eli's feet, and his gun barked, and then barked again. At the second bark the bird was still going, and the air in

Eli's vicinity was blue and sulphurous. D. and I looked at one another, and knew we were even for those two cotton-tails. Two grouse and a rabbit fell to our guns in the next hour, and as it was becoming dark and we were near home, concluded to quit for the day.

As D. and I walked down the railroad track in the dusk, each busy with his own thoughts, and tired enough to sleep on a picket fence, we brought to a close a day in no way remarkable for the size of its bag or the oddity of its incidents, but thoroughly enjoyable withal.

D.'s version of the second day is as follows:

Election day dawned clear and cold, and after having a hearty breakfast our little party climbed into an old buckboard, and tucking Spot under the seat, started on our second day's hunt; just as anxious as we were the preceding morning, only not quite as spry.

We drove about six miles to a little village called Woodburne, and going straight to the only hotel in town, we unhitched the horse and put him in the barn while Eli was casting his vote.

Stripping ourselves of everything that was not absolutely necessary, we started to hoof it to the shooting grounds, always on the lookout for anything we might start along the roadside. After we had gone about half a mile, we came across a large patch of woods and decided that we would start in for blood. Spreading out in a line we broke into the woods, and hadn't gone far before we heard a whirr of wings and a quick shot, and then the voice of Eli's boy calling, "I've got him, dad!" And sure enough, he had first blood of the day. He pocketed his bird while N. and I looked on with envious eyes.

After being cautioned by Eli that there wasn't to be any "You first, dear Alphonse," but to shoot the minute we saw anything, we started off again, Eli working the dog, and N. and myself starting at every little rustle of the leaves. We went on this way half an hour or so without starting a single grouse, and Eli was beginning to say a few things such as "Well, boys, this is th' fust time I've cum through these here woods without scaring up at least half a dozen birds, anyway," and cursing the luck in general. N., who had been doing a lot of hunting and was not saying much, hollered to us that Spot had got a point, and when the rest of us came up, sure enough, there was the old dog frozen stiff as a poker pointing to a large laurel patch. Eli pricked up his ears, and motioned for me to come up slowly, every now and then steadying the dog by talking to him. N. was on his right, eagerly waiting for the bird to flush. As I came up I heard a whirr and just caught a glimpse of an old grouse sailing off through the trees. I raised the old twelve to my shoulder and let fly both barrels; but alas! it was the same old story—nothing doing. In the meantime, N. had flushed a bird over to the right and had duplicated my performance, although he claims he raked the bird, and Eli said he saw some feathers fly, so it must be so.

After holding a short consultation, we came to the conclusion that it was about time to eat a little lunch; so Eli led the way to a clear little brook that he knew ought to be near where we were. Laying our guns to one side, we endeavored to do full justice to our sumptuous repast, and I imagine we succeeded very well. The result of our morning's shoot had been one solitary grouse, and that was killed by our guide's boy.

We rested for an hour and took condolence out of several pipefuls of tobacco, and feeling much refreshed, we started out again in quest of the wily grouse. During the course of the afternoon we managed to bring down a grouse apiece to our respective guns, and N. shot a couple of rabbits. I had to catch an early train to the city, so it rather broke up our afternoon and caused us to hunt hurriedly over some good woods, where if we had gone carefully we might have shot one or two more birds.

THE TYROS.

An Exciting Bear Hunt.

BY EDWARD A. SAMUELS.

I HAD often expressed the wish to Steve Norris, my old-time guide and boatman, who had served me faithfully on more than one good outing with rod and gun, that I might, when opportunity offered, join him on one of the fur-trapping expeditions he had been accustomed to make every autumn; and it is therefore hardly necessary to say that when I received a letter from him early in November a few years ago, stating that he had put up a line of traps, and I could come as soon as I desired, the invitation was eagerly accepted, and that my grip was quickly packed and I was soon speeding on an express train to the northern country, in which was the home of my guide.

His traps were located in the wilderness, about twenty miles from his house. A dozen miles or so of this distance was covered by an old tote road, over which a buckboard proved a not uncomfortable vehicle, the horse being driven by old Steve's son, a big, muscular fellow, about twenty years of age, who had already acquired much of the knowledge of woodcraft, for which his father had long been famous.

At the end of the tote road the horse was unharnessed, my dunnage and the provender for the animal were packed in two large bags, which were strapped on his back, and we then took up the route over a path which was very rough, its last two miles being merely a blazed trail.

We arrived at the trapper's camp late in the afternoon, and found him busily engaged in stretching some skins of minks and musquash which had recently been taken from his traps.

Of course, his greeting was a cordial one, and I was soon made to feel myself at home in the shanty or

camp that he had erected. Although the walls of this structure were composed of no heavier material than sheets of bark, it was strongly and compactly built, the layers of the bark being so deftly withed together that the interior was as warm and comfortable as the room of a dwelling house. It was about twelve feet square, and contained a rough table, two or three benches and a couple of bunks, in which were laid soft and fragrant beds of hemlock boughs.

It was a primitive affair, such as one would expect to be occupied only by a hunter or trapper or one of his Indian cousins.

After putting away my belongings beneath the bunk which had been assigned to me, I joined the others by the camp-fire, where they were preparing supper, in the cooking of which some choice slices of venison, that Steve had procured a day or two before my arrival and in anticipation of my coming, played a conspicuous part.

Our meal was eaten with the keen relish that hunters and woodsmen always possess, and it was followed by the burning of tobacco, which seems inevitable when conditions similar to ours prevail.

During our "smoke talk" I learned that the line of traps extended about eight miles, following the course of the stream which flowed before the camp, and circling a small lake a couple of miles away.

I also learned that mink were rather plentiful; that of wildcats, or lynxes he had already captured three; that there were otter in the lake I have named, some of which he expected to trap; that musquash were abundant, and "bear signs" were so plentiful that he had four traps placed in situations which he felt certain would give a good account of themselves.

While we were engaged in conversation, I was startled by a most unearthly yell, which was uttered by some animal in the undergrowth near the camp; it was almost exactly like the scream of a young girl in great distress or terror. Excited as I was by the uncanny sound, I made a movement as if to seize my rifle, but Steve motioned me back to my seat, saying quietly, "You don't need to worry about that critter, it's only a porcupine, or quill-pig, as it's sometimes called; they often holler like that at this time of the year. I confess I jumped myself the first time I heard one of the brutes."

"Porcupine!" I exclaimed. "Is it possible that such a scream as that could be uttered by one of those animals? I thought it might be a panther, for I once heard a cry somewhat like that as I was tenting on the Magalloway River. I suppose, however, that they are about exterminated in these woods."

"Yes," he replied, "and I'm mighty glad of it, too; they're savage brutes, and unless a man has a gun with him he stands no chance with one of 'em. I had an adventure once with a painter, or 'Injun devil,' as people sometimes name 'em, that I shan't forgit to my dyin' day."

"I had been out trappin' near Spencer Lake, away off to the east'ard from here, and was going home with a putty heavy pack on my back, for I had my camp kit, a pair of blankets and forty or fifty pelts. I had almost reached the cove where I had left my boat, when I heard sticks crackin' just behind me, and then some-thin' let out a screech that made me jump, for I knew what it was; I had heard it before."

"Now, I knew that that critter was on my trail, and that he was bound to make meat of me if I'd let him. I didn't have a rifle in those days, but I used a single-barreled gun which carried an ounce bullet putty well and would generally knock over most any animal if it hit it right."

"I felt putty consid'able skerry, for I knew that unless I hit that brute right I was done for, for running with that heavy pack on was out of the question. I turned around two or three times and looked back and saw that the critter was gitting more and more clost. Gosh mighty, but he was a whopper! His body seemed to be over six feet long without counting his tail. Every now and then he gave a screech that made my heart jump. At last, when he got within four or five rods of me, I put up my gun, aimed at his head, and pulled trigger. The gun had an old-fashioned percussion lock, and, though the cap exploded, the gun did not go off, there bein' no primin' in the tube."

"I confess I got rattled then, and began to run, and I run good and hard, too, and had almost reached the boat when I stumbled over an old root and fell sprawling; and there was where I had a lucky escape, for as I fell I started out an old bear from the bush nearby, and he made off in the direction of the painter."

Gosh 'mighty! what a screech the varmint let out when he saw the bear. He didn't seem to care for me then; bear's meat seemed to be what he wanted.

"I scrambled up and made for my boat, which I pushed out into the lake in mighty short meter, and when I got at a safe distance I laid by and watched the fun."

"The bear turned tail as soon as he found out what was after him, and made for the shore of the lake, calkerlatin', I reckon, to swim out into the water, knowin' that he would be safe there, for the panther hates water like pizen. But he wasn't quick enough, and he had jest time to throw himself on his back on the shore when the painter made a jump for him."

"Well, if that bear didn't make his hindlegs, paws and jaws work it's no matter. I never see sich clapper clawing in all my born days."

"The painter seemed to git all that was coming to him, for he pulled back and looked at the bear, as if he thought he was a putty good fighter; but the brute must have been hungry, for he made another jump for the bear, who was still lying on his back. The second

fight wasn't as long as the first one, for the sharp hind claws of the bear cut into the belly of the painter in such a way that the critter was glad to crawl away with some of his innards hanging out.

"As for the bear, he got up a little the worse for wear, shook himself to see if he was all there, and ambled off in a direction different from that the painter took.

"Yes," continued the old trapper, as he refilled and lighted his pipe, "a bear is mighty handy with his feet, for he can box with his forepaws so well that a man has got to be putty quick to hit him with an ax or other weapon; and as for his hindfeet, the claws on 'em is as sharp as knives, and a man or other critter has all kinds of trouble comin' to him if those claws get a chance to slash him."

Steve was in a reminiscent mood that night, his stories of the denizens of the forest keeping me interested until bedtime. He had been a keen observer, and was thoroughly conversant with the characteristics and habits of every wild animal that was pursued either as game or for fur.

On the following morning we were astir at daybreak, and after eating a hearty breakfast, Steve and I left the camp for the purpose of visiting the traps, leaving Oscar, his son, to tidy up things, preparatory to starting down the trail with the old horse, on their return to the trapper's home.

To visit a line of traps eight to ten miles in length means to the ordinary walker a good day's tramp, and a pretty rough tramp at that, for the path, if path it can be called, leads through all sorts of cover, around or over ledges, windfalls, etc., and before we had accomplished half the distance, I was glad to have an opportunity to take a short rest.

Our catch thus far was a good one, consisting of a couple of minks, a red fox and a lynx, the two latter having been taken in wire snares, which proved more effectual with these suspicious animals than ordinary steel traps are.

"It's no use lugging all this meat around," said the guide, as he quickly removed the skins from the animals. "We'll leave these carcasses here to draw the bears, and in a day or two we'll set a trap here for 'em. And speaking of bear traps, I've got one clost by that has been set a couple of days, and as there was plenty of signs, it ought to have a grip on one of the critters by now. We'll soon see, anyway."

At these words, throwing his pack over his shoulder, Steve started off with ax in hand, I, with rifle ready for instant service, keeping close behind him.

The route was through a dense piece of chaparral, through which it was impossible to see more than two or three rods in any direction, but the spot at which the trap had been set was soon reached, the old trapper picking his way without any difficulty.

"Yes, old Bruin has been here sure enuff," exclaimed the guide, "and he has lugged the trap off with him. The next thing is to find the critter."

A few words of explanation concerning the method of setting a bear trap may be necessary here.

The presence of bear in any stretch of forest is detected by the experienced woodsman by certain unmistakable signs, such as the ripping open of an old log or windfall for the grubs it may contain, or the digging up of an anthill, or the tearing down of the bark from the trunks of trees, beneath which the big white borers and beetles, upon which the animal feeds, are secreted.

Selecting a suitable location for placing the trap, it is baited with the entrails and other offal of animals, which are dragged around the spot and finally left at the place where the trap is to be set; and sometimes the more flamboyant the bait is the more attractive it seems to be to the bear.

The trap is set so that the animal cannot reach the bait without springing it with his foot, and to the chain that is attached to it is fastened a log of wood four or five feet in length, called a "hobble." This is not so heavy as to prevent the bear from moving around, and when he finds himself caught he starts off, dragging the hobble behind him; and sometimes he is able to go a mile or more before he gets tired and lies down. Of course, there is a chance of the hobble being "hung up" between two trees or saplings, but he generally picks out an open route. The trap is chained to this hobble firmer than to a tree, for the reason that if it is thus firmly attached the bear gnaws off his foot and escapes.

In dragging the hobble he leaves many signs, which are easily followed by one experienced in woodcraft.

Hanging his pack in the crotch of a tree nearby, the trapper, with ax in hand, took up the trail that had been left by the bear and hobble, following it as accurately as he would have done if the tracks had been made in newly fallen snow.

"Gosh 'mighty!" he exclaimed, pointing to the imprint of a huge foot in a soft spot that had been crossed, "he's a buster and no mistake; it's the biggest footprint I've ever seen."

I looked at the imprint, and wondered how I should act if I were within reach of one of those immense paws.

For at least half a mile the tracks were followed before the cracking of sticks, which indicated that we were nearing the animal, was heard. Pushing steadily ahead, the guide soon discovered the huge black form of the bear as he was crawling beneath a big windfall, or old decaying trunk of a dead tree, as if he were endeavoring to conceal himself.

"Well," said the guide, "he's crawled in under that windfall, and the next thing is to git him out. The best plan is for me to go 'round on the other side and poke him out with a pole, and you stand on this side and shoot when he comes out of cover."

I assented to this arrangement, and stood with cocked rifle near the windfall awaiting the appearance of the bear. The trapper, after cutting a stout pole, moved around to the further side of the windfall and began poking in the spot where he thought the animal was secreted, and it was not long before a loud growl announced that his probing was effectual. The bear was evidently disinclined to come out, for it required considerable urging on the part of Steve to move him, and when he did emerge from his hiding place, instead of coming out near where I was stationed, he started out

briskly on the further side, evidently with the intention of attacking the trapper.

"Come round here, quick!" shouted Steve, "the bear has got rid of his hobble somehow, and if we don't look out we'll lose him."

I hurried to the spot as quickly as I could, and found that the brute, now thoroughly enraged, instead of endeavoring to escape, was attacking the guide with the greatest fury. As he was encumbered by nothing but the trap, which was attached to one foot, he could move almost as if he were unhampered, and easily evaded the blows that Steve aimed at him with the ax, and quickly sent it spinning into the undergrowth. The trapper, now disarmed, had no alternative but to run, for the bear was rushing upon him, and about to seize him with his huge black paws. Steve was a pretty good runner, and he darted about among the bolls of the trees with a celerity that was astonishing in a man of his years; but the angry bear was also quick in his movements, and ever and anon, he almost came within striking distance of the guide.

As I was following them, I did not dare to shoot, fearing that the bullet might hit the trapper, who was on a line with the bear from me, and it was only after Steve reached a pine tree, into which he swung himself by its lower limbs, and which he began climbing, the bear following him, evidently determined not to be cheated of his prey, that I had an opportunity to use the rifle with safety to my friend. Higher and higher mounted the guide, the bear following him almost as well as if he had no clanking trap fastened to his foot; and he had mounted nearly thirty feet before he was in a position that would insure a successful shot, when, aiming carefully at the point of juncture of the head and neck, I fired. But one shot was needed, for the work of the bullet was fatal, and almost without another struggle the huge brute came crashing down through the branches to the ground.

"That was a mighty close call," exclaimed Steve, when he had descended from his lofty perch and stood beside me. "Old Bruin meant mischief, for sartin. I hadn't reckoned on his gittin' rid of that hobble. Well, we'll take off the brute's pelt and git back to camp, for it's growing late."

It was an unusually large bear, and its long glossy black fur was in the best possible condition. It did not take long to remove the skin and hams, which Steve made into a pack, and slinging it over his shoulder, together with the huge trap, led the way back to the windfall, where he recovered his ax, and then, retracing our path to the spot where he had left his pack, a portion of which I insisted upon carrying, we started "homeward bound" for the camp, which we reached just as the sun was sinking beneath the western horizon.

"A Deplorable State."

LA SALLE, N. Y., Nov. 1.—*Editor Forest and Stream:* Game laws are made to be broken. At least this seems the only use that is made of them through this section of the State. I cannot think of one game law that is the proverbial exception to prove the rule that is not openly violated. The old Niagara, once the home of many game fish, flows peacefully on as of yore, but its sturdy inhabitants have nearly gone. Its banks and surrounding territory once furnished cover and feed for a feathered host, but to-day the covers stand deserted.

The maskinongé, the king of all our game fish, are practically extinct. Time was, and that only a few short years back, when a boat could bring in two or three large, gamy 'longe for a day's catch. To-day you are lucky if you can land one for a season's catch. It was a pleasure in those days to sit in a boat and feel the tremble of the line caused by the whirr of the spoon. Anticipation was keen, momentarily realization probable. Now, alas! anticipation is at lowest ebb and realization rare! rare! rare!!! And why? Simply because our game laws are not enforced; our game officials are—well, not doing their duty. I know personally that our game wardens know of daily infractions of the law, and I have yet to learn of one single instance where they have even tried to detect the infringers.

Again, Upper Niagara black bass fishing was at one time fine. Not later than 1901 catches of from 60 to 70 bass were made by one boat in one day, and we think we hear you murmur "game hog!" To-day the catches are very small, and "fisherman's luck" by no means rare. Again you ask me why, and again I answer, non-enforcement of the game laws. "Game hogs" have played their part, but it is a very small part as compared with other fish-destroying agencies. The way our fish have gone was nicely told one day last spring by a little boy about four years old. Our little boy saluted his father upon his return from work one evening by telling him what a large basket of fish two men had caught that day, and ended his story by stating that "they had caught them all on one hook that they had in a valise." That tells the whole story. There are too many using the fishing tackle that is done up in small packages and must be lighted before using. Our bass spawning beds are literally blown to pieces. Big fish and little fish, game fish and food fish all come to the top after a stick of dynamite has done its fiendish work. "Familiarity breeds contempt," and so familiar has this thing become along our shores, that no one seems to pay any attention to it. No attempt is made to keep the dastardly work secret, and I have known of blasting to be done within 100 feet of men who were trying to have a little sport fishing in a lawful way. Seine fishing is indulged in to a considerable extent, and while the damage done to game fish in this way is considerable, it does not begin to compare with the damage done with dynamite, as the principal fish caught in the seines are sturgeon.

For the last two years I have been advocating stocking our fields and covers with birds, and the one great obstacle that I have found was the non-enforcement of the game laws. Wherever I have brought the subject before sportsmen they have invariably answered that the attempt would be useless, for the birds would receive no protection and would be killed faster than we could supply them. I still cling to my theory and still persevered in my undertaking until a few days ago, when I gave up in despair. There was a small covey of quail back about a mile, and these I had been watching and fostering as one

would a baby. Imagine my indignation and grief when the other day a man informed me that one of our hunters had gone back there and potted the whole bevy. I should as soon have thought of firing upon a group of children as shooting into that tame flock of birds, but unfortunately there are others whose scruples are less fine.

Our duck shooting has gone the same road as all the rest. Decoy shooting a few years back was very good. To-day the feeding grounds along the shores are empty. The great number of hunting gasoline launches are to blame for this. Every flock of birds that arrives on our river are spied out with long-distance field glasses and a launch is after them. They are chased morning, noon, and night, and the duck that stays longer than one day is a fool. They are given no chance to feed, and spend what little time they are among us flying up and down the center of the river looking for some quiet resting place.

Have not things sporting reached a deplorable state in this section? Is there a remedy? That this article will reach the eyes of someone who can suggest a remedy is the most heartfelt wish of

A READER.

In New England.

Boston, Nov. 5.—Mr. Cyrus A. Taft, of Whitinville, reports that the hunters in his section are flushing some coveys of quail, and he thinks there are one or two that will kill all they can, but this is not true of all of them. He is anxious to get more birds the coming year for stocking, and says he is strongly inclined to put out some early in the winter, as he thinks by his system of troughs for feeding he can carry them through all right. Partridge shooting, he says, is fair.

Mr. Charles Bradbury, of Camden, Me., tells me that woodcock and partridge shooting has been exceptionally good in his section this fall.

Mr. William Pray, of Boston, says his experience in Massachusetts, so far as upland birds are concerned, this season has been very discouraging, and his main reliance for birds is his place in Maine.

Our smelt fishermen have had phenomenal success this season—so good that some of them who are hunters as well as fishermen have deferred their gunning trips up to the present time. On the north shore several boatmen have seen an anomaly in the shape of a white whale.

I have reports of several deer being killed in various towns in New Hampshire, one of the largest in Berwick weighing 250 pounds. Several have been reported from Vermont of unusual size, 250, 275, 300, and the largest 350 pounds; also several bears, the largest weighing 400 pounds. A bill is before the Legislature at Montpelier to abolish the open season on deer for a period of three years, and I understand it is meeting with some support. The great slaughter of last year (1,000 deer) has, in the opinion of some, reduced the stock almost to an alarming extent. Most of the Massachusetts sportsmen who have returned from Maine have been able to secure one or two deer, and several have got a moose also. One of these is Miss Helen Maude Locke, of Arlington, who has just returned from a hunting trip which she made in company with her uncle, Mr. Edwin S. Farmer. They brought out other trophies, but of course the moose was most prized. The antlers contained 20 points and measured 52 inches from tip to tip. Miss Locke's first shot struck just back of the shoulder, the second in the forehead, killing instantly.

The shipments from Bangor this year in October were 1,564 deer, 92 moose; as against 1,675 deer, 78 moose for the same period in 1903. Many game birds have been secured which, for safe transportation, must be properly tagged and accompanied by the owner. By neglecting these precautions, some of the hunters have been forced to forfeit their birds.

CENTRAL.

Small Shot for Brush Shooting.

A RUFFED grouse jumped from under a stump close to my feet and he suddenly lost one wing, cut off as neatly as you please. "That was a bad shot," said Sam. "Why so?" asked I. "Because," said Sam, "if you had held straight and hit him fairly he would have been blown into smithereens."

The point of view is the thing with which to pin decisions relating to such a shot, and there may be many points of view aimed at my ideas concerning the use of small shot for brush shooting, but the subject is worth some notes anyway.

Did you ever notice that most of the ruffed grouse that are brought to bag at this time of the year have broken wings? That seems rather peculiar if one holds up a plucked grouse and observes what a comparatively small part of the sky-line is occupied by the vulnerable surface of a wing. And yet not many grouse are bagged with wings whole, although there may not be more than one or two shot in all of the rest of the body of a bird.

One day last week I shot a few partridges and woodcock, but there were several others that flew right along while I was playing a Japanese march for them, and if they did not stop flying before night, they went a long way if the speed rate was maintained. I felt, however, that birds which kept on had been in the center of the charge at several of the shots. Number 6 shot was used that day, and it was the first time that I had used such large shot in brush shooting for many years. Next day I went out in the afternoon with a supply of No. 7½ shot, but only got shots at five birds during the afternoon. Four of these came down with the first barrel—three partridges and one woodcock—and every one of the four came down with broken wings, but otherwise in what might be called good running order. My argument is this: If we use large shot there are fewer shot to the charge, and fewer wings are hit, and birds hit fatally in the body may fly out of sight before they drop. If we use small shot and hit more wings, more birds will drop where they can at least be retrieved by greyhounds, and the body shots are not nearly so likely to be fatal for the birds which escape. By using small shot we are more humane toward the birds, and at the same time we can be more generous toward our friends who are awaiting our return home with game for distribution.

The reasons for hitting more wings with small shot are probably two. One that is commonly recognized is be-

cause there are more shot to the charge; the other is an idea of my own, and as such may not be acceptable, but it is presented at face value.

During the flight of a partridge the wings presumably traverse at each stroke a space somewhat larger than the diameter of the body of the bird.

The whole charge of shot does not arrive at a given spot at the same instant, and there is an appreciable interval between the arrival of the shot at the head of the

RELATIVE SPACE BODY AND WINGS.
A—Body Space. B—Wing Space.

charge and of the trailers which bring up the rear. During this interval the wings of a bird may sweep one or more times through the area of the arriving shot, and if the wings in one stroke sweep a space which is equal in diameter to twice the diameter of the body of the bird, we have an explanation for the reason why so many wings are hit. A single shot in the wing will bring the bird down more promptly as a rule than several shot in the body.

It may not be in the interest of game protection to give away this wing tip, but birds in the brush are fairly safe against the younger generation of shooters, at least, for the latter are apt to practice on artificial flying targets, and that introduces a principle of protection. The sportsman who learns to hit artificial flying targets is shooting at something that is going slower and slower all of the time after it leaves the machine, and when he goes out into the brush he has to shoot at something that is going faster and faster all of the time with its own machine, and the shooter splits the difference and nothing else with his charge.

Then again the men who practice on artificial flying targets are apt to get into the habit of taking sight along the gun barrels, and when they are in the woods a lot of limbs get in the way. They do not take sight along the bat when striking at a ball, and unless they stop sighting and learn to bat the birds with the gun, we shall have plenty of game birds left for many years to come.

ROBERT T. MORRIS.

NEW YORK, Nov. 8.

Hints and Wrinkles.

Readers are invited to send for publication under this head hints and wrinkles drawn from practical experience, and pertaining to shooting, fishing, camping and outdoor life.

A Wallet for Toilet Articles in Camp.

NO MATTER how many bags and boxes the amateur camper out takes with him to the woods, he will find that some system of keeping everything in its proper place, and providing that proper place, is necessary if he expects to find a thing when he needs it. And few petty annoyances so exasperate one as a long and almost fruitless search for some article that is generally found at last in the very bottom of a duffle bag, underneath sundry articles of clothing and the like. The toothbrush, the hairbrush and comb, and articles that are needed every day have a way of getting lost or mixed with other articles, and in the end one naturally concludes that it is best to separate such things from the rest of the outfit and keep them together in some receptacle made for them.

As canoeists often go from camp to camp, and get into the habit of separating each group or articles in their outfits, a wrinkle often observed among their effects is worthy of mention here. This is a bit of canvas with pockets sewed on, which is hung in the tent while in use, and rolled up and tied with a string for stowing in some duffle-bag when camp is moved. An illustration of a simple contrivance of this sort is given here, for the reason that any person can make one in a few minutes if he is handy at sewing on a machine, or if not, some good-natured woman relative will help him out. Some of these wallets are made of a single piece of heavy duck, nicely bound with braid, and with six or more pockets sewed on one side, each pocket being also neatly bound. These are not difficult to make, but the simpler one illustrated will answer many requirements. It is less fancy, but thoroughly serviceable, nevertheless. To make one, then, take a piece of canvas or brown duck 18 by 24 inches or more in size and fold one end over the piece a little more than a third of the entire length. Then turn the edges down all round and sew two or three seams up the sides and across the top. These will leave the article with one large pocket, while the seams will answer to stiffen the edges instead of using braid. Down the front two more seams are then sewed, when the wallet assumes the form shown in the illustration, with three roomy pockets. A grommet is then put in each one of the upper corners, a bit of tape sewed on the back, and the thing is completed. On one of the walls of the tent two bits of cord should be sewed, and the wallet is then suspended inside the tent by this means, where it will be within reach at all times. Nothing handier for holding small articles can be found. When camp is broken, the wallet is taken down, rolled up and tied with the string, then stowed away until the tent is pitched in some other place.

Besides the brushes and comb, a shaving brush, razor, paper, and soap—if one carries these things to camp—can be kept in it, as well as a tiny mirror, spool of thread, buttons, needles, perhaps a screwdriver, and even fishing tackle or a target revolver and some cartridges can be kept in the wallet and away from the damp ground. Some tents are made with pockets in each corner, or several pockets on one side, but while these are handy, during a continuous rain they become damp, so the

separate pocket is better, and as it is taken out of the tent when camp is broken, the articles it contains are not so likely to be smashed as they will be if they are left in the other pockets while the tent is folded or rolled.

Again, it is the simple and inexpensive articles one makes that he often appreciates most, for in a great many respects the cost of an article does not add to its real value in the estimation of the owner.

A Serviceable Tin Box For Camp Use.

Here is a box that should be found in every outfit of canoeists and campers. It is an ordinary japanned tin bond box, costing thirty cents at a stationery shop, but in a year's use it will be found fully as serviceable as any other one article carried by the camper. The dimensions of one of these bond boxes are $4\frac{1}{2}$ by $4\frac{1}{2}$ by 10 inches. They are made of heavy tinned iron, stayed at the edges with wire, and are practically indestructible and waterproof unless entirely submerged. There is a wire handle, hasp and staple for a fastening at one end, and the box is heavily japanned outside. The illustration shows one that has been in use for five seasons, but is good for more.

One of these boxes is very handy in a camper's outfit, as it will hold a large number of small articles likely to

CAMP POCKET AND HANDY BOX.

be lost if not kept in something of this sort, and its advantages over a bag for small stuff are evident at a glance. As a box for fishing tackle alone, this variety is worthy of trial, while articles that are subject to rust if exposed to damp air are well protected if kept in it. This is especially true of revolvers or pistols, and small cartridges loaded with nitro powder deteriorate to some extent if exposed long to salt air.

Sling Straps for Rifles.

The sling strap is not so much appreciated in this country as it is in Europe. Here one sees a rifle carried by means of one of these handy straps now and then; while in European countries both guns and rifles are very generally carried on a sling strap while their owners are afield, but not actually engaged in hunting for game. It is true that modern rifles are lighter in weight than were those of even a few years ago, but it is equally true that even a comparatively light rifle seems to grow heavy during the fag end of a long tramp. If, therefore, the weight of the rifle may be shifted from the hand to the sling strap now and then, one will feel much fresher at the end of the tramp and be more comfortable all the time he is out, besides having his hands free while the shoulder bears the burden.

All of the manufacturers of rifles supply swivels and sling straps to order, and these are superbly made in all respects save one: the straps are too wide for lightweight rifles; an inch is sufficient width, whereas most of the standard straps are nearer one and a half inches.

But some persons object to this plan because of the studs that are set into the stock and fore-arm, or the barrel, and to which the swivels are attached. There is a way of getting around this feature, too, and it is very satisfactory. A simple strap can be made with a slip-loop at either end. One loop is slipped round the tang of the stock, and the other round the barrel, where the fore-end will hold it in place, and if this loop is made of rather thin leather, it need in no way interfere with a clear view of the front sight. I have often used a strap of this sort for carrying game in an emergency, and found it quite handy. One of the ends can be so arranged that the length of the strap may be changed at will.

PERRY D. FRAZER.

North Carolina Audubon Society.

GREENSBORO, N. C., Sept. 14.—*Editor Forest and Stream:* The first year's work of bird and game protection in North Carolina under the new State law has closed. The work of the Audubon Society, which is the State Game Commission, may be briefly summed up as follows:

One hundred and twenty-five thousand copies of printed information, such as linen posters containing digests of the game laws, copies of the laws in pamphlet form, etc., have been distributed among the people. Twenty-nine game wardens have been employed, and as a result of their activities twenty-two shipments of game, which were being forwarded to northern markets, have been seized in the express offices and express cars, their contents confiscated, sold at auction and wherever sufficient evidence existed the shippers have been prosecuted. "Fire lighting" of ducks and geese has been largely stopped in Currituck and Pamlico Sounds. Not until the past year has a serious effort been made to enforce the game laws, but during this time the wardens, under the directions of the Audubon Society and its friends, have secured sixty-one convictions for violations of the bird and game laws.

To further stimulate interest in bird and game matters the secretary has made thirty-two public addresses and lectures, many of these being accompanied with stereopticon views of portraits of the birds and photographs taken in the field.

The Society numbers at the present time over 800 members. Among these are many gentlemen from the North, who, while hunting in the State last winter, became interested in the work the Society was doing,

united with it, and have contributed to its success by their financial support and sympathy. Some joined as sustaining members, paying \$5 annually; some as life members, the initiation fee for which is \$10, with no additional fees or dues.

The secretary would be very glad to correspond with any one who is interested in the work of bird and game protection in North Carolina, and who may care to join the Audubon Society.

Copies of the law, or information regarding matters connected with the game interests in the State will be gladly furnished upon application.

T. GILBERT PEARSON, Secretary.

Old Jim Beckworth, His Book.

Editor Forest and Stream:

In the year 1881 I attended a council of River Crows, held at the old Stillwater Agency in Montana, the object of which was to cede the right of way to the Northern Pacific Railway extension west of the Missouri River; and there I met the three United States Commissioners from Washington, and also several prominent military officers from Fort Custer (including your whilom correspondent, Captain Geo. K. Sanderson, then senior captain of the post), and the head chiefs of all the ten Crow tribes, of whom I have photographs at this day. One of these chiefs was a dark negro named "Smoky" (from his color), who told me he was raised on a plantation in Missouri. His age I should judge was 35. His affiliation with these always friendly Indians was inspired by reading Jim Beckworth's book, of which he had a copy. This book had a rough wood-cut portrait of Jim, whose features had somewhat the cast of a mulatto's, which some persons allowed that he was. My own adventures among the Crows at that time would make almost as interesting reading as Jim's, if I could get any magazine to print them.

This brings me back to my caption, and to Jim Beckworth himself. He was born in Fredericksburg, Virginia, and migrated to Missouri with his father's family about the time of the Louisiana Purchase. All of his people were massacred by the Indians except himself, and he took refuge at the trading post of St. Louis, where he was occupied several years. At the approach of manhood he enlisted under General Atkinson (for whom the old Fort Atkinson of sixty years ago, at the Great Bend of the Arkansas River, was named) in pursuit of furs. He was afterward the hero of many exciting adventures along the Great Divide, which he recorded, or got some more competent person to record, in his book. It might have been Captain Jim Bridger himself who put his hand to the pen. He lived, it seems, for twenty years among the Mountain Crows, and became one of their principal chiefs. I dare say that it was his influence largely that kept the Indians steadfastly friendly. It used to be their boast that they had never killed a white man.

As Jim Beckworth was not restricted in the article of wives, he took unto himself almost as many as the Grand Turk or King Solomon. When he left the nation he left behind him a numerous progeny of half-breeds, one of whom became in his turn a chief of the tribe. This intermixture accounts for the pale complexions of so many of the Crows, as well as for their friendship. The stark faces of Beckworth's massacred family, murdered by the Indians, were kept as a tradition in the tribe; and so we may not know how many emigrants to the Far West were immune from attack through this one far-reaching incident. Verily the ways of Providence are inscrutable.

The information imparted by Jim Beckworth's book is of a quality to compare with that contained in Ruxton's "Life in the Far West," which came out some half a dozen years earlier, and is of great value to the annalist of to-day. To one who has enjoyed the opportunity of intercourse with the redskins during the '50s, while they were still in their breech-clout state, and who can vouch for what he has seen with his own eyes, it has every appearance of being entitled to credence. The recitals of his adventures in war and the chase are less exaggerated than the majority of our modern camp-fire stories. He was no doubt a keen observer, as all plainsmen and old-time mountain men were, and accordingly he gives very minute descriptions of the various tribes he "met up with." While he was not contemporary with the earlier "pathfinders," the information he gives constitutes a very valuable suffix to their recitals.

CHARLES HALLOCK.

Lost His Head Twice.

PLAINFIELD, Mass., Nov. 4.—That's queer, too! But the fact remains. A plump partridge has just thumped against the side of the cottage where I am now writing, with force enough to jar the building. That is a fact, too, for I felt it, and I thought it was a boy's baseball that had hit. The bird had obviously lost its head. For a few minutes it lay stunned upon the lawn until our French-Canadian man of all work came and picked it up. After a little it came to, and began to struggle. Then he bore it away to the wood house, where there is a chopping-block and an ax, and there he lost his head again!

CHARLES HALLOCK.

Long Island Dee.

THE two deer hunting days on Long Island last week—Wednesday and Friday—brought out the usual concourse of men and dogs, but the number of deer seemed not so large. The other days were Wednesday and Friday of this week.

A WESTERN paper devoted to dogs advertises a book on "the immortality of animals and the relation of man as guardian from a Biblical and philosophical hypothesis." By the side of this, in the next column, are advertisements of a book on training dogs for the pit. There seems to be wanting here a saving sense of humor.

All communications for FOREST AND STREAM must be directed to Forest and Stream Pub. Co., New York, to receive attention. We have no other office.

SEA AND RIVER FISHING

A Past Grand Master of Angling.

MANY of the men who have become expert with rod and reel, masters of woodcraft, skilled in the life and makeshifts of the camp, joying in the attractions of stream and forest, yet feel in their old age that their best angling joys were had when they did not know of finer tackle than the rude pole, cork "bobber," line tied to the hook without leader or snell, and when they used the grasshopper, angleworm or grub for a lure.

From such humble beginnings men like Hallock, Jordan, and Harris have become experts with the fly, writers about fish and fishing, makers of books, founders of sporting publications, and over their words we love to linger as we find them all too few. But that springtime of their boyhood was the best, as they were happy with the tamarack or cane pole while fishing for chubs or sunfish in the pond, or were after shiners and "punkin seeds" along the creek.

"Heaven lies about us in our infancy." What would not the old fisherman give to hark back to those child days! Would Hallock tell of his angling in Alaska, Quebec or Nova Scotia, where he captured trout and salmon with the Murphy bamboo rod and shining reel? Would he speak of the days and nights along the Nepigon, his cruises along the Florida coast, his delight in canoe and camp? Yes; but dearer yet must be the recollection of his days with the perch and sunfish more than a half century ago.

Such men, authorities upon the sport of fishing and camping, are entitled to the thanks of all true sportsmen. Think of that distant date when *FOREST AND STREAM* was founded, of its struggles, and the devoted work of its founder until it became and continues a well-spring of pleasure to so many thousands of readers each week. Such an accomplishment—practical, beneficent—places sportsmen under lasting obligations to those who have woven into the journalism of sport the best years of their lives.

There are also men who, of course, have fished in widely separated regions, who for many years had little thought of sharing their experiences with their fellow sportsmen by telling about them in print. Trout, ouananiche, sea trout, bass, grayling, grilse, salmon, the deer and caribou in Quebec forests, the joy of canoeing and angling along the Miramichi, Nepisiguit, St. John or Tobique rivers in New Brunswick; the smoke and flicker and flame of camp-fires, the stalking of deer and listening to the drumming of partridges and calls of quail—these were what they longed for "as the heart panteth after the water-brooks," and the all too short vacation meant life with them.

Some of these men are now old, unable to bear privation, undue exertion, the tent life and cramped posture of the canoe, wading the stream or carrying the gun. But they not only retain their love for those outing scenes, but it has all become more dear. "Absence makes the heart grow fonder." They have but to sit in the armchair or lie in their beds at home and close their eyes, and presto! before them swings that winding, forest-bordered river where they were so happy. The fishing of youth, the sport of manhood, the laborious and painfully-bought camping of older age, have been succeeded by the sporting joys of memory. Prisoners they may be, but, like Christopher North, their hearts are out in the forests, beside lakes and streams, joying in wind and storm. And as they grow ominously near to their farewell to earth, how their hearts must reach forward in longing and hope that on the Other Side some stream, camp, tent and canoe may be vouchsafed to them, and the renewal of childhood and its heaven "around about."

These men have reached a ripe age when their brother sportsmen best love to read what they may choose to write of their experiences. Often they have full strength of brain and faculty when confined even to their rooms with infirmities. And what a pleasure it is to read their contributions to the sporting publications! A very few retain all the strength and judgment of the days when they were editors, lawyers, merchants—men who were a part of, and joyed in, the world's work. Strong, virile, their bodies infirm, they yet ray forth opinions and experiences that are the result of even a three-fourth century's knowledge of sport. They are men whom all sportsmen, even those whose hair is already silvered with age, delight to honor.

Fond recollections cluster about them even in dreams, proving the worth of Rousseau's words, "Absence is to love what the wind is to the fire; it extinguishes the little, but increases the great."

Such a man, a past grand master of angling, and a prominent authority whom we all love to honor, lives at Sussex, New Brunswick, and is now eighty-four years old. Readers of *FOREST AND STREAM* do not need mention of his name to recognize this all too poorly drawn picture of him. May his few remaining years be bright and happy in that home up in the beautiful Kennebecasis Valley.

L. F. BROWN.

The Qualities of an Angler.

THE arms here shown, which we have called "the device of all true anglers," is the frontispiece of "The London Anglers' Book, or Waltonian Chronicle," published by John Baddeley in 1834, and, as the extended title page runs, "containing much original information to anglers generally, combined with numerous amusing songs and anecdotes of fish and fishing never before published." The editors of the *Bibliotheca Piscatoria* describe the little book as "coarse and Cockney," and the description is perhaps not undeserved; we give one of the yarns, of the "Setting Horse," a story which will be recognized as that one which in slightly different form Lincoln used to tell of the horse which squatted to point game when in the middle of a river, to the great chagrin and alarm of the rider. But whatever we shall say of the contents of the book—and it was a good sort of book for those who wanted a good book of that sort—we will all assent to Mr. Woodward's estimate of the frontispiece as a gem.

THE DEVICE OF ALL TRUE ANGLERS.
Being the frontispiece of "The London Anglers' Book." London, 1834. From the collection of Mr. Russell W. Woodward.

It is an ideal device. Mr. Woodward kindly sent us, as fitting to go with it, this exposition of the qualities of an angler, as set forth in John Denny's "Secrets of Angling," an extremely rare little book of verse printed in 1613, forty years before the "Compleat Angler." Here follow

The Qualities of an Angler.

Now, ere I farther goe, it shall behoue
To shew what gifts and qualities of minde
Belongs to him that doth this pastime loue;
And what the vertues are of euery kinde
Without the which it were in vaine to proue,
Or to expect the pleasure he should finde.
No more then he that hauing store of meate
Hath lost all lust and appetite to eate.

For what auails to Brooke or Lake to goe,
With handsome Rods and Hookes of diuers sort,
Well twisted Lines and many trinkets moe,
To finde the Fish within their watry fort,
If that the minde be not contended so,
But wants those gifts that should the rest support,
And make his pleasure to his thoughts agree,
With these therefore he must endued be.

The first is Faith, not wauering and vnstable,
But such as had that holy Patriarch old,
That to the highest was so acceptable
As his increase and of spring manifolde.
Exceeded far the starres innumerable,
So must he still a firme persuasion holde,
That where as waters, brookes, and lakes are found,
There store of Fish without all doubt abound.

For nature that hath made no emptie thing,
But all her workes doth well and nисely frame,
Hath fild each Brooke, each Riuer, Lake and Spring,
With creatures, apt to liue amidst the same;
Euen as the earth, the ayre, and seas doe bring
Forth Beasts, and Birds of sundry sort and name,
And giuen them shape ability and sence,
To liue and dwell therein without offence.

The second gift and qualitie is Hope,
The Anchor-holde of euery hard desire;
That hauing of the day so large a scope,
He shall in time to wished hap aspire,
And ere the Sunne hath let the heavenly cope
Obtaine the sport and game he doth desire,
And that the Fish though sometimes slow to bite,
Will recompense delay with more delight.

The third is Loue, and liking to the game,
And to his friend and neighbour dwelling by;
For greedy pleasure not to spoile the same,
Nor of his Fish some portion to deny
To any that are sicklie, weake, or lame,
But rather with his Line and angle try
In Pond or Brooke, to doe what in him lyes
To take such store for them as may suffice.

Then followeth Patience, that the furious flame
Of Choller cooles, and Passion puts to flight,
As doth a skilfull rider breake and tame
The Courser wilde, and teach him tread aright:
So patience doth the minde dispose and frame
To take mishaps in worth and count them light,
As losse of Fish, Line, Hooke, or Lead, or all,
Or other chance that often may befall.

The fift good guift is low Humilitie,
As when a Lyon coucheth for his pray,
So must he stoope or kneele vpon his knee,
To saue his line or put the weeds away,
Or lye along sometimes if neede there be
For any let or chance that happen may,
And not to scorne to take a little paine,
To serue his turne his pleasure to obtaine.

The sixt is painefull strength and courage good,
The greatest to incounter in the Brooke,
If that he happen in his angry mood,
To snatch your bayte, and heare away your Hooke:
With wary skill to rule him in the flood,
Vntil more quiet, tame, and milde he looke,
And all aduentures constantly to beare,
That may betide without mistrust or feare.

Next unto this is Liberalitie,
Feeding them oft with full and plenteous hand,
Of all the rest a needfull qualitie,
To draw them near the place where you wil stand,
Like to the ancient hospitalitie,
That sometime dwelt in Albions fertile land,
But now is sent away into exile,
Beyond the bounds of Isabellas Ile.

The eight is knowledge how to finde the way
To make them bite when they are dull and slow
And what doth let the same and breeds delay,
And euery like impediment to know,
That keeps them from their foode and wanted pray,
Within the streame, or standing waters low,
And with experience skilfully to proue
All other faults to mend or to remoue.

The ninth is placabilitie of minde,
Contented with a reasonable dish,
Yea though sometimes no sport at all he finde,
Or that the weather proue not to his wish.
The tenth is thanks to that god, of each kinde,
To net and bayt doth send both foule and Fish,
And still reserue inough in secret store,
To please the rich, and to relieue the poore.

Th' eleauenth good guift and hardest to indure,
Is fasting long from all superfluous fare,
Vnto the which he must himselfe inure.

By exercise and vse of dyet spare,
And with the liquor of the waters pure,
Acquaint himselfe if he cannot forbear,
And neuer on his greedy belly thinke,
From rising Sunne vntil a low he sincke.

The twelfth and last of all is memory,
Remembering well before he setteth out,
Each needful thing that he must occupy,
And not to stand of any want in doubt,
Or leaue something behinde forgetfully:
When he hath walkt the fields and brokes about,
It were a griefe backe to returne againe,
For things forgot that should his sport maintaine.

Here then you see what kinde of qualities,
An Angler should indued be with all,
Besides his skill and other properties,
To serue his turne, as to his lot doth fall:
But now what season for this exercise
The fittest is and which doth serue but small,
My Muse vouchsafe some little ayd to lend,
To bring this also to the wished end.

Fishing in Parauay.

THE people of Paraguay—or at least the people of Asuncion—are not fish eaters to any great extent. The River Paraguay at Asuncion teems with desirable food fishes of several species. The fishery is conducted by Italians. The daily product of the five or six seines averages thirty corubinis, which range in weight from 1 to 3 pounds, and sell at from \$1 to \$9 each, Paraguayan money, or one-ninth of that amount in American gold. A trawl fishery operated by about the same number of men catches as many more of other species, notably the pacu and dorado. The dorado is regarded as a game fish, taking a troll and also a fly. I imagine the best tackle

SEINE FISHING AT PARAGUAY.

for them would be the same as used for maskinongé or the large pike pickerel. Inquiry as to why the people did not eat more fish, elicited the reply that fish are too expensive, and besides, "nobody but Indians eat fish." Now, even in the capital city of Paraguay, the natives have much Indian blood in their veins. As there was ample room for the operation of long seines, I inquired why they were not employed to insure a much larger catch, and to this the reply came, "There is no demand for more fish." "But if they catch more," I said, "the price can

be reduced, putting the fish within the reach of the poor people." The answer came, "They do not care to reduce the price." This is illustrative of the fact that immigrants to a country of easy going habits and customs, quickly acquire the easy-going ways of their adopted country.

The introduction of artificial ice plants into tropical countries will revolutionize the food question, and it will not be long before the people of Asuncion will outgrow their sensitiveness about eating fish. The ice plants will make it possible to keep fresh fish. At present the fishing is conducted and the fish are marketed in the afternoon, to be consumed at the dinner or evening meal. The seine fishing is conducted from rowboats, two men to a boat. Each boat has a fishing ground on which a permanent anchor is denoted by a buoy. One end of the net rope is attached to the anchor and then one man pays out the seine while the other rows in a circle, returning to the anchorage as the last of the net strikes the water. The boat is then made fast to the anchor in the place of the seine, and the latter is hauled in. Very frequently a useless sort of fish gets into the seine and cuts his way through it, releasing the more desirable ones at the same time. The photograph was taken on a dark day in front of Asuncion while a scine was being hauled. I imagine the natives of Paraguay, in the country, eat fish when they have energy enough to catch them. Although fond of sports, few anglers, for the pleasure of it, are found among the natives of South America.

JOHN W. TITCOMB.

WASHINGTON, D. C.

A Trout Setter.

From "The London Anglers' Book," 1834.

A BUTCHER in the neighborhood of Uxbridge was in possession of a Dog who had lost, through his dare-devil exploits, an ear and an eye; his tail was also curtailed, although he was no cur, as his courage would prove, and his other faculties were in perfect order. The Dog was the Butcher's inseparable companion, and accompanied him wherever he went. Their dispositions were similar, and they often wandered about the neighborhood early in the morning, the Butcher riding a favorite Welsh Pony, more prized for his size than his beauty. The Pony was, if possible, more attached to the Dog than the Dog to the Master.

The Butcher had observed that his Dog was, by natural inclination, fond of sporting, and encouraged him to a certain extent, for at one season of the year the hares are to be found early at the same spots, and although disturbed, will return to lay at the exact place the next morning. The Dog had found the resting places of all the hares in the neighborhood, and would make a dead set at them, till he received the word to put them up, which being done, he would then proceed to find another. In this manner the Butcher, the Dog, and the Pony nearly every morning amused themselves, till at last the Pony knew where to find the hares as well as the Dog. One morning the Dog was absent with one of the Butcher's men of business to fetch some sheep home, the Master and Pony went by themselves the usual round, and the Butcher was surprised to find he was conveyed to the same spots, nor would his companion leave till he had dislodged the game, after which the nag regularly proceeded to find another hare. Thus he discovered a quality in the Pony he was not aware of, and purposely confined Snap the next morning, to put the Pony's abilities to a further test, when he found he acted exactly as before.

An annual coursing match took place about this season, and the Doctor, the Parson, the Lawyer, the Butcher, and several other gentlemen met at an inn to arrange where it should take place. The conversation turning upon the capabilities of the dogs to be engaged in the sport, the Butcher offered to lay a wager of a rump and dozen that

his Pony would find more hares than any Dog they could bring. The Company thought at first he was in jest, but when they saw his earnest manner, and found his cash on the table to support his bet, they soon cried "Done!" and the wager was laid.

The Parson was a keen sportsman, and had really some good Dogs, but they were, to be sure, a little out of practice, he having been laid up with the gout. The Lawyer had been promised the use of a Dog belonging to a notorious poacher whom he had got through a scrape; and the Doctor had borrowed a none-such from one of his patients; at all events, the Butcher and his Welshman would stand no chance.

The day and place of meeting being appointed, the Butcher, on his Pony, was the first on the spot (having gone through a rehearsal the previous night); he was soon joined by the Lawyer, Doctor, Parson, and sundry lookers-on. It was soon proved that the Dogs stood no chance with the Pony, who regularly walked up to the hares, to the surprise and admiration of the field. It immediately occurred to the Parson that if he could possess the Pony he would be able to ride to his sport without the trouble of hunting with dogs, and offered to buy him of the Butcher, and although the price set upon him was at first an obstacle, he ultimately purchased him at the price asked.

The coursing match had thinned the hares in the Pony's circuit very considerably, and the Parson and Pony were busy among the remainder till they were all exterminated. Day after day the Parson and the Pony went out, but returned empty, the Pony not having the benefit of his old friend Snap's instruction; till his master began to repent his bargain, and to accuse the Butcher of having taken him in. He had occasion to go some distance, and on his way obliged to cross a ford. The Pony having reached the middle, made a sudden step, which sent the Parson head and heels over the Pony's ears into the stream, and with very great difficulty he escaped drowning, but assistance being at hand, he was helped out. The next time he met the Butcher he complained of his bargain, and, indeed, called it a little short of swindling. This gave rise to such high words that both Doctor and Lawyer were likely to have a job. The Butcher contended that, as the season was over, the Parson had no right to expect the Pony would act unsportsmanlike. "That's not what I complain of," said the Parson. "I complain that he is a complete gib. I narrowly escaped drowning by his pitching me over his head into the stream when crossing the ford." "Oh," exclaimed the Butcher, "I had forgot to tell you he is equally famous for finding trout as hares, and no doubt he stood at one of them." "Say no more," says the Parson. "If that's the case, I am satisfied. Trout fishing is quite as agreeable to me as coursing."

The Kennel.

Points and Flushes.

THE Western Massachusetts Fox Club has issued the notice of their seventeenth annual meeting, to be held on November 16 and 17, at Westfield, Mass. The notice in part reads as follows: "The hunters' horn will sound at 5 o'clock on Wednesday morning for breakfast. At 6 o'clock carriages will be ready at the Park Square Hotel to carry the hunters to the grounds. The Annual Club Dinner will be served to members and guests at 6:30 o'clock on the evening of the first day's hunt. Kindly notify G. E. Austin by November 6 if you can attend. This is imperative, in order that proper arrangements may be made for the banquet. We hope to be favored with your presence."

EDWARD G. CLARK, Secretary.

YACHTING

Salt Water in Marine Gasolene Engine Cylinders.

BY A. E. POTTER.

A LITTLE salt water in a gas engine cylinder will do a considerable amount of harm in a very short while, particularly if the cylinder is hot at the time. Leaky gaskets are usually the cause, resulting in turn from imperfect surfaces or insufficient width of cylinder walls. Cracked or spongy cylinders or slight holes between the water-jacket and ports or water in the crank case frequently cause trouble. It is usually the custom now to discharge part or all the jacket water into the engine exhaust, and unless great care is observed in installation, water will sooner or later trouble you. In two-cycle installation, unless the top of the cylinder is lower than the surface of the water outside, no very great care need be observed, except that the water ought to enter in the direction of the exhaust gases. The exhaust should always be above the water line. In four-cycle engines it is frequently the custom to have the exhaust either at, just above, or just below the waterline, thereby not only reducing the power of the engine materially, but rendering the liability of getting water into the cylinders very great sooner or later. Add to this the fact that frequently the top of the cylinder is below the waterline, and there is nothing to prevent water from running through the pump into the water-jacket, then into the exhaust pipe, filling it, and, should an exhaust valve be off its seat, filling the cylinder.

Frequently, even where the top of the cylinder is above the waterline, water will be found in the cylinder, and the novice in particular will be puzzled to explain its

presence. A solution of this sometimes seeming phenomenon is that when the engine was stopped there was a considerable amount of water in the muffler and exhaust pipe, which, seeking the lowest point, became "trapped." Should the exhaust valve be off its seat, these hot exhaust gases, condensing, form a partial vacuum in the cylinder and this water is drawn into the valve chest and frequently into the cylinder itself. In the two-cycle engine this is not nearly so liable to happen, owing to the fact that when the exhaust port is open the inlet port is usually open also, and new gas takes the place of the condensing hot gases.

I know of one case in particular where a three-cylinder two-cycle engine of 24 or 27 horsepower was condemned for no other reason than that the water from the sea cock would continually fill the after cylinder. After this defect was remedied, it did good service in another boat, and, for all I know, is in use to-day.

Another case in point is where two four-cylinder four-cycle engines were condemned and taken out of a yacht and others installed in their place at an expense of several thousand dollars for no other reason whatever than that water could not be kept out of the cylinders, while the exhaust was some two feet below the surface of the water outside, and no means of relieving the vacuum.

I certainly advocate the use of water in the exhaust; but if the top of the cylinder is below the waterline outside, the water discharge must extend to a point considerably above the waterline, with a free outlet, while above that point the connection to the exhaust should be made. In addition there should be a drain cock always in the lowest part of the exhaust piping between the engine and where the water enters, which should be kept

open in starting and always when engine is shut down.

Salt water in a hot gasolene engine cylinder has a tendency to corrode the walls of the cylinder almost as soon as it touches them. The side where the thrust from the piston comes, where of course there is a thinner film of oil, is attacked more quickly, thus increasing the tendency of loss of compression due to wearing the cylinder unevenly. The rings are very likely to become rusted into the slots and become useless for the purpose designed.

In case water should be found in the cylinder, the first thing would be to wipe it out carefully and use kerosene freely, turning over the engine several times by hand. Then, having proceeded to prevent a recurrence of the trouble, shut the engine up and run two cups of kerosene and cylinder oil in equal parts through the engine. The cylinder oil, being heavier, will run through first, followed by the kerosene. If the engine is allowed to stand over night, incalculable harm may be done.

There is one caution I should like to impress on owners of gasolene engines, and that is when attempting to start your engine it seems to be "set," or the pistons slightly stuck in the cylinders. This almost invariably indicates the presence of water, perhaps in but small quantities, but sufficient to cause you trouble sooner or later. Its source should be sought and the trouble remedied at once. If it is in the gasket, a new one should be put on at once. Don't make the mistake that is frequently made, and attempt to use rubber sheet packing, as many do; but get a packing that is especially made by one or two prominent manufacturers, a combination of asbestos and brass wire gauze, and the slightly increased expense will be repaid you many times. One caution in using this,

however: be sure and tighten the head by screwing down the nuts or cap screws just as soon as the engine has run a few minutes. Should your inlet or exhaust valves at any time show the appearance of rust, look for water leaks, for this condition always is positive proof of coming trouble.

A Week on the Cuban Coast.

WE HAD intended starting on this trip some months before, but had been delayed by many causes, chiefly by the non-arrival of our power dory, which had been contracted for a July 1 delivery, but which, owing to the failure of the boat-builder and his dishonest attempt to swindle us, only arrived at the end of September.

On Thursday, Oct. 8, we finally left the town of Guantanamo, situated some fourteen miles north of the bay of the same name, by rail, to join our squadron, which was waiting for us at Caimanera, a small village at the terminal of the Guantanamo railroad, over which all the sugars made in this district, some 40,000 tons last year, are shipped.

The squadron consisted of the flagship, a 25ft. sloop, Soledad (described in FOREST AND STREAM, Dec. 21, 1901), the aforesaid power dory fitted with a 1½ horsepower kerosene engine, made by the International Power Vehicle Co., of Stamford, Conn., and a 13ft. tender.

The party consisted of the Madame and myself, the captain; George, the colored cook and factotum; Modesto, a Spanish sailor, who composed the crews of the three ships, and Esperanza, a colored carpenter off one of the sugar estates, whom we took along to put up camp and to keep us provided with fresh meat with his gun. We took along two wall tents and two shade tents, for down there the sun is somewhat too much in evidence most of the time. All the ice, food and drinks was packed away, the tender put on deck, and with the dory at the end of the tow-rope, we raised the mainsail and started at exactly 3 P. M., almost no wind. After a few minutes, wind dies out and dory brought alongside; Captain jumps in and starts getting the engine ready. Now the dory is ahead and the sloop at the other end of tow-rope, being pulled along at about 2½ miles. At this point we look like a cup racer being towed to the line. In this fashion we cover the few miles to Fisherman's Point, near the entrance to the bay, now famous for the fighting there during the war, when the marines beat off the Spaniards after repeated attacks. Here now are a few houses belonging to the pilots, and a cable station. We anchored here to wait for the land breeze that almost always blows at night, to continue our outside trip. We whiled away the time by preparing and eating dinner. In due time, soon after dark, our breeze arrived, but on trying to raise the anchor we found we had caught the cable. However, after some loss of time, we cleared it and got under way, this time towing the dory. Wind, fresh from the N. for the 3-mile run to the light-house at the entrance to the harbor, which we quickly made, then flattened sheets for a close-hauled sail up the coast, to the once famous "Puerto Escondida," which was the home port of all the pirates and buccaneers in the days of the Spanish Main. This bay is an ideal spot for camping, and is well named "Hidden Bay." The entrance is very narrow and full of reefs (see photograph), and high hills hide the masts and sails of any ship once inside, and one can easily imagine the old-time men-of-war passing and repassing along the coast looking for the pirates and not seeing any trace of them! There are no inhabitants at all on this part of the coast which is quite wild, and, of course, there are no charts, nor buoys, nor lights anywhere between Guantanamo and Maisi, and one has to know the channels to get into any shelter.

We were making good time in spite of a lump of a sea which kept pounding us continually and soon made all hands, barring Captain and crew, most uncomfortable, some one remarking that the ocean was no place to cruise on anyhow! By 3 A. M. we were opposite the entrance, and as it was a very dark night, we decided to lower sails and start the engine in the dory for a tow in, for any attempt to beat in against a head wind in the narrow channel on a dark night would probably land you on a reef, of which there are many along the channel. We had selected a small beach of clean sand that runs out into the bay about a mile inside the point for our camp, and toward this the dory was steered, once clear of the reefs. This beach slopes off rapidly into deep water, allowing the sloop with her spoon bow to run right on to the beach and to tie up to land while still in deep water, and enables one to walk ashore from the bows without even a plank, as may be seen from the photograph.

Our tents were soon up and everything snug by 4 A. M., and all hands turned in for a short sleep. Soon after daybreak came hot coffee, and then Esperanza was started inland with his gun after meat, and the Captain took the dory to go for fish for breakfast. A few minutes trolling at half speed at the entrance to the bay provided a couple of Spanish mackerel, one about 20 pounds and the other 16 pounds. These are caught here with a light hand line with a piece of mullet for bait, and they put up a good fight, and plenty of skill is necessary to bring them in. A novice will not only lose the fish, but also the line, and will have his hands badly cut. By 8 o'clock the Captain was back, quite satisfied with his day's work. Soon after a yell was heard inland, and Esperanza appeared, staggering under the load of a fat cottontail deer, which he had killed half a mile back of the camp. Esperanza and his deer were photographed in the shelter tent; then the deer was cleaned and cut up, and what could not be eaten fresh was salted down for future use. Fresh meat will hardly keep twenty hours in this climate, so the natives cut it into strips, put some salt on it, and hang it out for a couple of days in the sun to dry—then it will keep a couple of months. Later, bathing suits were donned, and a swim along the beach indulged in; but one has to keep very close to land, for these waters are full of sharks and other fish, that will take a bite out of one if they get a chance. Nothing much was done for the rest of the day, and as soon as it was dark, at low tide, we went for lobsters. This is how they catch them here. You take a torch, and

THE SQUADRON TIED UP TO THE BEACH.

FRESH MEAT.

ENTRANCE TO PUERTO ESCONDIDO.

TWENTY-FOOT LAUNCH COMET—DESIGNED BY NORMAN L. SKENE FOR E. M. GILMAN AND BUILT BY T. L. WHITE.

either wade around the rocks in two or three feet of water, or go in a small rowboat, holding the torch near the water, until you see the lobster (they come out to feed on dark nights and can easily be seen with a torch). As soon as you see one you jump into the water and grab it, keeping an eye open that nothing grabs you in the meanwhile. The lobster is thrown into a bag over your shoulder, or into the bottom of the boat, and you continue. This way we caught four weighing about 9 pounds each. Only the Captain retired and allowed the crew to do the grabbing. Once upon a time the Captain believed in civilized methods for fishing, but gave them up after they had cost him many dollars in nets, baskets, pots, etc., that the sharks, saw-fish, sword-fish, etc., smash almost as fast as you lower them overboard.

All hands then turned in to sleep the sleep of the just with "the starlight on our faces" to quote from a much-discussed poem.

With a little shooting, plenty of fishing, some sailing and much power-boating, one happy lazy week went by, and with great regret we struck camp to return. For three days previously it had been blowing hard from the E., and quite a heavy sea was running outside. Early in the morning the Captain and crew took the dory for a long run outside to see how the engine would behave in really rough water. It was a pleasure climbing up big seas and then sliding down on the other side without getting a drop of water on board; the engine ran merrily, just as well as in smooth water.

About midday, seeing that the wind was, if anything, freshening, we decided to wait no longer, so tying three reefs in our mainsail and without setting a jib, we headed for the entrance, towing the dory. We were just able, by pinching her, to clear the rocks on the

leeward point, though the sea running in the narrow channel made it nasty work, and before we got clear she put her nose under up to the mast, much to the horror of the Madame, who thought we were going down sure. Once clear, however, we were able to ease her off and, running before the sea, it was not so bad. We tore down the coast, making record time; but as the wind still kept on freshening we had to drop the peak, until we made the lighthouse at the entrance to Guantanamo Bay, where we gybed around and came into smooth water for our 9-mile beat up to the dock at Caimanera. The dory towed well, but we had to double the tow-rope so as not to get in without her. I am sure this small boat never before went so fast and perhaps never will again.

It did not take us long to make our anchorage, thus ending a most enjoyable week, and we were hardly on shore before we were making plans for another trip, of which perhaps more anon.

E. A. B.

NEW CRUISING LAUNCH.—Mr. Henry J. Gielow has recently closed a contract with the Electric Launch Works, of Bayonne, N. J., for a 70ft. cruising launch. She is 74ft. 5in. over all, 70ft. 2in. waterline, 12ft. breadth, and 4ft. 10in. draft. The construction is of wood throughout, and of a very substantial character.

NEW AUXILIARY YAWL.—Messrs. Macconell & Cook have designed for Mr. H. A. La Chicotte, of New York city, an auxiliary yawl 46ft. over all, 32ft. waterline, 12ft. breadth, and 7ft. draft. She will have liberal accommodations, and will be fitted with an 18 horsepower Standard engine.

Twenty Foot Launch Comet.

THE design of the launch Comet is from the board of Mr. Norman L. Skene, of Boston, and her plans are published in this issue. The boat was built by T. L. White, of Manchester, Mass., for Mr. E. M. Gilman, of Boston, Mass.

The plans show the boat to good advantage, and a very fair idea may be had of her appearance and construction. She was built in a very thorough and substantial manner, and mahogany was used almost entirely in her finish. Comet was built solely for a comfortable boat and as such is a success.

The engine, which is a 3 horse-power Murray & Tregurtha motor, was entirely nickel-plated, as were all of the metal fittings used on the boat.

The dimensions are as follows:

Length—	
Over all	22ft. 8in.
Waterline	20ft.
Overhang—	
Forward	1ft. 4in.
Aft	1ft. 4in.
Breadth—	
Extreme	5ft. 10in.
L.W.L.	5ft.
Draft—	
Extreme	2ft.
To rabbet	10 3/4 in.
Freeboard—	
Forward	2ft. 8in.
Least	1ft. 9in.
Area midship section	3.06 sq. ft.
Displacement	2,200 lbs.

"Forest and Stream" Designing Competition No. IV.

Sixty-foot Waterline Cruising Power Boat.

\$225 in Prizes.

THE three designing competitions previously given by FOREST AND STREAM have been for sailing yachts. In this competition, the fourth, we are to change our subject and give the power boat men an opportunity. The competition is open to amateurs and professionals, except that the designers who received prizes in any of the three previous contests may not compete in this one.

The following prizes will be given:

First prize, \$100.

Second prize, \$60.

Third prize, \$40.

Fourth prize, \$25, offered by Mr. Charles W. Lee for the best cabin arrangement.

Mr. Henry J. Gielow, N.A., has very kindly agreed to act as judge. In addition to making the awards, Mr. Gielow will criticise each of the designs submitted; and the criticisms will be published in these columns.

The designs will be for a cruising launch propelled by either gasoline or kerosene motors, conforming to the following conditions:

I. Not over 60ft. waterline.

II. Not over 4ft. draft.

III. A signalling mast only to be shown.

IV. Cabin houses, if used at all, to be kept as low and narrow as possible.

V. Construction to be of wood, and to be strong, simple, and inexpensive. The cost of the boat complete in every detail must not exceed \$9,000.

VI. The location of tanks and engine or engines to be carefully shown. Either single or twin-screws may be adopted. The power and type of the motor must be specified.

VII. The boat must have a fuel capacity sufficient to give a cruising radius of 700 miles at a rate of 8 miles an hour. The maximum speed shall not be more than 14 miles nor less than 10 miles. The estimated maximum speed must be specified.

VIII. All weights must be carefully figured, and the results of the calculations recorded. A thousand-word description of the boat and a skeleton specification must accompany each design.

The design must be modern in every particular, without containing any extreme or abnormal features. We wish to produce an able, safe, and comfortable cruising boat, one that will have ample accommodations, so that the owner and his wife and two guests, or three or four men, can live aboard, and one that can easily be managed at all times by two or three paid hands in addition to the steward. The draft is restricted to 4ft. in order that the boat may have access to nearly all harbors, canals and rivers North and South, and may thereby widely increase the cruising field. We have in mind a boat that can be used North in the summer and South in the winter, and a craft well able to withstand outside passage along the coast in all seasons of the year.

Special attention must be given to the cabin arrangement. The interiors should be original, but devoid of any impractical features. Arrangements should be made for a direct passage forward and aft without going on deck.

Drawings Required.

I. Sheer plan. Scale, $\frac{1}{2}$ in.=1ft.

II. Half breadth plan. Scale, $\frac{1}{2}$ in.=1ft.

III. Body plan. Scale, $\frac{1}{2}$ in.=1ft.

IV. Cabin plan and inboard profile and at least one cross-section. Scale, $\frac{1}{2}$ in.=1ft.

V. Outboard profile. Scale, $\frac{1}{2}$ in.=1ft.

The drawings should be carefully made and lettered; all drawings should be preferably on tracing cloth or white paper, in black ink. No colored inks or pigments should be used.

The drawings must bear a *nom de plume* only, and no indication must be given of the identity of the designer. In a sealed envelope, however, the designer must inclose his name and address, together with his *nom de plume*.

All designs must be received at the office of the Forest and Stream Publishing Company, 346 Broadway, New York, not later than February 3, 1905. All drawings will be returned. Return postage should accompany each.

The FOREST AND STREAM reserves the right to publish any or all the designs.

MEETING OF THE Y. R. A. of L. I. S.—Mr. T. H. McDonald, of the Bridgeport Y. C., presided at a meeting of the Y. R. A., of Long Island Sound, held at the Hotel Astor, Longacre Square, New York, on Monday evening, October 27. Sixteen clubs were represented by the twenty-two delegates present. After the reading of various reports, a committee was appointed to confer with other clubs concerning a universal measurement rule. The following nominating committee was appointed to nominate officers for 1905: Ward Dickson, chairman; H. H. Gordon, F. C. Sullivan, C. F. Kirby and Fred. A. Hill.

All communications intended for FOREST AND STREAM should always be addressed to the Forest and Stream Publishing Co., New York, and not to any individual connected with the paper.

Gas Engines and Launches.

(Continued from page 372.)

BY F. K. GRAIN.

Propellers.

THE propeller wheels used on gas engines are, as a rule, smaller in diameter than employed in steam practice, the reason for this being that the gas engine is usually run at a higher speed, and where no reversing gear is used, the engine is, of course, obliged to start against the full load of the wheel. Of late the manufacturers have been using wheels of larger diameter and less pitch, the effect of this being to increase the efficiency of the wheel, making the engine easier to start, decreasing the number of revolutions somewhat, but adding to the speed of the boat and materially reducing the consumption of gasoline. In order to avoid the use of reversing gears inside the boat, the reversing propeller wheel is used to a large extent. These wheels, although of many different patterns, are mechanically all on the same principle, the blades being turned by the movement of a sleeve surrounding the propeller shaft, which revolves with the shaft, as of course there are no gears to intermesh or any necessity for slowing down as with the inside reversing mechanism. These wheels will reverse at full speed, and as the wheel always travels in the same direction, it takes hold instantly of the water and will not race as in the case of a solid wheel reversed, as the action of the water is all in the same direction.

The reversing propeller wheel is necessarily somewhat weak structurally, it being impossible for mechanical reasons to design them as a perfectly true screw; they therefore lack the efficiency of the solid propeller wheel.

Although this deficiency would hardly be noticeable excepting to the expert, the word "pitch," relating to propeller wheels, is not universally understood, as the same word is employed in designing the angle of the propeller shaft or incline of an engine. As applied to the propeller wheel, it refers to it in the same sense as to the pitch of a screw, the propeller wheel being in action a perfect screw. Therefore, the pitch of the propeller wheel designates the number of feet that the wheel would travel in one revolution, supposing it to be a screw; therefore if we have a propeller wheel 20 inches in diameter and 30 inches pitch, it denotes that it will travel 30 inches each revolution. It is by this means that calculations are made on the speed of the vessel. From this, however, in calculating speed we have to deduct for skin resistance and the slip of the propeller, etc. In small power boats any estimates based on these calculations will as a rule prove anything but reliable, as proportion of beam to length is in all cases excessive in comparison with larger vessels. Of course, as we decrease the pitch of the propeller wheel, we have a slower screw, consequently more powerful, and for this reason it is becoming the practice of high speed boats to use a wheel at the least possible pitch, and in order to gain on the travel of the screw to increase the revolutions.

While this proves very efficient and gives the extra power to drive the boat at increased speed, it also materially increases the consumption of gasoline and the wear on the engine and batteries, and this practice is therefore hardly to be recommended for every-day use. The form and general design of the propeller wheel has so often been extensively experimented with, that the subject is worn threadbare, and is sufficient to say that the true screw propeller wheel will, in all probabilities, remain as at first the standard of excellence. We have not the exact figures before us, but we believe that the true screw wheel is capable of developing 96 per cent. of efficiency, therefore it will be readily seen that all that can be possibly hoped for by improved and freak propellers will be 6-100 per cent., which will readily be admitted to be hardly worth bothering with.

Launches.

Every owner of a launch is admittedly a self-confessed crank on the subject of his particular boat and his ideas on the subject. The whys and wherefores of the design of small launches admit, however, of very limited variation, and modern practice confines us to but few forms. Up to the past few years it was the custom to make the lines of the hull considerably hollowing in the bow, also cutting away under the stern, and in most cases the greatest beam of the under-water body was placed as in small sail boats, aft of midship; in other words, until the sail boat had been almost entirely superseded by the power boat, the inclination among the builders, especially those who built from rules of thumb, was to make the power boat of about the same form as the sail boat, but of less beam.

With the power boat the greatest beam of the under body should be forward of amidship, and all lines should be full, showing no hollows; in other words, the sail boat is designed with a view of doing its best work while beating to the windward, lying on its side, whereas the power boat is to travel on an even keel. Until quite recently the launch with the overhanging or fantail stern was the popular boat, unquestionably a very handsome form of a boat. This fantail, however, added weight to the boat, made the lines of the stern abrupt in their curves, and where properly designed, the fantail of course not touching the water, it was simply so much useless wood carried around and a handicap to the speed of the boat. In the modern boat we find the form of the deck plan to be almost a wedge, the stern being the widest part, thence tapering gradually to the bow.

We will then have a boat without any hollow lines, with its greater draft near the bow, the keel tapering up to the stern, which is cut off square and wide. In this case the boat will draw no water under the stern, the effect being that the boat will, owing to its wedge shape in the forebody, displace the required amount of water with the least possible effort, the water then passing the stern, flows under the boat with the result that the buoyancy of the afterbody is increased. It is admitted that the nearer we can keep a boat to the top

of the water the faster it will go, owing, of course, to the reduced resistance, and in the above form of boat we obtain these results. This model of boat, while very seaworthy, if built to extremes in length of reduction of beam, will, however, prove to be a very wet craft, which necessarily is the case with any form of high speed boat. In the construction of a launch it is hard to combine speed, seaworthiness and carrying capacity and meet with success, therefore determine for what use you wish your boat and the locality in which it is going to be used, keeping those points in mind in buying, otherwise you are liable to meet with disappointment.

It is said that there is very little new under the sun, and this can more truthfully be said in reference to the construction of launches in general, as there has been very little variation in the method of building wooden vessels since Mr. Noah built the Ark.

In order to get, or rather to make the effort to obtain a boat at reduced prices, a number of buyers are influenced to allow some house carpenter, who has built a boat probably when he was a boy, build their boat. This invariably leads to disappointment, either in model or workmanship, or date of delivery, and the first thing to do when you have made up your mind to own a launch is to go to a reputable builder, who builds boats and nothing else, or to a firm who will turn out the complete launch which you may test before final settlement.

[TO BE CONTINUED.]

Queries on Marine Motors.

R. R. H., Wareham, Mass.—If R. R. H. will send his name in full, we will take pleasure in answering his question in full. We do not answer any anonymous questions.

H. L. W., Philadelphia, Pa.—I have read with interest Mr. F. K. Grain's articles on "Gas Engines and Launches" that have appeared in your columns from time to time, and I have found them helpful and instructive. During September I bought a new launch fitted with a 6 H.P. two-cycle engine, and then my troubles began. The engine runs satisfactorily for three or four days, or a week, and then, without warning, and apparently without rhyme or reason, absolutely refuses to start. After working over the engine for a long time it starts just as suddenly as it stopped. Will you kindly suggest some remedy, and also tell me how to prevent recurrence?

Ans.—From observation and from the numerous inquiries received at this office, we assume this to be a very common trouble. For that reason this question is answered very fully.

In getting ready to start your engine, first see that the rocker arm is free, not gummed or "stuck" in the sleeve, and see that the lever is not loose on the shaft. A drop or two of kerosene will usually suffice to loosen a "stuck" shaft, or it may be necessary to remove it and brighten it with a piece of emery cloth. If the lever is loose on the shaft, drive the taper pin lightly or tighten the set screw. Close the switch, and with a wooden-handled screwdriver touch the insulated and uninsulated part of the plug at the same time. If no spark shows at either point on breaking, turn the engine one quarter of a revolution and see whether or not you get one. If you do, it shows that the current "breaks" and arcs properly, providing the points are dry and clean. If you can get no spark, open and close the switch several times. If a slight spark appears at the switch as you break the contact, it shows that the current is "grounded" somewhere, and this must be sought for. Disconnect the wire from the insulated electrode, close the switch, and snap the wire sharply across the binding post of the electrode and then on some part of the engine. If the two electrodes are in contact, you will get a spark at both places. If not in contact, you ought to get no spark at the electrode. If you do, here is your ground, and either a new plug should be used or the mica insulation should be replaced with new.

It is frequently the case that you get no spark at all, or a very light one. In this case, search diligently for loose wire connections at the battery, switch, spark coil, ground wire at the engine, also at the insulated electrode; if still weak or no spark, open the switch and connect one end of a wire to the spark coil binding-post farthest from the battery, and with the other end touch the opposite pole of the battery, giving a short circuit through the battery and spark coil. If you get no spark, try each cell separately and find if you have a "dead" cell, which should be thrown out. A small battery volt-meter is handy, but a cheap electric buzzer or bell will be found very convenient for this purpose. Attach two short wires and hold one to the positive and one to the negative of each cell. Any difference in the strength or voltage will show itself in the noise of the bell or buzzer. You should always carry a set of about five cells of good dry battery, wired together by means of flexible terminals, easily procurable at almost any supply house, and almost indispensable, binding the cells together with a good stout cord. Leave one zinc and one carbon unconnected, of course. These should always be kept in a dry place, for when your spark fails you as above, is when you will need a new set in all probability.

Now, in case your engine is of the jump spark type, instead of proceeding as above, you would turn the engine over until the contact is made at the "timer," "commutator," or whatever the device may be called. Then close the switch. If the vibrator does not begin to sing, press lightly on it with the finger. If it does not vibrate when closing the switch, but you can notice a tremble at your finger end, it will be necessary to adjust it; but before doing so, be sure that all battery and wire connections in the primary wiring are tight. The large cable that runs from the coil to the spark plug and from the opposite binding post to the other on the coil is known as the secondary wiring. Having satisfied yourself that the vibrator works as it ought, you can be reasonably sure that the spark is all right, although to be "cock-sure," open the switch, remove the plug carefully—more so if porcelain insulated than mica—lay it on the engine so that the metal body of the plug only shall be in contact, then, the contact being on at the "timer," open and close the switch several times. If a good fat spark appears, well and good; but if a crooked, lean, slow spark, the points are too far apart. In this case always open the switch and with a screwdriver or something close the aperture slightly; one thirty-second part of an inch will usually be sufficient; the point of a penknife is

a good gauge. If a spark shows up inside the plug, it means defective or broken insulation. If of porcelain, replace it or substitute another plug. If of mica, tighten the insulation by slightly tightening the nut. This latter trick I have used on several occasions, rendering defective plugs good as new. I know of one in constant use for two seasons which had been condemned as no good, with nothing the matter with it except that the shellac used as a binder for the mica had burned out, leaving it spongy and loose.

There is one condition which ought to be considered in the line of jump spark ignition troubles. Suppose the vibrator works satisfactorily, and after trying several plugs you can get no spark. This would show a short circuit in the secondary wiring. It may be that the wire is wet, runs too close to the piping or engine, or maybe it is not sufficiently insulated. The remedy for this would be to incase the cable or heavy wire in ordinary rubber tubing, and if desired results are not then obtained the only recourse is to put in a new secondary cable between spark plug and coil. As a matter of precaution before this step, disconnect the two wires from the secondary terminals on the coil, and connect two short wires thereto so that the ends shall be about one quarter of an inch apart. Then close the switch. If the coil is in proper shape, the spark will jump across the intervening space whenever the primary current is closed. If a coil is used with no vibrator, similar to the usual coil used on motor cycles, there will be seen two sparks, one on closing and one on opening the primary current.

In the jump spark ignition, remember that the voltage is from 20,000 to 30,000, and don't touch or get near any part of the plug, secondary wiring or coil binding-posts when the switch is closed, for you are liable to get a very unpleasant shock which you will be likely to remember.

Having satisfied yourself that the sparking mechanism is in proper shape, next see that you have sufficient gasoline. If you are using a generator valve, be sure that the needle valve is at the proper position; rock the fly-wheel back and forth three or four times, and if the ignition is set very early, as it should be for easy starting, bring the starting pin up unusually high in the opposite direction and let go. The engine ought to start, the compression at first starting the piston down and the fly-wheel in the right direction, the circuit breaks, causing a spark which ignites the charge of gas pumped into the cylinder, which in turn explodes and carries the piston by the next upper center, unless the ignition is set so early that the force of the next explosion is felt before the center is past and the engine stops and reverses, running several times part of a revolution in either direction.

Now turn the engine over carefully by hand and note the position of the piston when igniter snaps. If the contact points are bright and there is no water in the cylinder, you can be quite sure that the ignition is all right.

Having dealt with the ignition, we will give our attention to the explosive mixture. In this connection we will have to treat of several subjects, the vaporizer or generator valve, float feed or constant level carburetor, the check valve engine, and the newer type of so-called "ported" engine.

The generator valve regulates more or less accurately the gasoline feed, and at the same time acts as a check valve against the explosive mixture which is compressed lightly in the crank case of the usual two-cycle, or as we shall call it here, the check valve engine. The usual trouble with beginners starts right here with the generator valve. If the engine does not start after one or two attempts, and gasoline shows at the generator valve, the chances are that the engine is "flooded," that is, the mixture is so rich in gasoline that it will not ignite. The remedy now is to close the gasoline valve and turn the engine over a dozen times or more with the relief valve open until an explosion occurs. Then close the relief cocks and start the engine. If it begins to slow down, open the gasoline valve and regulate the flow until the proper mixture is obtained. Sometimes a drop of water or a little dirt will effectually close up the needle valve or a little dirt may get on the seat and by preventing the valve poppet from seating will allow too much gasoline to enter, thus rendering the mixture either too poor in gasoline, which renders the engine liable to explode in the crank case, or too rich, when the engine will smoke, miss explosions and eventually stop. To the practiced man, the condition will be readily apparent, but to the novice he had better stop the engine and take the vaporizer apart, and try to find the trouble. Remember that the usual trouble, when the spark is in proper shape, is too much gasoline. There is one condition that will not usually occur except in cold weather, and that is by the cold formed from the rapid evaporation of gasoline freezing the moisture in the air until a thin coating of ice prevents proper seating of the valve and the gasoline supply will be interfered with.

With float feed carburetors there is very rarely any trouble experienced, but they cannot be attached to the ordinary check valve engine unless a swing or other light acting check valve is employed.

In the so-called "ported" engine, in which the gas inlet is opened and closed by the piston, the generator valve gives so much resistance that the carburetor is almost a necessity, if any power is to be got out of the engine. In starting a two-cycle ported engine with a float feed carburetor, it is usually necessary to put a few drops of gasoline into the cylinder through the priming cup or relief cock, then prime the carburetor by depressing the float, and the engine ought to start if the spark is in good shape on the first or second revolution with the relief cock opened.

It is usually understood that given an ordinary gasoline engine with perfect mixture and proper spark, it ought and will run. Now, there is one condition which will thoroughly upset these calculations, and that is water in the cylinder, either through the gasket between the head and cylinder, the exhaust or cracked cylinder. If its presence is ever suspected, lose no time in getting rid of it. An almost infallible indication of slight leak is when, on attempting to start, the piston seems, or really is, "stuck" in the cylinder. Water will saturate the insulation of the firing-pin or insulated electrode and kill the spark. If any moisture exudes from the insulation on starting or attempting to start, investigate at once. Don't let salt water remain in your cylinder one minute longer than necessary.

British Letter.

A GOOD deal of unnecessary mischief is being made by the irresponsible manner in which some of the papers comment on the alteration to Rule 6, governing the races for the British international cup for motor boats. The rules have recently been amended by the International Commission, and many improvements made, notably in lengthening the course to between thirty and thirty-five miles. It has also been decided in future that the start is to be flying, and that all competitors shall be started together by signal five minutes after the preparatory signal (Rule 6). Mr. Basil Joy, the secretary of the A. C. G. B. I., is stated to have said that, in consequence of this alteration to Rule 6, "there will be no possibility of a similar contretemps occurring as that which robbed Napier Minor of her victory at Ryde this year." Remarks of this kind, which have been freely indorsed by many of our papers, are not calculated to promote good feeling between British and foreign clubs, and are altogether uncalled for. It has been abundantly proved that Napier Minor was knocked out at Ryde the moment she was beaten by Napier II. Nobody knew this better than Mr. Edge, and nobody was more fully aware that Napier Minor was not qualified to run than he was. The fact that Napier II. was of too flimsy construction to stand the smooth water of the Solent, was unfortunate, but to expect that, as a result of her breakdown, he should be allowed to run his already defeated Napier Minor was simply to expect one set of rules for himself and another for his opponents, which is obviously not the highest form of sport. There can be no doubt whatever that Napier Minor was run against Trèfle à Quatre in direct opposition to the rules governing the races. This being so, she was not a winner, although she came in first, and to talk about her as having been robbed of her victory is simply to talk sheer nonsense. It has also transpired that Mr. Edge did not obtain official sanction to run Napier Minor instead of Napier II., as he would have us believe, but that when he approached two of the race officials, Major Lindsay Lloyd and Mr. Dinsmore, on the subject, they said they thought he would be entitled to do so; but they were particularly careful to tell him that the opinion they offered was entirely unofficial, and Mr. Edge said he quite understood this. This puts Mr. Edge clean out of court; and, in spite of his many attempts to keep himself before the public eye, by writing to the papers, as is invariably the case with him whenever things do not go exactly as he wishes, he has but few sympathizers among the better class of people who follow the so-called motor boat racing.

It is a pity that the International Commission did not see fit to bring in a rule to the effect that no competitor shall be allowed to run more than one boat in future, for so long as any one individual is able to enter more than one boat, the representatives of firms engaged in the trade of building motor boats and engines will always have the pull over private owners, and motor boat racing, at any rate as far as high speed launches are concerned, will remain what it now is—merely a trade advertisement—owing to the enormous outlay required to procure even a small launch.

The Council of the Yacht Racing Association had a meeting on Oct. 14 at the Royal London Y. C. to consider and adjudicate upon some protests which had been referred to them from time to time during the past season. None of the cases presented any great complications, but one which was referred by the Torbay Sailing Club, arising out of a foul at the start, shows how little competitors and sailing committee alike know about the much-vexed question of the luffing rule, even when there are no complications. The wind was in such a direction that the boats would have it on their starboard quarters when they cut the line at right angles. While maneuvering for the start between the guns, one boat, A, saw that she was going to be too soon, hauled her wind and sailed along the line. Another boat, B, which was sailing free and could have borne away under A's stern, did not do so, but luffed and put herself in the position of overtaking boat. A promptly luffed B, as she had a perfect right to do, under Rule 29, and she forced B outside the starting line. After this there was a foul, presumably owing to B bearing away and forcing A over the wrong side of the line. B was palpably in the wrong, but she protested against A, which won second prize, and A was disqualified by the sailing committee. A appealed to the Yacht Racing Association, with the result that her appeal was upheld. This is really quite a simple phase of the luffing rule; but it only shows how easy it is to misinterpret it and how necessary it is to have a competent court of appeal.

E. H. KELLY.

MEASUREMENT RULE CONFERENCE.—A conference of delegates from the New York, Eastern, Atlantic, Larchmont, Beverly, Boston, Seawanhaka and Marblehead Corinthian Y. C.'s and the Y. R. A., was held at the New York Y. C. on Thursday, October 27, for the purpose of discussing, and if possible recommending, to the clubs in interest a uniform measurement rule.

The importance of this conference cannot be overestimated, and as the clubs and associations represented control practically all the racing in New York and eastern waters, it is to be devoutly hoped that the consummation of the object of the conference may not be prevented by reason of the personal predilections of either individuals or clubs. While there is but little probability that all racing yachtsmen will accept any one measurement rule as perfect, it is indisputable that uniformity on the Atlantic Coast with any good rule as a basis is vastly to be preferred to present conditions.

It is a fact that by reason of unsatisfactory measurement conditions, a number of men heretofore prominent in racing have deserted to the automobile and so-called automobile boats, and their building boats and returning to yachting is dependent upon the adjustment of this important question.

It is probable that several meetings will be required to fully discuss and decide upon all details, but it is expected that whatever rule may be recommended will be presented to the various clubs within the next few weeks.

Co-Education on a Yawl.

BY SARAH HITCHCOCK, BUFFALO, N. Y.

OUR party consisted of four, captain, mate, skipper and an A. B. Of course, our captain and mate were old yachtsmen, but the skipper and A.B. were new yachswomen and not quite thoroughly seasoned. Two summers' experience doesn't make a real sailor of a woman, and the wonder is that the men expect it.

Our boat is able, easy to steer under all conditions, and will point as high as the average sloop—"an able, handsome lady," if the opinion of her crew is to be relied upon—yawled-rigged, built by Weir, of Hamilton, 36ft. over all, 25ft. waterline, 10ft. breadth, 5ft. draft, with 3,400 pounds of iron on her standing keel and 1,000 pounds of inside ballast. Her least freeboard is 26in.; bilges hard, and, to quote the mate, is as stiff as a church. We carried a bright cedar dinghy, which we found towed well in all kinds of weather. Her cabin, with 5ft. 10in. head room, is commodious and comfortable. Two transoms, 3ft. wide, make luxurious seats by day and capacious beds at night by having three iron strips reaching from one transom to the other across the passage way, on which are laid two boards 10in. wide and the full length of the bed, leaving stepping room between. The cushions being turned about and the space at the end filled in by a third cushion (which formed a back in the day time), made two berths, almost the full width of a bed. A burlap curtain stretched from the companion to the galley doorway and completed the sleeping-car aspect of our cabin.

We left Buffalo in the early dawn, and with a very light spinnaker breeze made Port Colbourne, Ontario, before noon. There are no ports along the American or south shore of Lake Erie, short of Dunkirk, so Buffalo yachtsmen always set sail for Canadian ports. There is an inhospitable shore, too, and keel boats must give reefs and land a wide berth.

Is one ever ready to start on a cruise? We had spent plenty of time over plans and discussions, and were ready to pride ourselves on our start. But not for long, for at Port Colbourne we were obliged to mend the spinnaker, set up the bobstay and get ice and fruit. While these things were being done by the men, the ladies prepared lunch. The galley does not boast of full head room, but has all the other comforts. There are two trusty Primus stoves, an ice box, a large galvanized water tank and the prettiest of blue dishes. It was just the time to christen our new copper frying pan, for we were to have chops.

"Everybody ready? If you are, I'll put on the chops," called out the skipper, popping her head above the companion way. She put the pan on to let it get "real hot," and it did. She had the lining well melted before she had found the chops. The captain looked sad.

"They told me that wouldn't need relining for three years."

"That meant on land. Three days on a yacht," retorted the skipper.

A little cool air settled the tin, and we tried it again, with success. We had a small folding table to put up between the seats and a white oilcloth table cover that is most fitting on a cruise. When under way, we used paper napkins, and sometimes wooden plates.

Port Colbourne is at the entrance of the Welland Canal, and affords good shelter. Recently finished breakwaters give a fine berth, where one is not disturbed by passing vessels or by any wind that blows.

After dish-washing for the ladies and a short smoke for the men, we got away for Port Maitland, twenty miles further west. Our progress was slow, and we soon found ourselves becalmed in the big bay between Sugar Loaf Point and Mohawk Island Light, with every indication of a long calm. Fortune favored us toward late afternoon, and a lively northeaster blew up, bringing a pouring rain; but this was not minded, as we bowled along with the wind on the quarter, through the inside passage to Maitland.

Twilight was deepening into darkness as we dropped our hook in Grand River. This picturesque spot is a favorite with Buffalo yachtsmen, and we found other boats there, come to spend the Fourth of July. The friendly landlady of the port let us dry out at her kitchen fire, where other yachtsmen had already gathered.

The next day, the Fourth of July, dawned clear and cloudless. We breakfasted on fruit, shredded wheat biscuit, bread and butter and coffee. A saucer of berries was passed to each one. "You must eat those first and then put the biscuits in the same dishes. I'm not going to do superfluous washing this hot day," said the A. B.

Butter packed in a crock proved a satisfactory way of carrying it; except in the country we had no trouble in getting cream. After a light breakfast we did without hot dishwater. The lake water at summer temperature answers admirably if some good soap is used.

We got under way about 9, starting with jib and driver, and setting the mainsail as we passed the light-house.

"What's the course?" asked the mate as he hoisted the ensign.

"S.S.W. ½ W., and the wind is out of the N.E."

"Then let's get out that spinnaker again, mate."

"Aye-aye, captain." And it was set to stay all day for a run of fifty-eight miles.

We bowled along with a cheerful ripple under the bow, making eight miles an hour steadily. Hour tricks at the tiller all round make easy work. The day was perfect summer, sky clear and blue and the breeze warm—a hot day on shore we learned afterward.

We passed out of sight of land before long, munching our sardine sandwiches in the middle of the lake, where the water looked deep and cool, and where the whitecaps shone more brilliantly, tumbling and tossing in their frolics. The tap, tap of the ice-pick was almost the only sound heard during the afternoon. The mate had turned steward and brewed tempting collins, which he presented at intervals. The captain drowsed over a book and complained of indigestion by turns. Only a helmsman was needed on deck throughout the day. Presently we began to catch hazy glimpses of the Chautauqua hills on the south shore, and got the

glasses out to pick up the Erie lighthouses. Our course must have been carelessly taken, for we made land fully ten miles too far east. It was worth while, for the water is deep close to shore, and one can sail along near enough to see the people at their doors and hear a friendly dog bark. The bluffs make a pleasant relief from the low Canadian shore line, and the absence of reefs from Dunkirk to Sandusky is a comfort to yachtsmen.

Entering Presque Isle Bay through the channel at the eastern end, we hailed a passing yacht, and were told to take Scorpion's moorings off the yacht club. It was a friendly reception indeed, for we found the Fourth of July celebration about to begin on the edge of the water. The bank that rises sharply beyond was crowded with people in gay colors, giving a sort of patchwork effect.

We took in the spinnaker, jib and driver as we entered the harbor, and had them furled and stowed as we rounded up to our mooring under the mainsail alone. The tomato salad had been prepared on the way.

"Let's eat in the cockpit."

"Is it soup to-night?"

"I'm for that."

"I'm for big dishes."

There was much to see. Boats of every description gathered about us in the gloaming, making merry with songs and laughter, while the moon rose majestically over the hill to lend her aid to the pretty shore scene.

"No dish-washing to-night," said the skipper, finding her glass of iced tea.

It was smoke and rest, for our hearts were filled with a contentment that only such a day's sail can bring.

That affinity which one sailor has for another brought some Erie Y. C. men alongside after the fireworks were over, to bid us welcome. Every attention was shown us while we lay at Erie.

"After all, what religion knits people so closely together as a common sport?" as Stevenson says in his "Inland Voyage." "For will any one dare to tell me that business is more entertaining than fooling among boats?"

When we were at anchor we made ourselves very comfortable. A large wind sail, equipped with flaps, kept out by means of a stick fitting into grommets, was hauled up through the forward hatch by means of the spinnaker or jib halliards. It stood about six feet high and had a diameter equal to the hatch. This carried a current of air through the cabin, keeping it cool when the deck was unbearable. An awning was spread above the cockpit over the boom and guyed at the four corners to the jigger shrouds aft and the backstays forward. When long in port, a rug was spread in the cockpit, and a table with a green cover held books, needlework and a pitcher of ice water.

A day and a half in Erie was well spent, but the mate likes to be on the move.

"Put the gaskets on him," suggested our captain, and with a meager smile the mate subsided.

It was just as well, for there was the usual south-wester blowing. Our mooring was exposed, and the short waves made it rather tiresome by evening, so we dined ashore, clad in our best.

Luck was with us, and we believed in it when a light N.E. breeze came up next morning. We worked our way out of the bay, but ran into a calm off Presque Isle Light. Nothing to do but send our mate in for a swim. It never failed to bring a breeze.

"Going in, mate?"

"Too hot."

"Oh, do! We don't want to sit here all day."

But the mate was obdurate.

There were pound nets near by, so we investigated them. They are set anywhere apparently, and abound along the American shore from Erie on, constituting a serious menace to those who cruise by night. (Yachtsmen will encourage the movement started last fall for their abolition as being an obstruction to traffic on the waterways.)

The sun blazed down on us. The barometer rested high and steady. With the evening we hoped for an "offlander," an assured thing, the Erie men told us, especially during such hot weather. Presently a light air came off the lake, and we mogged along slowly but steadily, thinking to make Conneaut, our next stop. The twilight fell, and with it the light lake breeze. Then we were treated to a novel experience, for the trusty breeze from off the heated shore crept out, flopping the sails over, and we lost not a moment's headway.

Conneaut, with its smoke and noise, came into view about 8 o'clock. We decided to pass it by and perhaps put in to Ashtabula. Why should we leave such a glorious moon? If the ladies would turn in, the men agreed to stand two-hour tricks from 11 o'clock until morning. 'Twas the captain's trick and about 2 o'clock. Below all was quiet. Who could stay awake when the silence of the night was upon him, unless he had compass and moon to keep him company? We were nearing Ashtabula, another smoky commercial port, where boats load with coal and iron ore. The "offlander" was blowing the smoke out over the lake and obscuring the light. A freighter was outside calling for the fog-horn. Three short blasts, then an answering blast from the lighthouse. A voice out of the night startled us all.

"What's that?"

"Where?" shouted the mate, leaping on deck.

"That black thing to port."

"To starboard, you mean."

"No, to port. Looks like a breakwater; but there is none here. Look up the Coast Pilot and see what there is at Ashtabula."

"Nothing but piers and lighthouses," said the skipper, book in hand, poking her head out of the companion-way; so we were no wiser and must needs steer between these black objects, holding our breath for fear there were more ahead or more underneath.

We afterward found that they are new cribs not yet charted.

Past the smoke, the moon again lighted our course, and we moved lazily along until morning. At day-break the A. B. came on deck for her trick. Chart and log gave us Fairport, distant about 10 miles. Drifting

along, we waited for the 10 o'clock breeze our captain believed in. It came out of the N.E.

"Spinnaker again, mate." And we needed it to keep her from yawing, as the breeze quickly freshened to fifteen and at times twenty miles per hour.

Express packages were waiting for us at Fairport, but we passed on, under the smart breeze, and by Cleveland, heading for Rocky River, the port of the Lakewood Y. C., seven miles beyond. It is only a small river and a hard port for a stranger to make, for one must keep well to the west of the dilapidated old piers and in midchannel between them and the bluff.

"Take off your mainsail and go in slowly," called a passing boat. We stored our spinnaker and furled the mainsail, and went in under jib and driver, dropping the driver when we were well inside. A deep-draft boat must know this little harbor or be well guided, not to run aground on a sandbar. The river is deep to the banks and full of yachts, all made fast to tall piles stem and stern and close to shore. They looked like a long procession, two abreast, coming down the river. They drop sails and pole to their places in line, and present a novel sight to those, like ourselves, who make moorings in wind and current.

We were offered a pile close to shore, and found a pier of one plank ready to use. Wind and weather were of no moment in this snug berth.

The men took pillows and blankets and slept in the club house, for it was a warm harbor. A mosquito or two worried the skipper, so she used the new mosquito netting, the joy and pride of the captain. The companion was opened wide and three thin sticks fitted closely into it, with netting stretched tightly over them, so that we were completely screened. We spent three days in this lovely spot. (Boats were moored along shore, with their spars in the branches. Most of them are sloops, and not a few of fine design, with most enthusiastic owners, who gave us a hearty welcome and made our stay a delightful one to remember.) One evening we rowed up the river to find a laundry. The company purse suffered a collapse when we had paid for it, but \$5 all around the next day put it into commission again, and the row up and down the river was worth a good deal. While we were drifting back in the moonlight, the gaskets on the mate parted; clamoring on board, we consequently got ready for a start. The moon was hazy, and there had been every prediction of thunder showers all day; but about 11 o'clock we cast off our lines and were poled out of the river by a member of the club. Every yacht there is furnished with these long pike poles. Hoisting our mainsail again under way, we set our course W.N.W. to clear Avon Point, eight miles beyond, before directing our course to Vermilion. There was a light offlander blowing. One has to keep well out from Avon Point, from one to five miles, according to the man you talk to and the depth of his keel. Keels count more than charts when you talk to a man of the locality.

About midnight a red light appeared on our starboard bow.

"What's that rhyme about 'red to red,' etc.?" asked the A. B.

"Green to green or red to red, perfect safety, go ahead," responded the skipper, proud of her winter's work at boxing compass and learning road rules.

"Better have a look at her," concluded our captain, and we found her to be an old wind-jammer with all her light canvas set and a beautiful sight in the misty moonlight slowly approaching us.

Changing our course to pass alongside and then astern of her, we hailed her helmsman and asked how far it was to Lorain.

"Ten miles," he answered. If he had only reminded us not to look for the light with an offlander blowing we would have been more thankful.

We were not at all sure of our shore now, for we had evidently gone further out than we should and the moon was obscured by cloud. Whether we were half a mile from shore, or five, was a mystery. We had lost our bearings. Chart, Coast Pilot and compass were not working together. Each one was going its own gait, while our eyes played tricks on us at every turn, and we were steering toward land one minute and out into the lake the next.

It was growing darker and darker in the northwest. Lightning flashes broke the blackness more frequently.

"Better take in the log, and double reef the mainsail. All hands on deck!" The A. B. took the tiller, the skipper stowed everything loose, while the men shortened sail. Reefing a yawl is an easy matter. The short boom, all inboard, made quick work of it, and the sail was soon re-set. Jib and jigger halliards were cleared and coiled ready to run. Darker and darker it grew, and nearer came the thunder and lightning. It was 2 o'clock in the morning. No light anywhere except the hand lanterns we used to work about the deck.

"There she comes," yelled the mate.

"Down with the driver and jib!"

They were down, but not tied when the squall was upon us. A gleaming mass of white struck our bows and broke over us, and the captain on the bowsprit passing a gasket around the jib, went to his waist in the angry sea that lay beyond and into which the yacht plunged, snorting and pitching. The double-reefed mainsail alone was enough to lay her rail well under and to send her along at a fast clip. She was headed into the wind to avoid a lee shore. The racket in the rigging, the shriek of the wind and noise of rain and spray made even loud orders inaudible, except from a windward position. There was no time for coats, and even the captain's sou'wester didn't protect his glasses, for the spray, blowing off the top of the waves, flew aft in a line with the boat.

Frequent trips forward were necessary, as the side lights kept going out. These trips were only possible on hands and knees. The slatting and pitching put out the flame as fast as lighted, and the A. B., now below, having been relieved at the tiller by the mate, was kept busy lighting lanterns, which were passed up to the captain, who crawled back and forth with them. The spray constantly showering his glasses, made it impossible for him to take the stick.

Below, all was confusion. Time had not been taken

to stow things snugly. Port holes of course were closed. Bathing suits, stoves, books and plates played about the floors. The eggs preserved their dignity. They alone failed to join in the mad frolic, but sat composedly in an open basket on top of the ice box. Their mission in the world was evidently not finished.

Speeding on at a furious rate in the pitch darkness, a sudden flash of lightning revealed the fact that we were among pound nets. In another moment the yacht took a lurch, and a huge stake appeared along her lee rail, inside the boom and the mainsheet. In a trice it was straining against the latter and prevented putting the yacht into the wind. It was a breathless moment for the mate, as the pole bent and bent, and it was a question as to which would go, the mainsheet or the stake. The sheet held and finally cleared, but that pesky stake was bound to give us more trouble, and held up the dinghy when she came along. However, that smart little lady executed a side step and trotted along after her mother.

In connection with our lights going out, a large freighter to starboard had given us uneasiness. Where was she now? She might have been ten yards ahead and we not be able to see her because of the blinding rain which fell in sheets. And where was the Lorain light? Had we passed that?

Presently, under the beating of the rain, the sea began to go down a bit, and the wind dropped somewhat. At dawn we saw the light, two miles away. Time of day? No time, only daylight, and we could see where we were. The wind went out nearly flat. We hurriedly spliced the main sheet and set all sail, but soon found ourselves flopping helplessly. Everything pulled and banged and clattered about that could make a noise. The blocks on the jib traveler, as well as on the main traveler, made harsh music as they scraped back and forth. The sea was still high.

It had all been too much for our skipper, for she had had a cucumber for supper, and she needed sympathy in the cabin. The captain held the tiller. He had had a hard night and felt the need of sleep, but grasping the stick with a will, he sat comfortably enveloped in a steamer rug, and in sleep as well. Coming on deck with some chocolate as morning refreshment the A. B. couldn't help a smile as she relieved him of his task. A light air out of the south soon sprang up, and she put about and headed for Lorain.

Coming abreast of the opening, all hands were called. It wouldn't do to take them in asleep. Breakfast and a few hours' rest sufficed for Lorain, and the yawl with the men on board, was towed out. All sail was hoisted and the course set for Vermillion. We were left behind at the hotel, asleep, but were en route by electric car by afternoon. Skirting the shore of the lake, we could see the yawl lazily making her way in and out among the pound nets.

We found Vermillion a delightful little town. A small river makes a snug harbor for some fishing tugs, but the piers are rapidly falling into decay. Our first duty was to buy provisions for Sunday, but we had to see if the yacht was making any headway, so we walked out to the lighthouse. We were tired, and we were sleepy, and the A. B. is an easy sleeper, so she went to sleep on a ledge at the foot of the lighthouse, while the skipper went back to get some lunch.

Had the A. B. moved in her sleep she would have had to swim for her life, unless some of the spectators on the opposite pier came to her rescue.

At night the wind died out, but later came the offlander. We got our provisions and ice in a rowboat and waited for the yawl. We had picked out a snug berth beside a pier, so when her red and green came into view the skipper got out at the pier, while the A. B. rowed out to pilot them in.

Squalls and N.W. winds kept us in Vermillion for four days. We were cruising for pleasure. The gaskets loosened often on our mate, but we managed to keep him amused pretty well.

What to have for dinner was of more moment now, with no sailing to occupy us. Chicken and creamed potatoes one night; fish that the captain was meaning to fry, but boiled in butter and water instead, for another night, and berries, berries all the time, with potato salad as a relish.

The mate poked the barometer religiously. It was low, hugging 29, and absolutely refused to rise.

"Kill sailing as a sport, those barometers," growled he. "Wouldn't have one in my boat. Keep you in when it's fun outside."

The village blacksmith spent one day fixing the gooseneck for the spinnaker, a piece of work that lasted fully a week. Other yachts put in to avoid the storms, so the townspeople turned out to inspect. Most of them "supposed we thought we were having a good time, but we couldn't make them believe it."

One quiet afternoon we were sitting in the cockpit sewing, and a little old lady dressed in the garb of long ago, came by on the pier. Our awning was just low enough to hide us, but she dipped fore and aft to get a glimpse and say a cheery word or two. Finally pulling up the awning, she gazed a moment and asked, "Don't ye git sick like, a-teetering like that all the time? I would."

At an early hour one morning, one of the storm-bound yachts hailed us as she passed on her way out bound for Sandusky, and said there was a fine offlander blowing. So there was, and we were soon under way bound for Put-In-Bay.

We ladies were to sleep a few hours more. With the wind on the quarter, we made a fine start, and held it for a hour, when the wind shifted to S.W. and headed us, freshening all the time. Beds were no longer beds, but inclined planes. The spinnaker boom, which we carried aloft, was banging against the mast. The captain went aloft on the hoops to lash it to the jumper stay.

We had laid our course to pass south of Kelly's Island, but the wind headed us, so that when we made land we found we could only fetch north of Kelly's Island. Picking up land on our port bow, we could make out Sandusky. Then Pelee Island came into view on our starboard bow. It was a gray, misty morning, sky and water were all alike. There is a passage

just north of Kelly's Island and one directly south of Middle Island.

Everybody had a different idea of the course, because what is every one's work is no one's work.

It had been an unwritten duty of the A. B.'s to lay off the course carefully, while the others did or did not as they pleased. They usually pleased, but this morning they had not, so when we found ourselves fetching north of Kelly's Island, a spirited controversy arose.

"What's that red can buoy for?" asked the captain.

"It marks a reef northeast of Kelly's Island," answered the A. B. from below, "and you must keep south of it, too."

"Nonsense, it's good water anywhere here; that means for big vessels."

"Oh, very well; rocks showing don't matter, I suppose. The Coast Pilot says keep south of it, or else north of the black gas buoy that is near Middle Island."

"We can't fetch that on this tack."

"Well, come about then."

"Oh, you're crazy down there."

"Look yourself, then," and the chart and Coast Pilot appeared on deck impelled by the wrathful arm of the A. B.

"Mutiny and insubordination!" yelled the mate, dancing a hornpipe and chewing some chocolate. "Irons and the lazarette for the A. B." And he circled about the deck to the whistled tune of a Sousa march.

We tacked.

Put-in-Bay is well named, for it is as snug an anchorage as ever was found. Gibraltar Island lies north of it and South Bass Island south, where there is a resort called Put-in-Bay. In Rocky River a gentleman had given us a rough sketch of the bay, with a chicken coop on Gibraltar Island for the central point. We were to drop anchor right abreast of it, and we did, not more than fifteen yards from shore.

A yawl from Sandusky was lying near, and her occupants regarded our burgee with some curiosity. It was not strange, as we do not often see east end burgees at western end ports nor the reverse either.

We were at the extreme point of our cruise. Coming up the lake with a spinnaker had been of much more interest than letters, but here we found a two weeks' budget, the first since leaving home.

As there was to be a regatta here the next week, it behooved us to brighten up a little and have things shipshape, for boats began to arrive next day.

Sitting under our awning late in the afternoon, passing a lazy hour or two before dinner, we saw a schooner coming around Gibraltar Island. Her decks swarmed with a uniformed crew. In big arm-chairs on deck sat a company of portly gentlemen, attended by cabin boys. With mainsail flattened in she came into the wind and slowly lost her way. Down went her anchor, at a mute signal from her captain. Down went her headsail and foresail at the same time. It was Priscilla, of Cleveland. She was built twenty years ago to compete with Puritan as a possible America Cup defender, and is as beautiful and staunch as ever. "Queen of the unsalted seas," most assuredly, and we felt repaid for a long trip just to see her come to anchor.

Soon after a very large yawl came around the island and dropped anchor alongside Priscilla. She was from Sandusky, and was followed by a large sloop from Toledo. All the yacht etiquette was observed, and we all joined in.

The three boats were returning from a week's cruise about the upper end of the lake, and had organized an Interlake Cruising Club. They expect to be joined by several more boats next year.

That night toward 10 o'clock it began to blow from the S.E., and blow hard. We put out the spare anchor and turned in. Sleep was all very well for an hour or two, and then it came on to blow a gale of fifty miles, and rained hard. Every puff sent a quiver through the yacht from stem to stern, as she pulled at her hawsers. "That awning must come down," and the captain rose accordingly, with the mate following. Some things are funny, even in strenuous moments, for it is funny to hear two bare-footed, wet and thinly clad men try to get an awning down in a gale of wind. We could positively hear their teeth rattle as the icy rain got to the quick. We were anxious lest some of the larger boats ahead of us should drag anchor and swing on to us. We were but a little way from shore, but the water is deep to the very edge. As we sat up and looked out the port holes our relative positions seemed to have changed for a minute, until we placed the points of the compass or swung back to the original position. Toward morning the wind took off a little and we slept again at daybreak we found several new comers at anchor with hard runs to report and bedraggled crews and boats. At different times during the day they continued to come around the island into the bay, with small boats gone, spars and sails carried away, and one with an extemporized jury rig—eloquent testimony of the night.

Many of the smart boats, at anchor or near us during our stay, "were drawing too much water," as they put it, so visiting around from yacht to yacht was the order of the day, and the boats were visibly lightened, while the crews were as visibly weighted, and empty bottles bobbed and nodded sociably as they floated about.

Squally weather continued for several days, and incoming boats brought tales of hard trips and bad weather.

With us time had begun to be a thing of moment, for our runs were to be long, as we were to return by the north shore. We should be moving on, and we held daily consultations on the advisability of going, with every prospect of a very hard day's run; but our faith in luck had not diminished, and we were enjoying life very well.

After five days at anchor, we awoke one morning early to find a light spinnaker breeze blowing. A long day, but an easy one, for it was a sixty-five mile run to Port Rondeau, and no harbor anywhere en route.

With all hands on deck at 4 o'clock we hoisted sail and left Put-in-Bay. Setting the spinnaker just outside the bay, we laid our course due east to pass south of Ballast and Middle islands. Our log was put out, and

when four miles east of Middle Island, we headed for Southeast Shoal Lightship, with a course of N.E. $\frac{1}{4}$ E. It was a beautiful morning—a day to take it easy and enjoy the water, sky and air to the utmost.

Bowling along at a merry gait until late in the morning, we passed the lightship, leaving it a mile to port, and shaped our course N.E. to make Port Rondeau.

On our port bow was Pelee Spit, which we soon left behind, putting ourselves out of sight of all land for two or three hours.

As the afternoon advanced, the breeze died out, leaving a flat calm, and off the N.W. was brewing a thunder storm. It looked ominous.

"Let's get ready for this. Double-reef the mainsail and see what's coming."

Halliards were cleared and everything stowed. Rubber coats were put on and we were really ready. We waited. A light air out of the east came up and still the storm seemed to be coming on out of the northwest. We dropped jib and driver and sat waiting, ready we were; but the storm went around to the west, so we put on all sail and shook out the reefs.

Still our easterly air, and then the storm was coming again.

"Double-reef again!"

Double-reef we did, and doused jib and driver. No more wind and no more storm; so for the second time we put on all sail again. The light east wind had almost gone out, leaving fog.

Rondeau was some eight miles farther, and night was coming on. Not a promising one either, for we could hardly see the light.

Our course had been carefully taken and as carefully kept, and before dark we had made out the port with the glasses.

Knowing we were not to have a shore supper, we enjoyed some good canned chicken, à la creme, and made ready for a calm night. The storm had gone round, but we did enjoy the satisfaction of having been ready for it, so we took hour watches now and were happy.

We had barely steerage way left; but, fortunately, Port Rondeau was not a commercial port, so we had no fear of large vessels. We managed to keep our course for a little while, but we could not see the light. Finally it was little use, and a boat does move even with no perceptible wind, so the A. B. took her trick at the tiller. It was about 3 o'clock in the morning when she declared she heard shore sounds.

"Captain, come up," called the mate who had been on watch forward, "we hear shore sounds on our port bow. I heard a rooster crow off there, too."

"If your compass is working, it's impossible," quoth the sleepy captain, and he went below to pick up that dream of cruising in the Mediterranean where he had left it. It was no use, he was soon called again, and the A. B. resigned the tiller to him and she went below, still insisting that she heard shore sounds, and she was right, for in a few moments we were aground. Not badly, of course, for we had no real steerage way and the yawl rested as easily as on a feather bed.

All sail was dropped and the anchor was carried out astern to kedge off to. Then we let off the mainsheet, so the boom was at right angles to the boat, and topped it up.

"Come on, you girls," urged the mate, "climb into the dinghy and get on the end of this boom."

"What if we should drop in?"

"Drop in, why that wouldn't hurt anything. Water is a little wetter than fog, that's all."

Our mate was always optimistic, and a heavy weight in the bargain, but it always takes three to list the yawl. We soon canted her over, so her keel no longer rested on the bottom, and the captain pulled her free.

"All right, we're afloat." He held the lantern, which closely resembled a fire-fly in this fog, and we scrambled back and anchored for the rest of the night. There was a lively discussion as to who it was that had failed to keep the course, and no one had been so careless. Our talking had attracted the attention of a wakeful farmer's wife, and a voice came out of the fog, asking what the matter was. For answer we preferred to ask a question about the light.

"About two miles east," was the answer. "Need any help?"

"No, thank you, we were only looking for the light," called back the shrewd skipper.

Their friendly solicitude was appreciated, but we preferred to keep our real situation to ourselves.

Wet and sleepy, we lay ourselves down for a few winks before daylight. That is, some of us did, for some of us were good sleepers.

It always took the skipper to see to things, for she never slept unless she had to. She sat up and shivered to enjoy the birds' morning carols.

Daybreak revealed our situation, and we were not more than thirty feet from shore, with the light hardly a mile's sail away.

The port of Rondeau is a delusion and a snare. We found good piers and a lighthouse, with a large bay inside, perfectly land-locked, but no place for a boat drawing five feet to sail in. The town of Rondeau does not exist, unless one small store can be called a town, and that lies at the extreme end of the bay. There is a summer resort at the pier called Erie.

Here we expected important mail, and had supposed Port Rondeau to be at the piers. After a few hours' rest, the ladies started to hunt Rondeau and mail, while the men took the yacht on to Port Stanley, where we joined them. Their breeze was a fresh one on the quarter, so that they had to tuck in two reefs. This is easy, even though short-handed, in a yawl. She travels along under jib and driver, while the mainsail is let down and reefed at leisure. One man steers, the other reefs and takes his time. Meanwhile, the boat is under absolute control.

All the Canadian ports that can have any possible commercial use are being improved and are snug harbors. A little stream, hardly a river, is the *raison d'être* of them all. Much can be said for Port Stanley itself, but we were not so well impressed by the people. Their welcome was hardly cordial. Tied alongside the pier, we were at the mercy of their remarks, which were mostly harmless sarcasm but irritating. Even the

harbor master tried to collect dues, but our lawyer was not to be duped that way, and asked for the statute. He read and declined to pay and afterward proved his point upon correspondence with the government authorities.

From Port Stanley to Port Burwell is a paltry twenty miles, a mere step, so after an early breakfast we set sail about 9 o'clock, with a nice wind from the land. This went out presently, leaving us very nearly becalmed until the 10 o'clock breeze came off the lake, giving us a nice wind on the beam. It was a glorious sailing day, but we were glad to have such a short run, as the morrow's run was to be very long. Sailing by day and making a port every afternoon was like running on schedule time, if such an indignity can be offered a sail boat.

By this time the moon was at its best in the early morning, so we slept with our weather eye open to make an early start for Port Maitland, as it was seventy-five miles, with no chance short of it for good shelter. Inside Long Point is a small bay off the lighthouse, but very indifferent protection at best, I am told. At 1 o'clock the mate jumped up to view the prospects.

"Out of sight, captain, let's be off. The night's simply great, and there's an offlander blowing that is the real thing."

So silently did they get under way that the A. B., lying snug in her berth, called out, "Are'n't we off yet?"

"Off? We're a mile out." She curled up contentedly, lulled to sleep again by the cheerful sound of the water rushing past the pillow. Not so the skipper; her head had been above the companion to see that they had cleared all right. It was a beautiful start. A breeze of fifteen miles on the quarter was sending us along in the stillness of the night. Every star shone out its brightest. Water and sky seemed to combine forces to charm the mariner who should be on deck.

We were not more than a mile from shore, so the mate stood watch forward for pound nets.

"Nets to starboard; quick!" "Hard a-lee," "A pole dead ahead," etc., came sharply out of the night.

Toward 5 o'clock the offlander went out, leaving bald spots all about us. It was hardly worth while to hold the tiller, but a ripple ahead encouraged the helmsman.

At 6 o'clock it was the duty of the ladies to turn out, so the A. B. came on deck to find the yawl off the lighthouse at the western end of Long Point. Across the narrow strip of land one could see Port Rowan, ten miles across the bay, and pick out the cottages of the Long Point Company in the marshes just inside the bay. Long Point is a long, narrow sand spit, and is owned by a company of sportsmen who occupy these cottages in the fall while they shoot ducks and deer, with which they have stocked the point.

Sitting at the tiller, to be on hand if the ripples and bald spots should be merged into one, the A. B. scanned the point with the glasses in an effort to catch a deer at the water's edge. It was a listless occupation. No clouds to watch, no boats nearer than the ship's course on the far horizon, no gulls and no breeze. It was a dreamy hour. Below there were sounds that are evidences of happy dreams. All was as still as nature. can be when she is drowsy. It was a warm morning and she felt it.

"What's for breakfast?"

"I'm for jute rugs," (the mate's name for shredded wheat biscuit).

"We got milk at Burwell you know."

"We'll take it in the cockpit."

But, alas! that milk had soured and was about to go by the board, when the A.B. thought of the good cottage cheese it would make, and make it she did and tied the bag to the jigger shroud, letting it hang over the side to drain.

Skirting the shore for several hours, with barely steerage way, we began to notice a deeper blue in the water. Why was this? The Coast Pilot was referred to, and we found that Lake Erie is deepest off Long Point.

Our breeze began picking up and heading us as if it might be going around with the sun, as it often does in mid-summer. Our course was due E., but fortunately the breeze died out about noon. Here was the mate's chance to swim for a breeze. It is a much surer remedy for a calm than scratching the mast or whistling. He did go in while we kept a sharp watch astern, lest that 2 o'clock breeze should come ahead of time. The water was exceptionally clear as we were off the end of Long Point.

Barely ten minutes after the mate was on deck again a light breeze came out of the S.W., and our course was N.E. by E. for Port Maitland, thirty-five miles away. Another spinnaker breeze, and one where a spinnaker added greatly to our speed.

To be sure we were not bowling along very fast, but it meant that we would make Port Maitland that night if the breeze held.

Before long we had left all land beyond our horizon, and it is much less entertaining sailing to have no land to speculate upon and no light to look for. Even calling all hands to look at the lighthouse you have picked up ahead and which proves to be a tiny fishing buoy, is more entertaining than water, water everywhere.

[TO BE CONCLUDED.]

Rifle Range and Gallery.

Zettler Rifle Club.

THE attendance at the regular practice shoot held Nov. 1, was very light. Scores follow on the 25-ring target, 75ft., offhand: L. P. Hansen 1208, C. Zettler, Jr., 1207, C. G. Zettler 1191, L. Maurer 1184, F. J. Herpers 1155, J. G. Bernius 1151, A. Begerow 1137, T. H. Keller 1136.

On Oct. 29 the ladies held a contest on the Zettler ranges, in which Miss Millie Zimmerman, daughter of that famous marksman, Gus Zimmerman, led the race for first place. Scores: Miss Millie Zimmerman 486, Mrs. H. Fenwirth 485, Miss K. Zimmerman 482, Miss B. Ludwig 479, Miss F. Muller 478, Mrs. F. Liegiebel 476, Mrs. F. Watson, Mrs. Stoltz 469, Mrs. H. Scheu 466, Mrs. H. W. Turbett 464, Mrs. B. Zettler 451.

*The decimal diameters of bore are the minimum sizes as recognized for proof purposes, except in the case of 4-bore and 32-bore, where special values have been adopted.

Chamber Sizes for all Bores.

THE accompanying table of chamber sizes represents the outcome of nearly a year's work of the Gunmakers' Association and its sister society in Birmingham. It may be remembered that we took strong exception to the series of chamber dimensions which were issued by the two associations in September. The present table of altered sizes provides a full justification for the withdrawal of what we then objected to. It must not, of course, be assumed that we were alone among those who felt that the 1902 sizes could never come into general use by gunmakers and cartridge manufacturers. In fact, the memorandum now issued jointly by the two associations characterizes their various defects under the following six subject matter headings: (1) The published sizes were not in accordance with the rules laid down; (2) the 5-bore cartridge put forward to replace the conventional so-called 4-bore was not wanted; (3) no chamber for the above 4-bore was specified; (4) the 32-bore cartridge specified could not be used with a barrel of the caliber laid down; (5) several of the chambers departed from existing sizes to an extent requiring the manufacture of the old as well as the new cartridges, in order that existing guns might not be thrown out of use; (6) the reduction in length of the 2 9-16 in. cartridge to 2 1/2 in. was regarded as an undesirable alteration.

In setting to work to frame a new series of sizes which would command the confidence, not only of all gunmakers, but also of the ammunition manufacturers who had refused to countenance the 1902 table of sizes, a series of sound general guiding principles was laid down as a basis for controlling the work to be undertaken. These were that as rules cannot be strictly followed in all cases, none should be quoted; that, where possible, sizes previously agreed to should be adopted; that there should be a suitable relation between the front end of the chamber and the bore of the barrel; that the chamber taper should be .005 in. per inch of length; that, though the size under head may vary with different lengths of the same cartridge, the diameter of the rim should be unaltered; that, in order to save complication in regard to the uniform taper, two sets of sizes should be given for the size under head, viz.: to the nearest thousandth of an inch for chambers, and the nearest ten-thousandth for gauges; that the shape of the rim recess should be altered to give a square edge for gripping the cartridge; and, finally, that the mean diameter of wadding for each bore of cartridge should be specified.

The system adopted for the working out of the new chamber sizes proceeded upon lines of logically developing the different measurements, starting with the bore of the barrel as a basis. This process is very clearly shown in the arrangement of the accompanying table. The decimal diameters of the various calibers of shotgun were taken at the values specified for the purposes of proof, exceptions only being made in the cases of 4-bore and 32-bore cartridges, where practice departs from the theoretical diameters arrived at by treating the nominal bores as equivalent to so many spherical lead balls to the pound. To test whether the decimal calibers so obtained were in correct relation with the average size of gun barrel, reference was had to the mean diameters of wadding which have a definite value, by reason of the standardization effected in this respect by the ammunition manufacturers. In some instances there may have been a doubt as to the exact size of a given bore of wadding, but as the divergence seldom amounted to more than a few thousandths of an inch, it was found comparatively easy to arrive at characteristic mean values. The difference, therefore, between the minimum caliber of the gun and the mean diameter of the wadding for the various bores specified represents the ideal relation which theory and practice have jointly defined. This series of diameters of wadding has never before to our knowledge been specifically stated in print, which affords a subject for congratulation to the two associations, since progress in cartridge making must always advance along the lines of standardization.

The nominal and decimal length of the various cartridge chambers are shown in parallel columns, and it is interesting to note that the two have been brought into closer juxtaposition than in any previous set of sizes. The only exception arises in connection with the nominal 2 1/2 in. case; but as it is unlikely, at this time of day, that sportsmen will refer to this cartridge as of 2 9-16 in. length, the two dimensions are placed side by side. It is thus open to the sportsman to continue to designate the cartridge as of 2 1/2 in. length, the gunmaker being equally justified on his side in terming the chamber 2 9-16 in. The depth of the rim, which is shown in the next column, will be seen to represent a diminishing value, starting with the 4-bore and finishing with the .360-bore. Again, it may be stated that the graduation of dimensions is very evenly maintained, and that the new sizes give reason for hoping that the slight alterations of cartridge which they involve will represent a marked change for the better as regards facility of extraction. The adjoining column, which specifies the length of the chamber taper, is more or less in the nature of a constructional piece for the calculation of other portions of the chamber. The length of the taper walls of the chamber is obviously obtained by deducting the depth of the rim from the total length over all.

The column of additions to the decimal diameter of the bore for arriving at the front of the chamber represents an entirely novel method of arriving at chamber dimensions. In the previous table of sizes this relation was ignored, with the result, for instance, that the 32-bore cartridge, with external dimensions of .562 in., was expected to shoot in a barrel of .526 cal., whereas this margin of difference was so small that the interior of the cartridge would of necessity be much smaller than the bore of the barrel. Other instances of a less glaring nature could be quoted, in which the bore of the barrel was unsuitably related to the size of the chamber. It is, however, evident, that the adoption of a progressive series of differences must provide the required agreement between cartridge chamber and barrel. Consequently, by adding the values stated in the seventh column of the table to the diameter of the gun barrel, the dimensions at the front end of the chamber were

immediately arrived at, and these are stated in the next column.

To arrive at the diameter at the back of the chamber by calculations based on the front diameter was a very simple matter. The length of the taper walls of the chamber, as shown in the sixth column, required only to be multiplied by .005 in order to give the number of thousandths of an inch that the diameter at the back of the chamber exceeded that at the front. The column of calculated tapers shows the amounts that had to be added to the size at front in order to give a true taper to the walls of the chamber of .005 of an inch for every inch of length. The addition of this value to the diameter at the front of the chamber is shown in the table as the size under head, for which three alternative dimensions are submitted. The first in millionths of an inch is merely put forward to show the theoretical diameter. The middle column gives the same value to the nearest ten-thousandth of an inch, this being for the guidance of gauge makers, whose working instructions must be stated within this fine limit. The conventional chamber size is, of course, that shown in the third column, being true to three decimals of an inch.

Having arrived at the fore and rear dimensions of the chamber, it is necessary to determine the additional size for the extending rim. This diameter is known as the size of head, and in continuation of the principle of showing the relation which exists between adjoining portions of the chamber, the column of additions is duly displayed. These, it will be seen, represent the same mathematical sequence as is evident in the other columns of differences already referred to. The size of head—in other words, the diameter of the rim—is thus given for all sizes of cartridge. The last column, which states the radius of the rim circle, may be dismissed in a very few words. Experience has shown that a chamber with a square rim recess is difficult to clean, and is generally unsatisfactory from a mechanical point of view. On the other hand, the edge of the rim recess cannot be too square and sharp, since satisfactory ejection of the cartridge depends upon this condition being fulfilled. It was therefore decided that the form of the rim recess adopted should represent a square edge, with a slight rounding of the corner, where dirt would otherwise collect. An additional reason for adopting a square edge to the rim recess than was specified in previous chamber dimensions was that the naturally plastic nature of the cartridge head, when subjected to the pressures experienced in shooting, causes a tendency for the cartridge rim to mould itself to the shape of the rim recess of the chamber. By squaring the corner of the rim a better shape is imparted to the cartridge to facilitate extraction.

Reviewing the new series of chamber sizes as a concrete whole, there seems to be good reason for saying that they contain many desirable features, and apparently none that is objectionable. It is, of course, not to be expected that in the official card of chamber sizes shortly to be issued the whole fabric of figures here reproduced will be used. The present table is merely put forward as a justification for the dimensions now issued. The various columns of differences, representing the scaffolding, so to speak, will be removed now that the new sizes have duly passed the preliminary report stage. That they may be accepted as final is shown by the fact that Messrs. Eley, Joyce and Kynoch have jointly approved the whole of the dimensions laid down. It would thus appear that a question which has been under active discussion for no less than five years has at last reached its final stage. In answer to those who may object that sizes have previously been issued only to be withdrawn at a subsequent stage, it is reasonable to point out that the exceeding technicality of the question made it impossible to arrive in one step at the conclusion which now seems so obvious.—Field (London).

Massachusetts Rifle Association.

SCORES follow for the regular weekly shoot:

Long-range match, 1000 yds.: F. Daniels 46, W. Charles 39, M. T. Day 39.
Offhand match, Standard target: R. L. Dale 93, S. C. Sampson 82, M. T. Day 80, A. W. Hill 76.
Offhand match, German ring target: R. L. Dale 226, A. Nieder 211, M. Alden 209, F. H. West 193.
Military revolver match: D. A. Allen 46, G. P. Cooley 46, O. C. Charles 44, W. A. Smith 42.
Pistol match, 50 yds.: E. E. Patridge 92, Mrs. E. E. Patridge 81, J. B. Hobbs 79.

Tau Alpha Society.

THE following scores were made Nov. 2 by this society on the Zettler ranges. Twenty shots per man on the regular 1/4 in. ring target offhand. Scores: E. S. Hall 446, W. S. Prenchard 417, E. D. Barlow 416, Gerard N. Whitney 414, R. G. Shirley 374, H. S. Orr 359, J. V. Geraghty 342, Lloyd Collis 322, E. D. McMurray 329.

A handsome silver cup went to Mr. Hall, he having won it by a comfortable margin under the conditions imposed, namely, high man for three consecutive shoots.

Trapshooting.

If you want your shoot to be announced here send a notice like the following:

Fixtures.

Nov. 8.—Bound Brook, N. J., Gun Club all-day shoot; merchandise prizes. F. K. Stelle, Sec'y.
Nov. 17-19.—Tampa, Fla.—Tampa Bay Rod and Gun Club, \$400 added. J. A. Hansbrough, Sec'y.
Nov. 24.—Ossining, N. Y., Gun Club merchandise shoot. C. G. Blandford, Capt.
June 8-9.—Dalton, O., Gun Club annual tournament. Ernest F. Scott, Capt.

DRIVERS AND TWISTERS.

In the club team contest, Nov. 5, the Castleton Gun Club was victorious at Rahway, N. J.

The Florists' Gun Club defeated Hill Rod and Gun Club, of Chester, Nov. 5, by a score of 168 to 140, ten men on a side.

The Media Gun Club defeated the Highland Gun Club at Gorgas Station, Pa., Nov. 5, by a score of 176 to 162, in a ten-man team match.

At the live-bird shoot held at Point Breeze Track, Philadelphia, last Saturday, Fred Coleman was the only one to kill straight in the 10-bird event. He had the back mark, 31 yds.

The Narberth Gun Club lost the team match in the opening series of the Trapshooters' League, to the North Camden Gun Club by a score of 126 to 106, out of a possible 250.

We are authoritatively informed that the firm of Messrs. J. H. Lau & Co., New York, will be continued under the same firm name as heretofore, with no change of policy or management.

The Clearview and S. S. White gun clubs met in a ten-man team contest at Darby, Pa., on Nov. 5. Each contestant shot at 25 targets. Clearview won by a score of 192 to 183. Mr. H. Stahr, of the S. S. White team, distinguished himself with a straight score, his nearest rival being Mr. F. L. Ludwig, of the Clearview team.

A ten-man team contest between the Meadow Springs and Hillside gun clubs, near Philadelphia, Nov. 5, was won by Meadow Springs, with a score of 172 to 149 targets. Four of the Hillside team were absent, so under the rules each was credited with 12 in the score. In the Meadow Springs Club handicap, seventeen contestants, three tied on 25.

The twenty-eighth and last trophy shoot of the season, held by the Garfield Gun Club, of Chicago, had thirteen contestants. Team races are now quite a favorite form of the club's competition. Three matches were shot, six and seven-man teams, captained by Dr. Meek and Mr. Eaton. Dr. Meek's team won all three of these team contests.

Mr. W. G. Hearn, who has been seeking health on the shore of Long Island during a number of weeks past, has entirely recuperated. He has accepted a position with the Marlin Fire Arms Co., New Haven, Conn., as traveling salesman, and had arranged to assume his duties as such on Monday of this week. Mr. Hearn has had a long and broad experience in the gun and ammunition trade, and has many friends.

Capt. C. G. Blandford writes us as follows: "The next regular club shoot of the Ossining Gun Club will be held on Saturday, the 12th inst. Some handicap prize events will be shot. Members of the team are especially requested to attend. A number of shooters have requested that we run a tournament on Thanksgiving Day, Nov. 24. We have been promised some very fine merchandise prizes for that day. The programme will be as follows: Six sweepstake events at 15 clay birds, each \$1.30 entrance. Three events at 25 clay birds each, merchandise, \$1 entrance. The prizes will be worth double the price of entrance. First prize in one event will be a pair of binoculars worth \$25. For further particulars apply for programmes to C. G. Blandford, Captain, Ossining, N. Y."

BERNARD WATERS.

IN NEW JERSEY.

Montclair Gun Club.

MONTCLAIR, N. J., Nov. 5.—Owing to the fact that a large delegation of the Montclair Gun Club accompanied their team on their visit to Rahway to-day, but seven shooters faced the traps. All present had a very good time. Several novelty matches were arranged. A walking match; standing with back to the traps when giving the word to pull; shooting with the gun at the hip; in fact, quite a number of experiments that did not appear on the score card, were the order of the day.

At Rahway the Castleton Gun Club were the winners of the silver cup, but Montclair was but one point below the winning team.

New York Athletic Club.

TRAVERS ISLAND, N. Y., Nov. 5.—The weather conditions were pleasant and favorable for good shooting. The shooting contingent of the New York Athletic Club was out in good force, and probably had in mind the benefits of practice for the Election Day shoot. Mr. George Bechtel was high man on actual breaks in a special cup event, with 24 out of 25. Messrs. F. W. Perkins and G. E. Greiff followed with 23 each. The conditions were of the best. The summary:

Shoot No. 1.—Special cup; 25 targets:

	Bk.	Hcp.	T'tl.		Bk.	Hcp.	T'tl.
W J Elias	20	4	24	H S Sidway	15	4	19
G E Greiff	21	1	22	L G Schroeder	11	6	17
J Tanty	16	5	21	H J Frost	12	4	16
F W Perkins	16	4	20				

Shoot No. 2.—November cup; 50 targets:

	Bk.	Hcp.	T'tl.		Bk.	Hcp.	T'tl.
G Bechtel	41	8	49	F W Perkins	37	8	45
G E Greiff	44	2	46	Dr. De Wolfe	34	8	42

Match between Warwick Gun Club, of Warwick, N. Y., and West Milford Gun Club, of West Milford, N. J., ten-man team, each shooter shooting at 25 birds:

Warwick Gun Club—Williams 20, Welling 19, Rogers 18, Lines 18, Edsall 18, Green 18, Dunning 17, Ogden 15, Servin 15, Hyatt 12; total, 170.

West Milford Gun Club—Manchee 18, T. P. Terhune 17, Moody 17, W. S. Terhune 16, Van Orden 14, Hall 13, Cooley 12, Thorn 11, McLaurey 11, Deghucce 6; total, 135.

JOHN B. ROGERS, Capt.

Hunter Arms Co. Trophy.

MANNING, Ia.—At the shoot held by our club members on Oct. 16 for the silver loving cup donated by the Hunter Arms Company, of Fulton, N. Y., the day was a bad one for good scores. The wind was blowing a gale, but the interest in the event did not lack. Mr. H. Hoffman and Mr. Ed. Breckenridge tied on the event, and Mr. Breckenridge won the tie shoot-off by one target.

G. A. ROBER, Sec'y.

WESTERN TRAP.

World's Fair Handicap.

ST. LOUIS, Nov. 4.—The State shoot was held here last May, but did not draw as well as it should, though the excursion rates were on. The G. A. H. was lost to this city, though it had aspirations, so that it was thought best to hold a World's Fair Handicap on live birds.

Alex. Mermod set to work to give a shoot that would be worthy of the name "World's Fair Handicap." He was importuned to make a live-bird race, and 50 live birds, \$50 entrance, was the ultimatum. What puzzled him most was the handicap, which was finally set for 34yds. as the limit.

Tuesday, the first day of the month, was the opening day, and what pleasant day it was for being out of doors. It was genuine Indian summer, smoky and very quiet; no wind to assist the birds in any way, neither were the steady flights of targets in any way perverted.

When all was ready to start, the live-bird event, 10 birds, \$7 entrance, high guns to win, there were twenty-five to enter.

The birds were a little slow to start, yet there was, now and then, a screamer that "woke 'em up." Eleven men divided on straight 10, while seven lost one, so the boys were in fine fettle, and each thought he would win the handicap, figuring from the results.

The target game was not a hard one, as the trap was run with moderation, yet steady, and the target thus maintained a steady, even flight.

There were thirty-five who took part in this pleasant pastime, and as good scores were the rule, all were happy. Many were the regrets expressed that two tournaments had not been provided, as there would no doubt have been fifty shooters present.

Taylor, from Dayton, O., and W. R. Crosby, were the good ones with 98 to the credit, while Fisher and Anderson came next with 96. Fifteen who shot through averaged over 90 per cent.

Totals of the five events, each at 20 targets: Garrett 92, Anderson 96, Peters 81, Kauffman 91, Rodaman 65, Cornelius 91, Fisher 96, Taylor 98, Scheiss 72, Williams 78, H. Spencer 95, Mermod 93, Powers 95, Clayton 83, Tipton 29, Marshall 91, Crosby 98, Wade 83, Riehl 95, Spencer 93, Peak 88, O'Neil 83, Oberding 81, O'Brein 92, Young 88, Elliott 62, West 82, Money 93, D. Gilbert 79, Lister 12, Robinson 53, Boyd 58, Booker 17, Duncan 17, Mrs. Topper 14.

The wind-up for the day was a miss-and-out, \$2 entrance. The birds were not fast as a whole, hence the match was long-drawn out, and only ended at the twenty-first round when only Ed. O'Brein, Kansas, and Ellis Duncan, from Louisville, Ky., were left in. Wade killed 18, Booker 15, Marshall and Riehl 12, Money 14. The scores:

Event No. 1, 10 birds, \$7 entrance, high guns:

First Day, Nov. 1.

Second Day, Nov. 2.

With perfect weather conditions, the big handicap was started at 9 A. M., Wednesday morning, there being twenty-three of the best shots of the Western and Central States among the entries. Target shooting was abandoned until the afternoon, and all interest was centered, by the shooters and the visitors, in the "get-away" of the great 50-live-bird handicap. Handicap, did I say? Well, I guess yes. Look at it.

One year ago a tournament was held here, during which there were some excellent scores made from the 33yd. mark, something like 99 out of 100 with the other dead out. In getting up this

programme, it was the intention to set this party, and probably one other, his side partner, back a yard, hoping thereby to draw more from the ranks of the best shooters in the amateur class. What was the outcome? The very man the rule was made for failed to come, and as one other presented himself who was set back to 34, see what followed. All others were set back, some one yard; others two yards. There were six on the 33yd. line, half of them amateurs; ten on 30yds., four being experts; three at 31yds., and three at 30yds., none nearer.

This World's Fair Handicap will then set a precedent for longer distance shooting. Some very good scores were made, as it took 47 to get in the money, and those getting 47 only took down about half their entrance. This would indicate that the distance was about the proper one. On the other hand, what of those who did not get above 44, and those who withdrew? The withdrawals were: Clayton 33, Anderson 32, Elliott 32. True, they shot well on the first half of the match, but they soon lost out when a lively lot of birds were struck.

The good scores made show good shooting, of course; but they were made with no wind and hazy atmosphere, and their flight was steady. They were trapped in the Fulford trap, with underground loading, which invariably handicaps the birds to a great extent by making them slow. If the wind had been blowing strong, then the lost birds would have been much greater.

The handicap committee was picked up from among the shooters, and they no doubt were honest in their opinions; yet it must be said that in justice to all, when a man comes 500 or 1,000 miles, or even one mile, and puts up \$50 to shoot, he would be entitled to know who the handicap committee was going to be before making the entry.

As to the shooting, it went on quite regularly, and still rather slowly, as but one set of traps was in use, and when the hour of 4 P. M. had arrived, the shoot was abandoned for the day at the end of the thirteenth round.

Peters, the Cincinnati sporting goods man, had missed 6, and he was out; Hall, the good one, who has won many a hard race, was straight, as was Anderson, who followed him; Wade was not much disheartened, having lost two, but after Clayton had made 24 out of 25, he let three start away for Kansas City from the 33yd. peg and withdrew. Frank Riehl had lost 2, Harry Tipton 3, "Our Tom" and Chan Powers, 1 each, Booker 2, Duncan 4, Bill Crosby 1, and that an easy one, Charley Spencer 2, Chas. Young 3, Robinson 1, Harlow Spencer 2, John Cabanne 2, Harold Money 1, O'Neil 2, Dave Elliott 4, Garrett 2, O'Brein 1, and Ward 4. So all had a hard-luck story save Hall and Anderson, and they had something to cause them to lose sleep—as how to get the next 20 was the puzzle. Hall, at any rate, knew well the birds would be lively on the start off in the morning. And the shooting was by squads of five, each man shooting at 10 birds for a string and then wait.

The target shooting was indulged in to the extent of 100 targets, in which more than half the contestants went above 90 per cent. "Old Reliable" Crosby scored 98, same as first day, being equalled by Chas. Spencer, Chan Powers; Alex. Mermod and John Garrett going down the line with 97, Riehl and Money 96, Marshall 94.

Ten of the amateurs had entered for a fine silver cup, given by a St. Louis sporting journal, for which the 97s were a tie. The shoot-off was a hot one, and there were two strings of 25 before a decision. Powers did not account for 2 of his, while Alex. and John let one go "unbusted." In the second string Garrett made a 25, while Mermod fell away to the bad. Garrett thus shot at 150 targets and lost 4. Mr. Garrett came on to the fair to enjoy himself, as he brought his wife and daughter, who were delighted spectators at the tournament. Totals, of the five events, 20 targets each, are as follows:

One hundred targets, \$2.50 entrance, for sportsman's cup: Peters 84, Clayton 92, Anderson 88, Cornelius 87, West 84, Garrett 97, Riehl 96, Powers 97, Marshall 94, Crosby 98, C. Spencer 98, Robinson 86, Cabanne 83, H. Spencer 92, Money 96, O'Neil 91, Mermod 97.

Third Day, Nov. 3.

Now for the third day, the climatic conditions remained the same, and all the shooters had to contend with was the fast birds that would most likely be trapped.

Hall and Anderson shot a couple to warm up, and the race was on. Each killed first round, but in the second Anderson's bird fell outside, and he was doomed. Hall went straight with 10, but his partner, Anderson, went down and out by a loss of 4. Wade missed one, and Frank Riehl "stubbed his toe" so hard that he scored but 2 out of 6 in a row. Tipton lost one, and the next squad came on. Marshall, Powers and Booker lost a bird, Booker 2 and Crosby none. It must be made note of that for the second time during the tournament Tom Marshall lost his thirteenth bird. Sure, says Tom, all because Gilbert was not present with his rabbit's foot.

MONOLOGUES OF KIAH.

It was a raw, rainy day in camp. The duress imposed by the bad weather occasioned some grumbling. All day the light was of a twilight sombreness. Not a rift in the murky sky afforded hope of a return to sunshine. Inertia and glumness dominated. Late in the afternoon, Reuben Green became more cheerful and therefore more talkative. He started thus: "This was the kind of day our party of four encountered when we started on a big-game hunt in the fastnesses of the Cascade Range at its northern part. That now is several years ago. All the members of the party, excepting myself, were experienced and successful hunters of that famous region. We, however, were alike well armed and equipped. Our main quest was for silver-tips"—"Excuse me for interrupting you," Kiah broke forth, eagerly, "but while it's on my mind let me tell you that you just now hit on a word which has been swirling through my head all day. Just a moment more to tell you about it. The matter of tips, all kinds of tips, it seems to me has become a serious question. It concerns everybody. Now, take my own case for example—tips have almost ruined me. I have been figuring them up all day, and they amount to enough to yield a living income if I had had sense enough to invest them in some good stock that appreciated about 600 per cent. instead of throwing them to the birds. Of course, a tip is supposed to be a gratuity, given for some nominal personal service, or for some real service, for which he who serves is already paid. However much, at their inception, tips may have been considered as gratuities, they long since have passed into the domain of extortion. Indeed, in the fashionable hotels and restaurants, the manner of extracting tips from a recalcitrant guest borders close on blackmail, as by tilted noses and hostile looks the attention of other guests is directed to him. The double phase of character exhibited concurrently by a fashionable waiter is of things fantastic. He commonly serves in all the effulgence of evening dress. In speech and manner he affects a refined suavity and solicitude in behalf of his victims, and yet he is so debased and lost to all self-respect that, before the public, he will extend his hand for a humiliating paltry gift, and, if it is not forthcoming, will assume the manners of a disappointed cur. Still, the tippee has embellishments. He whose esteem is measured by tips, has a graduated scale of thanks corresponding to the size of the tip. For 25 cents he displays a weary resignation and mute forbearance. For 50 cents he will give a dainty nod and address you as Monsieur. For a dollar tip he will pour you another glass of water, will tenderly help you with your hat and overcoat, and bid you a respectful good night. A peculiar feature of tips is that the more you buy the more you are supposed to pay the waiter for that privilege, so that while you are purchasing from his employer you are paying the waiter a commission also. Still, there is a difference in waiters. There is a pleasure in tipping a really skillful waiter, but what I dislike is that I have to tip whether I am in the humor or not, or else take my place on the waiter's black-list, which signifies that every waiter in a restaurant makes common cause against the free American citizen who refrains from tipping one. And yet there is a great deal in a name, for graft and tip, while having certain differences in practice, have much that is common in principle. As a peculiar phase of a parasitic development in a profitable business, it is an interesting study. There is no more reason why I should fee the waiter who serves his employer in serving me than I should fee the street car conductor, the grocery clerk, the postman, etc., except at Christmas time. Strange to relate, if it were not for me and others like me who dine in restaurants, the waiter would have no vocation at all as at present. One may be penalized lightly for a first offense, but let the offender come athwart the outraged waiter a second

time and he will find the elaboration of slow service, scraggly dishes and ill will. So it is with my barber, the baggageman, the butcher, the baker, the candlestick maker—but those are some of the reasons why I enjoy camp life, with its independence and freedom, so much the more. But, Rube, you began to tell about your bear hunt. Tell us the rest."

"Oh," Rube replied, "that's so long ago since I began the story that I have forgotten all about it."

BREAKING OPEN PACKAGES.

DEPUTY GAME WARDEN JOHN BUCKLEY, of Milwaukee, has been carrying things with a high hand in his search for fish unlawfully in course of exportation from the State. The Wisconsin statute prescribes that it shall be unlawful for a transportation company to carry out of the State any trout caught in inland waters, or any other game fish, except that twenty pounds in weight, or two in number, may be exported under certain restrictions. It is further provided that any shipment made in violation of the provisions of the law may be seized, confiscated and sold by any game warden "in a manner provided by law." The law, Section 22, Chapter 312, of the Laws of 1899, prescribes that it shall be within the power of every officer charged with the enforcement of the laws protecting fish and game "to examine and open any package in the possession of a transportation company, which said package he shall suspect or have reason to believe contains contraband fish or game." Under the authority thus conferred, Warden Buckley has entered the trains of the Chicago & Northwestern Railroad Company and has forcibly seized trunks, valises, grips, and other packages, and broken them open, only to find in numerous cases no prohibited fish or game in them. The company has protested to the local officers and to the Attorney-General, but has been unable to put a stop to the conduct of the warden; and finally has taken the question to the courts. As a result, Court Commissioner Hugh Lyon, of Milwaukee, has issued an order restraining Warden Buckley from searching baggage for fish or game unless the baggage shall be seen to contain such material carried in violation of the law. The grounds upon which the railroad company claim that the game warden should be restrained is that the section of law which gives him authority to search baggage without a warrant is in conflict with Article 4 of the amendments to the Constitution of the United States, which reads: "The right of the people to be secured in their persons, houses, papers and effects against unreasonable searches and seizures shall not be violated; and no warrants shall issue but upon probable cause, supported by oath or affirmation, and particularly describing the place to be searched, and the persons or things to be seized." It is also claimed by them that the game seizure provision is in violation of Section 11 of Article 1 of the Constitution of Wisconsin, and that therefore it is null and void.

THE LONG ISLAND DEER HUNTING.

THE Long Island deer hunting this season has not been all that the anticipatory fancy of its participants painted it. The open days were four, the first two Wednesdays and the first two Fridays of the month; and though there was the usual mob of shooters a less number of deer was scored. This may be explained by two reasons, first, that the deer when alarmed took more precipitately to the protected estates where they were safe from pursuit; and second, that private grounds were more thoroughly policed and there was therefore less chance for trespass upon them.

Deer hounding on the Island is followed in a way which in every other part of the State is forbidden. Nowhere else than on Long Island are dogs permitted for chasing deer. The procedure there is for the hunters to take posts along the line of the drive, many of them securing positions in the night that they may be ready for the break of day; and as soon as daylight comes the drivers put the dogs on the trail and drive the deer past the hunters amid a fusilade of rifle ball and buckshot. The Long Island deer are semi-domesticated creatures which have a certain degree of confidence in their human co-tenants of the soil, and they do not always promptly recognize the meaning of the opening uproar of men and dogs and guns. But a deer is by nature no fool, and after

the frightening and enlightening experience of the first day, the Long Island animals are shy and alert and wary and wise enough in their own way to stay in the grounds of the South Side Club and on other protected territory, where they are secure from pursuit and know that they are secure.

As for this Long Island deer hounding, it is not deer hunting. There is a grave question if the time has not come when it should be done away with, or perhaps there is no question about it. Long Island deer should be exempt from this annual raiding by a mob of men and dogs. If there are more deer in the country than the people living there care to have, the surplus stock might well enough be taken up by the game commission and removed to the Catskills and the Adirondacks. As we have said before, this Long Island deer range might be utilized as a valuable source of supply for other parts of the State where there is room for deer hunting. The Long Island performance "between daylight and sunset on the first two Wednesdays and first two Fridays after the first Tuesday of November" is too much like a massacre of domestic stock.

THE SAN JOAQUIN VALLEY ELK.

It has long been known to a few persons that in the San Joaquin Valley of California there remains a remnant of the vast herds of elk that in the days previous to the gold find roamed that great State, furnished food to its inhabitants, and shared the pasturage of the wild cattle and horses which formed the wealth of the Spanish settlers. These herds were practically exterminated many years ago, but there remain on the lands of Messrs. Miller and Lux, the great cattlemen, a few head which, through the wisdom of the proprietors of the soil, were protected, and, if they did not increase, at least remained stationary in numbers. Messrs. Miller and Lux are broad-minded men, and two or three years ago offered to present to the general Government this band of elk, provided the Government would furnish a place for them and remove them to it. This generous offer was, we believe, first made public by Dr. C. Hart Merriam at the annual dinner of the Boone and Crockett Club in January, 1903.

For two years efforts have been made to secure from Congress an appropriation sufficient to provide a home for these elk while they should be held under fence and under the eye of the proper protecting officials. Singularly enough the chairman of the House Committee on Agriculture has been opposed to the appropriation of funds sufficient to properly carry out this project. A small sum of money has been appropriated, however, a paddock inclosing not far from four-fifths of a square mile has been built in the Sequoia National Park, and at this present writing the elk are being gathered up to be removed to their new home. Dr. C. Hart Merriam, the eminent Chief of the Biological Survey, who has been constantly working at this matter for a number of years, is now in California and is superintending the transfer.

It is believed that these elk represent a species hitherto undescribed, and quite different from the elk that formerly roamed the plains from the Mississippi westward. In habit they are reported to be somewhat similar to the old-time plains elk, living in the open country often among the tules of the marshes, and rarely visiting the timbered foothills. It is to be hoped that before long we shall know more about them.

ONE of the elements of the characteristic piquancy of the FOREST AND STREAM is found in the wide range of its correspondence, which comes from every quarter of the land, and often brings to the common fund some local peculiarity of sentiment, wisdom or speech which has for the rest of us an agreeable twang of novelty. There, for instance, is the word "fiste" used this week by Mr. Morphew who writes from Arkansas. When the proofs came back from the printer this word was queried on the margin. The proofreader evidently could not find it in his dictionary. Yet the term "fiste" or "fice" or "fyse"—for it is spelled in all these ways—is by no means uncommon in the South. It is a good old English word, meaning a small dog, or cur, and has lingered in many sections of the South; and we believe is still current in New Jersey and Pennsylvania. Mr. Morphew's use of it shows that it is a part of the Arkansas vernacular.

THE SPORTSMAN TOURIST

The Moros of Mindanao.

AWAY down in the very southernmost part of the Philippine archipelago lies the Island of Mindanao, smiling in the sunshine or scowling under the clouds which sweep over its mountains.

As one skirts along its shores the island seems almost like a bit of stage setting, with its cool, green groves of cocoanut palms, its graceful bamboos, and its towering mountain peaks shimmering in the lazy distance or raising abruptly from the ocean.

The water is blue and covered with little whitecaps; flying fish skim from wave to wave; here and there a school of mackerel breaks from the water, only to go plunging back again with a splash, or a porpoise rolls lazily along his way. The air is cool, and the sun bright and usually not too warm, for, although this fairy island is only little more than five degrees north of the equator, it is never uncomfortably hot, and that moist, sticky heat, so common to the tropics, is almost unknown.

As you loll back in your long bamboo chair, and

MORO GIRLS.

watch the shifting scene and drink in the spicy odors of the land breeze, while the steamer plows her way through the blue waters, life does indeed seem well worth the living; you watch the groves of trees gradually grow larger and larger and then pass astern and speculate as to the inmates of the picturesque little houses nestled so snugly among them; or idly follow a vinta as it goes skimming along, its rag of a sail bellied out by the wind and its outrigger cutting off the tops of the waves and dashing the spray all over its occupants.

Between you and the shore there will probably be thousands of gulls wheeling and circling, their white wings flashing in the sun, and lending to the picture just that touch of life necessary to complete it.

It is indeed a charmingly peaceful scene you gaze upon, and as you turn with a sigh of content and call a passing steward to bring you something cool to drink, you can hardly realize, that beneath and beyond those mountains on the horizon, which glimmer and glisten so in the sun, there are people who have never heard of the United States, and whose whole idea of the universe is limited to the country side in which they dwell. People who do not know that there is any other place in the world besides Mindanao and the islands adjacent to it; and who believe that the reason that it does not sink into the ocean, is because a big fish carries it on his back, and that the earthquakes, which so frequently visit the island, are caused by this fish wriggling to get away from something which is attacking it. People who worship all sorts of strange gods, devils and evil spirits; who make human sacrifices to their deities; who wear little or no clothing, live in trees and subsist on fruits, nuts, and the game they can kill with their primitive bows and arrows, spears or snares. That in some places the old feudal system, like that which our forefathers lived under in England hundreds of years ago, flourishes.

It is estimated that there are about twenty-five tribes living on the island, and of them little or nothing is known of twenty, beyond the mere fact that they exist. Mindanao was occupied by the Spaniards for nearly four centuries, and only in the past year did a traveler, Mr. A. H. Savage Landor, discover a race of white people living there, of whose existence not the slightest inkling had ever reached the ears of the Spaniards or of the civilized world. Once penetrate five miles beyond that silvery beach on which the little waves lap and play, and you will find yourself in a strange land—a land as uncivilized and savage, as wild and untamed, as any to be found in the whole world. Huge snakes will glide stealthily away at your approach; monkeys of a dozen different varieties, from the old gray ape three feet and a half tall, to the little, long-tailed fellows scarce six inches high, will chatter and scold at you as you pass; here a deer will jump from

his bed almost under your feet and go crashing away through the dense jungle with its network of vines and creepers, and there a wild boar will grunt defiance at you from behind a bush. Bright-plumaged birds flit from tree to tree, parrots and toucans, pigeons and doves, and a hundred others. Gorgeous blossoms and dainty orchids make the air heavy with their perfume, and over all broods that warm silence, alive with a thousand voices of the various wild creatures so dear to the lover of the woods.

It is indeed hard to believe as you glide along and gaze upon the peaceful beauty of the scene which unfolds itself before you that this gem of an island should so belie its looks, and that its crystal brooks, rolling and tumbling down to the sea, are full of the deadly amoeba, that germ which has killed more of our soldiers than all the bullets and knives of Spaniard, insurgent and savage; that many of those beautiful trees are poisonous; that the forest is full of venomous snakes and reptiles; that a night spent in the jungle is almost sure to be followed by an attack of fever, and that each rock may conceal a lurking savage waiting to plunge his spear into you as you pass—but still, such is the case.

The little town of Malabang lies on the shores of Illana Bay fifteen miles from Parang Parang, twenty-five from Cottabatto and 150 miles straight across the bay from Zamboanga, the capital and metropolis of the island. Directly back of Malabang, to the north, there rises from the surrounding hills a triple-headed mountain, known as the Genassi Peaks, and just behind these peaks lies Lake Lanao, the sacred lake of the Moros; on a bluff overlooking which is Camp Vicars in the very heart of the Moro stronghold; and those living there are the first white men who have ever been in that country, although there is a legend to the effect that about 1587 a force of Spaniards entered it and succeeded in maintaining themselves there for two years or more, but were finally all killed or captured by the natives, and nothing ever heard of them again. This legend seems to be borne out by the fact that there are found among the Moros of the lake, or Malanaos, as they are called, Spanish helmets, swords and shirts of chain mail, which the Moros say were brought into the country by this expedition, from which their ancestors took them.

Ten miles from the coast as the crow flies, and twenty-three miles from Malabang by trail, one might as well be in the heart of Africa for all the evidences of our twentieth century civilization he would meet, and it was like living three or four hundred years ago to be with the people who call the country theirs.

The Moros are Malays, and originally came to

MOROS OF THE LAKE.

Mindanao from Borneo. Arriving at Mindanao they settled along the coast at different points, and following up the rivers gradually drifted inland. At the present time most of them live in the valley of the Rio Grande de Mindanao, the largest river on the island, which flows into the sea near Cottabatto; there are other communities of Moros near Zamboanga, on the south, and Iligan on the north coast, a large number of them are settled in the valley of Lake Lanao, and they are found scattered along the entire coast of the island and here and there through the mountains. The whole of the Sulu archipelago is also populated by them, although the Moros of that section differ slightly in language and customs from those of Mindanao.

In religion the Moros are ostensibly Mohammedans, but that faith is really only a veneer, concealing beneath it a mass of superstition and belief in all kinds of evil spirits.

They are a very war-like people, constantly fighting among themselves, and forcing the native tribes in their vicinity to pay them tribute, and were for years the

terror of the entire Philippine group. They are armed, as a rule, with ancient guns of every conceivable size, make and date, from the old flint-lock bell-muzzled blunderbuss up, although not a few Remingtons are found among them, and now and then a Mauser or some other higher-power rifle. They invariably file or knock off the rear sight of a gun as soon as they get it into their possession, and frequently cover the front sight with a piece of cloth or nipa to protect the barrel from the weather. When thus armed they are little to be feared, except at close quarters. They also use knives of various kinds, and spears which they throw very skillfully, and sometimes carry shields. In their forts, they have many peculiar brass or bronze cannon, which they got from India after the mutiny, and which they call "lantakas." These cannon are of little account, except to make a noise, and while I have seen a number of them used in the various fights we had, I never heard of their doing any damage.

The Mindanao Moros are not pure Malays, their blood being considerably mixed with that of the Chinese, Arabs and native tribes inhabiting the island, with whom they have intermarried. They are fairly good looking, generally short in stature, but beautifully formed, very muscular, and have small well-shaped

ON THE TRAIL IN MORO LAND.

hands and feet. Their hair, which is long, black and straight, is worn twisted into a knot on the top of the head and is frequently covered by a gay-colored handkerchief, tied into a fantastically-shaped turban.

Their vitality is simply wonderful, and they will recover readily from a wound which would kill one of us almost instantly. I know of a case of a man who had fourteen frightful cuts, one of them through the brain, who lived for eight hours after having been wounded, notwithstanding the fact that during this time he had been carried over two miles slung to a pole as one would sling a deer to pack it out of the woods.

They are, as a rule, cheerful, fond of all kinds of games, especially those of chance, wrestling, dancing and athletic sports, and have a keen and well-defined sense of humor and of the ridiculous. Unlike the Filipino, they are for the most part honest, and while they went in and out of my tent at will for nearly a year, I never had the smallest article of any kind stolen by them. Personally they have a fanatic sort of courage, that impels them at times to go bravely to certain death, but they are utterly unable to face white troops in an open fight, unless they are strongly entrenched or in vastly superior numbers. I once saw one of them, absolutely alone and armed only with his kris, charge two companies of American regulars. It afterward developed that he had taken an oath to sell himself into slavery if the Americans were victorious, and rather than keep it had decided to die, killing as many Americans as possible while they were killing him. This they called "going jura mentado," which is really nothing more than taking an oath before a priest, to run amuck. There is quite a ceremony connected with this act, the one taking the oath clothing himself in white, fasting and praying for a certain length of time, and dividing his property among his relatives and friends before starting out. This act, it is said, was in former years very common, but in recent times it has been stamped out, and while we were being constantly warned by our allies that this or that Moro had gone "jura mentado" and was coming into our camp to get killed, I personally never knew of but this and one other case.

The Mindanao Moros, unlike those of Jolo or Sulu, have no one head, the country being divided among numerous Sultans, who have their Dattos under them, and who in turn have their followers, and so on. When a Sultan declares war on another tribe, he sends word to his Dattos to join him, bringing with them their men; this they do if they feel like it, or the Sultan is strong enough to compel obedience. It not infrequently happens that a Datto will become more powerful than the Sultan to whom he owes allegiance, in which case he does pretty much as he pleases.

The coast and river Moros, since their old favorite method of earning their living by piracy has been put

down, live mostly by fishing and trading. The lake Moros, however, are excellent agriculturists, and also skilled workers in wood and metals; they know something of the arts and sciences; the women weave beautiful cloth from silk and hemp fibres, and all of the better class read and write their own language with more or less fluency. The lake dwellers are unquestionably the elite of the Mindanao Moros, who, having been driven back by the others from the coast and rivers, finally settled on the shores of Lake Lanao, and making up their minds that they had gone far enough, decided to stay and fight it out; which they did with such good success, that for over three hundred years they kept not only the other Moros, but the Spaniards as well out of their country, and it was not until about 1889 that the Spaniards obtained a foothold on the north end of the lake at Marahui and built a road from there to Iligan. Over this road they carried three gunboats, made in sections, and had just gotten them put together, when the Spanish-American war broke out, stopping all further operations.

For a couple of years after the war, the Moros gave little or no trouble, but in March, 1902, a detachment under Lieut. W. D. Forsyth, 15th U. S. Cavalry, which was scouting in the mountains back of Parang Parang, was attacked one morning while at breakfast and one man killed, the detachment being forced to abandon their horses and everything else except their rifles and to make their way as best they could back to Parang Parang on foot through the jungle, not daring to follow the trail which they soon found was literally lined with Moros in ambush. In order to punish them for this act of hostility against the Government, an expedition was fitted out at Malabang to go to Lake Lanao, recover the horses abandoned by Lieut. Forsyth, and teach the people there that it would not do to trifle with the United States. This column, known as the Lake Lanao expedition, left Malabang under the command of Colonel (now General) Frank D. Baldwin, of the 27th U. S. Infantry, on the 18th day of April, 1902, and had five fights with the Moros between April 19 and May 2, the last and greatest of them being the battle of Bayang, in which fifteen Americans were killed and fifty-six wounded out of about 250 men actually engaged.

The Sultan of Bayang, the most powerful, hostile and influential ruler in the lake country, was killed in the fight and his followers were either killed or scattered. This expedition, which was the first to enter this sacred land, established Camp Vicars, named in honor of 1st Lieut. T. A. Vicars, 27th U. S. Infantry, who was killed in the battle of Bayang during the assault of Fort Pandapatan, thus in less than three weeks gaining a foothold in the lake country, which the Spaniards had been trying for nearly four hundred years to accomplish without being able to do so, and it was there that the writer was stationed for a year, and where he learned what little he knows of the Moro character and customs.

AHMI COMMISSARIO.

My Sermon to Negroes.

It was down in the middle of the Texas cotton country, and right in the middle of the cotton-picking season, when I preached my first and last sermon in any pulpit. The sermon may not have been a very polished one; it had at least the merit of being extempore. I used no notes, but "made it up as I went along."

The Civil War had been over eighteen months, and the planters were trying to get on their feet again, but found it to be hard work. Most of them had still all the negroes who had been their former slaves; the young men had not yet begun to crowd into the cities, but the negroes only worked when they felt like working, and any sort of an excuse was sufficient for them not to feel like it; that was the way that most of the men at least felt a good part of the time. Cotton was still worth 20 cents a pound; it had been worth 30 cents not long before, and would only be worth about 10 in a year or two, so the planters naturally wanted to make hay while the sun shone. The negroes got a cent a pound for picking seed cotton. It takes about three pounds of seed cotton to make one of ginned, and I have had negro women tell me that they picked and got paid in silver for one hundred and fifty pounds a day.

Just in the middle of the most busy season an old negro evangelist, who had been traveling half over Texas, struck our county and began to hold his "bush meetings." He would hold forth a day or two on one plantation, then move to the next, taking with him all the people off this one who would follow him.

The planters were very tired of this, but were afraid to interfere with him. This bureau of ours was here, and if a white man only looked crooked at a negro, the negro would complain of it, then the white man would be arrested.

I came in contact with the planters a good deal on account of my being our sheriff's deputy, and found them to be a clever set of men. They complained to me about this old nuisance, but I could do nothing. But at last I had some of them go to the bureau officer and tell him that I had sent them. I had no use for the average negro preacher, anyhow. I had seen many specimens of him in different parts of the South, but this one seemed to be below their average even. When a boy we had a burlesque of a negro sermon which we used to rehearse. It had for a text "And they shall gnaw files and flee unto the mountains of Hepsidam, where the lion roareth and the whangdoodle mourneth for her first born." Since then I had attended meetings held by colored men in the South, whose sermons were a burlesque on even this one. Theirs could not be made a burlesque of; they were a complete one in themselves. I would have to keep in mind where I was now not to laugh at them.

Some of these "ministers" could not read the plainest chapter to be found in the Bible and not twist it all out of shape, and give it a meaning it was never intended to have. But I have forgot all about my minister.

I was sent for by the captain who was in charge of the bureau at Lagrange, one morning, and asked what I knew of this man. I told him all I knew of him. Then I was told to arrest him whenever I met him. I started to find him right away. I wanted to put him out of business for

a while for the benefit of the planters. Going out in the direction I had heard of him last, I met a young negro a few miles from town, who told me where to find "Uncle," that was what they called him. I found him in a grove a few hundred yards from a planter's house; and dismounting at the house first I met the planter and told him what I had come for. The preacher had just begun his service, I suppose. He was "lining out" a hymn. I could hear him from here. The hymn he was at work on was "When I Can Read My Title Clear." I could have sung it for him without any lining out. The lady coming to the door said, "Stop and take dinner and let him finish his sermon; then arrest him." A negro boy took my horse and I sat on the porch listening to the singing and praying until we were called to dinner. At the table the lady complained of the loss of her house servants; all except the cook and one boy were up there now, she said.

"They will be here in a short time now," I told her, "and will stay here. I mean to give those negroes a talking to that will keep them at home for a while."

After dinner the planter and I walked up to the meeting. "Uncle," had a small stand placed under a large oak tree for his pulpit. His hearers sat on the grass just below him. He had taken his text from the Sermon on the Mount, and while we stood here behind him, he read the verse "Blessed are the pure in heart." He made it "poor in heart," and so understood it, as I found from his remarks on it.

"This will do for to-day," I told the planter; and stepping up to "Uncle" I said: "Stop this; I want you now."

"What does you want me for, sah?"

"I have been sent to arrest you. Come with me now."

"Can't I finish dis sermon, sah?"

"No; I'll finish it for you. Sit down here."

He took his seat on a chair he had; and walking to his stand on which his Bible lay open I closed it; then stood a moment looking down on the sea of black faces. There were at least 500 of them here—men, women and children. A good many of these women were the house servants that their mistresses needed so badly. I could tell them by the smart dresses and ribbons they wore. The field hands wore no ribbons, nor much of anything else except rags.

"I have a few words to say to you people before I dismiss you," I told them, "and I want you to pay particular attention to what I do say. Keep it in your mind, and tell it to all your friends who are not here to-day."

"I have arrested your preacher because he has been trailing you people all over the country after him and keeping you from your work. You have been following him around when you ought to have been saving the crops. Now, this must stop, and stop right now. Go home and go to picking that cotton. How do you expect to live next winter if you don't work now when the work has to be done? These planters won't keep you; they can't if you don't pick their cotton. They will have nothing to keep you on. You are free now. We have made you free, and that is all we can do for you; you must now help yourselves. Work, just as the white man does, or starve. Don't sit around here waiting for that seven acres and a mule that some fool white man has told you of. He was lying when he told you, and he knows it as well as I do. There are no seven acres or a mule for any of us; if there were, I would want mine right now. All the acres and mules either you or I will ever get will be those we buy and pay for."

"But dese heah planters has lots of land, sah," an old negro told me.

"Yes, I know they have, and they are going to keep it. We won't take it from them; it belongs to them just as yours will belong to you when you get it. Yours can't be taken from you then, either."

"Now remember, these meetings you have been holding every day in the week must stop right now. Hold your meetings on Sunday. The Bible here says that for six days you must work in the cotton fields and rest on the seventh. Then you can go to church, or go fishing if you want to."

"Uncle" was heard from now. I had been expecting to hear from him long since. Jumping up he said: "No, sah; I begs youah pahdon, sah; but dat Bible doan say so. Dat what you tell 'em is not in it, sah; an' I knows it, an' so does you, sah."

"You sit down and keep quiet, Uncle. I am doing this preaching, or trying to. You keep still."

"Now, you people go home and go to picking cotton. When I come out here again, if I do not find you at it, I will take as many of you as that jail will hold—and it can hold a good many of you; and put you in it and keep you in it. That is all now. Go home."

"Can't I give them the benediction first, sah?"

"Yes, but nothing else. I want no more preaching here to-day."

They stood up while he gave them the benediction, and he made it a long one, too. Then I asked him if he had a horse. "I has a meuel, sah." "Then get him and come on." A boy brought him his "meuel." The mule was not much larger than a donkey, and "Uncle" stood nearly six feet high. When he was mounted his feet just cleared the ground.

I brought him down to the "big house," and got my horse and we started. Part of the congregation were now striding out for home in all directions; and part of it, mostly women, and all of them in their bare feet, fell in on the road just behind us.

"Where are you people going?" I asked them.

"We want to go with 'Uncle' to town, sah, if you will let us."

"Well, I won't. You don't want to go to jail, do you?" No, they did not. "Well, that is where he is going. Clear out of this now." They left.

The bureau officer in town had a district that embraced several counties; he had been a volunteer captain and hailed from New England, but he was a fair man; he treated both whites and blacks exactly alike. I often tried his cases myself, not bringing them to him at all. He would tell me to go out to a certain man's place, find out what the trouble was, and if the planter was to blame to bring him in. The trouble generally was that a party of negroes had made a raid on this man's chickens or hogs, and he had shot at them. I would give the negroes a calling down then, and bring nobody in.

I took "Uncle" to town and up to the court house, where the bureau was.

"Is dis de jail, sah?" he asked.

"This is the court house. I'll try you here first, then find you the jail; but your trial will be only a matter of form. I tried you on our way in here. I am going to give you two years."

I had the old fellow scared half to death now; he believed everything I told him. I had put in my time coming in in stuffing him with information about the bureau and what I could do with him. Leading him by the arm, I took him into the office and up to the captain's desk. The old fellow was about to begin an address, when I said: "That will do now; cut that short off. The captain does all the talking that is done here. This is the Freedman's Bureau I told you about."

"So you are a preacher," the Captain said, looking at him.

"Yes, sah, I tries to preach."

"You don't succeed very well then," I said, "if that sermon I listened to to-day is a fair specimen of your efforts at preaching."

"What church do you belong to?" the Captain asked.

"I is a Baptis', sah."

"You have put your foot in it now," I thought. The Captain was a Methodist, and had no use for any other church.

"Where were you ordained?"

"Sah?"

"He does not understand you; he has never been ordained. None of these colored traveling preachers have; they ordain themselves whenever they think they have a call to preach."

The Captain said: "Well I hardly know what to do in your case. You cannot hang him, can you?" he asked me.

"Yes, sir, I can, as soon as you give me the order."

"Uncle" was shaking now as though he had the ague. At last the Captain asked, "Have you any friends here in town?" Yes, he had.

"Then stop there to-night and come here again in the morning, and I will see what I can do about your case."

I was afraid that he might forget to come back; so next morning I hunted him up and brought him back. Then the Captain gave him his orders not to preach any day except on Sunday, and let him go.

I met him a few days after this, still hanging around town, and asked him what he meant to do? "You are not doing any more preaching, are you?" I had been watching him and knew he was not preaching. No, he had not done any. "And you don't seem to be doing anything else. Why don't you go out and pick cotton? You can make as much at it as you can at preaching, and you won't be taking money off men who are poorer than you are yourself then."

"No, sah," his Master had called him and he must preach. He was going up to Round Top now.

"Oh, no you are not; that is in my district also, and I don't want you up there any more than I do down here."

Well, then, could he go to Columbus. Yes, but he would not want to, though, if he knew the sheriff there. Going to the office now I wrote to the sheriff of Colorado county, telling him that "Uncle" was about to pay him a visit, and if he did not need him there, to pass him on to Galveston, not back this way again; we did not need him here.

He blew into Columbus a few days after this, and started one of his revivals right in town, and the sheriff put him in jail for vagrancy.

The talk I had given the negroes was all over the county in less than three days. The planters could tell me about it wherever I went; their negroes had told them. Some of the planters afterward told me that I had saved many a bale of cotton for them. One old planter who had a big place a few miles from town had had great trouble with his field hands, and weeks before I had arrested "Uncle" I stopped at his place all night one night; then next morning, just at daylight, started at one end of his negro quarters and went clear to the other end, running every man and boy out to the field without his breakfast. I had to pull most of them out of bed; then telling the women to get their breakfast and follow the men. There never was any more trouble with these hands. They picked cotton now from sun to sun, and saved his whole crop.

This man had a big bunch of fine horses, Kentucky stock that he was raising for market. He told me to go into his field and select the horse that suited me and ride him away. It would have taken me about thirty seconds to select that horse; I had him selected ahead, but I would not be allowed to keep him in the troop, and would not take him as a present and then sell him.

CABIA BLANCO.

The Tobacco Cure.

PLAINFIELD, MASS.—A writer in the St. Louis Globe-Democrat reports a speedy cure of a badly sprained ankle by the application of a poultice of tobacco leaves dipped in water. He writes: "When I reached my rooms I was surprised to find that the pain in my ankle was very much lessened, and decided to give the poultice a fair trial. In the morning when I awoke there was absolutely no pain in my ankle whatever, and only the slightest suggestion of a swelling. I was able to don my shoes without trouble, and that day attended to business as though nothing had befallen me. Since then one of my friends suffered a sprain and consented to have a leaf tobacco poultice applied, which resulted in his case just as it had in mine. I have also tried it in other instances of slight injury, where there was pain and danger of swelling, and have found that invariably it relieved the pain within a remarkably short space of time, and generally prevented any swelling." Tobacco quids were almost the sole application for wounds and bruises on the plains fifty years ago. They could not get anything else in emergencies, and almost every man had his plug.

CHARLES HALLOCK.

Wrecked by a Whale.

Capt. Jones, of the British steamship Quernmore, reports that on Sept. 30 he sighted the Danish schooner Anna of Marstan flying signals of distress. The vessel was in danger of sinking, and the crew of six was taken aboard the Quernmore and brought to Baltimore. Capt. Madsen, of the Anna, reports that on Sept. 27 his vessel, which was in ballast, struck a whale, and was so seriously damaged at the bows that she gradually filled with water. The Anna was bound from Patrix, Iceland, to Campbelltown, N. B.

Trails of the Pathfinders.—XIX.

Ross Cox.

On the 17th of October, 1811, the ship *Beaver*, Captain Cornelius Sowles, sailed from New York for the mouth of the Columbia River. She carried one partner, six clerks, and a number of artisans and voyageurs, of the Pacific Fur Company, an association of which John Jacob Astor was the chief proprietor. Among the clerks on this ship was Ross Cox, who, some years later, published a work in two volumes, called, "The Columbia River, or Scenes and Adventures During a Residence of Six Years on the Western Side of the Rocky Mountains among Various Tribes of Indians Hitherto Unknown, Together with a Journey Across the American Continent."

Cox was a British subject, but, like many of his compatriots, was eager to secure an appointment among Mr. Astor's company, for he was captivated by the love of novelty, and with the hope of speedily realizing an independence in the new country that was being opened.

It will be remembered that, for about a hundred years after its charter had been granted, the Hudson's Bay Company made little effort to extend into the interior the trading posts which it, alone, had the privilege of establishing on the shores of the Hudson's Bay and its tributary rivers. True, trading posts had been established in the interior, but chiefly by the French traders, who had practically possessed the country until the close of the French and Indian War. Then came the founding of the Northwest Fur Company of Canada, before long a formidable rival to the Hudson's Bay Company. It was conducted on the wiser plan of giving each one of its employes the chance to rise and become a partner, provided only his success justified the promotion. The Hudson's Bay Company, on the other hand, hired its men, paid them regularly, but offered no inducements to extra exertion on the part of its officers. The result could not be doubtful; and as we all know, consolidation at length took place between the two companies.

In the early part of the last century, John Jacob Astor, whose fur trade with the interior had not been altogether satisfactory, determined to explore the northwest coast, and proposed to the Northwest Company to join with him in establishing a trading post on the Columbia River. The proposition was declined. Nevertheless, in 1809 Astor formed the Pacific Fur Company, and needing able and experienced traders, he induced a number of men connected with the Northwest Company to leave that establishment and join him. Among these were Alexander McKay, who had been a companion of Sir Alexander Mackenzie in earlier days.

Astor's plan was to establish posts on the northwest coast, to which each year a vessel should carry goods for the Indian trade, and having discharged her cargo at the mouth of the Columbia River, should take on board the furs of the year's trade, and thence proceed to China; selling her furs there, she should load with the products of that country and return to New York.

The first vessel fitted out by the Pacific Fur Company was the ill-fated *Tonquin*, commanded by Capt. Jonathan Thorne. She sailed from New York in 1810, with a number of partners, clerks and artisans, and with a large cargo of goods for the Indian trade; and about the same time a party under W. P. Hunt and Donald Mackenzie left St. Louis to cross the continent to the mouth of the Columbia.

The *Beaver* was the next of these annual ships to sail. She rounded the Horn, and touched at the Sandwich Islands, where a number of the natives were shipped as laborers for the post, and on the 8th of May the ship's company found themselves opposite the mouth of the Columbia River. They crossed the bar without accident, and after a voyage of six months and twenty-two days, cast anchor in Baker's Bay.

The accounts which they received from their friends at Astoria were very discouraging. Here they learned of the loss of the ship *Tonquin*, with all on board at the time. There had been almost constant quarreling between the captain and his passengers. The captain was a man of great daring, but harsh and arbitrary in manner, and very ready to quarrel with the British subjects whom he carried as passengers. His obstinacy resulted in the loss of several men at the mouth of the Columbia; and the chief mate of the vessel, in consequence of a dispute with the captain, left her, and obtained an assignment to command a little schooner built by the company. The *Tonquin*, with McKay and Lewis, one of the clerks on board, dropped down to the mouth of the Columbia and proceeded northward, to go as far as Cooke's River, on a trading excursion.

In the meantime the overland parties, under the command of Mackenzie, McLellan, Hunt and Crooks, after great suffering, reached the fort.

The fate of the *Tonquin* was learned in the month of August, 1811, from a party of Indians from Gray's Harbor. They came to the Columbia for fishing, and told the Chinooks that the *Tonquin* had been cut off by one of the northern tribes, and every soul massacred. This is what seems to have happened. The *Tonquin*, somewhere in the neighborhood of Nootka, cast anchor, and McKay began to trade with the natives, who were perfectly willing to part with their furs. One of the principal men, however, having been detected in some small theft, was struck by the captain, and in revenge the Indians formed a conspiracy to take possession of the vessel. The interpreter learned of this, and told McKay, who warned the captain of the intended attack; but he only laughed at the information, and made no preparations for it. The Indians continued to visit the ship, and without arms. The day before the vessel was to leave, two large canoes, each containing about twenty men, appeared alongside. They had some furs in their canoes and were allowed to come on board. Soon three more canoes followed; and the officers of the watch, seeing that a number of others were leaving the shore, warned Capt. Thorne of the circumstances. He immediately came on the quarter-deck, accompanied by Mr. McKay and the interpreter. The latter, on observing that they all wore shot cloaks

or mantles of skin, which was by no means a general custom, at once knew their designs were hostile, and told Mr. McKay of his suspicions. That gentleman immediately apprised Captain Thorne of the circumstances, and begged him to lose no time in clearing the ship of intruders. This caution was, however, treated with contempt by the captain, who remarked, that with the arms they had on board they would be more than a match for three times the number. The sailors in the meantime had all come on the deck, which was crowded with Indians, who completely blocked up the passages, and obstructed the men in the performance of their various duties. The captain requested them to retire, to which they paid no attention. He then told them he was about going to sea, and had given orders to the men to raise the anchor; that he hoped they would go away quietly; but if they refused, he should be compelled to force their departure. He had scarcely finished, when, at a signal given by one of the chiefs, a loud and frightful yell was heard from the assembled savages, who commenced a sudden and simultaneous attack on the officers and crew with knives, bludgeons and short sabres, which they had concealed under their robes.

"McKay was one of the first attacked. One Indian gave him a severe blow with a bludgeon, which partially stunned him; upon which he was seized by five or six others, who threw him overboard into a canoe alongside, where he quickly recovered and was allowed to remain for some time uninjured.

"Captain Thorne made an ineffectual attempt to reach the cabin for his fire-arms, but was overpowered by numbers. His only weapon was a jack-knife, with which he killed four of his savage assailants by ripping up their bellies, and mutilated several others. Covered with wounds, and exhausted from the loss of blood, he rested himself for a moment by leaning on the tiller wheel, when he received a dreadful blow from a weapon called a *pautumagan*, on the back part of the head, which felled him to the deck. The death-dealing knife fell from his hand, and his savage butchers, after extinguishing the few sparks of life that still remained, threw his mangled body overboard.

"On seeing the captain's fate, our informant, who was close to him, and who had hitherto escaped uninjured, jumped into the water and was taken into a canoe by some women, who partially covered his body with mats. He states that the original intention of the enemy was to detain Mr. McKay a prisoner; and after securing the vessel, to give him his liberty, on obtaining a ransom from Astoria. But on finding the resistance made by the captain and crew, the former of whom had killed one of their principal chiefs, their love of gain gave way to revenge, and they resolved to destroy him. The last time the ill-fated gentleman was seen, his head was hanging over the side of a canoe, and three savages, armed with *pautumagans*, were battering out his brains.

"In the meantime the devoted crew, who had maintained the unequal conflict with unparalleled bravery, became gradually overpowered. Three of them, John Anderson; the boatswain, John Weekes; the carpenter, Stephen Weekes, who had narrowly escaped at the Columbia, succeeded, after a desperate struggle, in gaining possession of the cabin, the entrance to which was securely fastened inside. The Indians now became more cautious, for they well knew there were plenty of firearms below; and they had already experienced enough of the prowess of the three men while on deck, and armed only with hand-spikes, to dread approaching them while they had more mortal weapons at their command.

"Anderson and his two companions seeing their commander and the crew dead and dying about them, and that no hope of escape remained, and feeling moreover, the uselessness of any further opposition, determined on taking a terrible revenge. Two of them, therefore, set about laying a train to the powder magazine, while the third addressed some Indians from the windows, who were in canoes, and gave them to understand, that if they were permitted to depart unmolested in one of the ship's boats, they would give them quiet possession of the vessel without firing a shot; stipulating, however, that no canoe should remain near them while getting into the boat. The anxiety of the barbarians to obtain possession of the plunder, and their disinclination to risk any more lives, induced them to embrace this proposition with eagerness, and the pinnace was immediately brought astern. The three heroes having by this time perfected their dreadful arrangements, and ascertained that no Indian was watching them, gradually lowered themselves from the cabin windows into the boat; and having fired the train, quickly pushed off toward the mouth of the harbor, no obstacle being interposed to prevent their departure.

"Hundreds of the enemy now rushed on deck to seize the long-expected prize, shouting yells of victory; but their triumph was of short duration. Just as they had burst open the cabin door, an explosion took place, which, in an instant, hurled upward of two hundred savages into eternity, and dreadfully injured as many more. The interpreter, who had by this time reached land, states he saw many mutilated bodies floating near the beach, while heads, arms and legs, together with fragments of the ship, were thrown to a considerable distance on the shore.

"The first impression of the survivors was, that the Master of Life had sent forth the Evil Spirit from the waters to punish them for their cruelty to the white people. This belief, joined to the consternation occasioned by the shock, and the reproaches and lamentations of the wives and other relatives of the sufferers, paralyzed for a time the exertions of the savages and favored the attempt of Anderson and his brave comrades to escape. They rowed hard for the mouth of the harbor with the intention, as is supposed, of coasting along the shore to the Columbia; but after passing the bar, a head wind and flowing tide drove them back and compelled them to land late at night in a small cove, where they fancied themselves free from danger, and where, weak from the loss of blood and the harassing exertions of the day, they fell into a profound sleep." Here they were captured, and a little later killed.

Such is Cox's account of the destruction of the *Tonquin*, obtained, we may presume, from the interpreter. Other accounts of the same event agree with it in its main facts, though there is some question as to who it was who blew up the ship, some narrators believing that it was Stephen Weekes, while others think that it was Lewis, the clerk.

As if the spirits of the newly-arrived traders had not been sufficiently dampened by the story of the *Tonquin*, an added misfortune followed the next day. This was the return of one of the parties that had started overland, some to trade, others to carry despatches to the east. These men had been driven back by an encounter with Indians, and after great difficulties and much suffering, reached the post again.

Cox has much to say of the situation of the fort, and its surroundings, of the natives, and of the bountiful supply of elk, wildfowl and fish, on which they subsisted.

On the 28th of June, 1812, a party of nearly a hundred men, well supplied with trade goods, started in canoes up the Columbia. They went well prepared to meet the Indians, each man carrying a musket and forty rounds of ball cartridges, and each also wearing leathern armor, "a kind of shirt made out of the skin of the elk, which reached from the neck to the knees. It was perfectly arrow-proof; and at eighty or ninety yards impenetrable by a musket bullet. Besides the muskets, numbers had daggers, short swords and pistols; and when armed cap-a-pie we presented a formidable appearance." At the portage every precaution was taken to guard against surprises. Five officers were stationed at each end of the portage, and the remaining, with twenty-five men, were scattered along it at short distances from one another. This was especially necessary at the foot of the first rapids, where the portage was three or four miles long, the path narrow and dangerous, and in some places obstructed.

The ascent of the river, over falls and rapids, was very laborious. The boats had to be dragged up part of the way, and the labor was hard and long-continued. A little negligence of some of the men who were at the upper end of the portage resulted in a small trouble, for wandering away a short distance from the goods, two Indians endeavored to carry off an entire bale. It was too heavy for them, and they were about to open and carry away the contents, when two men, carrying burdens, arrived and gave the alarm. The Indians attacked the men, but the disturbances called back the officers, and the Indians fled. "A shot was fired at them by our best marksman, who was told merely to wing one, which he did with great skill, by breaking his left arm, at upward of a hundred yards distance. The fellow gave a dreadful shout on receiving the ball, but still continued his flight with his comrade, until we lost sight of them."

Keeping on up the rapids, they saw other Indians, some of whom were on horseback, and much more attractive to the eye than the canoe Indians seen further down the river. From the fishing Indians they purchased salmon in considerable numbers.

Before this they had reached the high volcanic, treeless country, and had found rattlesnakes; and here an odd incident happened to one of the men, named La Course, which might have been fatal. Cox says: "This man had stretched himself of the ground, after the fatigue of the day, with his head resting on a small package of goods, and quickly fell asleep. While in this situation I passed him, and was almost petrified at seeing a large rattlesnake moving from his side to his left breast. My first impulse was to alarm La Course; but an old Canadian whom I had beckoned to the spot requested me to make no noise, alleging it would merely cross the body and go away. He was mistaken, for on reaching the man's shoulder, the serpent deliberately coiled itself, but did not appear to meditate an attack. Having made signs to several others, who joined us, I was determined that two men should advance a little in front to divert the attention of the snake, while one should approach La Course behind, and with a long stick endeavor to remove it from his body. The snake, on observing the men advance in front, instantly raised its head, darted out its forked tongue, and shook its rattles; all indications of anger. Every one was now in a state of feverish agitation as to the fate of poor La Course, who still lay slumbering, unconscious of his danger; when the man behind, who had procured a stick seven feet in length, suddenly placed one end of it under the coiled reptile, and succeeded in pitching it upwards of ten feet from the man's body. A shout of joy was the first intimation La Course received of his wonderful escape, while in the meantime the man with the stick pursued the snake, which he killed. It was three feet six inches long."

Toward the end of July the party camped at the mouth of the Walla Walla River, and met a number of Indians of that tribe. Twenty horses were purchased for Robert Stewart's party, and its eleven members left the next day for St. Louis. The Walla Wallas seem to have been friendly and attractive. They were kind and gentle, yet dignified; as were also the Indians of the Pierced-nose tribe, then called by the French *Les Nez Percés*, a name which they still retain. Their houses were large; some square, others oblong, and some conical; they were covered with mats fixed on poles, and varied from twenty to seventy feet in length. These people seemed well to do, and owned many horses, twenty-five of which the traders bought; and from this time on some of them proceeded by land, while the others dragged, paddled or pulled the canoes up the stream. It was at a Pierced-nose village, at no very great distance from the Columbia, on Lewis River, that the party left their boats and canoes, caching them in the willow brush, and leaving them in charge of the chief. Here they secured about fifty horses for pack animals, and a few for riding, but not nearly enough to give a horse to each man. Traveling along up the stream, the thirty-two men who were in Cox's company started for the country of the Spokanes. They had the usual incidents of travel—trouble with pack-horses, lack of grass for their animals, often lack of water for themselves; but before they had gone very far an adventure happened to the author which made it impossible for him to chronicle the doings of his party.

On the 17th of August they stopped for noon, and

turned their horses out to graze in very good feed. Cox went apart some distance, and after feasting on the fruit that grew here, lay down and went to sleep. When he awoke the sun was low, and no sound was to be heard. His companions had vanished. It afterward appeared that they had started in three sections, at a little distance from one another, and that each division of the command supposed Cox to be with one of the other divisions. It was not until toward night that his absence was discovered; and in the meantime he had awakened and set off in pursuit of the party, but soon lost the trail. He was lightly clad in a shirt and pair of cotton trousers, and moccasins. He had no arms; no knife; no means of making a fire. The first night out he plucked a quantity of grass, covered himself with that, and slept through the night. On the following day he journeyed eastward, and late in the evening saw, only a mile from him, two horsemen rapidly riding to the east. They were near enough so that he could see that they belonged to his party. He raced after them, shouted, waved his shirt, and did everything possible to attract their attention, but they did not see him. By this time his moccasins had absolutely gone to pieces, and this night the labor of pulling the grass cut his hands. It was two days since he had eaten. Birds and deer were numerous, and close to him fish were seen in the waters, but he could not catch them. That night, however, he found an abundant supply of cherries, which gave him a hearty supper; but the howling of wolves and "growling of bears" kept him awake much of the night. The following day he looked for horse tracks, and at night returned to the place where he had slept before. His feet were now so much lacerated by prickly pears and the stones over which he had walked, that he was obliged to make bandages for them from the legs of his trousers. His fear of wolves and bears grew; and perhaps the man's weak condition tempted the animals, for he tells us that they came quite close to him. As he wandered on occasionally he saw horse tracks, but always old; yet showing that there were people in the country. On the night of the 25th, he found no water, and as he was about to lie down to sleep, he found that he was surrounded by snakes of every kind. "It was a peculiar soul-trying moment," he tells us. "I had tasted no fruit since the morning before, and after a painful day's march under a burning sun, could not procure a drop of water to allay my feverish thirst. I was surrounded by a murderous brood of serpents, and ferocious beasts of prey; and without even the consolation of knowing when such misery might have a probable termination. I might truly say with the royal palmist that 'the snares of death com-

passed me round about.'" But he lived through it. All the next day he traveled without water, and when at night he came to a stream, he was so weak that he fell into it, and was almost carried away, but caught himself by an overhanging bough and regained the shore. Here he found food and ate it eagerly. "On looking about for a place to sleep, I observed lying on the ground the hollow trunk of a large pine, which had been destroyed by lightning. I retreated into the cavity; and having covered myself completely with large pieces of loose bark, quickly fell asleep. My repose was not of long duration; for at the end of about two hours I was awakened by the growling of a bear, which had removed part of the bark covering and was leaning over me with his snout, hesitating as to the means he should adopt to dislodge me; the narrow limits of the trunk which confined my body prevented him from making the attack with advantage. I instantly sprang up, seized my stick, and uttered a loud cry, which startled him, and caused him to recede a few steps; when he stopped and turned about apparently doubtful whether he would commence an attack. He determined on an assault; but feeling I had not sufficient strength to meet such an unequal enemy, I thought it prudent to retreat, and accordingly scrambled up an adjoining tree. My flight gave fresh impulse to his courage, and he commenced ascending after me. I succeeded, however, in gaining a branch, which gave me a decided advantage over him; and from which I was enabled to annoy his muzzle and claws in such a manner with my stick as effectually to check his progress. After scraping the bark some time with rage and disappointment, he gave up the task, and retired to my late dormitory, of which he took possession. The fear of falling off, in case I was overcome by sleep, induced me to make several attempts to descend; but each attempt aroused my ursine sentinel; and, after many ineffectual efforts, I was obliged to remain there during the rest of the night. I fixed myself in that part of the trunk from which the principal grand branches forked, and which prevented me from falling during my fitful slumbers. A little after sunrise, the bear quitted the trunk, shook himself, 'cast a longing, lingering look' toward me, and slowly disappeared in search of his morning repast. After waiting some time, apprehensive of his return, I descended and resumed my journey through the woods."

A few hours later Cox came upon a well-beaten horse-trail, with fresh tracks both of hoofs and human feet. Following this he came that evening to a spot where the party had camped the preceding night; and about a large fire which was still burning found the half-picked bones

of grouse and ducks, on which he made a hearty meal, the first flesh he had tasted in a long time. For two days more he followed the trail; on the second day finding fruit. The tracks grew constantly fresher, but the bandages of his feet were constantly wearing out, and, with the exception of his shirt, he was almost naked. At evening he came to a fork in the trail, with fresh tracks on both branches. One led up a hill, the other into a valley. Cox took the upper one, but as it was growing dark feared that he might not find water at night, and turned back and followed the trail into the valley. Before he had gone far he thought he heard the neighing of a horse, and hurrying onward before long he saw several horses feeding in a meadow on the other side of a stream. He crossed, and one of the horses approached him, and to the weak and starving man the good beast looked like a real friend. A little further on he saw smoke, and then two women appeared, who at sight of him fled to a shelter at the further end of the meadow. From this at once emerged two men, who came running toward him in the most friendly manner. They carried him in their arms to their home; washed and dressed his wounds, roasted some roots and boiled salmon for him. In fact, they treated him as if he had been a relation rather than a stranger. The men talked with him in signs, and gave him to understand that they knew who he was, and that he had been lost and that they with other Indians and white men had been searching for him. To a man who had been wandering in the desert for fourteen days, the sight of these Indians, and the harsh, guttural sounds by which they expressed their thoughts, were perfectly delightful. Full, warm, and clad, for the first time in two weeks, he slept that night as he had never slept before.

The next day the men took him in a canoe across the Coeur D'Alene River, and having given him deerskin clothing, they set off on horseback to the eastward.

After seven hours they came to where some of the Canadians were at work getting wood. Francois Garderie joined them just before they reached the tents, and taking Cox for an Indian, spoke to him. It was not until he replied in French that he recognized him, and there was much rejoicing in all the camp when he joined his people. The party had supposed that he had long perished; for considering his youth and his inexperience in the Indian country, the oldest voyageurs had given him up after the sixth day.

GEORGE BIRD GRINNELL.

[TO BE CONTINUED.]

NATURAL HISTORY

California Bird Life.

Editor Forest and Stream:

Having spent August, September and part of October in California, I have a mind to submit a few jottings of my observations while in that country and traveling across the intervening territory.

The journey was made via St. Louis, St. Paul, Butte, Montana, Seattle, Portland, and thence by Shasta Mountain and the Sacramento Valley, to San Francisco. Being on a strictly business mission with important engagements to meet, there was no time to linger by the way, nor make any diversions for the purpose of sight-seeing. A couple of hours were spent in St. Paul, where dwells Mr. Charles Cristadoro, one of FOREST AND STREAM's valued contributors; but there was no time to meet him on his own "dung hill," and renew the fight over the duck and Limburger proposition. The interval between trains was fully occupied in negotiating for an upper berth in the sleeper for Portland, along with a crowd of other unfortunate applicants. A berth had been secured (?) in St. Louis two days before, and paid for, but the Burlington agent had failed to provide for it by wiring ahead. Shasta Mountains was passed a little more than arm's length distant, apparently, in whose environs the genial Ransacker abides on his coon-haunted "ranch," and makes and bakes bricks for his needs by a recipe from the encyclopedia.

In traversing the extensive plains east of the mountains, a most notable feature was the absence of forest growth and the paucity of bird life, these doubtless being directly related. Sparrow hawks were more in evidence than any other bird as seen from the train. These, with a few blackbirds, made up nearly the whole of visible bird life in a day's journey.

While in California my movements were restricted to making a number of excursions from San Francisco to all parts of the Sacramento valley, below the mountain region, and less extensively into the San Joaquin valley. Through this "great central valley" of California, bounded on the east by the "High Sierra" and on the west by the Coast Range, the Sacramento River courses southward from the northern extremity, and the San Joaquin northward from the southern end. They meet opposite San Francisco and flow together into the ocean through Suisun, San Pablo and San Francisco Bays, the Coast Range barrier having been broken here in a former geological age. All of this region is also characterized by the lacking of forest growth and paucity of bird life. There was a total absence of the numerous varieties of song birds that so enliven the woods and groves of the east and south. Only one variety of blackbird was observed, which is identical with one of our southern varieties, somewhat smaller than the common crow blackbird, with conspicuous yellow eyes, and a few with red shoulders. These birds were more numerous than any other species.

The bluejay of this region was encountered infre-

quently. It differs widely from the southern jay in many particulars. It is a secretive bird and not easily descried in the thickets. Its single, unmusical and disagreeable note was heard on a number of occasions before the bird could be seen and identified. It appeared to be a dark blue all over, without any display of white in its flights. The multi-colored magpie made a striking appearance, with its rounded wings and extremely long and narrow tail. A single flock of a hundred or more was seen near the Feather River, whirling along the fence row and across the field with a great show of animation.

One strange variety of bird was seen in the upper Sacramento and Feather River country, whose popular name even could not be learned from the citizens encountered. This bird flew along the road side from one post to another, is slate-colored all over, and somewhat resembles in size and flight our southern "bee-martin" (Audubon's "kingbird"). A small bird resembling the field sparrows, was called by the people the "chippy" bird. One only mockingbird was observed in the upper San Joaquin, and a few robins were visible. There were some doves, and a few "valley quail," but neither were numerous, though the country abounds in small grain.

Along the water courses were many blue herons and a smaller bird supposed to be a bittern, or "fly up the creek." Also many hawks were seen along the Sacramento in some localities, and a species of owl, that exhibited so much daytime alertness and quickness of motion as to suggest that it might be a "hawk-owl." These birds presumably live on the "gophers," a small burrowing rodent that infests the alfalfa fields and destroys much of the crop by feeding on the roots of the plant. These burrowers invade the levees along the river bank, in places honeycombing the embankments, and are a principal source of danger in flood times, their burrows sometimes causing crevasses in the levees. In some localities men are employed to patrol the levees, with "trap and guns," for the destruction of these little creatures, that are about the size of a small rat.

It is a curious sight to see the large gray squirrels, in a treeless country, racing across the dusty roads and desiccated plains and disappearing in burrows in the ground. These squirrels much resemble our common grays, but are somewhat larger. They are not esteemed as game animals, and are not protected by the game law, while the "tree squirrels" are. What they live on, the Lord only knows.

The open season on ducks began on Oct. 15. Some complaint was heard that the date was fixed in the middle instead of the first of the month, as it was said that the home-reared birds were fully grown by the earlier date. In the Tulare Lake country, upper San Joaquin valley, sprig-tails were shot in September, in the wheat fields, under the plea of depredation on the grain. This seems to have been accepted as justification by the game law authorities. There were many ducks in evidence on the marsh lands about the bays,

mallards, teal, and sprig-tails, and the duck crop promised to be abundant. These marsh lands have all been appropriated by the numerous hunting clubs. In one case, known to me, four cents an acre was paid to the owner for the season's shooting privilege.

I have reserved for the last my observations on the meadow lark, having something particular to say about this bird. In controversy with several of your western contributors over the question of this bird's claim to being considered a "song bird," I believe the expression was used that those gentlemen and myself were looking at the opposite sides of the same shield.

This expression is specialized and emphasized in its application to the California meadow lark. This bird has a strong family resemblance to the southern meadow lark, but there are some very marked and particular differences. In coloration, the California lark lacks the vividness of contrast between the bright yellow "vest" and glossy black "cravat" that is conspicuous in the southern variety. But in voice and utterance the difference is most striking. While again there is strong family resemblance between the vocal expressions of the two, those of the California bird are much superior in volume and richness and in variety of notes. There is a distinct difference also in the notes uttered and in their arrangement. Moreover, the California lark is quite voluble, his song being frequently heard, while that of the southern lark is infrequently, as well as feeble and monotonous. The California meadow larks are rather numerous, and are widely distributed throughout the Sacramento valley.

These observations were made in the late summer and autumn, when the cheerful songs of the meadow larks were the only bird voices to relieve the stillness of nature. It may be presumed that his voice is much more in evidence in the spring time; and the California meadow lark is certainly entitled to all the honors of a "song bird," in an otherwise songless region.

Whether the alliance is closer between the California larks and those of the middle west, or between the latter and those of the south, I am not informed, but suspect this to be true, judging from the claims advanced in favor of the northern lark as a songster. There were but a few turkey buzzards and carrion vultures, and some common crows, observed in California, mention of which was omitted above, and I believe that completes the list of birds seen in that country.

Several "jack rabbits" were seen in the Tulare Lake country. These differ much in size and appearance, and in manner of running, from our "cottontails" and "cane cutters." The latter run with ears laid back flat and the little "cotton" tail erect, and proceed in bounds with legs extended fore and aft. The "jacks" run with their rather long tails closely tucked down, like a wounded deer. In their mode of progressing, there is an appearance of stiff verticality of the legs, the body being high up from the ground. They run on a level for half-dozen yards or so, and then make a little up-

ward bound, as if for observation. This they continue to do, bounding upward at regular intervals as long as in sight, running always at great speed. The appearance of those animals in their flight was rather comical to my unfamiliar eyes.

In returning from California, the southern route was taken. After leaving the irrigation oasis in the vicinity of Los Angeles, the route traversed some two thousand miles of unbroken desert of most desolate and forbidding aspect. There was no bird life visible, except a few sparrow hawks and a few crows. I felt a concern for these poor birds, as I was unable to conjecture how they obtained a livelihood.

The welcome sight of an expanse of forest was not presented until after Houston, Texas, was passed. Our approach to the crossing of the Pecos River was heralded by the announcement that we were to cross the highest bridge on the continent, 365 feet down to the water. As the train approached, there was nothing in the appearance of the country to indicate the vicinity of a river, but we popped suddenly upon a deep chasm incised beneath the desert plain by the flowing waters of past ages, the desert features reaching up to the very brink of the cañon. The train paused some minutes on the bridge, where there is a foot-way from which the passengers were allowed to toss stones down into the rather insignificant stream at the bottom.

COAHOMA.

Some Animals I Have Studied.

XV.—The Truth About Squirrels—Queer Doings of Deer.

SOMEONE many years ago published an extravagant eulogy of the squirrel, picturing in poetical prose his beauty, grace, litheness, strength, and concluding somewhat like this: "Lithesome as a bird, free as air, and innocent as the angel that walks by your children." Innocent? Perhaps. That is, if hawks, eagles, tigers, lions, and all other carnivora are innocent.

In reality the squirrel is fierce, rapacious, not at all squeamish about violence or bloodshed. He is not merely prompt and brave in defense, but is mercilessly aggressive. Not that I condemn him for these propensities, for it is as easy to find excuses for them as for man's similar practices. But let us be right, even when sentimental.

Nevertheless the squirrel possesses many admirable qualities after taking the fullest measure of his common and uncommon faults. It is asserted by some that he is not wholly vegetarian or granivorous, but that he commonly eats insects, and occasionally mice also; and pet squirrels have been known to kill rabbits that were put in with them. One of our neighbors built a beautiful little house with fine wire netting sides for a menagerie, and put in, first, two or three fox squirrels, which soon became so tame that they would eat peanuts from the hand of even a strange man. Then some rabbits (I forget how many, but I think they were full grown) were added. One day in passing I missed the rabbits, and inquired what had been done with them. Mr. Gillen, the proprietor, sadly informed me that they had been slaughtered by the innocent-looking squirrels, every one of them.

I have known wounded squirrels to whip big, cowardly dogs—temporarily. A squirrel's teeth cut like a pair of scissors or like a saw, for the jaws move right and left with a sawing motion instead of up and down. His movements are quick, his strength is marvelous, and his cunning is probably unsurpassed. Many species of animals move the jaws in nearly the same manner, but probably no other can bite so severely in proportion to size. And certainly no other (excepting possibly mountain sheep and allied cliff-jumpers) can fall from so great a height with so little injury.

Squirrels not only fiercely fight general enemies, but one species fights another, just as one tribe of men fights another. Indeed, I have cause for suspecting that they sometimes fight individuals of their own kin and species—generally from jealousy. And in that sort of battle they are supposed to perform a certain malevolent act scarcely mentionable in a polite journal like *FOREST AND STREAM*, and unthought of by other animals lower than human; though others have, at very rare intervals, accomplished the same by accident—i. e., without choice.

The endurance of a very old male squirrel is almost beyond belief. Once I saw one driven from his hole by fire emerging with his eyes almost burned out, his whiskers gone, and his whole body singed, and ascending to a great height in a tall pine. There he was shot twice with a rifle, at last falling upon the rocks in a rough gorge below the root of the tree, where he "stood off" a pack of hounds and won a yelp from a large, cross brindle farm dog, until I put my foot on him, which I would not have done had I not wished to end his misery, for my sympathies were now with the squirrel, for which interference the said brindle dog attacked me! Judge C. Floyd Huff, of Hot Springs, can attest this story.

Now, I don't want the classification of animals rearranged, yet I sometimes think the squirrel should be given to the quadrumana instead of the quadrupeds, even though a rodent; for his feet are all practically hands, very flexible, very prehensile. In climbing, he does not depend at all on his claws (indeed they are often blunt as an old dog's), as does the cat; but clasps rough projections, however small or undiscernible, between the cushion-like knobs under each joint of every toe or finger. He cannot climb a solid, smooth, upright surface as a cat can; but give him a tree with rough bark or numerous limbs, or a soft, dead, rotten surface, and he can run all around any cat. Another proof that his claws are not needed, is the fact that he comes downward head first, instead of slowly and painfully backing down cat-fashion.

Exercising stealthy, Indian-like tactics, I have often concealed myself in favorable locations and studied the habits of wild squirrels; and no one who has not done so can realize what a wealth of entertainment he has missed. The study of tame or captive squirrels cannot inform one fairly of the complex character of those in a state of nature. They have their heroic, noble traits, as well as their selfish and cruel habits. Many a time I have known an old sire, suddenly approached and startled in his home tree, to refuse to dart into the secure hole containing the female and young; and not only bark warn-

ingly to his mate, but expose himself plainly to the hunter, as if to draw his fire, and even leap into another tree, at great risk, and thence into another, and still another, leading the enemy entirely away from the nest. And sometimes his exposures are so sudden, so unexpected, and his leaps from cover to cover so swift and bold, that it is no shame to the ordinary rifleman if the little schemer gets lost in the woods without a wound. I have even known a "father squirrel" to jump to the ground after being shot at, defying two men and a dog, and escape. Yet such is their understanding that they seldom risk coming down when a watchful dog is near. They seem to know that they cannot outrun a dog; at the same time they evidently feel assured that the dog cannot climb or shoot. Their idea seems to be that while in the tree they must dodge the man, and while on the ground the dog is most to be dreaded. But while in the tree trying to dodge bullets, they are so afraid of hawks that if any large bird, even a crow, flies over, they will frequently forget, or ignore, the gun below, and come scampering wildly down in search of a hole.

I have seen squirrels of largest size run out upon limbs so slender that they curved like a rainbow with them; then, nothing daunted, continue on outward over twigs small as slate pencils, at last hanging by a mere bunch of leaves, till, *mirabile visus* by a tremendous effort they leapt over toward the nearest foliage of a neighboring tree, several feet distant horizontally, but far enough below to enable them to slant within reach as they fell, sometimes catching by a hold as frail as that just left.

Our neighbor Armon once helped saw down a tall pine which broke off about the middle as it struck the ground, revealing a nest of young squirrels in its ample hollow. The mother escaped. Fearing the dogs might kill or injure the little ones (there were three, I think, yet blind and helpless), Mr. Arman transferred them to the hollow stump and covered that with a chunk that would have weighed about fifteen pounds, intending to remove the covering when ready to depart. He forgot it, however, and left it so. But next day when he returned, the chunk was moved slightly aside and all the squirrels were gone. He has no doubt that the mother wedged herself into the stump and rescued her babies. He does not think they were taken by an enemy.

There are comedies as well as tragedies in squirrel life. Sometimes they miscalculate and get ridiculous falls, at which even the jays seem to laugh. They laugh merrily themselves if they don't fall into water, and are not menaced by an enemy. They seem at peace with hornets along the Little Wabash, else, with their rude, rash ways, they'd get into many a "funny" scrape with them. But with all their skill and cunning they are now and then the victims of certain little inanimate things—burrs. A big red squirrel came dancing along toward a shock of corn where I was only half concealed with a large rifle. He, or others of his kind, had been there before, for there was a peck of shelled corn with the germs all eaten out, by the shock. He saw me too late to escape to the woods, so he started to run up a dead tree near by. But, ere he had risen twelve feet, he stopped with a wry face—there were burrs on his "elbows!" He bit one of them—one of the burrs, not the elbow—off. It stuck to his lips. Oh, what a face he presented! He grinned good-naturedly as he looked toward me, seeming to say: "Old fellow, don't shoot just yet. Don't you see, it wouldn't be fair!" He took one hand and pulled the burr off his lips. It fastened itself to his fingers. He tried to shake it off, but it adhered. Then what? Why, he reasoned; and with the same result as I have frequently observed in dogs and cats, namely: turning both lips back and carefully nipping the burr with bare teeth, it drops to the ground as soon as the jaws part again. Simple enough, apparently, but requiring undoubted forethought and great care. Dogs and cats soon learn this. And so did this squirrel; or else, if it was not his first trial with burrs, he suddenly remembered a former experience and promptly resolved to profit by it. After that he rapidly ridded himself of the burrs.

While talking of the many-sidedness of squirrels, I am reminded, by my own experiences with deer, that they, also, have not the simple, unvarying habits most people suppose, although their average intelligence is evidently very low in the scale of animate beings. (1) Instead of being always timid and alert, they are sometimes the most stupid and careless animals I know of (excepting rabbits) for a few minutes at a time. (2) They are not entirely herbivorous nor vegetarian, but eat a little of almost everything they come in contact with that they can at all chew. I believe they would eat meat, fat or lean, if the animal odor were completely disguised, even if the odorant happened to be some nauseous substance. I've seen them at least nibble at punk, rags, leather, paper, hair, minerals, greasy things of various sorts, tools of men, bits of household furniture etc. (3) The buck is not entirely selfish, but sometimes tries to defend the doe, or even a fawn.

I will endeavor to illustrate 1 and 3:

1. I have often placed myself within well-nigh arm's length of sound, wild deer without the exercise of any unusual or difficult caution. They were asleep? Well, not always; for on one occasion, at least, I walked up to two, one of which was feeding. She had her tail toward me, was in full view, in low grass, and I was walking on a hard, gravelly road, with a sack of meal on my shoulder. My approach could not have been noiseless, either, for I wore coarse, heavy shoes. I was so amazed that I stood still, within about twelve feet of her, wondering if I could pass on without arousing her notice. After what seemed like a long while, and as long a look at her as I desired, I went yet nearer, somewhat more cautiously than before. I believe I could have touched her with an ordinary walking cane (I hope Mr. Brown will not ridicule this, for I am "with him" on the dusky mallard question), but I had none. I stood there, trembling and panting with excitement, until the situation became tense and uncomfortable. Was the doe bewitched? Ahem! Still I was not noticed. I coughed. Then she looked back. Next she gave a startled jump. And in a moment I was startled, too, for up sprang a larger deer beyond her, and away they went, with a suddenness which proved that neither of them was wounded, sick, tame, nor in any manner disabled.

At another time I was running along a hard road, down hill, and passed within three feet of a pine log, parallel with my course, behind which three deer were lying, not at all concealed; and not one of them stirred

until my dog (Major, the clown), who was about a rod behind me, came up to them, when they sprang up and ran away all right. About two hundred yards distant they stopped behind a huge white oak and seemed to be fighting him; while he appeared to consider it the gayest lark of his life. He barked at them just as he was in the habit of barking at the hogs when romping with them. But I was on an errand for a sick man, and had to hasten on.

3. One evening, soon after I settled on my homestead, I heard a pandemonium of barking, yelping and howling dogs of every voice going by west of the house. Soon three deer—buck, doe and fawn, I supposed—crashed by, northward, closely pursued by a string of assorted dogs which seemed endless, for they kept plunging by all night and till nearly noon next day. A small white-and-black fiste was in the lead of the pursuers, and was so much swifter and fiercer than the hounds, that he occasionally seized some part of the hindmost deer, causing it to bleat piteously; and every time this happened, the buck would plunge back and scatter the hounds like chaff in a whirlwind, for they—or several of them—were ever close up at each effort of the fiste to stop the deer; but the fearless fiste would only turn from his intended victim long enough to defend himself. No retreating for him! Again the noble buck would race forward, the rear deer, which was usually the doe, I think, the fawn seeming to be kept purposely in the middle as much as possible, having put a few rods' distance between herself and her merciless pursuers during the slight delay. The buck made so many backward charges before they went over the hill out of my sight, that I could not avoid thinking he intended to do his utmost to save his companions; though I am told this is unusual for a buck.

Here I will halt in my animal biographies. If I write any more about them, it will be in story form.

L. R. MORPHEW.

HOT SPRINGS, ARKANSAS.

The Drum of the Grouse.

AITKINS, Minn., Nov. 6.—*Editor Forest and Stream*: In a recent issue, L. F. Brown asks if partridges drum in the fall. To which I answer, yes. Mr. B. will doubtless recall the lines:

"Hid in the woods are many subtle voices,
In ceric cadences through shadows coming;
Night, cloaking bashful tongues, rejoices
In owls who! who! and ruffed grouse faintly drumming."

Those lines were written in the deep wood in early October, and were suggested by sounds of the night as heard in a tent. Queer place to write poetry that might have done credit to a literary mill in Boston, but nevertheless true, as was the ruffed grouse drumming. That was four years ago, when for two months—September and October—the grouse drummed every day and all day; every night and all night. This year, under similar circumstances, with seemingly a far larger supply of partridges, there is very little drumming.

It is the old grouse that drums in the fall; possibly the young, but assuredly the old. The drumming is not made with the wings, but is identical with the rumbling noise made by the strutting turkey gobbler, the booming of the prairie rooster, sage grouse, and so forth. This cannot be said to be knowledge gained from close acquaintance, for the wild drumming grouse is hard to get on intimate terms with, except by the new nature school, but from general observations of all animals and birds as well as grouse as seen from the rear end of a shotgun, or while drowsing in the wood on warm days, or loafing in camp and field, I have noticed many accurate descriptions of just how the grouse did up the drumming act, and have wondered that someone who knew did not get up and smite the nonsense in the solar plexus; but then I reflected on what S. D. Barnes said about there being ten witnesses to defend an old legend to where one would stand for simple facts, and I realized that we are still in the grasp of the spook story and the new nature rascals, and herewith throw up the sponge.

E. P. JAQUES.

KELLER, Wash., Nov. 8.—*Editor Forest and Stream*: Ruffed grouse drum in the fall and winter in this country. I have killed them from their drumming logs many times, and have killed them from the top of a snowbank. This when the snow was late in going off in the mountains in the Clearwater country.

This spring an old drummer took possession of a log over a thicket about two hundred yards from my cabin. I went over one day and flushed the old fellow, and cut away the brush so that I would have a clear view from a little hill near, probably 75 yards; and I then left, and it was not long before the drummer came back, and I was ready to take a good look at him with my 12-power Zeiss monocular, which would bring him up so that he appeared to be not over ten feet; I could plainly see those feather-like hairs around his bill. I think I went and watched him at least twenty-five times.

When he would begin, he would stand up very straight, then would ruffle up his feathers, then strike two strokes with his wings. Then he would begin and go through, and at the finish quit with two strokes; but the wings seem barely to touch, and the wings do not touch the bird's body. I have several times shot them through the head, and when they fell on their back, in a depression, and while in their death struggle, they drummed as plain as they did when on the log or other projection.

About forty years ago a party of us hunting in the Blue Mountains above Dayton were camped in a rail lean-to, and a pheasant was drumming near camp. I asked one of the boys to go with me and we would see if we could not kill it by a torch light. He laughed, and said he did not care to go sniping. I then said to another, "Bill, let us go," and Bill said "All right." I split a torch, and we went toward the place from whence the drumming proceeded. It was one of the darkest nights I ever saw. We got to within about twenty feet of the big log, and the bird flew up into a white fir that stood near. I said to Bill, "I will climb the tree and see if I can't locate the bird." I got up the tree to where the limbs were thick enough so that I had no trouble in climbing. Then he gave me the torch, and I went on up; and when up about twenty feet I saw the bird not over six feet above me. I had my Colt's .36 revolver, and held

the light so that I could get a fairly good sight, and fired, and down came the bird. When we returned to the camp we had the laugh on the boys, and we roasted and ate the bird.

While going to Republic in April, I camped at Thirty-Mile Creek, where there is a service bottom, and there are probably a hundred acres in the flat. It began raining soon after we had put up our tent; it rained a little all night, and was raining in the morning when I woke up, and there was one continual drumming without any intermission. I never had heard such a thing in any place where the ruffed grouse are found. This fall, when I camped there again, we were out but a few minutes and got six birds, all we needed for our breakfast; we had killed all we needed for supper in traveling along the road. Deer are well driven back from the road, and it is late in the winter before they come in very near.

Bear are about as plentiful as usual. The salmon have been very scarce, and some nights the Indians catch only three and four. They seem to be a food of the past. A few years ago I went past the trap one morning, and the night before they had taken 2,600 out, and there were some fine ones. But say what you will, trout is preferred by

LEW WILMOT.

Sleeping Ducks.

Editor Forest and Stream:

Mention has been made in your columns of the alleged unwisdom of using the "universal negative." In a discussion, most men resent it. Yet no man ever really saw a live and foliated tree, as Ruskin has amply demonstrated. Likewise, no man ever saw exactly the same rainbow in any two consecutive instants. This is also true of clouds. And no two men, even when standing side by side, ever saw the same rainbow at the same instant. "No man knows it all," and often not even some part of that all of which he may feel very sure he has entire knowledge. Let the doubter look through a field-glass up and down a stream for five minutes, and note how much more he sees—proving the universal law of obscurity under which we live.

The above "universal negatives" are thrown in here just for good measure. And I now repeat what I have as yet only used as a general denial, but this time as a "universal negative," that no man ever saw two or more dusky mallards (*Anas obscura*) all asleep together.

Of course, this is intended to apply only to dusky mallards that are in a wild, free, healthy state, like the dusky mallards that Mr. Burroughs declared were all sound asleep—and not to birds dead, or also dressed and in cold storage; nor to those that possibly might be drugged or poisoned by abnormal air or food.

The following appeared in your columns last week:

"They proved to be two black ducks, * * * and their heads were so flat that as one lay partly behind the other, they looked like a short piece of a log. After watching them a while, I went to camp, got my gun, and shot one with my rifle barrel. If those ducks were not sound asleep, then I have never seen anything asleep in my life."

If two or more "black" ducks were seen "asleep" (one of them being shot while asleep!), and which were without a sentinel, then one or both of those ducks were not dusky mallards. It would be interesting to know just what the markings on those ducks were.

How can this shooter know that "black" ducks a rifle-shot away were both dusky mallards "sound asleep?" One or both of these "black ducks" might have been the ordinary brown mallard (*Anas boschas*), the shoveler (*Spatula clypeata*), which is of a dark olive brown, or the black scaup (*Fuligula marila*), or easily one of several varieties of the scoters; for all of them look black when "squatting" on ice. Both or one of them might have been of the numerous black hybrids or sub-species, or specimens of the brown sprigtail.

As Mr. Ackert has proffered a full exhibition next March of two or more dusky mallards "slumbering" while "standing on one foot with their heads under their wings," it is preferred to accept this proof when both sides will be present. When the proof is really furnished, it will be fully acknowledged here as to that special feature of this discussion, and to which gentlemen are, for manifest reasons, so eager to confine it.

Meanwhile, if Mr. Ackert will be my guest from next Christmas eve to the morning of January 2, I will take him over the Southern Railway to Goldsboro and Beaufort, and thence by boat to Ocracoke, on the outer North Carolina coast, east of Pamlico Sound, where he shall be made comfortable at The Hunters' Rest. But he must leave his gun at home, and use only field glasses, and the blinds on wheels, behind which he can advance to within fifty yards of redheads, mergansers, brants, and thousands of dusky mallards. Probably he can also do this with wild geese there. It will be strange if he does not be favored with seeing from one to four square miles of water "black" with ducks. He will see along shore and on the water dusky mallards, many "asleep," in pairs, quartettes, families and flocks, but will never see even two together without one is a sentinel for the other. And he must write and publish here a detailed account of his observations of groups, pairs, etc., of dusky mallards, and whether he saw any of the birds without sentinels. He could not fail to not only oblige, but greatly interest readers. I will agree to write nothing about the trip.

When, during many years, a man has observed dusky mallards, I insist that by perfectly legitimate reasoning he may safely state the above "universal negative." And meanwhile, here are a few little extracts from what the real naturalists have said about dusky mallards:

"Shy and vigilant. Many sentinels are seen on the look-out while the rest are asleep."—Audubon, Vol. VI., pp. 247-248.

"So vigilant that on the least alarm from the sentinel," etc.—Bailey's "Our Own Birds," p. 240.

But the ex-president of the American Ornithologists' Union, Mr. Elliott, is the present real authority on our wildfowls. His several books, and his work for the Smithsonian Institution, are well known. His work, "Wildfowl," published in 1898 by F. C. Harper, has this to say of dusky mallards: "Of all water fowl, it is one of the most cunning and suspicious. It has a keen sense of smell; and no matter how well one may be concealed in a carefully constructed blind, if the wind blows toward

the advancing bird, it will detect the sportsman's presence and remove itself from the dangerous neighborhood. It is rare when it will even settle among decoys. Watchfulness and ability to detect danger," etc. (p. 106). And he says of even the common mallard, a much less vigilant bird than the "duskies," that "They are in the habit of taking a nap in the sun's rays, having one or more of their number, however, to act as sentinels, and announce any approaching danger." (p. 103.)

Until after March, no further mention of this matter will be made by me.

L. F. BROWN.

Birds in the Zoo—A Suggestion.

WHILE the collection of birds of prey in Bronx Park is fairly representative, that of song birds, it must be confessed, is very poor. Whoever has visited the Zoological Gardens in London, or the Jardin des Plantes in Paris, cannot fail to have been struck by the contrast offered in this respect. Of course our institution is new, and it may be, and no doubt it is, the intention of the management to add materially to the present collections, not only of birds, but of beasts, as facilities for their proper care are provided. In this connection I should like to make a suggestion.

It is a well-known fact that when birds are crowded together, no matter how musical they may be individually, they make only a shrill discord, which is very trying to the nerves. But apart from the effect upon us it is a gross injustice to the song birds to herd them (if I may use the expression) with a lot of noisy "trash." I recollect that during a visit to the Zoo in Philadelphia, I was moved to something very like indignation at hearing the British blackbird—that beautiful poetic minstrel—endeavoring to sing while a South American jay kept squawking and a West Indian rail blowing his fish horn, as it seemed in envious derision.

I repeat it is a gross injustice to birds like the British blackbird, to condemn them to such company. Some people, I suppose, imagine that birds have no taste or feelings. Nothing could be further from the truth. We do not find song birds in a state of nature keeping company with the rabbit, or pouring forth their songs when they are liable to be interrupted by jarring sounds. How has our best songster come to have earned the designation of Hermit? No, indeed; song birds are not indifferent to their company or environment, but, on the contrary, are exquisitely sensitive and select. And we may well believe, too, that their music is a source of infinite joy and consolation to them. Rob them of it (as we virtually do when we place them side by side with mere vulgar makers of noise), and we do them a worse injustice than in depriving them of their liberty.

Now why, in the new arrangements at the Zoo, should not the famous songsters at least have little separate buildings or pavilions for themselves? There they could be happy, or as happy as it is possible for them to be in confinement, and then we could hear and study their individual lays in all their purity. How delightful in the springtime to have the bulbul from Persia singing in one pavilion; the nightingale from England in another, and so on!

I confess I have sometimes doubted of the benefit to be derived from gazing on a wild animal in captivity, but I have never doubted of the beneficent influence of birds. Their grace and beauty appeal to the æsthetic sense and their songs awake in us a joyous unison with nature, as it were. Assuredly when man comes to be perfectly civilized, as I trust he will some day, he will owe it not a little to music and not least to that variety of it which springs so marvelously from the untutored throats of birds.

NEW YORK.

F. M.

Monarch, the Big Bear.

Editor Forest and Stream:

One of our essayists—Lowell, I think—said concerning plagiarism that if someone found a way for transmuting lead into gold, no one would be particular about where he got his lead. This is not a reflection upon Mr. Allen Kelly's writings, for I have never heard of his "Bears I Have Met, And Others," but have ordered it by this mail, apropos of the controversy. My friend Mr. Barnum used to say to his critics, "Say what you please about me, but do not leave me alone." We must allow as much literary license to Thompson Seton as we do to Kipling. Literary genius is something that we have to accept as a whole, just as we buy a basket of peaches, and when an author has vogue he leads out into the light a lot of ideas that otherwise would have to shine in the shade. Thompson Seton's Redruff in "Wild Animals I Have Known" is recognized by the few who read my "Bonasa Umbellus, Rex" in a collection of sketches that was published a few years ago. That volume received more than one hundred press notices of such favorable character that for a while I associated only with celebrities, and always rode in a cab instead of taking the trolley car with the crowd. The book was displayed on the shelves of the Putnams and listed in their catalogues, but something less than fifty copies were sold, I believe, and this autumn publication was discontinued and the plates melted. Let no one think that I want literary fame, for I have trouble enough with my legitimate profession.

On Thompson Seton's country place there is a beautiful stream that has wet the pens of many admiring writers. Where does that stream come from? From my own country place. The whole business starts from several big springs in a romantic part of my forest, but no one would suspect that it began from anywhere excepting under Thompson Seton's line fence. He is welcome to all of the water that runs from my land on to his, and to all of the lead that I can dig up for transmutation. He may even describe me as a rough character whose language is unfit for publication, and with justification, for a stranger looking for farm help came into the field where I was working not long ago and said that he wanted to employ me as soon as I was through with that job. And as to language unfit for publication, one of my bulls got loose the other day and uprooted sixteen thrifty young

pine trees that had been carefully set from the nursery last year, and that were my especial pride. When Allen Kelly comes to New York again, we will hunt up Thompson Seton and get L. F. Brown to bring along a copy of Kipling, and we will all go over to the Metropolitan Club for a good dinner at my expense.

We do not always stop to consider how much benefit may result from having things taken from us. Another one of my neighbors, Sam. Taylor, of the Rider and Driver, has a lot of beautiful thoroughbred horses that can jump over things like philosophers, and when they all get into my garden do I object? Not a bit of it. People driving through the place think they are my horses, and that I can afford to feed them on green peas and celery, and it gives me such standing that the bank no longer sends notice that my account is overdrawn.

Then again there is often nice etiquette in such matters. When Caribou Charlie and I were exploring a wild Labrador river we took along three canoe paddles as provision against accident. Two Indians coming down river with one whole paddle and one broken one stopped to talk with us, and on departing the Indian who spoke English said: "You haddum tree aviron ki tchiman. Me haddum one aviron nin tchiman. Now you gottum two aviron. Me gottum two aviron." It would have been a breach of etiquette of the country to have claimed our paddle. It was not a case of theft, but simply one of plagiarism of a paddle, and the Indians appreciating its fine workmanship thought more highly of us for having furnished it.

ROBERT T. MORRIS.

NEW YORK, Nov. 7.

Wild Pigeons or What?

Editor Forest and Stream:

A few days ago a small telegram from Chardon, Ohio, appeared in a Cleveland paper giving an account of a flock of about 500 pigeons that had passed over this town of Chardon, flying south.

I set this down at the time as being a reporter's yarn, and paid no more attention to it then; but since then I have seen a more extended account in two local papers, each account by a different correspondent, so there may be some truth in it after all. The best account is this one, given by the Corry, Pa., Leader:

CHARDON, O., Nov. 1.—A flock of fully 500 wild pigeons passed over Chardon Saturday afternoon. Hundreds of people who are familiar with the markings of the wild pigeon witnessed the sight. The flock was also seen at Aquila Lake. The reappearance of these birds after an absence of twenty-three years, has caused considerable speculation among the sportsmen of this locality. Wild pigeons were last seen near Chardon in April, 1883.

The last great flight of these birds in northern Ohio was witnessed in the spring of 1876. The pigeons reappeared in the spring of 1877, but in greatly diminished numbers. Their total disappearance later caused the belief to become general that the birds had been annihilated by market hunters. For years the Smithsonian Institution has had a standing offer of \$1,000 for a single specimen of the American wild pigeon. At various times the presence of pigeons has been reported in remote sections of foreign countries, but all efforts to locate the birds in the United States have proved fruitless.

These pigeons, if that is what they were, and I begin to think now that they may have been pigeons, came across Lake Erie from Canada. Chardon is about twenty miles due south of Lake Erie.

CABIA BLANCO.

[These may have been passenger pigeons, but we have spent some time in the past running down and proving false similar reports, that we are disposed to doubt it. If the reporters' statements about the pigeons are no more trustworthy than that about the Smithsonian Institution and its \$1,000 reward, even the most enthusiastic naturalist is not likely to lose much sleep over the Corry Leader's story.]

Travels of Prairie Chickens.

AN Emporia man advances the theory that prairie chickens are so scarce about Emporia now because they migrate west every spring to hatch their young. This sportsman was out trying to find some the other day and failed, although he went clear to the Flint Hills.

All the farmers along the way told the same story. Each said there was a big bunch of chickens on his farm until spring and they then disappeared. The farmers thought it was nothing strange that the chickens should go west to hatch their young, and are looking for chickens to come back next winter.

As a matter of fact, prairie chickens are not among the migratory birds, but the chickens in this part of the country seem to be adapting themselves to conditions. This country is being settled up closely and put under the plow, and the birds want wilder territory, where their young will be safer than in a well settled locality. Then in the winter the birds come back to the cultivated country because there is plenty of food in the fields.

Last year the attention of sportsmen was attracted by great flocks of chickens that came in from the Northwest in the duck season. It was the first time they ever saw chickens migrating. A flock was seen near Americus which was said to have had 400 chickens in it. Last winter there were a number of flocks of chickens within four miles of town, which was an unusual thing. The birds were supposed to have come in from western Kansas to get the benefit of the plentiful supply of kaffin corn, which the chickens relish.—Emporia Gazette.

It is astonishing how quickly the foreigner degenerates in Africa. He is himself conscious of this degeneracy, but is apparently powerless to overcome the downward tendency. Climatic conditions influence the mental and moral as well as the physical and social environments. Africa is the home of some peculiar maladies; among the most violent are the fever, the ulcer, the kra-kra, and the yaws. A stranger in coming to Africa is sure to have the African fever or its equivalent, which sometimes manifests itself in an ulcer which has been known to fasten itself upon the body with all its hideous consequences for more than twelve years. The climate and the fever leave the victim with his energy gone, his health impaired, and his will shattered. Europeans find it necessary to make trips to the Madeira Islands or to the continent to build up the waste places, for which there seems to be no remedy here.

GAME BAG AND GUN

A New Brunswick Hunt.

THE Province of New Brunswick, in the neighborhood of the Tobique River, was once noted as a favorite resort for caribou, but for some reason this fickle, migratory animal has become somewhat scarce in that locality. The moose has become more abundant. Various reasons are given for the diminishing number of caribou and the increased number of moose, but I do not undertake to explain the cause of the change. There are certainly quite a number of moose in the country, and if one is not too eager to shoot the first chance he gets, and will wait till he sees a good head, a hunt of several weeks ought to secure satisfactory results. The law allows a sportsman only one moose, and that fact should make him careful about bagging anything which comes in sight.

The true sportsman should form a resolution to carry out a good trophy or nothing. It is pitiable to see what rubbish some people will lug out of the woods; heads that are wanting in size and defective in fair proportions. The head of the moose lacks the grace and beauty of outline which characterize the elk, the only large animal of this continent which can compare in size, and so it must make up in massiveness what it lacks in other respects. An elk's head is almost invariably beautiful and graceful whether large or small. In securing a trophy you can afford to be more independent of size in getting an elk head than in getting the head of a moose.

The attractiveness of a moose head consists largely in its grotesqueness, and the size has quite as much to do with that as its shape.

If you intend to hunt in New Brunswick, a great deal depends upon the kind of hunting you desire whether you go early or late in the season. In the early part of the season, say from the first of September to the 25th of October, there is little or no snow, and it is extremely difficult to get any large game at that time by stalking; the ground is covered with dry leaves and brittle wood which make considerable noise at every step. At that season you must depend largely upon canoe work and calling for moose, while caribou and deer are still more difficult to hunt during that time.

The moose frequently come down to the water, of which they are very fond, and in which they bathe and wallow. The caribou are less apt to frequent such spots. Calling is a favorite method of bringing moose within range, but great care has to be exercised, for a single false note and your noble quarry, instead of accepting an invitation to a funeral, which he is to grace, will retire to a place of safety.

When there are a few inches of snow on the ground, hunting becomes more attractive to the true sportsman. Instead of sitting in his canoe waiting for something to come within his range, he is vigorously exercising his muscles and his knowledge of woodcraft to secure a shot, and often his skill is put to a considerable trial in shooting through thick timber.

There is nothing more improving to health and conducive to happiness than strenuous exercise in the cold bracing air, with sport as an incentive. Whatever may be the outcome of your hunting, you are sure to take out of the woods with you an increased supply of vital energy and robustness which after all is very important. If your hunting should not furnish you with such tangible results as you would like to see, console yourself with the reflection that a very wealthy man once offered "a million dollars for a new stomach," and perhaps you have secured an equivalent for a great deal less.

Early in October of this year I joined my guide at the forks of the Tobique. We immediately started out in a canoe, into which I packed all my things, to pole up the Little Tobique. The water was pretty high, and this increased the difficulty of ascending a river which naturally contained a strong current, diversified by rocks and the debris of stray logs and woodland refuse. The sturdy skill of the guide was considerably taxed in spite of the small assistance rendered by me with the paddle, and yet I was of some assistance in forcing the canoe over places where there was no poling bottom. In about five hours we reached our destination and put up at the camp, which consisted of a very commodious log cabin, where we found the cook, who soon began to busy himself in preparing the evening meal. The two succeeding mornings I got up before day, while the stars were still bright, and returned late in the morning, having as a reward for my pains a good appetite and plenty to satisfy it, when I could succeed in getting it down. The third morning both the guide and myself overslept, and with a blush of shame I encountered the glare of "Old Sol" as he fiercely drove his burning rays down upon our heads.

It seems that the same morning a lazy bull moose had been guilty of the same offense, and appeared at the bank of the river to take his belated bath just as our canoe came dancing and twisting down the swift, turbid stream toward him. The big bull did not seem in the least concerned, although every moment we were rapidly drawing nearer. If he had been standing in the water, I believe he would have let us run into him had we been disposed to do so. With a quick movement of the paddle the guide turned the canoe so that I could secure an easy position to shoot, and then a sharp crack of the Mauser rifle, followed by the heavy swaying motion of the animal as he sank with a deep groan to pour out his life blood on the sand, closed the incident.

The head measured 52 inches and was quite shapely. As I surveyed the prostrate form of this pride of the Canadian forest, I thought that it was no particular skill of mine which had brought it within easy reach and secured me a fine trophy. It seemed to me as though the original owner of the antlers had almost made me a present of them. We do not appreciate anything so much if it comes into our possession too easily. I would have

been better pleased if his "royal nibs" had made the shot more difficult and had given me a chance to exercise my skill. He may have mistaken me for one of those sportsmen who tremblingly pass the gun to the guide and ask him to shoot.

During that time I saw another moose which I declined to shoot, because, as I informed a friend, I had all the law allowed, and for the further reason that "it had no head." When I informed my friend that the moose "had no head," he seemed somewhat incredulous, but after I explained that this was "an Irish bull," he seemed better satisfied.

During the rest of my sojourn I had considerable amusement with my .22 automatic Winchester, which affords plenty of practice without making too much noise, in shooting at a mark, and is also useful for small game.

The return trip home was diversified with the experience so common of the transition from the rough camp life to your own fireside, when you sit in an easy chair and talk it all over with your friends. Sixty miles of paddling down the Tobique, ever impelled by its rapid though wayward current, which required the constant correction of your course, and interrupted the survey of the beautiful banks decorated by the virgin forest for miles, marked the first day's journey. The next day a ride in stuffy cars over a second-class railroad until you finally land in a Pullman coach and spin along at the rate of sixty miles an hour. Perhaps you pick up a chance acquaintance with one or two sportsmen who have just returned from a similar outing, and tell you of their mighty deeds which lose nothing by repetition; you shrink within your modest little self as you listen, for you know you have accomplished nothing which will stand well in comparison.

On my way back I met several sportsmen, one of whom related to me his exploits, which were very tame on first recital. We were sitting in the smoking apartment of the Pullman, when presently two other sportsmen came in and we got into conversation over our different hunting experiences. The two sportsmen who came in last related the wonderful feats which they had accomplished. After they had talked themselves out, my first acquaintance, much to my surprise, who had been so modest in what he related, took a fresh start. I think a couple of good drinks, which stimulated his imagination and stirred his personal pride, had something to do with it. With an eloquence which truly surprised me he added the "verisimilitude of truth to otherwise bald and uninteresting statement of facts." It was evident that the newcomers were outclassed, for my modest friend was not only gifted of tongue, but he told his story last. I have discovered that there are more ways than one of establishing a reputation as a sportsman, and sometimes the "gift o' gab" is more important than skill in handling a rifle.

E. F. R.

NEW JERSEY.

In North Carolina.

RALEIGH, NORTH CAROLINA.—The partridge hunting season has begun in almost all of North Carolina, and as predicted, there is a very good crop of birds, with a great many youngsters among them. Old hunters who devote themselves to prowling around the woods at night in search of the toothsome 'possum, declare that the young 'possums have a lot more sense than the old ones, because they always climb the biggest trees they can find, whereas, nine times out of ten, the old 'possums climb the little tree. In fact, this peculiarity has come to be a by-word among hunters. Just so, it seems, the little partridges have learned how to alight in trees, and sit very close to the body of the tree. By doing this they look exactly like a knot on the limb, and can deceive the keenest eye, while of course a dog cuts no figure in such a case. The old birds are learning this habit of taking to trees, and I find that all the sportsmen are talking about it; not only so, but about the long flights the grown birds are making—three hundred yards, four hundred yards, five hundred yards, and even six hundred yards, at one burst. Time was when if the birds were flushed in an open field they would fan out, so to speak, and there was a picnic in picking them up one by one; but now they make a mad rush for the nearest woods or heavy shelter, and go clear out of sight in their flights. There will be more sportsmen in the State than ever before the season ends. Last year there were about a thousand registered sportsmen, and no doubt some slipped in from Virginia and South Carolina who did not pay the \$10 license tax to the Audubon Society.

Speaking about 'possums, one of the funniest trials ever held here was one in which a negro boy with a little body, big appetite, and very fine taste, was before a magistrate on the charge of having found, just before the season opened a lady 'possum with her dear little brood of about a dozen 'possumlets. He had no compunction, but killed mamma then and there, and took away the little ones in order to raise them. The game warden here prosecuted him, and he was convicted and sentenced. All the little 'possums died, and the loss of so much highly prized food naturally set the old hunters against the youngster. Nothing on earth is more prized than a 'possum, and a wag once remarked that he would like to see the effect if one of them were taken into a negro church during a revival meeting. He intimated that it would break up their affair. The writer has been out twice after 'possums since the season opened, and has walked ten miles each time to no purpose; but yet there are plenty of 'possums. Barbecued, with hot sauce, baked sweet potatoes on the side, and hot corn bread cooked thin and well done, they beat any food which four-legged animals furnish. Why people up North have not caught on to their goodness passes comprehension.

There are plenty of bears in North Carolina, and these are both in the mountains and in the extreme eastern counties. Mr. and Mrs. W. L. Pierce, of San Francisco, have come to North Carolina after them, and have started in hunting around Mount Mitchell, one of the wildest parts of the United States. In this region, and part way up the mountain, lives "Big Tom Wilson," who has with his rifle shot 150 bears, while his son has a good number to his credit, the son's wife also having shot several.

This seems to be a very good season for large game in this State, and it will really pay sportsmen to visit the mountain and eastern counties after bear and deer. Waynesville, in the mountain region, is a good point to start from; while Newberne, Morehead City, and Wilmington are good points in the east.

By reason of their courtesy to the son of the late Edmund S. Heath, of Newark, N. J., the Messrs. Dortch, well known and delightful sportsmen of Goldsboro, N. C., have received bequests amounting to \$11,000. This Dortch family is well known in this State, not only for being good shots but for breeding good dogs; in fact, typical Southern gentlemen sportsmen. Charles Heath, who was their personal friend, visited them each winter until he died. Until two years ago he hunted every season with them, but when he returned his health was poor. He came South in an endeavor to recuperate, and went to their home, where he was just the same as a member of their own family, a dear friend to them, and greatly liked by all the people. He died suddenly, and these gentlemen went with the remains to his New Jersey home. His grateful father never forgot their loving kindness to his son, in health and in sickness.

FRED. A. OLDS.

KINSTON, N. C., Nov. 11.—Quail shooting in this section is better this season than we have had in several years; in fact, all game known to this section is more plentiful than heretofore. A good many birds were left from last season to raise from, and we had a very favorable spring and summer for their raising, it being very dry about the time they were hatched, and not too much rain at any time till the young birds could fly. People are also more particular about keeping their dogs shut up. Loose dogs do more damage two months in the spring of the year than all of the shooters do in the five months of shooting season.

I. M. TULL.

Tiger Nights in China.

From the South China Weekly Post.

THERE is no dearth of tiger stories in South China, but it does not often occur that a more interesting authentic yarn comes to hand than the tale of the hunt which has lately taken place at Yik Ma, a village not half an hour's ride from Pakhoi.

Three weeks ago news was brought in that a pair of tigers had taken possession of the cover near the village, and during the evenings and nights paraded the street and held up the villagers, levying toll on pigs and dogs, and, it was said, children.

Two of the foreign sportsmen immediately made Yik Ma their headquarters, and found the paddy-fields in the vicinity trodden by the beasts, and the inhabitants in a state of panic. Previous to their arrival, a beat had been organized by the natives, the result being simply that one was badly mauled and the tigers in status quo.

At the time, July 25, the moon was nearly full, and the foreigners tried the easiest method of bagging the tigers, sitting over a pig at night. They were ensconced in a tree for some hours, and found it a method necessitating more patience than the average man possesses. The tree was the abode of more ants than they had imagined were contained in the whole province. Mosquitoes were in myriads and very hungry to boot, smoking was strictly prohibited, and talking not tolerated; and after an hour, cramp assailed them in every limb. Moreover, piggy, more philosophic than the tiger slayers, went to sleep. One of our friends, who shall be called B. in this narrative, with more courage, perhaps, than discretion, came down and prodded him to a sense of his duty, till the welkin rang. B. had just reached the foot of the tree, and it was very difficult to climb, when A. noticed, in the very poor light which the clouded moon afforded, a huge dark mass noiselessly detach itself from the cover—some forty yards away—and come swiftly toward the tree, piggy and B., who were all in his line. With a word of warning to B., who could not see the tiger, he fired several times after the first shot, more with the idea of frightening off the tiger from B. than of wounding him. Within three seconds or so tiger had retired, with piggy, who, after the first squeal of terror, lapsed into silence, whether of fear or death it is impossible to say. It was so dark at the moment that little could be seen; the beast was a grand old fellow, but his motions were so snaky, and the light so bad, that it is no wonder that he was missed. A curious fact is that he deliberately seized and carried off the pig in the face of a rapid fire.

The sportsmen went home sadly. On the next day, a beat of the surrounding cover was made, but no tiger was seen, the bushes were very dense, and the beaters terrified and lazy. It is next to impossible to make them keep line or go well into cover. The army presented a grotesque appearance, every weapon imaginable being carried, even an executioner's sword and the dummy pikes and halberds usually seen in front of yamens; gongs and kerosene tins being beaten as an accompaniment to the deafening howls of the mob.

On returning to the rest-house the tiger was reported

to have been seen lying in a sweet potato field outside the house during the beat, and sure enough, there were his tracks.

Night after night the two sat up in various trees over dogs, pigs and goats, but, although the tiger was seen on several occasions at some distance, no shot was possible. On one occasion fresh tracks were found in the morning, showing that he had come straight up from behind in the shadow to the tree in which the two sportsmen were presumably asleep, and had stayed there within a very few feet; and, probably, there was a smile on the face of the tiger.

This was a very big male, and must have been nearly, if not quite, ten feet from tip to tip. He was obviously not accustomed to be crossed, and prowled at first very openly by day and night. He avoided Europeans, but paid little attention to the natives who frequently met him. He did not seem to be a confirmed man-eater, as he had had many chances of carrying off the villagers.

After a few days he became very wary; wherever the sportsmen sat up, tracks were found somewhere else, and frequently the pad-marks were so fresh that he must have been about a few minutes before they were seen. On one occasion they watched till sunset and went home for dinner, intending to return when the moon rose, leaving heavy impedimenta, spare rifles, ropes, etc., under guard of a shikar in the tree. Hardly were they out of sight when Mr. Tiger appeared, and the coolie fired and missed him.

Meanwhile the tracks became more numerous and of various sizes till it was quite evident that there were at least four or five tigers in the neighborhood, two being cubs, and one apparently a medium-sized tigress. On Sunday, Aug. 7, at dawn, B. was watching in a tree alone, when the biggest tiger emerged from cover and gave him a fair chance. B. gave him two bullets, and he bounded off into cover, leaving traces of blood. B. then organized a beat, going through the cover himself at the head, the only possible way of keeping the men at all in order. Presently, with a growl, the beast turned like lightning from deep cover, and mauled a beater slightly, clawing his heel badly; B. followed him up, and presently got a broadside shot into his ribs at ten feet with a single-shot .44 rifle.

The tiger luckily did not charge, for on B. turning to his carrier for his second rifle, he saw him in full flight howling. A. then arrived, and they ascended two trees at the extremes of the bit of cover, where the tiger obviously was lying. Hardly was he up, when B. heard panting underneath him and saw the brute. He fired, and the tiger rushed forward with a terrifying growl right through the bushes under A.'s tree, reaching thick cover, where he hid. A. could see a section of ribs between the boughs, and lodged a Dum Dum bullet where he judged the shoulder to be. The wounded beast turned a somersault backward and made a convulsive rush back toward B.

Thinking him finished now, the beaters were called back, and he was left awhile to stiffen or die, and later B. went into the cover to find him. Hardly had he gone twenty yards when a second and smaller tiger sprang at him. B. tripped and was helpless, and in a moment the brute was biting his legs. He instinctively drew his legs up to protect his head and neck, and succeeded, for after biting his ankles and calves, the beast sheered off. B. managed to crawl out of cover, and then collapsed after a most marvelous escape. Whether it was the tigress or a well grown cub, it is impossible to say. B. was carried back to Pakhoi in great pain; but now, we are pleased to learn, he is doing well. He is to be greatly congratulated on such a comparatively easy escape from his encounter with a beast which could, with one blow, have thoroughly avenged the four bullets in her lord and master.

The villagers report many stories of these tigers within the last few days. It is said that every evening the wounded old male drags himself on his fore-paws to some stream or other to drink, bleeding and partly paralyzed. Moreover, six tigers are now seen, some of them foraging for their wounded father, whom, the Chinese say, they actually have been seen to drag to and from the water. On the 9th inst. no less than three parties of foreigners were waiting in trees in the vicinity, but did not see any tiger, though the villagers say that next morning two, one wounded and another, came to water. While the former drank, the other stayed on a small hill hard by, watching, eventually chasing a woman who passed, but doing her no harm, returning to his drinking friend, and they disappeared together in to cover.

The vitality of this tiger is marvelous. He is bleeding continually, carries four or five bullets and howls with pain at night. The villagers' stories are to be taken not too literally, but it seems extraordinary that a small village so close to Pakhoi should be infested with these brutes.

The nature of the country presents great difficulty for their extinction, as the cover, though not large, is very dense, in some places almost impenetrable and straggling in many directions. Beating is almost impossible, accidents being almost inevitable owing to the lack of pluck and discipline in the men which can be employed; but we hope greatly that one day soon the tigers will be bagged. The accident and the pluck which occasioned it have made every one eager for vengeance.

Currituck Duck Shooting.

REPORTS of the duck shooting at the opening of the season on Currituck Sound indicate an abundance of birds. Food is abundant, and already the ducks and geese have made their appearance in large numbers. It is understood that at the Narrows Island Club, where six members were present, the first day's shooting yielded 146 birds, and the second day 193. Geese, as usual in that favored wintering ground, are very plenty.

It seems altogether probable that the results of the abolition of spring duck shooting over a considerable portion of Canada and the northern United States are already being felt, and in the course of a few years the observance of the law may result in a great increase in the number of birds.

In New England.

BOSTON, Nov. 12.—*Editor Forest and Stream:* The regular November meeting of the State Association was held on Thursday evening, November 10, with President Hinman in the chair. There was a good attendance, and twelve new members were elected. A vote of thanks was tendered Messrs. C. W. Dimick and O. R. Dickey for the assistance rendered by them last spring in obtaining and distributing quail. A nominating committee, of which the librarian, Dr. E. W. Branigan, is chairman, was named by the president to present a list of officers for the coming year at the December meeting and which will come up for final action on the second Wednesday in January, the date of the annual meeting.

Several members spoke of the scarcity of quail and partridges in their respective localities. Ex-President Reed, recently returned from Princeton, tells me he saw very few birds, securing only a few woodcock. In that section the ruffed grouse are almost extinct. Mr. A. B. F. Kinney says a similar condition exists in the whole region about Worcester. Mr. Herbert E. Tuck, of Haverhill, reports that he has been out but did not take his gun; instead he took a camera with his dog. Most of the gunners there, he says, are exercising praiseworthy restraint, but "of course we have a few that would shoot the last bird if they could, and they are of the kind that would not give a cent toward restocking, and then will kick because the birds are all gone." He reports that some of the quail have bred this season and a "few flocks are seen." His friends who have been in the brush say partridges are scarce. He has done some hunting in New Hampshire, but did not find birds numerous there. I hope soon to secure information regarding conditions in the western part of our State.

Messrs. Dimick and Dickey returned a week ago from the east central part of Vermont, where they were out for a couple of days and did not meet with their usual success. From Maine come many reports of excellent bird shooting. One friend, just back from Nova Scotia, says "We got a good number of birds, but had to work hard for them, some of the time wading in water several inches deep." Three Hyde Park sportsmen who have a stand a few miles out got ten out of a flock of twelve geese.

The Vermont Legislature at last accounts were still wrestling with the deer question, some members working to abolish the open season, others to shorten it one-half to five days. One member characterizes the deer shooting of this season as merely "a slaughter of pet animals" that had become a part of the farm stock as much so as the cattle. He calls it unmanly slaughter, declaring there is room for "ten times their present number" without causing material damage to offset the charm which their presence gives our State.

Last Monday was the banner day for game receipts at Bangor—137 deer, 8 moose and 4 bears (and a few more expected by a later train). E. D. Atherton, of Boston, got one of the moose, and John J. Warner, also of Boston, secured one of the bears. Thirty heads went to Bangor and Portland taxidermists for mounting. Fully half the total were killed by Maine hunters. The receipts on Friday, November 11, were 84 deer, 3 moose, and 1 bear. C. E. Vitter and another New York hunter, and one from Portland got moose. Half a dozen Boston men secured deer, among them W. A. Washburn and W. E. Wyman. A host of hunters are now on their way into the woods to be on hand when the snow comes to enable them to track the deer. Up to Friday night the Bangor receipts for the week were 494 deer and 19 moose, as against 670 deer and 20 moose in the corresponding time of 1903. An albino deer has been shot by Mr. Hedge, of Plymouth, near Eustis. Isaac Taylor, of Taunton, killed a loup cervier near Spotted Mountain. CENTRAL.

Mr. Hallock is Out.

PLAINFIELD, Mass., Nov. 11.—I sold my only gun a day or two ago, and went out of business. It was a 2-shot 12 gauge "Bill Golcher" hammer gun, bought in St. Paul in 1880, and has done good service in a great part of the United States and Canada. I never moved anywhere across country without it. My last shot was fired October 3 at a swinging target. Lieutenant Butler, of the Sons of Veterans Camp here in Plainfield, who purchased the gun, says it is a very good pattern of No. 7 shot evenly distributed. The distance of target from firing point was 50 yards. That lets me out of the tournament at 70 years of age with a tall feather, especially as I never was a crackerjack, don't you know. I used to have quite a variety of shooting irons when I was in my prime, but the arsenal was disbanded quite a while ago, and Bill Golcher has been my only companion since. CHARLES HALLOCK.

Where do the Little Ones Make Tracks?

Editor Forest and Stream:

While not a hunter of the deer, yet I have frequent occasion to invade the haunts of *Cervus virginianus* in search of the "small deer" of our fauna, in which I am somewhat interested. These trips are usually made in the company of a learned friend well versed in the ways of our larger mammalia, and we not infrequently run across deer signs, and the accompanying track of what is unhesitatingly pronounced that of a buck—a big buck. So, too, I hear now and then of neighbors or acquaintances seeing the track of a "big buck." True 'tis that the tracks it has been my privilege to see do look big; and I find it no difficult task to descry in the mind's eye a lordly buck, adorned with a pair of regal antlers, proudly borne aloft as he pursues his stately; yet no doubt alert, way through the forest glens and upland meadows. Nilly-willy, the resonant lines from Sir Walter surge to mind,

"The stag at eve had drunk his fill,"

as we follow for a few rods along the trail writ plain in the ruck of autumn leaves turned slightly awry by the long dangling toes, punctured here and there by deep-sunk hoof marks which seem ever to just graze the prostrate twigs which would crackle as they break were he to step on and not beyond them. My friend finds it no

difficult matter to follow in his wake on such a tell-tale trail for great distances.

But what I am driving at is, where, oh, where do the deer which are not "big bucks" walk abroad? I am fully aware that the deer family is not composed wholly of these stately lords of the harem, and that somewhere in the dark recesses of the forest dwell the coy does, spry spikes and shy fawns. And yet it has never been my fortune to have pointed out to me the trailing track of one of these lesser ones. From a nearer view I know something of the biggest fish and why he inevitably gets away, and can readily make allowance for the "big buck" that the huntsman hit though it got away by reason of a defective shell or through being a mile or so distant when the shot offered. But for the life of me I am still unable to fathom the mystery as to where the cunning does, the frisky young spikes, and the pretty spotted fawns walk when they go a-feeding or an airing. Will some mighty Nimrod from among your gentle readers, better versed in the wiles and the ways of the woods, rise to explain why 'tis only the tracks of the big bucks that we see? WILLIAM WALTERS CHAMPION.

WILLIAMSPORT, November.

The Government's Importation of Camels.

From the Twentieth Annual Report of the Bureau of Animal Industry.

BY CHARLES C. CARROLL, A.M.

IN the early "50s" the Government was sorely beset with difficulties in protecting the vast frontiers of the country from ravages of hostile Indians. The transportation of men and supplies over the great reaches of plain, mountain and desert that stretched between the Mississippi River and the Pacific coast was a problem that swallowed liberal appropriations of money and used up thousands of mules, and was in the end so poorly solved as to chafe and fret the spirits of successive commanders. The roving Indian, with his agile pony that enabled him to make deadly swoops on isolated settlements and escape with ease, was a continual nightmare to the War Department; while the unprotected condition of the Pacific coast, so remote and so painful of access, disturbed it no less. Under these circumstances it occurred to the military officials that the use of the camel might at least aid them in performing the difficult duties of protecting the expanding frontier and keeping open a line of communication between the Mississippi and the coast.

The idea of translating this old servant of mankind from the East into America was not a new one. After the conquest of South America by the Spaniards, it is recorded that Juan de Reineza, a Biscayan, made an attempt to introduce camels into Peru, and toward the end of the sixteenth century camels were seen near the foot of the Andes by José Acosta, the Spanish missionary and writer. But the animals were not looked on with favor by the ruling Spaniards, and they dwindled away. In 1701 a vessel, probably a slave trader, brought some camels from Guinea to Virginia, but no record remains of the enterprise except that it failed. In the early times camels were brought also to Jamaica and employed there with success until a small insect, called the "chiqua," so we are told, got into their feet and ended their usefulness.

Maj. George H. Crosman was the first of our military men to consider and advocate the use of the animal for military purposes in this country, the transportation difficulties of our stubborn Indian war in Florida convincing him that camels might be used with effect. He made a study of the subject, and about 1836 brought it to the attention of the authorities. His ideas were taken up by Maj. Henry C. Wayne, whose studies on the subject were more complete, and who, as early as 1848, suggested to the War Department and to members of Congress the plan of a Government importation. At about the same time Jefferson Davis, then a United States Senator from Mississippi, was impressed with the desirability of trying the animals, and, as chairman of the Committee on Military Affairs, labored until he left the Senate (in 1851) to secure some practical test by the Government.

The suggestion that camels be used in this country for travel, for carrying the mails, and for transporting supplies is frequently met with in the newspapers of the "40s." These suggestions were made both by tourists from other countries, surprised at the wide extent of our territory, and by observant Americans who had traveled in the Orient and had become acquainted with the universal use of the animal throughout all of the eastern countries.

John Russell Bartlett, who was appointed in 1850 by President Taylor as a commissioner to run the boundary between this country and Mexico, on making the report of his three years' service in that work, strongly urged that camels be employed by the Government in the Southwest. At about this time, too, Prof. George P. Marsh, the philologist and diplomat, who served this country as minister to Turkey and to Italy, published an instructive book on the camel "considered with reference to his introduction into the United States," taking the ground that an energetic attempt to import and use these animals could not but result in success.

In the winter of 1852-53 the proposition was made to the Committee on Military Affairs in the Senate to authorize the Secretary of War to import thirty camels and ten dromedaries, together with ten Arabs to look after them, the proposal being supported by a paper of some length by Mr. George R. Gliddon, the archaeologist, who had lived twenty-eight years in the Levant, and was, during eight years of that time, United States Consul at Cairo. No measures were taken, however, by that Congress to provide for the importation.

When, in 1853, Jefferson Davis became Secretary of War in the Cabinet of President Pierce, he came more intimately into contact with the troubles of military transportation in our great West, and resolved to give the camel an opportunity to lessen these difficulties. Major Wayne was asked to prepare some remarks on the subject, to be used as the basis of an appeal to Congress, and he wrote a paper in favor of the project.

This paper was liberally drawn upon by the Secretary when he submitted his annual report and recommendations in December, 1853. This report, which was transmitted with the President's message to Congress, aroused a good deal of interest on account of the general belief that something could be accomplished with camels in this country. After reciting the dangers of the slow transportation between the East and the West, and giving in detail the results of an exploration which had been ordered by Congress for the purpose of locating the best route for a proposed transcontinental railway, Secretary Davis said that even such a railway, if built, would but partly remove the difficulty. It would serve to transport troops and to supply depots along the route and at the extremity of the line, but there would still be vast reaches in the interior too remote from its depots materially to feel its effect. "On the older continents," he continued, "in regions reaching from the torrid to the frozen zones, embracing arid plains and precipitous mountains covered with snow, camels are used with the best results." They carry all the commerce of central Asia, and have been used from the mountains of Circassia to the plains of India to transmit dispatches, draw ordnance, and as a substitute for dragoon horses. The example is cited of Napoleon who, by the use of the dromedary in his Egyptian campaigns, subdued the Arabs, a race "whose habits and country were very similar to those of the mounted Indians of our western plains." Mr. Davis, therefore, believed that the dromedary would supply a want in the way of carrying expresses, making reconnaissance, and moving troops rapidly across country; and he recommended that "necessary provision be made for the introduction of a sufficient number of both varieties of this animal to test its value and adaptation to our country and our service."

The Secretary's recommendation did not bring results from that Congress, but it served to encourage those who believed that the camel would prove useful as a beast of burden in the United States, and a company was formed in New York, under a liberal charter from the Legislature of that State, with the announced objects of importing and developing a number of camels of different kinds and of employing them in transportation in the West. The organization was styled "The American Camel Company," and its officers were William G. King, Charles W. Webber and Edward Magouran, the last an enthusiast on the subject.

In his report of December, 1854, Secretary Davis, after again calling attention to the great sums expended for the transportation of men and supplies, said, "I again invite attention to the advantages to be anticipated from the use of camels and dromedaries for military purposes, and, for reasons set forth in my last annual report, recommend that appropriation be made to introduce a number of the several varieties of this animal to test their adaptation to our country." The committee that prepared the annual army appropriation bill seemed still skeptical, for the bill came to the Senate with no provisions for camels. In this body an amendment proposed by Senator Shields, of Illinois, was attached, appropriating \$30,000 "to be expended under the direction of the War Department in the purchase and importation of camels and dromedaries to be employed for military purposes." In the House the proposition had for its sponsors Mr. Phelps, of Missouri, and Mr. James A. McDougall, of California, the latter venturing the prediction that the results of the experiment would "prove invaluable to the country." After the usual vicissitudes of amendments to appropriation bills, this proposition became a law in March, 1855.

Secretary Davis lost no time in beginning what he evidently expected to prove a most successful and far-reaching experiment. In May he directed Major Wayne to proceed to the Levant, stopping in England and France for the purpose of interviewing military men in those countries in regard to the camel and its uses in war. The Secretary of the Navy placed at the disposal of Mr. Davis the storeship Supply, with her crew, under the command of Lieut. David D. Porter (afterward Admiral Porter), for the purpose of transporting the animals to this country. It was supposed that the climate of Texas would more nearly furnish such conditions as the camels were accustomed to, and it was accordingly ordered that they should be landed at the most convenient point in that State.

Major Wayne arrived in England in June, 1855. After inspecting the show camels at the zoological gardens in London and interviewing scientists and military men, he went to Paris, where he pursued the same course, obtaining considerable valuable information. He joined Lieutenant Porter and the Supply at Spezzia, Italy, June 24.

In the meantime Lieutenant Porter, having discharged his cargo of supplies for our Mediterranean squadron, and entering heartily into the spirit of the camel enterprise, had visited the farm of the Grand Duke of Tuscany, near Pisa, where camels had been bred and used for two hundred years. The original stock had come from Egypt, and a sufficient number were kept by the Tuscan ruler to perform the work of 1,000 horses. The animals were found to be performing hard work daily, being forced to carry loads as high as 1,300 pounds each, and toiling from sunrise to sunset. Despite this arduous service, they were badly treated by unappreciative keepers; were forced to obtain their entire subsistence by their own gleanings from nearly barren tracts of land covered with stunted pines and scanty grass, and were never housed, although the climate was hot in summer and cold in winter. The number was limited.

In order that they might be able personally to study the animals, ascertain how the voyage would be likely to affect them, and how the arrangement they had made for embarking and stabling would work, Major Wayne and Lieutenant Porter determined to secure one camel at the first opportunity. They accordingly sailed directly for Tunis, where early in August they bought their first animal. Upon applying for a permit to bring it off, the Bey of Tunis graciously presented to the United States through them two other camels—one, at least, a fine animal, that subsequently became the veteran of the herd and proved himself a sturdy sailor,

for he accompanied the ship for over 10,000 miles and was landed in good health on American soil nine months after his embarkation.

The voyage was resumed and Constantinople reached early in October. From this city the officers, leaving the ship, made a side trip to Balaklava, in the Crimea, to learn what they could about the camels that were used in the Crimean war. The English quartermaster gave them an opportunity of inspecting the animals in the possession of the English, and they gained much information which they regarded as pertinent and valuable. They were told that in the conquest of Sind some 25,000 camels had been used by Gen. Sir Charles Napier, an unusually acute student of transportation problems; and so satisfactory had they proved in the Crimea that the numbers on hand at Balaklava were to be increased for the next campaign. Here the Arabian,* or one-humped, camel was used almost exclusively. The average load was 600 pounds, carried twenty-five to thirty miles a day. A corps of 1,000 men mounted on 500 camels had rendered most effective service under General Napier. It was often marched seventy miles in twelve hours. On arriving at the desired point, the camels were left with the keepers and 500 men operated as infantry, the camels, kneeling and hobbled in a hollow square, even serving as a breastwork in case of necessity. The Bactrian, or two-humped, camel also was found at Balaklava, but, though stronger and heavier than the Arabian, was not so much used because of the difficulty of placing the load over his two humps and because slower in pace. Both officers were enthusiastic over what they saw and heard of the camel in the Crimea, Lieutenant Porter declaring that in the United States, at any point south of 36 degrees (about the latitude of Raleigh, N. C.), the camel would be fostered with the greatest care, and that its value there for labor would be much greater than that of the horse. He expressed the hope that he might see the day when every southern planter would be using the camel extensively, and he thought this not improbable, as a good work animal might then be imported from Smyrna for about \$300.

Two of the three camels procured at Tunis had shown symptoms of the itch; and, as it was feared that they might infect the ship with the disease, they were sold. Their lazy life on the vessel, coupled with good care and abundant food, had so fattened them that there was no trouble in finding a Turkish butcher, whose bid of \$44 for the two was accepted. The Sultan, professing great interest in the experiment of our Government, offered to present four of his finest animals, but, as they had to be fetched from Asia, our officers deemed it imprudent to wait. Persia had been thought to be the best place to procure fine camels, but it was now so late in the season that the mountain passes were filled with snow and ice, and a trip to that distant country would have been difficult, if not impossible. So the Supply was headed for Egypt, arriving at Alexandria in December. Major Wayne journeyed on to Cairo, where he purposed buying twenty dromedaries. An unexpected obstacle was encountered in the "custom of the country." In order to avoid having all his good camels and horses sent out of his domain to supply the wants of the Eastern war, the viceroy had made a law that no animal of any kind should be exported, and it was with the greatest difficulty that he was prevailed upon to issue a permit, first for the exportation of two camels, then for ten. The last concession came too late, however, as, wearying of the slow processes of oriental routine (the negotiations being conducted in due form through the American consul), Major Wayne had determined to sail after loading but three camels. But now the viceroy himself had become interested in the experiment of the United States, and proposed to present the Government with six dromedaries. It seems to have been the intention of the ruler to present six of his finest beasts, and on learning of the proposed gift the major and lieutenant were aroused to the highest pitch of pleased anticipation, particularly as they had met with such ill success in their purchases and had been so worried by the unforeseen rules against exportation. They expected nothing less than a group of lithe-limbed, deep-chested racers of the best blood of Oman or Nubia—the flower of the royal herd, with pedigrees reaching back toward the beginnings of recorded time. After a week of impatient waiting, they were informed that the present of the potentate was in readiness in the palace yard, and, upon going to embark it, their chagrin was severe when, instead of the swift, well-kept dromedaries of the desert, they found a wretched half dozen of the commonest street camels of Alexandria, their hanging heads showing the spirit broken by ill usage, half denuded of hair by the itch, and loathsome from disease. Lieutenant Porter spurned the gift and took little pains to conceal his disgust. The viceroy's minister was informed of the miscarriage of his master's well-intended liberality, and the blame was laid on the rascally subordinates to whom the selection of the present had been intrusted; and, after another week of waiting, six fairly good camels were forthcoming. Thus, when the Supply sailed on Jan. 22, 1856, she had on board nine dromedaries and the Tunis camel.

Our officers reached Smyrna Jan. 30, and, by having sent in advance Mr. Gwynn H. Heap, they were able to assemble rapidly the remainder of their shipment and prepare pack saddles and covers. This latter item was carefully attended to, as it was certain that properly fitting saddles could not be obtained in the United States. Mr. Heap's acquaintance with the languages and customs of the east, gained while serving as vice-consul at Tunis, enabled him to purchase the animals to the best advantage. Those he brought to Smyrna

*The natural historians have generally designated the two-humped animal of this genus as the camel and the one-humped as the dromedary. After a careful study and observation in the home of the animal, Major Wayne disregarded this classification, and speaks of it as of two distinct species—the Bactrian and the Arabian. The Bactrian has two humps; it came originally from Bactria and is now found more generally in Tartary and the northern parts of Central Asia. The Arabian has but one hump and is found principally in Arabia, Persia, Asia Minor, and India. The dromedary (Greek *dromas*, a runner) is simply a swift courser, or racer, as distinguished from the camel of burden (always, however, Arabian, or one-humped).

were bought at various points in the interior, the town camel being avoided, as it was generally infected with

the itch caught from the streets and dirty khans. He appears to have paid as low as \$100 for at least one animal and as high as \$400 each for several others, the average price being about \$250. No such fancy price as \$1,800 to \$2,000 for a single animal were paid, although the idea was prevalent at the time in this country that the camels had cost the Government about \$2,000 each. The prices, indeed, were found to vary, as do those of horses, according to breeding, size, training and soundness ranging from \$15 to \$1,000 and over. A sound burden camel capable of carrying from 400 to 600 pounds could be bought at \$50 to \$130, a dromedary at \$45 to \$1,000, the common stock bringing \$45 to \$150, and the swifter, pure-bred animals from \$150 up. A good Tuilu, or Maya, brought \$200, while two-humped Bactrian breeders sold at \$300 to \$600.

Lieutenant Porter solved, with his customary intelligence, the problem of loading the camels into the ship. He built first a boat twenty feet long and seven feet wide, flat-bottomed so that it would easily slide up on the beach. He then constructed the "camel car," very strongly made and bound with iron, with a door at each end, and shaped to fit snugly into the boat. The camel was coaxed into the car, or, if he withstood coaxing and refused to enter, ten sailors with a block and tackle forced him in. The car, mounted on trucks, was then rolled down the beach and into the boat. The car weighed 1,000 pounds and by means of it the animals, averaging in weight 1,400 pounds, but going as high as 2,000 pounds, were loaded into the ship at the rate of one each half hour.

The home voyage was begun Feb. 15, 1856, with thirty-three animals, as follows: Nine dromedaries, or runners, twenty-three camels of burden and one calf. Among them were two Bactrian males (two-humped) for use in breeding with the Arabian female. The offspring, called a "booghdee" (male Tuilu and female Maya), is always one-humped and much heavier than the pure Arabian and on this account is greatly prized as a burden-carrying animal. Mr. Heap had picked up a fine Tuilu, an enormous fellow 7 feet 5 inches in height, 10 feet long, 9 feet 9 inches in girth, and weighing when in good condition 2,000 pounds. Lieutenant Porter was obliged to cut a hole in the floor of the deck which served as the ceiling of the camel stable in order to accommodate this Tuilu's hump. Seven males were included in the load, the remainder being females, not counting the booghdee, which will not breed.

It was an interesting voyage home. The staunch little sailing craft met the most tremendous gales in the Mediterranean and was buffeted by unusually heavy weather during most of her trip across the Atlantic. It was often necessary, in order that they might not be injured by the tossing of the sea during the more violent storms, to tie the camels down in the position they assume when kneeling to receive their burdens, which posture they held for days at a time, eating and drinking much as usual and suffering no harm beyond a temporary stiffening of the joints.

The camels occupied a huge stable between decks. A thoughtful contrivance was a covered structure 60 feet long, 12 feet wide, and 10 feet high. Along the sides of this were placed at frequent intervals large portholes fitted with glass windows and heavy shutters. A hatch was provided in the top so as to let the animals down to their deck, and this aperture, being so far above the upper deck, could be kept open even during storms when it was necessary to close the portholes. Thus fresh air was assured in all kinds of weather—a very important matter on shipboard.

The success of this part of the experiment was due to the sagacity and watchfulness of Lieutenant Porter, who reduced the care of the animals to a military basis. He promulgated a set of "rules and regulations for the camel deck," requiring, among other things, that one person should always be on watch; the camels to be fed and watered every day at 3 o'clock precisely; the females having young to be fed and watered, in addition, at 7 o'clock in the morning; the deck never to be wet except by order; the hayracks to be filled every two days, and the amount of food to be kept account of; the camels never to be struck with anything but the flat of the hand; their beds to be littered down before sunset; each camel to be curried and brushed half an hour every day and their feet and legs to be well rubbed; their feet to be cleaned with soap and water twice a week; particular care to be observed in putting hay under their knees and haunches when they lie down; "the least thing the matter with an animal to be reported at once." The strictest cleanliness was exacted, the stalls being cleaned daily, and frequently witewashed. The daily ration of food consisted of a gallon of oats, ten pounds of hay, and a gallon of water to each animal, this being varied by occasional portions of crushed peas or barley made into dough ball; salt was served once a week. The animals got along very well on this regimen, although their natural diet consists of the leaves and tender branches of all kinds of trees and shrubs, while they have a special fondness for dried bushes of a bitter and astringent flavor and seem to consider prickly and thorny vegetation a dainty.

[TO BE CONTINUED.]

Anticosti Island, Anticosti.

It was in 1895 that the island of Anticosti was purchased by Mr. Henry Menier, the great French manufacturer, from the syndicate which had for some time owned it, the price paid being \$160,000. The island is 130 miles long by about 27 miles wide, and is thus larger than Long Island in New York State. It was then without human inhabitants except at one place, Fox Bay; the few people residing there supporting themselves by trapping and fishing. The waters about the island abound in fish, and produce the best lobsters in America.

Previous to the purchase by Mr. Menier, little was known of the interior of the island. Much had been written concerning it, but those who told the stories relied more on their imagination than on precise information for the material which they gave the public. As a matter of fact no large mammals, except the black bear, are found on the island; neither moose, caribou, nor even beaver existed there at the time of the purchase. There are no wolves nor lynxes.

After Mr. Menier first bought the island he had some

trouble with the colonists, who declined to accept him as ruler. Before long, however, this difficulty was smoothed away, the malcontents removed, and other colonists brought in. On purchasing the island, Mr. Menier naturally desired to learn what its material condition was, and what it produced. With this in view, he engaged as medical officer for the island, Dr. Joseph Schmitt, a naturalist in close touch with some of the most eminent scientific men of France. From his pen has recently appeared a monograph of the Island of Anticosti, giving us much reliable information about that inaccessible land. The paper, which is fully illustrated, is in French, covers nearly 400 pages, and has many maps and diagrams.

It is divided into five parts, of which the first, follow-

ing an introduction, deals with the geography, history, meteorology and climate, and the second with the geology and paleontology. The third part is botanical, and the fourth deals with the zoology, from protozoan up to mammals, with a page or two on anthropology. The fifth part tells very briefly of the treatment of certain diseases in men and animals, of the possibilities of agriculture, the resources of the island, and certain conclusions.

The part dealing with the zoology will chiefly interest our readers, many of whom will be surprised to learn of the great paucity of mammalian life on the island. The black bear, the otter, the marten and the fox are the sole land mammals noted, except two or three mice. Of marine mammals, on the other hand, there are many—

seals, whales, and dolphins. The walrus is entered in the list, but appears to be only a memory, since it seems to have quite disappeared.

Agriculture is undoubtedly possible in Anticosti, where wheat, oats, barley and potatoes appear to grow and ripen.

Mr. Menier purchased the island for a game preserve, and it is said that red deer, caribou and moose have been turned out there, as well as beaver, and that all of these are doing well. Silver foxes occur, and some of them confined in a large park are breeding with results that seem to be satisfactory. Mr. Menier is looking carefully after the well being of the fur-bearing animals, not less than of the game, and it is reported that fur is increasing.

Fish and Fishing.

Arctic Salmon and Whales.

VALUABLE contributions to the comparatively limited knowledge respecting the salmonidae of the far north, are believed to have been brought back by the members of the recently returned Canadian expedition to the Arctic Ocean, whose reports upon the natural history of the regions visited by them are awaited with no small degree of interest. While scarcely anything of importance has thus far been given out by members of the party in advance of the publication of their official reports, Mr. A. P. Low, of the Dominion Geological Survey, reports a large decrease in the whaling industry in Hudson Bay, but declares that a splendid industry might be established in canning Arctic salmon. The rivers, he says, still fairly swarm with these fish, which, while not as good as the Atlantic catch, are of a much better quality than the British Columbia product.

Good Fall Fishing in Northern Ontario.

Mr. L. O. Armstrong, tourist agent of the Canadian Pacific Railway, has just returned home from a trip through the French River district of Ontario. He left the railway at Wahnapitei station, and thence descended the river of that name until he reached the French River. In this district, which is to be opened up by the Toronto-Sudbury branch of the C. P. R., Mr. Armstrong says that there is a larger acreage of good fishing water within reasonable access than anywhere else in Canada. None of these waters have ever been netted or dynamited, and it is gratifying to know that everything that is possible is being done by the railway authorities to prevent the undue destruction of fish life in this important district. Mr. Armstrong got any number of bass averaging four pounds, some mas-kinongé averaging twenty-three pounds, and some doré averaging seven pounds.

The Sea Trout

During the last summer I was fortunate enough to enjoy opportunities for the study of the sea-run trout of the Saguenay and some of its tributaries. At times they afforded splendid sport, and were as plentiful during portions, at least, of the past season, as the salmon were scarce. The wordy war waged by the ichthyologists over the proper identification and name of this fish appears to be as far as ever it was from a satisfactory settlement, but among those who have angled for it there is but one opinion as to the excellence of both its flesh and its game qualities. So the practical disciple of Izaak Walton is equally satisfied with his sport among the sea trout, whether the fish be simply his old friend, the spotted brook trout, which has grown bright and silvery by a prolonged visit to the sea, or whether it be, as claimed by some, a distinct variety. It may be *Salmo trutta*, *Salmo trutta marina*, *Salmo im-maculatus*, bull trout, salmon trout or white trout to the ichthyologist. To the angler it may also be either of these, but it is pre-eminently, to him, the sea trout, to distinguish it from the fish that he takes in brooks and lakes far from the sea, as contrasted with this glorious silvery denizen of tidal or brackish water.

When first lifted from the sea, the backs of the white trout are of a bluish-green, just the color of the wave, and the under part of the fish sparkles like molten silver. Soon after the salmon have run up into the rivers on the north shore of the St. Lawrence, the whole of the Gulf along either shore abounds with the smaller fish, the individual specimens running from one to seven pounds in weight. They proceed up the rivers to spawn, though it was formerly supposed that they never ascended into the purely fresh water. This belief was undoubtedly strengthened by the fact that they are most freely caught either in the salt or brackish water, and that they are not always correctly identified when taken out of fresh water, because of the striking changes in both their form and coloration, produced by even a very short sojourn in fresh water. They lose flesh, and hence appear longer in shape and become very brilliantly colored, with tri-colored fins of black, white and scarlet, and numerous bright spots over the body, which have simply become visible because of the partial disappearance of the silvery sheen that veiled them when in salt water. This sheen gradually and partially disappears in fresh water, as it also does from the salmon.

Besides ascending the rivers to spawn, there is no doubt that the sea trout run into some of them after the smelt, upon which they feed, and when these latter return to the sea, late in the year, the sea trout again follow after them.

In the lower part of the Gulf of St. Lawrence, the sea trout fishing commences much earlier than it does farther west. Thus in the bays and harbors of Prince

Edward Island it is good in June. In these bays and along the coasts of the island, the fish are taken with a scarlet fly, from a boat under easy sail, with a "mackerel breeze," and often with a "heavy ground swell." The fly skips from wave to wave at the end of thirty yards of line, and there should be at least seventy yards more on the reel. It is splendid sport, as a strong fish will sometimes make a long run and give a good chase down the wind. In fact, it is not too much to say that the sea trout is the most valuable of the salmonidae after the Atlantic salmon itself, and neither in beauty of form or color, in excellence of flavor, nor yet in sporting qualifications do they fall behind even him, notwithstanding that they are his inferior in both weight and size. Often, too, a very large run of these beautiful fish is met, and among other catches on record is one of sixteen trout, weighing over eighty pounds, caught in one morning at St. Peter's Bay, twenty-eight miles from Charlottetown, in Prince Edward Island. The same angler, with a friend, killed 300 of these fish in a single tide.

Sometimes the sea trout is killed quite out of sight of land, by trolling a fly from a sail boat, much in the same way as in mackerel or bluefish angling. The trout frequently throws itself out of the sea to secure the rapidly skipping fly, its beautiful bright sides flashing like silver in the sunlight. When struck, it runs with sufficient velocity to bring the angler's heart into his mouth, and a hundred yards of line proves little enough, at times, to hold him.

In salt water fishing there is no need whatever to be particular about a choice of lure for sea trout. A fly is by no means necessary. Any bright artificial bait is all that is required, and any particular resemblance to known living creatures is apparently superfluous. Keeping well outside the bar, the angler should trail this bait at the end of twenty yards of line, and even more of the fish are shy. The spinning and glistening bait is apparently, to the trout, gifted with the power of escape. The trout is piqued, snaps, and reflects not until the hooks are in him, but then the angler must be prepared for a rush, beside which that of a pollack of the same size is a mere crawl.

Keeping in view the fact that these frantic efforts are the result of fright, the cautious angler knows how to let his fish run out to a certain point, when, suddenly raising the point of his rod, he brings pressure to bear and winds up. Out goes the line again, and the same compliments are exchanged, the number of the runs depending upon the angler's skill, and still more on the size and condition of the prisoner. The depth at which the spinner should work depends largely on the weather and general state of the atmosphere and water. A fresh breeze, as divers have remarked, will create a disturbance among the marine life below, even where the water remains perpetually calm; myriads of tiny creatures are set in pursuit, and these are the main objects of the trout's pursuit.

On calm evenings the sand-eels come to the top, where also the trout are to be found on the feed. A little variation in the number of sinkers used, aided by a little judgment and observation on the part of the angler will generally determine the exact position of the fish, which are at no time very hard to find, least of all when hungry.

Some of the best sea trout fishing is to be had off the mouth of the Cascapedia in the Baie des Chaleurs, and in the lower stretches of tidal water in the Moisie, the Trinity and the Saguenay rivers. In many of the salmon rivers, notwithstanding the sportive character of the sea trout, its rising at the salmon fisher's flies calls down upon it many maledictions, because of the disturbance which it creates in the pool in which it may be found, spoiling the salmon fishing for some time to come.

Yet when the salmon fishing is dull or the season for it has closed, many a good day's sport is taken in salt or brackish water in the lower stretches of the salmon rivers by their lessees, for upon a trout or grilse rod the sport afforded by a large sea trout is fully equal to that experienced in killing a salmon on a salmon rod.

On the Saguenay.

On no other trout water in the world, perhaps, is there the same character of trout fishing to be had as in the Saguenay River. The Saguenay sea trout, like the Saguenay salmon, have almost a world-wide reputation. The Saguenay salmon, however, must run into one of the tributaries of the great dark river before they will rise to the fly. The sea trout, on the other hand, are successfully fished for on the Saguenay itself, and the sport certainly offers an unique experience. Precipitous cliffs, ranging from 1,200 to 2,200 feet in height, hem the river in on either side, and in many instances these cliffs actually overhang the water. If the channel of

the river were to be dried up, it would be seen that some of these cliffs run down as far below the present level of the Saguenay as they rise above it. There are many places where the water is over a thousand feet deep, and this close to the cliffs. In almost any other water of one-tenth of this depth, it would be absolutely useless to fish with the fly. In the early spring and late in the fall, the fish would be found only in shallower water, and if they sought such deep water at all it would only be for the purpose of seeking the bottom of it in the heat of summer. But in the Saguenay, even the surface of the water is cold enough to satisfy the longing of any fish, even in the hottest weather, and in all the bays of the river there is excellent fishing. Except when agitated by storms, the water of the Saguenay is very placid. It is also very brackish and subject to the action of the tides. The gloom of the surroundings is quite awe-inspiring. The only signs of life are afforded by the occasional leap of a salmon, the bobbing up of a seal's head, or a school of white porpoises, rolling their huge bodies along the waters, ever and anon spouting a shower of liquid diamonds into the air.

In the still water of the Saguenay, artificial baits are quite unnecessary. In the eddies of the tidal water curling around the various points of rock, the sea trout rise readily to the fly throughout the season. In the latter part of June and early in July they may be caught in the St. Lawrence just off the mouth of the river. A little later they are to be found in Tadoussac Bay; and as the season advances, should be followed higher up the stream from bay to bay. One of the most successful flies for these fish is the red ibis. Another is the Montreal. These are both well-known flies that can be had of any tackle dealer. One that is less known, but is equally efficacious, is known as the Alexandra, called after the Queen of England, who is fully as successful as an angler as her husband is unsuccessful.

The Alexandra fly is intended as a vague imitation of a minnow, and was originally recommended to be east and played minnow-fashion just below the surface of the water. English fishermen found it to be so taking that its use was forbidden upon some streams. The favorite method of fishing with this fly is to allow the line to run with the current, and then draw it back upstream by short, sudden jerks that open and close the haekles, giving glimpses of the bright, silvery body. All the leading salmon flies are also excellent lures for sea trout, but new ones should not be used, for the trout bite so savagely that they destroy artificial flies very much more than salmon do. When not rising to the fly, the sea trout may generally be taken a little below the surface of the water, with the lance or sand-eel, which exists in large numbers in the Saguenay, and at low tide may be dug out of the sand at the mouth of the river, and wherever there are bays higher up the stream, where a portion of beach is revealed by the running down of the tide.

E. T. D. CHAMBERS.

Visible Results of Salmon Culture

Editor Forest and Stream:

In your issue of Nov. 5, Mr. W. E. Meehan, Commissioner of Fisheries for Pennsylvania, gives the first authentic intelligence the present writer has been able to obtain of any visible results from all the millions of salmon fry that have been planted in the rivers of the northern States since 1856. In that year, Dr. Fletcher, of Concord, N. H., got from the Miramichi River in New Brunswick 70,000 salmon ova, which were hatched out by Livingston Stone, of Charlestown, N. H., and planted in several rivers of New Hampshire and Connecticut. Though these were said to have "done well," I could never learn that a mature salmon was taken from any of the waters in which they were planted.

Mr. Meehan now tells that, "In the early '70s the late Thaddeus Norris and several other enthusiastic fishermen planted Atlantic salmon fry in the tributaries of the Delaware River near Easton, Pa. I think the number planted in two years was 50,000. Although it subsequently transpired that the tributaries of the Delaware in which these fish were placed were not the most favorable waters, a number of salmon lived and returned to the Delaware River. Probably thirty or forty were caught; but at the time the experiment was considered to be unsuccessful."

In 1868 Mr. Norris published in Philadelphia and London his work on "American Fish Culture," the best book on the subject the present writer has ever seen. At that time and up to his death, Mr. Norris was considered the best authority on fishculture in America, and if he pronounced the experiment a failure, there can be no reasonable doubt of the correctness of his judgment. Since that year many millions of eyed-ova, or young fry, furnished by Livingston Stone from his

hatcheries on the Sacramento and Columbia Rivers, have been planted in waters of the northern States; but the writer has never been able to get authentic intelligence of a single mature Pacific salmon taken from northern waters. When it was reported in your issue of Oct. 8, that Col. Haggart had taken a Quinnet salmon with a fly from Pierce Pond in Maine, he was glad that at last Livingston Stone's labors were about to show some visible results; but your next issue dashed all his hopes by announcing that the supposed Quinnet was only a native land-locked salmon.

Commissioner Meehan further informs us that, "About 1890 the late Henry C. Ford, then president of the Pennsylvania Fish Commission, planted several thousand fry in the tributaries of the Delaware River in Pike and Wayne counties on the Pennsylvania side. In 1895 more than \$5,000 worth of Atlantic salmon were caught in the nets between the head of Delaware Bay and Trenton. In 1896 and '97 I planted several thousand more fry. The result has been that since quite a number of salmon have been caught in the nets of the shad fishermen, and one year it was estimated that nearly \$3,000 worth were captured."

This is the first authentic intelligence the writer has been able to obtain, and he feels bound to accept it, coming as it does from a State Commissioner of Fisheries, though it staggers all his previous confidence in his knowledge of the life history of the salmon. He was under the impression that it had been well established, according to all the best writers on the subject, including Mr. Norris, that alevins became parrs in the first year of their life. In the second year, that they lose the parr marks and put on the bright silvery appearance of smolts, which go to sea in the fall of that year. The following year they return as grilse of four to six pounds, and in the next year as mature salmon. There are well authenticated exceptions to this general rule, of which no explanation has ever been given by the scientists who have most carefully studied the subject. But, waving natural history, and confining our attention to the practical part of the matter, we cannot but regret that, for practical purpose, the results are so little encouraging and that, so far as he has gone, Commissioner Meehan only sustains the facts and figures given in the last and previous issues of your paper.

From the several thousand of fry planted about 1890, there were caught in 1895 more than \$5,000 worth of mature fish. In 1896 and '97 Mr. Meehan himself planted several thousand more fry, which, with the natural increase of those planted about 1890, produced the estimated value of \$3,000, a little more than half the first planting yield. Since then fourteen years have elapsed; consequently there should be the natural increase for eleven years of all that escaped capture. It is much to be regretted that Commissioner Meehan did not give us the number or value of the salmon taken in 1903 and '04, so that we might know whether the catches continued to decrease yearly by 50 per cent. or whether they showed any increase. Perhaps some other State Commissioner can supply, through your columns, what Mr. Meehan has unfortunately neglected. Any authentic date that can be given will be a boon to hundreds of your readers, as well as to

THE OLD ANGLER.

Fish Chat.

BY EDWARD A. SAMUELS.

A Study of Fish Markets.

MANY years ago—yes, many more years than I wish they were—I used to knock about the country a great deal with my dear old father on outings with rod and creel. He was as great a crank—no, I will not say that; but he was as much of an enthusiast in all matters piscatorial as I am at the present time; and it was undoubtedly due quite largely to the intercourse we then had together in such matters that I now, after that lapse of time, find my greatest enjoyment in angling. "As the twig is bent so the tree is inclined." I am not quite certain about the correctness of that quotation, but I will let it stand; the bent of my mind, which naturally turned to nature studies, was permanently fixed.

In the great number of enjoyable outings we thus participated in, we visited many cities and large towns on our way to favorite fishing localities, and if our stay was in any of them at all prolonged, my father invariably steered for the fish market, if such there were; and if the place did not support the dignity of a market and had simply a fish stall, it answered his purpose quite as well. This trait in his character may seem strange to the ordinary run of people, for strangers in a strange city usually employ their spare time in inspecting public buildings, art galleries, parks, and other places which are supposed to interest the majority of travelers. But dear old pater's mind ran on fishes above and before everything else, and an inspection of the various varieties which were displayed for sale gave him greater pleasure than would a visit to an art museum filled with the choicest works of Rembrandt, Murillo, Michael Angelo, and other princes of the brush and palette.

In examining the piscine treasures displayed before us, he asked no end of questions relating to the localities from which the fish came and where, and the condition of the various catches; and time and again have I seen him poke open the maw of a fish which had recently been dressed, for the purpose of ascertaining the character of the diet upon which the fish had fed. We found in the markets of the different cities some species which seemed common to nearly all of them; but as a rule those which were being vended were local, if I may use that expression; that is to say, peculiar forms would not in ordinary markets be common to those which were considerably separated. Fish in Baltimore markets, for example, consisted very largely of the spotted weakfish or southern sea trout, so-called; to which were added shad and mackerel in their seasons, black sea bass, sheepshead, and a number of other species of more southern habitat.

In Philadelphia we found most of the above named species, together with the common weakfish or squeteague, and from interior waters the German carp, yellow perch, and catfish had come.

In New York markets, the largest of their kind on the

continent, we found, of course, all the species I have named, together with scuppaug, or porgies, as they are commonly called in that section; tautog or blackfish flounders, fluke, and various other marine species; south of New York we did not often find in any considerable abundance cod, haddock or halibut, the transportation of those species seeming to have ceased when the great metropolis was reached; but we found here displayed for sale fresh-water fishes which had not seemed to have sought a market in a lower latitude. Thus brook trout, whitefish, pickerel, black bass, and some of the western lake trout and others were always displayed in their proper season.

North and east of New York the display of fishes becomes more localized. In Providence mackerel and shad were always to be found in their season; scuppaug, blackfish and weakfish were also abundant, but fresh-water species, with the exception of the salmon, which of course is almost always on sale in every city, were a rarity in that market. In Newport the same conditions prevailed, the greatest abundance of scuppaug being seen there; in fact, I believe that even at the present time the largest shipments of that delectable pan-fish made to New York are from those two principal cities of Rhode Island.

In the Western markets the chief varieties of fish offered for sale were from fresh water; the cod, haddock, and two or three other leading salt-water varieties being received at the principal centers. One who is not familiar with the extent to which the breeding of the whitefish has reached, would be astonished to see the immense numbers that are sold in Chicago and other great Western cities. It seemed to be a popular table species, but to me it lacks the tasty qualities which appeal to the epicurean fancy. I have tried them fried, boiled and broiled, but somehow they seemed insipid no matter in which form they were cooked.

In Quincy Market, Boston, commonly, but improperly, called Faneuil Hall Market, we found almost, if not quite, as great a variety as that seen in Fulton Market; but north of Boston the number of species displayed for sale decreased very materially.

The habit I acquired in studying the fish markets clung to me, and it has been my custom, ever since my father passed away, to inspect the finny beauties which were offered for sale in places I visited, and I believe it has been of very considerable value to me in affording information which I could not otherwise have acquired.

Prevalence of the Striped Bass.

There was one species of fish which I have almost invariably noticed in all the markets on the Atlantic Coast, and that is the striped bass, or weakfish, as it is often called. From the Rappahannock all along the shore as far north at least as Montreal, on the St. Lawrence, it is found in greater or less abundance; and in many localities it is one of the most important, commercially, of all the marine fishes. I wish I had memoranda by me showing the magnitude of the catch in different localities; but those who have access to statistics can easily satisfy themselves on that point. I will state, however, that the Canadian Blue Book for 1903 gives the catch of New Brunswick alone at 138,300 pounds. While this is not an enormously large catch, when compared with the take of cod, haddock, etc., it shows that the bass occupies a respectable position in the Dominion fisheries. While this species seems to be holding its own in waters north of Massachusetts Bay, it appears to be gradually decreasing in numbers from that point southward; and not only that, but it is decreasing very perceptibly in average size. This fact I have already stated in FOREST AND STREAM for December 19, 1903. Of course the great decrease in numbers is attributable mainly to the great growth and spread of the weir system, particularly in Buzzard's and Narragansett bays, where it was formerly the most abundant of all the commercial fishes. In addition to the destruction caused by the weirs, pounds, etc., those voracious marauders, the bluefish, have done more than their share in reducing the great schools which were formerly so abundant; in fact, in the great bay I have named, the bass are so few in numbers that but little record is made of those captured in Massachusetts north of Cape Cod.

In the Report of the Massachusetts Commissioners on Fisheries and Game for 1903, I find that not a single bass is reported as having been taken in the waters of Essex county, where it was formerly very abundant, and not one in Norfolk or Plymouth counties, in both of which I used to get exceptionally good bass fishing.

In Barnstable county, however, the catch was about 9,000 pounds, and this encourages the hope that the fish will gradually recover from the destruction that has been meted out to it in the Bay.

The Bass in Canada.

While the bass seems to be holding its own in the rivers of New Brunswick along the northern shore, as far, at least, as the Miramichi, its size is gradually decreasing in those localities, as I have shown in the article above referred to; but in the St. Lawrence, according to Mr. Chambers, it is decreasing both in average size and in numbers. In his communication in FOREST AND STREAM of October 15, he mentions this fact and gives some interesting accounts of the distribution and habits of the fish in that river.

Mr. Chambers is correct in his statement that the bar, so-called by the Canadians, and the striped bass are identical. I have seen these fish in the markets of both Montreal and Quebec, and they were unquestionably the striped bass—*Roccus lineatus*—but that is a quite different species from the bar fish—*Pomoxys sparoides*—of Lake Michigan, the calico bass and grass bass of other western and southern localities, which never, so far as I am aware, attains a greater weight than two or three pounds. The habits of the two species are quite different, the striped bass being a bold, active predatory fish, preying, like the squeteague and bluefish, upon all the smaller species; the other is rather of a peaceful disposition; so much so, in fact, that, according to Prof. Goode, "it will live harmoniously with all others, and while its structure and disposition restrain it from attacking any other but very small fry, its formidable armature of spinous rays in the dorsal and abdominal fins will guard it against the attacks of even the voracious pike."

Apropos of the Montreal fish stalls, I would say I have

never seen exposed for sale any of the ouananiche or the splendid spotted trout with which the lakes and rivers of the Province of Quebec abound, and not a single grilse have I ever seen exposed for sale there, or for that matter, in any market in America.

Salmon Everyw. ere.

The salmon is almost always to be seen in every market, but those which are for sale are as likely—more likely, in fact—to have been brought from the Pacific Coast as to have been killed in near-by waters. In the Montreal market I have seen cod, haddock, and halibut which I was informed had been brought from Portland, Me.; but the variety of other species for sale there was exceedingly limited.

What Can We Do With the Dog Fish?

The more I look into the matter, the more I am convinced that something must be quickly done to check the ravages that are being made on our marine fisheries by that despicable pest the dog fish. Its numbers seem to be increasing with tremendous rapidity, and its rapacity appears to keep abreast of its fecundity. I have recently improved every opportunity for interviewing "bankers" and other deep sea fishermen, and from all with whom I have conversed comes the same discouraging story. One trawler assured me a few days ago that he lost in one trip over two hundred hooks which were bitten off at the ganging as neatly by the sharp teeth of the pseudo shark as if the lines had been cut with a knife. Another said that in hauling his trawls he not only found that the hooks were bitten off, but discovered that numerous heads of cod were left hanging from the hooks, the bodies having been eaten by the marauders. Some idea of the rapacity of the dog fish may be had when I state that some of the heads of the cods which were left hanging on the hooks had belonged, evidently, to very large fish. "Yes, thirty or forty pounders," as my informant stated. "I tell you it's mighty discouraging," exclaimed one of the fishermen, "to haul your trawls day after day and find that the dog fish have always been ahead of you; I don't know what we're going to do. One thing is certain, unless the dog fish let up on us, cod fishing is done for. There is some talk about the Government paying a bounty for every one caught; but if the bounty was large enough to make it an object to catch the brutes, the Dominion treasury could not pay the bills. There has also been more talk about setting up mills along the shore to grind up the dog fish for manure, but while we are waiting for all these things to be done, we are likely to starve. Some of us have been trying the experiment of ganging our trawl hooks with wire; the dogfish can't bite this off, and we have the satisfaction of clubbing the brutes to death when we haul them up."

Habits of the Dog Fish.

The dog fish is not solely a bottom feeder, as many suppose it to be, for it preys upon surface ranging fishes quite as much as it does upon those which forage deep in the water. For example, it follows schools of mackerel with the greatest pertinacity, a number of the dog fish acting in concert together in much the same way as that in which a horde of pollock will surround and destroy a school of herring or young cod. This habit of preying upon mackerel has earned for the destroyer the title of the "mackerel shark." It also follows schools of herring, and so vigorously has it attacked them this season, that the herring have been widely scattered, and for this reason, as most fishermen believe, bait has during the past year or two been exceedingly scarce; so scarce, in fact, that a large number of fishing vessels have been forced to lie idle.

I have watched the items relating to the fisheries which have been published in various Dominion newspapers, and gather from them that in the opinion of many anglers, netters, and others who are interested in matters piscatorial, that the salmon have been destroyed in such numbers by the dog fish that there is almost a danger of extermination of our king of game fish by the insatiable pirates.

At first glance one would hardly believe that such an active and quick-moving fish as the salmon could be captured by the little sharks; but when we remember that the mackerel, which is almost as speedy in its movements as the salmon, is caught without difficulty by the dog fish, it would seem that the opinions above expressed are not without foundation. All who are familiar with the habits of the salmon, know it is often captured by seals, and they cannot possibly be as quick in their attacks as are the dog fish.

The Tuna in a Nova Scotia Harbor.

Recently while enjoying a yachting excursion in the magnificent outer harbor of Lockport, N. S., our skipper discovered a large fish which was slowly moving about on the surface of the water. The yacht was headed toward the fish and we approached it closely enough to permit a pretty close examination of its great proportions. A monster it was, indeed, nearly sixteen feet in length, and its size was such that it must certainly have weighed at least seven or eight hundred pounds. It did not manifest any disquietude at our close proximity, but moved leisurely around, and most of the time just at the surface, its back and dorsal fin being out of the water five or six inches.

"That's a horse mackerel," exclaimed the skipper, as we glided by the huge fish.

"Yes," I replied, "and one of the largest I have ever seen; if we had a harpoon we might try our luck with him. I had no idea they ever came into these waters."

"Oh, yes," he answered, "we see them now and then all along the coast way up to the Gut of Canso. They're great fish killers, and no mistake. This chap is in here after herring, I have no doubt."

I make this record of the occurrence of the tuna in the locality I have named, believing it will interest those who have recorded its presence elsewhere. So large a fish could not be angled for in the manner in which the tarpon is; but smaller ones could be, no doubt, and what a fight they could put up! I used in former years to get no little sport in harpooning swordfish, and it is not among the impossibilities that when another season rolls around I may try my hand on a tuna. There will certainly be a good opportunity for doing so at Lockport.

YACHTING

GEORGE LENOX WATSON.

THROUGH the death of George Lenox Watson, Great Britain loses a fine sportsman, a thorough gentleman, and her greatest yacht designer. Mr. Watson was one for whom we cherished the greatest regard and respect both as a man and a designer. He was a man of great culture and rare ability and was loved and revered by all who came in contact with him. His was a fine character. His many successes did not change in the least his charming disposition and reserved nature. The life he led was of the simplest sort, and during his entire career he was untiring in his devotions to his mother. George Watson was perhaps the greatest designer of steam and sail yachts of his time, and his death will be sincerely mourned by his many friends in the States and at home.

We are grateful for the privilege of being able to print the personal recollections which follow from the pen of Mr. John Hyslop.

George Lenox Watson.

BY JOHN HYSLOP.

THE death of George Lenox Watson, which occurred early on Saturday last, November 12, comes to us as a most unexpected announcement. To those who knew him through his work as a yacht designer, it will be recognized that a man who stood in the foremost rank of his profession has been lost to it, and if the money value of his productions may be taken as a measure of the confidence which he inspired in his patrons, it may be questioned if he had any rivals who reached his level. To those of us who had the good fortune to know him as a man, other considerations than respect for his ability will make a deeper impress, and form a subject of more grateful comment. There has, since the first announcement of his death, been no lack of reference to what he has done as a designer, with much fullness of details, which make less needful any enlargement on this subject.

George L. Watson commenced yacht designing about the time when it had its inception as a profession distinct from the business of yacht building, and since that time the two lines of work have ordinarily been kept separated. The cutter *Madge*, which was brought here in 1881, was one of the productions of his earlier years. Her performances in these waters may, in strict accuracy, be called a revelation, and these, with a study of her details of rig and characteristics, influenced very perceptibly and beneficially a variety of changes in American yachts. Commencing as a designer of small yachts, Mr. Watson very speedily was intrusted with more important commissions, and indeed, in a very few years' time, may be said to have had a recognized preference in the profession for commissions in the larger class of vessels, and latterly the designing of the most costly steam yachts has constituted the greater part of his work. Our own most competent designers would, I feel sure, be the last to underestimate the merits of yachts designed by Mr. Watson for the international Cup contests. I am confident that Mr. Herreshoff would not. At this time, when the relative weight of hull and rig to total weight of displacement is such a well recognized factor in relation to speed, there would appear to be the need of a distinct superiority in model or elsewhere for a vessel to successfully engage in a contest when she has first to cross the Atlantic in either direction. In my experience as measurer of the New York Y. C., in every contest where Mr. Watson was present, there were many occasions which gave striking evidence of his manly spirit and fair mindedness, which I should be glad to give if it would not unduly lengthen this communication; and there are other experiences of my own, or well known to me, of which I could write feelingly, telling of the admirable, generous, and lovable character of the man. I saw something of him—of his home life, his business life, his associates and surroundings, and his personal habits—when I was in Glasgow in the summer of 1898. These all showed the confidence and high esteem in which he was held, and in contrast to this his own quiet, simple and unassuming demeanor. Intrusted at that time with the carrying out of important and costly contracts, he was content to describe himself as "just a toy maker." A faithful, diligent, conscientious hard worker in his profession, no detail regarded as drudgery, no inconvenience as occasion for shirking, he went about his work, and preserved through it all, if a somewhat retiring, yet a genial presence, and a kindly and active considerateness—even, as I know, for some who might reasonably have looked for resentment.

At the time I write of, Mr. Watson was a bachelor, his mother, then over 80 years old, presiding over his home, and the considerateness of which I have written showed itself toward her in the most exquisite development that I have ever witnessed. A bright-faced, gentle and refined woman, and such mutual appreciation of mother and son, formed a picture never to fade from my memory.

It will not be easy to replace George Watson as a capable designer. It would in many ways be more difficult to excel him as a man.

Past, Present and Future of the Motor Boat.

BY A. E. POTTER.

THAT the motor boat has come to stay, goes without saying. But a few years ago, not to exceed eleven, I saw on the Thames River at Norwich, Conn., a peculiar looking launch. It was running with no apparent effort except a peculiar popping noise, had no smokestack, nor did it resemble one of the electric launches first made famous at the Chicago World's Fair. I asked several bystanders what the propelling power was, and none could answer. Several days after, in describing the incident, I was informed that a gasoline engine was used for its propulsion, and I became at once interested; nor have I lost any of my enthusiasm since that time; on the contrary, it increases whenever I note any advance in construction, design or new features in this most instructive mechanism, following up as it did the bicycle, both of which are responsible for development of mechanical skill and knowledge, an opportunity which the American people were not slow to appreciate and grasp.

When John H. Hoxie, of Mystic, Conn., bought his launch, *Hattie B.*, equipped with a 6 horsepower Sintz motor, and on his trips up and down the Mystic River, and through Fisher's Island Sound—for all his coming was heralded by an "infernal" racket, especially rasping to churchgoers on Sundays or to the tired villagers seeking slumber at night—he was the envy of all others thereabouts. I have heard it said that once on a quiet summer's day his launch was heard at Noank from the time he left his moorings at Mystic until he tied up at Watch Hill wharf, and on his return the same atmospheric conditions being present, the progress was punctuated by regular snorts, save occasional missed explosions, until "blocked" at the Mystic drawbridge. While not vouching for the actual truth of the above, I do not consider the facts entirely chimerical.

The next season marked a great improvement in the *Hattie B.*, a larger engine with muffler increasing the speed and reducing the sound of the exhaust.

About that time Thos. H. Newbury bought from Palmer Bros., of Cos Cob, the first engine they sold. He installed it in a 17ft. rowboat bought from the keeper of North Hummock Light, after first adding a false stern. These were the first two launches on the river where now are owned in the neighborhood of a hundred, the little village of Noank, at the mouth of the river, boasting in the ownership of between forty-five and fifty, for the most part engaged in fishing and lobstering.

The first in Noank to adopt gasoline power for propelling their boat and for lifting their trawls of lobster pots were Wm. P. Latham and John L. Daboll, joint owners of *Falcon*; yet a canvass of the lobster boats this summer showed that but some four only were not equipped with power.

At Bridgeport, New Haven, Milford, South Norwalk, and other points on the Connecticut shore, the power boat is fast superseding the steam oyster boat, except with the large concerns who ship seed oysters extensively and own large beds. The individual boats licensed to fish on the public beds are debarred the use of power, either going to, coming from, or fishing on the grounds, or to haul dredges. I understand that even boats with power are not allowed to dredge unless the propeller wheels are removed. But for this there would be several hundred more motor boats engaged in catching seed oysters, and the oyster would soon share the fate of the lobster, so far as the Long Island Sound natural beds are concerned.

On the Long Island shore the conditions are a little different, in that the beds are usually owned by smaller concerns, cultivated by means almost exclusively of the power boat. There is hardly a planter who now uses steam for this purpose, or for marketing his product, even the sailing vessels being usually equipped with auxiliary gasoline power, in place of the old-time sloop with hand windlass.

In Gardiner's, as in Peconic and Great South bays, the motor boat plays a very important part. Where these craft are employed to transport fish to shipping points, fishing gear can be tended regularly, their product arrives in market in much better condition, and the result is that the gasoline motor once installed becomes, like the telephone, a necessity. So we might enumerate the various industries at different localities where for commercial purposes, such as carrying produce to market, short ferries, taking out fishing and sailing parties, the motor boat has proved the "proper thing in the proper place." These boats run in winter and summer, unless tied up by ice floes or storms, and, unlike the pleasure boat, which is hauled out and covered by the owner during the winter, are always "in evidence."

There is another large class of motor "boatists"—the man of moderate means who owns a boat for his own pleasure, whose first outlay is small, expense of running, care, and repairs is low. Probably no other form of recreation offers quite so much in return for the investment. He knows he can sell the boat at almost any time for what he paid for it, and his investment does not worry him. His "name is legion," as can be attested by the vast numbers which can be noticed on bays, rivers, sounds, etc., on every pleasant afternoon during the summer, or peacefully lying at their moorings when not in use. He can go when or where he pleases (of course after he learns his engine), alone or accompanied by family or friends. If he breaks down, he will always find a friendly launch to tow him home or to a safe haven, the credit of being able to do the towing is usually sufficient pay, trusting that when he in turn becomes entangled with a line in his wheel, or his gasoline tank is empty, some friendly launch will take his line to even

matters up. What does he care for racing? Perhaps he is unable to pay out the little extra that it would entail; but more likely he will say—and honestly, too—that he did not buy his launch for racing purposes; he doesn't know how fast she will go and doesn't care, so long as he can go where he pleases. Yet underneath this exterior apathy for motor boat racing he reads with avidity all the boating periodicals, all the racing news, and if he can afford the time and expense, watches the struggles from some point of vantage.

The cruising launch and the auxiliary yacht are important factors in the gasoline engine world. Those who can afford the cruising launch and the time to enjoy it, have usually one ideal, and that is a boat with a little better accommodations, a little more power, just a trifle increased speed, while the owner of the auxiliary, except with a good spanking breeze, rarely takes off his sail covers, and about the second or third season either removes the spars and converts her into a launch proper, or trades for a cruising launch. The yachtsman brought up to love the sailing craft, sighs, bemoans the lack of enthusiasm among his fellow sailing friends, and then—what else could he do? Why, he becomes the worst "crank" in the motor boat ranks.

There is but one more distinctive class. This is in truth a separate adaptation of the gasoline engine, and unfortunately we cannot all enter the sport with all that it means. It is in the high speed auto boat. Here is where brains, high mechanical ability, a knowledge of the high art of the naval architect, a cool head, a "long roll," and plenty idle time are necessary.

The speed results so far obtained this past year are remarkable, yet the auto boat is in its infancy.

From a business standpoint the power boat is a success. Examine the columns of publications who give up a part even of their columns to motor boats, engines, and accessories, and mark the vast number of manufacturers, both large and small, of marine gasoline engines, their number being augmented by new ones constantly springing up. How few of them meet with business reverses and leave the field to others. A remarkable thing it is that there is hardly a gasoline engine manufacturer or launch builder but has prospered the past year or two, while the indications are that the demand, being healthy, is bound to increase. Did you ever hear of a man tiring of motor boating?

Queries on Marine Motors.

B. A. H., Rochester, N. Y.—I am building a launch hull with bent oak frames—my first experience. Have keel, stem, sternpost and deadwood in place, also forms and battens ready for the timbers. What is the cheapest and simplest way to soften the timbers to bend them into place? I do not want to go to the expense of steam-box, boiler, etc. Which is better to bend, yellow bark or white oak? 2. What are the advantages, if any, from building a launch with a deadwood aft over using a double knee for a sternpost and planking from the rabbet in the keel and sternpost, rather than to a rabbet in the deadwood?

Ans.—The cheapest and one of the best methods is to procure a piece of second-hand 2in., 2½in. or 3in. steam pipe, or boiler tubing, about 6in. longer than the longest timber. Bury one end in the ground 2 or 3ft., first plugging it carefully with a piece of pine. Leave the pipe protruding from the ground at an angle of approximately 45 degrees. Fill this with water and build a fire under it. As soon as the water boils, immerse each timber separately; let it stand for a minute or two and it will bend like a piece of rubber. Green yellow-bark butts will be found to bend even better than white oak. The wood, of course, should be straight-grained.

2. A launch is undoubtedly stronger built with a good deadwood, and the cost would be less. It is largely a matter of choice and, except that all the room aft inside is needed for a reversing gear or wheel, we should strongly advise the deadwood. This construction would be heavier, but it would cost less, and the boat would be ever so much easier to "plank."

A. B. H., New Orleans, La.—1. Will a four-cycle engine burn more or less gasoline with a vaporizer than with a float feed carburetor? 2. Why do some makes of two-cycle engines take so much more fuel than others developing the same brake horsepower at the same speed?

Ans.—1. With a float feed carburetor and auxiliary air supply, a better mixture can be maintained with less wire drawing, thus getting more power with the same amount of gasoline. 2. On account of different locations of exhaust and inlet ports, higher or lower initial and final compression, different lengths of connecting rods, different methods of carburation, etc., *ad infinitum*.

W. A. W., Baltimore, Md.—The forward cylinder of my quadruple cylinder marine gasoline engine heats up badly. What is the cause and remedy?

Ans.—If your engine is installed at a considerable pitch, the forward cylinder may not get its share of the water. More likely the trouble may be from insufficient water piping from the engine. In case the pump is of the rotary or gear type, the piping should be larger on this account, else the water turned into steam makes back pressure on the pump and reduces its capacity. The remedy would be to increase the piping one size from the engine outboard, or increase the size or speed of the pump.

All communications for FOREST AND STREAM must be directed to Forest and Stream Pub. Co., New York, to receive attention. We have no other office.

Pleasure.

As Sailboat and Cruiser.

PLEASURE was designed and built for day service in the Great South Bay, Long Island, by the Herreshoff Mfg. Co., in 1901, and this accounts for her main characteristics, the water there being shoal and the winds strong.

Her dimensions are as follows:

Length—	
Over all.....	64ft. 3in.
L. W. L.....	45ft. 6in.
Overhang—	
Forward	10ft.
Aft	8ft. 9in.
Breadth—	
Extreme	15ft. 10in.
L. W. L.....	14ft. 6in.
Draft—	
To rabbet	2ft. 3in.
Extreme	3ft. 6in.
Board down	9ft.
Freeboard—	
Forward	4ft. 9in.
Least	2ft. 2in.
Aft	3ft. 2in.

These figures give one some idea of the boat's size. Her sail area, of about 1,800 sq. ft., makes her very easy to handle, particularly as there is no bowsprit and no topmast, and it is a simple matter to pull down the head sails. Her rig makes her a knockabout, although she is larger than the boats usually known as such.

As she was intended to make the passage through Fire Island Inlet in all weathers, she was very substantially built, double planked from the turn of the bilge to the planksheer, ceiled up throughout, and her frames and stringers are unusually heavy, the former being fastened to the keel with bronze knees. Bolted to the keel is about 6½ tons of lead in one piece.

Her length and breadth give her a fine deck, which is cut by a house about 11ft. 6in. long, and a cockpit 13ft.

PLEASURE—OUTBOARD PROFILE, INBOARD PROFILE, DECK AND CABIN PLANS.
Designed and built by the Herreshoff Mfg. Co., 1901. Owned by Theodore C. Zerega, N. Y. Y. C.

long. The cabin house, unlike most South Bay boats, has solid wooden sides, with the usual ports to open, and the cockpit floor is above the waterline. Inside she was almost without fittings or bulkheads.

She was acquired by the present owner, Mr. Theodore C. Zerega, N. Y. Y. C., during the spring of 1904, and there were many things to be done before she could be considered a cruiser on which one could live during the summer and make room so that a crew could be reasonably comfortable.

The first thing done was to charter a tug boat for a pleasant day in April and tow her from South Brooklyn to Jacob's yard, City Island. The owner was interested to see how much she would slap in the ferry-boat seas in going through the East River, and she rather surprised him by her good behavior. She was immediately hauled out upon her arrival at City Island and the work commenced.

From the mast forward, a distance of about 24ft., there was scant headroom, say about 4ft. 9in.; and as the galley had to go there, a mahogany hatch with slide was made, 5ft. long and 4ft. wide at the forward end, and 5ft. wide at the after end. The deck was cut out to this size, and this house, about 1ft. high, was fastened on. This made about 5ft. 8in. headroom and gave standing room for the cook. On top of this house was the forward slide, and at the ends and sides were placed lights and deadlights.

A large dresser and ample lockers for china and glass, and lockers for food were fitted on the port side of the forecabin, and a crew's water closet was placed on the starboard side aft. In the center aft was built a good sized ice-box, with ample cold storage room under the ice. Each man was given a locker for his clothes, and when the table was set up, the lanterns placed and a slab of green linoleum fitted to the floor, the forecabin was ready for the men. Three Primus stoves and one Khotal kept the cook-steward busy all summer. A bulkhead was built between the forecabin and cabin and the wash room enlarged. A new water closet and wash basin was supplied. On the port side, where an ordinary house ice-box had stood, was built in a buffet and lockers for glasses and bottles and an ample hanging locker for clothes. The bed places, transom seats and the after lockers were not touched, as they were just what was needed. A skylight was fitted to the cabin top, and after the painters had spent a few days inside, the cabin looked very comfortable indeed.

Under the cockpit was a water tank on port side, and one of equal size was supplied for the starboard side. When the plumbing was connected up, water was to be had by pumping either in the wash room or the forecabin. The cockpit floor is covered with a set of rubber mats that just fit. On the fore deck was placed a ventilator, which was kept in place throughout the summer, making life bearable in the forecabin in the warmest weather.

The upholsterer had plenty of work in doing over the bedding forward and aft, putting linoleum down all through, and carpet over the linoleum in the cabin.

There was an endless number of things to get for the cabin, but when everything was in position, even to lamps and curtains, the place looked comfortable, and during a three months' cruise proved most satisfactory.

On her fore deck she had two anchors, one 40 pounds and one 60 pounds, of the Herreshoff pattern. The 40-pounder was considered too small and was struck below to be used as a kedge. The 60-pounder was used as the ordinary everyday anchor and shackled to the chain, and a new Herreshoff anchor of 95 pounds was received from Bristol and placed on deck as a best bower. A large 135-pound fold-up anchor was purchased and stowed under the cockpit; but it spent the summer there, as we never had occasion to use it or its 45-fathom hawser. A compact little capstan on the fore deck handled the ground tackle with perfect ease. The steering gear is worth notice, as one can walk around it and steer, either standing up or sitting down, with perfect comfort.

A new 12ft. rowboat was placed on davits, fitted on the starboard side between the runner and the rigging, and when she is swung in there is plenty of room between her and the cabin house to walk past.

The local sailmakers, Messrs. Lathorne & Ratsey, overhauled the sails, which were in pretty good condition, and supplied the usual painted sail covers and a set of awnings and hatch covers made of Khaki-colored canvas that were easy on the eyes and perfectly waterproof.

Two men forward and a steward were ample to run the boat and keep her up properly.

After a most enjoyable summer, spent in cruising between New York and Stage Harbor, Chatham, the ship is safely laid away for the winter, her belongings carefully stowed in her locker; her linen in trunks, and her standing and running gear covered with canvas, so as to keep out the dust. Her mast was taken out and all rigging overhauled and given new service where required. The bilges and the cabin and forecabin floors have been painted. Her deck has been varnished two coats, and a skeleton frame built fore and aft to hold a heavy canvas cover made from a schooner's old mizzen and fitted with eyelet holes every 3ft., so that the cover is now over the frame and laced across under her keel.

Here we sadly leave her for the winter, but look forward to an early commission in the spring of 1905.

Co-Education on a Yawl.

(Concluded from page 417.)

We were particularly anxious to make a good land fall this time, and our course had been most carefully taken. It was a point of honor with us all to have our trick at the tiller show no deviation from the true course.

About 4 o'clock we sighted land on our port bow, and felt a great inclination to steer for it, feeling that we must be too far out. Then we began to look for the white shaft of Mohawk Island light. It stands on a tiny island a mile from the main land and marks the shore side of the reef that runs out a mile or more,

I am afraid we may have looked toward Dunkirk for it, so eager were we to pick it up over the water.

Mogging along thus, twilight came upon us, but not before we had picked up several familiar points west of Maitland.

"Fill the water tank, mate, while you are forward with the side lights. We may stay over here a day," sang out the skipper.

We were nearing home, for forty miles seemed a mere step after our longer runs.

Both the Maitland and Mohawk lights were plainly visible now. Betting ran high on our land fall, only we all felt sure we couldn't miss it; but when the captain bet a box of candy that we would hit the lighthouse keeper in the eye, there was no higher bet to be offered. We had held our course rigidly and were anxious to see the outcome.

It was quite dark, and the light was perhaps half a mile away, so the spinnaker was stowed and we ran on slowly, and the captain won his wager, for we ran straight in midway between the piers and anchored off the hotel.

It is a beautiful river, deep and wide and bordered by low fields, much like Holland. There is plenty doing in summer, but not a store of any kind short of Dunnville, four miles up the river, where deep-draft yachts can go very well. Here we rested a day just to more thoroughly enjoy our homeward sail over a familiar course.

Next morning brought us a spanking breeze out of the N. and we pulled up anchor about 9 o'clock. It was a breeze almost abeam after we passed the Mohawk light and set our course due E. to Point Abino, and a freshening breeze. A young bird, either a hawk or an owl, lit on the end of our main gaff, balancing itself with remarkable agility. For an hour it sat there, but suddenly started toward shore, and we noticed then what it had evidently noticed before, that we were abreast of Sugar Loaf Point, the nearest we had been to land in some time.

The wind was freshening and puffy now, so we tucked two reefs in the mainsail, to make the yawl ride on an even keel. She made just as good time as when she was carrying all sail and needed luffing in the puffs. Everything seemed to be hurrying; clouds, whitecaps, gulls and the yawl. It was a lively race with nature.

After passing Point Abino, our course lay a little N. of E. to make the red light at Buffalo. The wind continued to freshen and to work aft and rose at length, as we afterward learned at the Buffalo weather bureau, to thirty miles. In running before strong winds our yawl douses her driver, as it is found at such times to drag on her rudder. This and the jib being snugged down and the mainsail reefed, we found ourselves jogging along at a fast clip, the short boom easily clearing the seas, now very large.

"Get out your watches for this last twelve miles," called out the mate, "we're humming." And indeed we were. The yacht's hard bilges and comparatively flat floor kept her at it and we tore down on the lighthouse at a steamboat pace. All four of us were in the cockpit for this last hour of our month's cruise. The mate, as lunch time approached, handed out some of his good collins, and with a glass in one hand and a sandwich or doughnut in the other, we ate our last meal on board, and watched our flight.

"Let's get our pipes going and lay for that light," said the mate. "I tell you, old man, we're going to do the Buffalo-Point Abino record."

"We can't light 'em here. Come on down."

"Give the A. B. the stick. She'll keep her going."

"If you can get in at 2 o'clock you break the record all right," said the skipper, excitedly, one eye on the water rushing astern, the other glued to the white shaft of the approaching lighthouse.

"Don't look astern," cautioned the mate as a comber broke close to our taffrail, causing the A. B. at the helm to start apprehensively, "spoil your nerve."

We were now in the back wash, which sets out from the artificial break walls. This kicks up an ugly mass of tossing whitecaps when stirred by a strong wind down the lake. Solid water came over our forward decks and rushed aft with a swish and gurgle. The yacht jumped and bounded.

"This maelstrom is stopping us," growled the captain. "Don't you believe it. You're flying. It'll be better than two."

* * * * *

The skipper was right. It was better than two. We had smashed the local record for the last twelve miles and had to our credit the day's trip of forty miles in the good time of 4h. 30m.

Boston Letter.

BOSTON, Nov. 14.—The Regatta Committee of the Eastern Y. C., composed of Messrs. Henry Howard, chairman; George Atkinson, Jr., Stephen W. Sleeper, and Louis M. Clark, secretary, has issued in pamphlet form a most complete report of all the events given by the Eastern Y. C. during the season of 1904. Included in this report the summary of the ocean race from New York to Marblehead is given. The arrangements for this ocean race were very complete in every detail, and the information given in the report will undoubtedly be of great value to other clubs at this time when ocean racing appears to be a growing pastime. The records of the special open races, giving Dorel, Peri II., and Bat as winners of the cups presented by Commodore Laurence Minot, are given. A table showing the records of all of the yachts which took part in these races has already been published in FOREST AND STREAM. The port to port runs on the annual cruise are given in complete summaries. These also appeared in FOREST AND STREAM at the time of the cruise, with description of the conditions, the work of the various yachts, etc., on each run. Perhaps the most important records in the book are those of the series of motor boat races. Not one detail of this series has been omitted. The records of all of the boats on every leg of the course which they completed, have been preserved, and a table has been provided giving dimensions, horsepower, etc., with the greatest and the average speeds in

nautical miles. There is also a series of illustrations in half-tone showing the wave effects at different rates of speed. The motor boat race committee was composed of Messrs. Henry Howard, chairman; S. W. Sleeper, W. B. Stearns, A. Appleton Packard, and William Wallace, secretary. The production of this report is consistent with the work done by the Eastern Y. C. Regatta Committee during the past season, which was marked by earnest endeavor and great efficiency.

Whatever may be the outcome of the work of designers and builders during the winter months, it is certain that there is more or less apathy at present. The establishment of new rules may alter the situation somewhat, but it is unlikely that there will be many yachts built except for the smaller classes, with the exception of steam and power craft. Motor boats are in evidence on every hand, but there are few sailing craft. One of the neatest launches that has yet been seen, has been produced from lines by Mr. Fred. D. Lawley for Mr. J. H. Proctor, of Boston. The launch, or really cruising yacht, is 61ft. long, about 10ft. breadth, and 3ft. draft. She has a 40 horse-power motor, which is expected to drive about 12 miles an hour. The layout of this boat is most admirable; almost every inch of space is utilized, without giving the hull a crowded appearance. There is a raised deckhouse forward, abaft of which, over the low cabin trunk, is a very roomy bridge. In the forward part of the boat the crew is placed; these quarters run underneath the deckhouse and give considerable room. From the deckhouse, which is used as a dining saloon, a low companionway leads to the galley, which is ample for the needs of such a yacht cruising. Aft of the galley space is the engine room. Everything connected with the propelling of the yacht is in this room. There are two large gasoline tanks, one on each side, and in the after end of the room is the air tank. Connected with the engine is a dynamo for electric lighting. Access is gained to the engine room from the deck by a hatch and a ladder on the port side. In the after part of the boat is the main saloon, which has berths on either side, and an abundance of closet space. Leading off the saloon is the toilet room. There is quite a little room left in the space under the after deck, entrance to which is gained by a door under the main companionway stairs. There is quite a little deckroom aft, and there is plenty of space on either side of the cabin trunk to pass forward to the deckhouse. A signal mast is carried which is hollow. Inside the mast the wires are run to the light at the mast-head. The compressed air whistle is also placed on this mast, the pipe running up inside. Mr. Lawley has also designed an 83ft. boat which will have twin screws, with two 50 horsepower motors. The layout is something like that of the first boat described, except that the extra length allows of a double stateroom forward of the main saloon.

Mr. B. B. Crowninshield has a number of orders. The largest is for an 82ft. waterline auxiliary centerboard schooner, the owner of which wishes his name withheld for the present. She will be 108ft. over all, 82ft. waterline, 22ft. 3in. breadth, and 6in. draft. A novel feature of this schooner will be a deckhouse which will have full headroom, but which will not protrude in any unsightly manner above decks. This house will be placed over the engine space and one half will be sunk below the main deck. The owner and his guests will thus be enabled to see all that is going on around them, and at the same time be sheltered in stormy weather. He also has an order for a class of one-design 18-footers, the order coming from Mr. F. W. Denton, of Trimountain, Mich. At least four boats will be built. He has an order for a Y. R. A. 22-footer, but the name of the owner is withheld. Rather a novel order has come from a western yachtsman for a 22-footer. She is to be designed for the old rule of waterline plus the square root of the sail area, divided by two. Mr. Crowninshield's order is to design a yacht that will have so many freak features that the rule will be abandoned in the section where the boat is to be raced.

JOHN B. KILLEEN.

YACHTING NEWS NOTES.

For advertising relating to this department see pages ii and iii.

THE MARINE EXHIBIT AT THE SPORTSMEN'S SHOW.—The Motor Boat and Sportsmen's Show is giving promise this winter of extra attractions and an attendance far ahead of any previous exhibition. Space is being rapidly taken, and indications are that long before December 1 every foot of available space, including basement and galleries, will be taken. The New York Sportsmen's Show in itself is a big drawing institution, and this year's extra motor boat additional advertising will enhance its popularity, and by increasing the attendance will surely, from a business point of view, prove of benefit to exhibitors and visitors. The following exhibitors have signed contracts for space up to the present time:

Launches, Motor Boats, Etc.—Newbury & Dunham, American De Dietrich Motor Car Company, E. H. Gotshalk & Co., Milton Point Shipyard, Standard Boat Company, Buffalo Gasolene Motor Company, Palais De L'Automobile, Pierce Engine Company, Smith & Mabley, James Craig, Jr.; Electric Launch Company, Standard Motor Construction Company, Gas Engine and Power Company, Charles L. Seabury & Co., Lozier Motor Company, Truscott Boat Manufacturing Company, Cushman Motor Company, Mathews Boat Company.

Motors and Engines.—Edison Manufacturing Company, Smalley Motor Company, Carlyle-Johnson Machine Company, Isham Company, Trebert Auto and Marine Motor Company, F. A. La Roche Company, Sovereign Engine and Construction Company, Richardson Engineering Company, Spaulding Gas Engine Company, Mianus Motor Works, Eagle Bicycle Manufacturing Company, and many other concerns on the upper tier.

* * *

LAUNCH LADY ANTOINETTE SOLD.—The launch Lady Antoinette has been sold by Mr. Howard Keller, of New York city, to Mr. Harold Weston, of Jacksonville, Fla., through the agency of Stanley M. Seaman, New York. The boat was shipped to Jacksonville last week.

Royal Munster Y. C.

RARELY, if ever, did any club begin its existence with such a small roll of members or under less auspicious circumstances than did the Royal Munster Y. C., of Ireland, which, two years ago, attracted so much attention in yachting circles of the two hemispheres, by reason of its being the honored recipient of a "King's Cup" from His Majesty, King Edward VII., for an international race at Cork, Ireland.

The club was founded in 1872 (or 152 years after the establishment of its sister club, the Royal Cork Y. C., which has the distinction of being the first sailing club known to the world's history). In August of that year seven gentlemen, David Goold, Richard Foley, Thomas K. Exham, Patrick O'Connell, Joseph E. Russell, Henry Egan and Henry Harding Hayes, prompted by a love for yacht racing, then, unfortunately, beginning to rapidly decline in the south of Ireland, met together and formed themselves into what was then known as the Munster Model Y. C.

From the beginning, the primary object of the club was not only to revive racing, but more particularly to promote amateur sailing, and with these ends in view the members set to work. Each had his own little open sailing boat, and on the days appointed for racing, each was his own helmsman and crew, the reason for this single-handedness being a rule of the club, which distinctly said: "No person but a member of the club may be on board any boat, while taking part in a race given by the club." And the good effects of this rule were apparent when, in 1873, the club opened its second season with an increased roll of members and boats.

Thus encouraged, in 1873, the club held its first annual regatta, which was a complete success, and the third year of the club's existence not only saw a still further increase in the number of its members, but also the open sailing boats succeeded by the decked 16ft. class, known as the Munster Model Y. C. class; a year or two afterward came the 18ft. class, and, as time went by, these were in turn superseded by larger boats. Some of these erstwhile flyers are still to be seen flitting about Cork Harbor during the summer months, and even occasionally competing in races against the more modern boats of their size.

Thus, things prospered from the beginning with the club, and what must have been, if possible, even more gratifying to the original promoters, yachting had received an impetus and was beginning to revive. Year after year, the club became more and more popular; its spirit had spread and members began to pour in, bringing with them boats of more or less size on which to fly the flag of "the plucky little Monkstown Club," and to take part in its matches, till 1886, the conditions in which the club found itself were such as to render the title "Model" inappropriate. Accordingly, this title was dropped, and the club became the Munster Corinthian Y. C.

Under this name the club continued growing in favor and importance for six years, at the end of which time, through the request of His Majesty, the King (then Prince of Wales), Her late Majesty, Queen Victoria conferred the title "Royal" on the club, and changed its name to the Royal Munster Y. C.

In the same year ('92) the club, for the first time in its history, departed from its usual custom of catering solely for local yachts, and at its annual regatta gave a race for the crack first-class racers then going the round of the British and Irish regattas. This invitation brought the then famous 40-raters, Corsair and Thalia; in '94 Vigilant and Britannia met for the first time over an all-deep-sea course under the auspices of the Munster flag; in '95 the club was again honored by Queen Victoria by the presentation of a Queen's Cup. This much coveted trophy was battled for by Britannia, Ailsa, Isolda and the fast American 20-rater Niagara, the last-named losing the cup to the Royal cutter by only 9s.

1896 saw the first-class racers again assembled to do battle over the Cork Harbor course for prizes offered by the Royal Munster and also an important innovation, as far as local yachting was concerned, namely, the first appearance of the Cork Harbor six-tons (T. M.) one-design class, the establishment of this class being mainly due to the efforts of the Royal Munster, which gave a guarantee to provide weekly races confined to the new class for five years, and, though the guarantee is long since expired, the club continues to carry out its conditions.

To commemorate the club's jubilee in 1897, the then Commodore, the late Mr. Richard Foley, presented the club with a silver shield, to be given to the one-design boat winning the most races given by the club during the season. This gracious act tended to create even greater enthusiasm among helmsmen and owners, and to further encourage the enthusiasm, other members came forward with similar champion prizes in subsequent years.

Thanks to the efforts of the club, yachting in the south of Ireland had in 1898 become fixed on a firmer basis than it had ever been before. But the Royal Munster committee was not content with this prosperous state of things. It next turned its attention to making it permanent, and with that object the club boat class was established. These boats are of the 16ft. type, and were, as well as the one-design class, all built at Cork from the designs by William Fife, Jr. The club boats, as the name implies, are the property of the club, and for the purpose of teaching members, who would otherwise not have a chance of learning to handle and sail a yacht. A small annual subscription, in addition to the ordinary subscription, is required from those making use of the class, and the boats are allotted by ballot to subscribers who wish to take part in the races specially provided for them; and in order to fully insure the carrying out of the idea that prompted the establishment of this class, a special sub-committee is appointed annually to look after it and its interests.

The Royal Munster committee, also with a view to keeping the sport alive and of fostering a love for it from early boyhood, has admitted to membership, at reduced subscription rates, young gentlemen under

eighteen years of age. These junior members have all the privileges of senior members, as regards sailing, etc., but have no voice in elections or in the affairs of the club; nor is the fair sex forgotten, ladies also may become members on the same terms as the junior members, and as a result some of the lady-members have become more than a match for their masculine rivals in handling and racing a boat. From this, it may be seen, the Royal Munster is leaving no obstacle in the way of yachting becoming accessible to every one.

From the first day of its existence, the club has adhered steadfastly to its original aim—that is, the encouraging of and making of amateur yachtsmen. The rule aiming at this end and which is rigidly enforced, reads as follows: "On boats of 10 tons (T. M.) and under, only one paid hand is allowed to form part of the racing crew and then, only on condition he does not touch the helm, all the rest of the crew must be either members or non-residents of the County of Cork. Any violation of this rule disqualifies the offending boat and renders her liable to suspension for the rest of the season from taking part in races given by the club." The funds of the club are allocated solely to yacht racing and to the strict adherence to these two rules, together with the never-tiring zeal and energy of Mr. H. Harling Hayes, who has been secretary almost from the club's inauguration, and who is now the sole remaining one of the seven original members, may be entirely attributed the club's success.

That it has succeeded not only as a club, but also in fulfilling the end for which it was created, is an indisputable fact, proof of which was the club's selection by the greatest proof of which was the club's selection by His Majesty, King Edward, to be the first Irish club to become the recipient of a King's Cup since his accession. The efforts of the club to bring about international competition for this trophy are too well known to mention here, suffice it to say the committee did their best. Mr. Pierpont Morgan was waited on with a view to inducing him to bring Columbia over to meet Shamrock I., which Sir Thomas Lipton promised to enter, but, unfortunately, the notice given was too short to permit of the American flyer's crossing the Atlantic in time, and the project fell through. The cup was subsequently won by Bona.

The annual subscription of the club is one guinea (\$5); entrance fee, the same amount. There is no club house, meetings being held in one of the leading hotels of the city of Cork, otherwise the headquarters of the club are at Monkstown, a pretty and popular summer resort situated on Monkstown Bay, one of the widest expanding arms of Cork Harbor, and over which a great part of the bi-weekly races given by the club are sailed. Opposite the club quay is the anchorage, where numerous yachts lie moored throughout the summer season, and where there is sufficient water at all times for yachts of any draft, besides shelter from the prevailing westerly winds.

Few clubs can boast of the Royal Munster's record. Since its inauguration it has made giant strides. Thirty years ago its flag was unknown outside Cork Harbor; to-day, it flies at mastheads, not only throughout the United Kingdom, but in North and South America, and even as far east as Japan.

The club officers for the ensuing year, which shows promise already of being a good one, are as follows: Com. A. F. Sharman-Crawford, I. P., Slainté, 20 tons; Vice-Commodore, Arthur H. Julian, Maureen, 6 tons. Committee—G. A. Goold, James J. Foley, Thomas Russell, D. J. Daly, G. H. T. Beamish, George M. Fox, F. H. Stopford. Hon. Secretary, W. C. Taylor, B. L. Secretary and Treasurer, H. H. Hayes. J. J. H.

Officers of A. C. A., 1905.

Commodore—C. F. Wolters, 14 Main St., East Rochester, N. Y.
Secretary—H. M. Stewart, 85 Main St., East Rochester, N. Y.
Treasurer—F. G. Mather, 30 Elk St., Albany, N. Y.

ATLANTIC DIVISION.

Vice-Commodore—W. A. Furman, 846 Berkeley Ave., Trenton, N. J.
Rear-Commodore—F. C. Hoyt, 57 Broadway, New York.
Purser—C. W. Stark, 118 N. Montgomery St., Trenton, N. J.
Executive Committee—J. C. MacLester, U. G. I. Building, Philadelphia, Pa.; L. C. Kretzmer, L. C. Schepp Building, New York; E. M. Underhill, Box 282, Yonkers, N. Y.
Board of Governors—R. J. Wilkin, 26 Court St., Brooklyn, N. Y.
Racing Board—H. L. Quick, Yonkers, N. Y.

CENTRAL DIVISION.

Vice-Commodore—Lyman T. Coppins, 691 Main St., Buffalo, N. Y.
Rear-Commodore—Frank C. Denmler, 526 Smithfield St., Pittsburgh.
Purser—J. C. Milsom, 736 Mooney Brisbane Bldg., Buffalo, N. Y.
Executive Committee—F. G. Mather, 30 Elk St., Albany, N. Y.; H. W. Breitenstein, 511 Market St., Pittsburgh, Pa.; Jesse J. Armstrong, Rome, N. Y.
Board of Governors—C. P. Forbush, Buffalo, N. Y.
Racing Board—Harry M. Stewart, 85 Main St., East Rochester, N. Y.

EASTERN DIVISION.

Vice-Commodore—D. S. Pratt, Jr., 178 Devonshire St., Boston, Mass.
Rear-Commodore—Wm. W. Crosby, 8 Court St., Woburn, Mass.
Purser—W. S. Stanwood, Wellesley, Mass.
Executive Committee—Wm. J. Ladd, 18 Glen Road, Winchester, Mass.; F. W. Notman, Box 2344, Boston, Mass.; O. C. Cunningham, care E. Teel & Co., Medford, Mass.; Edw. B. Stearns, Box 63, Manchester, N. H.
Racing Board—Paul Butler, U. S. Cartridge Co., Lowell, Mass.; H. D. Murphy, alternate.

NORTHERN DIVISION.

Vice-Commodore—Chas. W. McLean, 303 James St., Montreal, Can.
Rear-Commodore—J. W. Sparrow, Toronto, Canada.
Purser—J. V. Nutter, Montreal, Canada.
Executive Committee—C. E. Britton, Gananoque, Ont.; Harry Page, Toronto, Ont.
Board of Governors—J. N. MacKendrick, Galt, Ont.
Racing Board—E. J. Minett, Montreal, Canada.

WESTERN DIVISION.

Vice-Commodore—Burton D. Munhall, care of Brooks Household Art Co., Cleveland, Ohio.
Rear-Commodore—Charles J. Stedman, National Lafayette Bank, Cincinnati, Ohio.
Purser—George A. Hall, care of Bank of Commerce, Cleveland, O.
Executive Committee—Thomas P. Eckert, 31 West Court St., Cincinnati, O.; Dr. H. L. Frost, 10 Howard St., Cleveland, O.
Board of Governors—Henry C. Morse, Peoria, Ill.

How to Join the A. C. A.

From Chapter I., Section 1, of the By-Laws of the A. C. A.: "Application for membership shall be made to the Treasurer, F. G. Mather, 30 Elk St., Albany, N. Y., and shall be accompanied by the recommendation of an active member and by the sum of two dollars, one dollar as entrance fee and one dollar as dues for the current year, to be refunded in case of non-election of the applicant."

"Forest and Stream" Designing Competition No. IV.

Sixty-foot Waterline Cruising Power Boat.

\$225 in Prizes.

THE three designing competitions previously given by FOREST AND STREAM have been for sailing yachts. In this competition, the fourth, we are to change our subject and give the power boat men an opportunity. The competition is open to amateurs and professionals, except that the designers who received prizes in any of the three previous contests may not compete in this one.

The following prizes will be given:

First prize, \$100.

Second prize, \$60.

Third prize, \$40.

Fourth prize, \$25, offered by Mr. Charles W. Lee for the best cabin arrangement.

Mr. Henry J. Gielow, N.A., has very kindly agreed to act as judge. In addition to making the awards, Mr. Gielow will criticize each of the designs submitted; and the criticisms will be published in these columns.

The designs will be for a cruising launch propelled by either gasoline or kerosene motors, conforming to the following conditions:

I. Not over 60ft. waterline.

II. Not over 4ft. draft.

III. A signalling mast only to be shown.

IV. Cabin houses, if used at all, to be kept as low and narrow as possible.

V. Construction to be of wood, and to be strong, simple, and inexpensive. The cost of the boat complete in every detail must not exceed \$9,000.

VI. The location of tanks and engine or engines to be carefully shown. Either single or twin-screws may be adopted. The power and type of the motor must be specified.

VII. The boat must have a fuel capacity sufficient to give a cruising radius of 700 miles at a rate of 8 miles an hour. The maximum speed shall not be more than 14 miles nor less than 10 miles. The estimated maximum speed must be specified.

VIII. All weights must be carefully figured, and the results of the calculations recorded. A thousand-word description of the boat and a skeleton specification must accompany each design.

The design must be modern in every particular, without containing any extreme or abnormal features. We wish to produce an able, safe, and comfortable cruising boat, one that will have ample accommodations, so that the owner and his wife and two guests, or three or four men, can live aboard, and one that can easily be managed at all times by two or three paid hands in addition to the steward. The draft is restricted to 4ft. in order that the boat may have access to nearly all harbors, canals and rivers North and South, and may thereby widely increase the cruising field. We have in mind a boat that can be used North in the summer and South in the winter, and a craft well able to withstand outside passage along the coast in all seasons of the year.

Special attention must be given to the cabin arrangement. The interiors should be original, but devoid of any impractical features. Arrangements should be made for a direct passage forward and aft without going on deck.

Drawings Required.

I. Sheer plan. Scale, 1/2 in. = 1 ft.

II. Half breadth plan. Scale, 1/2 in. = 1 ft.

III. Body plan. Scale, 1/2 in. = 1 ft.

IV. Cabin plan and inboard profile and at least one cross-section. Scale, 1/2 in. = 1 ft.

V. Outboard profile. Scale, 1/2 in. = 1 ft.

The drawings should be carefully made and lettered; all drawings should be preferably on tracing cloth or white paper, in black ink. No colored inks or pigments should be used.

The drawings must bear a *nom de plume* only, and no indication must be given of the identity of the designer. In a sealed envelope, however, the designer must inclose his name and address, together with his *nom de plume*.

All designs must be received at the office of the Forest and Stream Publishing Company, 346 Broadway, New York, not later than February 3, 1905. All drawings will be returned. Return postage should accompany each.

The FOREST AND STREAM reserves the right to publish any or all the designs.

ERIE Y. C.—At a meeting on the 9th inst., the following officers were elected to serve for one year: Com., W. L. Morrison; Vice-Com., Albert B. McDonald; Rear-Com., Carl Reichel; Fleet Captain, W. W. Ester; Sec'y and Treas., W. S. Reitzel; Directors—W. S. Foster and Frank Fairburn; Regatta Committee—F. Reitzel, F. M. Sloeum, E. A. Davis; Meas., Grant Lynch; Asst. Meas., Wilbur Altman; Surveyor, Henry Schacht; Asst. Surveyor, Frank Feisler; Fleet Surgeon, Dr. C. H. Harvey.

All communications intended for FOREST AND STREAM should always be addressed to the Forest and Stream Publishing Co., New York, and not to any individual connected with the paper.

Gas Engines and Launches.

(Continued from page 414.)

BY F. K. GRAIN.

Construction of Hulls.

In all cases the best construction for the average hull is to follow the old and standard method, which consists of a natural crook oak stem, oak keel, which should, if possible, be in one piece. The transom or backboard should also be of oak. The ribs we prefer of straight-grained oak, steam bent, and placed not over 12 inches apart from center to center.

In order to bind the heels of the timber or ribs securely together and to the keel, they should be connected by a piece called a floor timber. This may be of oak where the boat is moderately flat, but as it approaches the bow these timbers, if cut from straight stuff, will of course be cross-grained, and they should therefore either be bent in or cut from natural crooks. It is customary to gouge out a limber hole from the timbers near the keel, in order to allow the bilge water to drain to the lowest point.

This method of cutting the limbers of course tends to weaken the timbers, and much the most preferable plan is to gouge out a channel the length of the keel, making it sufficiently large, so that a strong copper sash chain can be laid in it. By pulling this chain then at any time the channel will always be cleansed.

In fastening the frame together for a power boat, we recommend the use of copper rivets, securely fastened with burrs where it is possible. In the wake of the engine it is a good plan to increase the size of the timbers or double the quantity. The planking should be of good quality of white cedar, not too wide, and fastened along each edge to the timbers with copper nails securely burred and riveted. Between each copper nail place a galvanized boat nail. This will prevent the plank from any inclination to buckle or warp. Of course at the ends of the planking—at the bow and the stern—it is necessary to use either galvanized nails or brass screws, as it is impossible to put in a copper nail and rivet it. The use of copper nails without being riveted is useless, for as soon as they corrode they will become so loose that they can be picked out with the fingers.

In all smooth planked launches the seams should meet on the inside of the planking, being open toward the outside. This allows of their being caulked, for which purpose cotton is used. After caulking, the seams should be thoroughly payed with white lead or varnish, depending upon the finish of the boat. This will harden the cotton and hold the putty afterward used to fill the seams. In the lap streak or so-called clinker-built boat, the upper edge of the plank is beveled off about one inch, the next plank lapping over it that much, the edges being fastened every few inches by riveted copper nails. In this method no caulking is employed, as the laps of the planking are supposed to be drawn firmly together. The upper plank of the boat is called sheer streak, and should be made of hard wood. On the inside of the boat we have a corresponding piece called the clamp, and this piece in a launch should be as deep as possible, in order to prevent the tendency, which exists in all power boats, to hog.

In hogging, the boat settles at each end, and this is caused, of course, by the greatest buoyancy of the boat being midships; and in small launches, where the motor is placed in the stern and the tank in the bow, there is a great tendency to hog. If a deck frame or brace were put across the midships of the boat, it would, in a great measure, prevent this trouble.

The deck timbers in the old-fashioned construction usually had a knee connecting each end to the side of the boat, called daggerknees. These, however, do not amount to much in a power boat and, in fact, we believe in making all cross-timbering as light as possible, as there is very little side strain in a power boat as in a sail boat, the strains being all the other way, we believe, in ample fore and aft timber.

On the deck, the plank, which is placed on the outside, is called a planksheer. The decking, filling in the planksheer, if made of hard wood in combination with a sheer streak and clamp, form a three-sided box around the entire outside, adding a great deal of strength to the boat. It is customary, however, at present for cheapness sake, to sacrifice this planksheer, laying the deck to the edge, parallel to the keel. The decks should be laid in comparatively narrow strips and thoroughly caulked.

In a great many launches we notice fancy hardwood decks of tongue and groove stuff without being caulked. These decks will soon rot out and will always be leaky, and there is no way of making them tight. In the inside finish of the boat, we believe in having as little fancy work as possible, dispensing with all beads, O. G. mouldings and other fancy work which it is hard to scrape up or reclaim when weather-beaten, and we think that after all it has a tendency to make a boat look cheap.

When a bronze propeller wheel is used, the rudder shoe, rudder and stem band should also be of brass or bronze, otherwise the galvanic action set up by the bronze propeller wheel will eat these articles if made of steel or iron, particularly of steel, especially of the finer grade, which corrodes much faster than iron.

In installing the engine no matter where located in the boat, the foundation should cover as many of the timbers as possible and should not rest on the planking if it can be avoided. The material for the engine bed should be of oak. We have neglected to say anything about mahogany for use in boat work, it being of course the king of woods when of proper quality, but is little employed nowadays on account of the expense.

In putting cabins on launches, their design will depend entirely upon the requirements of the owner; but we are very sorry to see a growing tendency to put high cabins on boats of 25 feet and under, as these boats are not sufficiently large or of sufficient beam to carry this top hamper, and are unquestionably dangerous, and in a strong blow with the average power are unmanageable. If a cabin is desired on a small boat,

the new style, now called hunting cabins, is by far the most preferable. These cabins are of the low trunk type, the same as in the old-fashioned sail boats, generally covering about two-thirds of the cockpit.

In designing a cabin launch where any kind of a gasoline or naphtha engine is used, the part used as an engine room should not be inclosed on the sides, as ample opportunity should be given all gases from the engine to escape and not be confined in the cabin.

In the matter of trimmings, or what is termed the jewelry for a launch, we have of course but the two, brass and galvanized iron, galvanized iron being the most serviceable, although it does not look quite as attractive, but needs no cleaning. The chocks to which the ropes lead, also the cleats, should be about two sizes larger than will be shown you by your storekeeper, as they invariably put on too small a chock, and one that will not hold the rope is worse than no chock, and a small cleat is an abomination.

The anchor for the boat should be in all cases amply large, with a good liberal supply of the best rope or chain for the same. It must be remembered that the anchor upon which the safety of your boat depends, and maybe sometimes your life, is the only real practical insurance which the average owner carries. There are at the present time a number of very excellent folding anchors in use which seem to have all the qualities necessary to make them equal to the old-fashioned anchor, and they have the advantage over the old kind, of taking up no room whatever.

All small power boats should carry a pair of good stout ash oars, as there is no telling when some accident may happen to the machinery or the propeller wheel, in which case, should the operator find himself in a heavy sea and close on a lee shore, especially without an anchor, the situation would at least prove rather trying.

Rifle Range and Gallery.

Rifles and Bullets.

BY WALTER G. HUDSON, M.D.

This is the first of a series of articles on modern rifle shooting from the pen of Walter G. Hudson, M.D., of New York city, president of the Manhattan Rifle and Revolver Association, and recognized as one of the highest authorities on the subject.

TARGET shooting as a sport has been more or less sharply divided into match rifle shooting and military rifle shooting. The points in which the match rifle differs from the military are its lighter trigger pull, finer sights, and better finish; and in addition, various departures from military styles are allowed in the way of special attachments, butt plates, heavier weight of barrel, etc. The match rifle also is developed with accuracy as its chief aim and accuracy at the particular distance it is to be used, while the military rifle has to be adapted to all ranges, and be strongly built and serviceable under adverse conditions, even if at the expense of some accuracy.

In view of these considerations, it is scarcely to be wondered at that the target rifle, developed with the sole object of shooting from the offhand position at 200 yards, as in vogue by the German-American (Schuetzen) clubs, should differ so much from the long-range match and military rifle. The schuetzen rifle has changed but little in many years, and in its present form is probably as near perfection for its purpose as it is possible to get. Most of the modern schuetzen rifles still use black powder, and in the finest American makes, the bullet is pushed down from the muzzle, as in the old muzzleloading rifles. They are extremely accurate, and the shooting is generally done on sheltered ranges; so that this kind of shooting brings the game down to merely one of skillful holding.

On the other hand, the long-range match rifle has of late years approached more and more closely to the military, so much so that most of the match rifles now in use in England are merely military rifles fitted with fine target sights. Skill in shooting at the long ranges, whether with military or match rifles, involves not only good holding, but also a knowledge of the effects of disturbing factors, such as changes of light, wind, barometric pressure, temperature, etc.

It must not be supposed, however, that schuetzen rifle shooting is of no value to riflemen who aspire to honors with the military or long-range rifle. It has the advantage of using very cheap ammunition, it is generally done on ranges provided with facilities that insure comfort to the shooter during even the coldest and most disagreeable weather, and it is the best possible training for fine holding. Therefore, it is far better for the riflemen who would keep in practice to shoot 50 or 100 shots at 200 yards say once a week or two weeks during the winter with a schuetzen rifle than to abandon the game altogether during cold weather. There are a large number of civilian riflemen who confine themselves almost entirely to this kind of shooting, and who are, nevertheless, very well posted and skillful riflemen, able to take up other branches of rifle shooting at short notice; and their skill in holding and intimate knowledge of many of the technicalities of the rifle, learned by long and careful practice with their own weapons, certainly put them far in the lead of the novice, no matter what other branch of rifle shooting they adopt.

But it is in long-range shooting undoubtedly that the rifeman finds the highest development of the sport. And in late years, since the advent of the modern smokeless powder rifle of high power and small caliber, it is gratifying to note, in our American as well as in the British weapons, that the military and match rifle have approached very near to each other. In the old black powder days the match rifle, with its paper patched bullet, heavy charge of powder and necessity of cleaning after each shot, was a far different weapon than the military rifle. In those days, to attempt to shoot 1,000 yards with a military rifle, would have been considered the height of folly. But now there is little difference in the scores made with match and military rifles at these long ranges. Indeed, our Krag, when a good barrel can be selected, and when the drag is removed from the trigger pull, is, in the opinion of many expert riflemen, fully capable at the mid and long ranges of holding its own against the finest match rifles that can be produced. There are few target sights that afford better aiming than the 1901 model Krag sight, and, while it is true that the target sights, as a rule, are further apart and adapted to the back position, the modern high power rifle seems to shoot so much better from the prone position as to more than compensate for any slight advantage the target sights might thus gain over our military sight. A glance over the records of those long-range matches of recent years that have been open to both military and match rifles, will show that in 90 per cent. of the matches the Krag has come out victorious. Indeed, the remark-

able development of accuracy in the American high power rifle within the past few years has not been due to any particular refinement in the weapon or sights, but solely to the improvement in the bullet and in the more uniform measuring of powder charges.

To deal understandingly with the differences that have taken place in rifles since the adoption of the high power principle, it will be necessary to look a little into the principles governing all rifles. A rifle may be regarded as an implement embodying all the resources of science and art in the effort to throw a projectile far, swiftly and accurately. The projectile is acted upon by the natural forces precisely as is a stone when thrown from the hand, the differences, due to the higher velocity of the bullet, being in degree and not in kind. The mystery that in the minds of the uninitiated is supposed to attend the flight of a bullet is chiefly due to the fact that the bullet cannot, under ordinary circumstances, be observed in its flight and its motion watched, like the stone.

The first thing that may be taken as true of all projectiles, no matter how thrown, is that they fall toward the earth as soon as the support is removed from them, just the same as though they were not projectiles. But, even while they are falling, the energy applied is driving them ahead. From this it will be clear that no weapon, however powerful, can drive a bullet so fast that it will go in a straight line; it immediately begins to fall as soon as it leaves the barrel unless the latter has been directed upward to some extent, in which case, besides its forward motion, it will rise until the upward force also imparted to it has been expended, and then begin to fall according to the well-known law of falling bodies—slowly at first, but faster the further it falls. The flight of a bullet, therefore, is always in a curved line.

It does not seem as though air would offer much resistance to the passage of a body through it, but any one who has ridden a bicycle knows that it does. Moreover, the resistance of the air increases much more than proportionately with the speed of the moving body, for if the speed be doubled, the resistance will be more than quadrupled. The air, therefore, becomes a much more potent factor in retarding the progress of a bullet than of the stone thrown from the hand, even though, weight for weight, the bullet presents less sectional area. The forward motion of the projectile, therefore, will become slower the further it travels, while its falling speed is continually increasing owing to the laws of gravity; and for this reason the further it goes, the more curved will be its flight, until at last it drops to the ground.

It is evident that the greater weight a bullet has in proportion to its sectional area, the less will be the degree of the resistance opposed to it by the air, other things being equal. An athlete could not throw a cork as far as a boy could a piece of lead of the same size and shape. Therefore the heaviest available material—lead—is used in the manufacture of the rifle bullets. For the same reason, the modern long bullet maintains its velocity much better than the old round bullet used in the musket and early muzzleloading rifle.

But when a bullet is made longer than its diameter, some means must be taken to insure its flying in the direction of its long axis—point on. This is the object of the spiral grooves that are cut on the inside of a rifle barrel, for it is found that if the bullet be caused to rotate with sufficient rapidity on its long axis, it will not turn sideways during its flight. The degree of this twist in the rifling is called its "pitch." The longer the bullet in proportion to its diameter, the quicker the pitch of the rifling must be; if the bullet is too long for a given pitch of rifling to handle, this will be shown by the bullet going through the target in a sideways or tipping position—in the parlance of the rifleman, it "keyholes." It is necessary for the bullet to be kept point on from consideration of accuracy, as well as to maintain its velocity.

When we increase the proportionate length of our bullets and use a quicker twist of rifling, it becomes necessary to harden the bullet by the addition of tin or antimony, so that it will hold on to the rifling and not be blown straight through the barrel without following the grooves—stripping, riflemen call it. But when we reach a certain point in lengthening the bullet and increasing the pitch of the rifling, no alloy of lead is sufficient to give good results. Therefore, in the modern high power rifle, the bullet is made up of a core of lead, with a jacket of very tough metal, generally an alloy of copper and nickel; and the tough jacket holds on to the rifling so well that we are enabled to fire charges of highly explosive compounds behind the bullet, giving nearly double the velocity that it was possible to obtain with the old black powder rifle. The modern high power rifle is, therefore, one which fires a jacketed bullet very long in proportion to its diameter, by means of a charge of smokeless powder several times as strong as black powder, with nearly double the velocity obtained with lead bullets and black powder; and as a result of the long bullet and high and well sustained velocity, the curve described by the bullet is much nearer a straight line—"its trajectory is flatter," its penetration greater, and its range longer.

There is another deviation laterally from the straight line shown by a rifle bullet and more pronounced in rifles having a quick twist; this is called "drift." It is a lateral movement due to the spin of the bullet on its long axis. As the bullet is constantly falling in its flight, the under surface meets with more air resistance than the upper, and the bullet, therefore, tends to roll laterally on this denser air; so that a rifle having a right-hand direction to its pitch of rifling, will cause a bullet to drift to the right, while one with a left-hand twist will drift to the left. Correction of this drift needs to be made on the sights of match rifles, but on the military sight of our national arm, the Krag, the correction is made automatically when the elevation is changed.

Gratis (O.) Rifle Club.

THE Gratis Township, O., Rifle Club held their November medal shoot on the 5th. The day was pleasant, but a strong wind caused several poor scores. The conditions were any rifle, 100yds., offhand, 4 shots, possible 48.

November medal match:

C Chrimer	12 12 9 12—45	Silas Lee	10 8 9 12—39
J W Leshner	10 19 11 12—43	M Pence	12 9 6 12—39
G. O. Chrimer	10 11 9 11—41	Geo Busche	10 6 8 11—35
C Busche	9 11 11 9—40	C Glaze	9 7 8 10—34

At the conclusion of the medal event three matches for cash prizes were shot under the same conditions, three moneys in each match. In the first G. Busche and G. O. Chrimer tied for first, and the former won, Chrimer second, Pence third. In the second, G. O. Chrimer and Pence tied for first. Chrimer won the shoot-off. Pence second, C. Busche third. Third match, C. Busche first, J. W. Leshner second, S. Lee third. The scores:

Prize matches:

G O Chrimer	43 46 40—129	C Chrimer	39 41 38—117
J W Leshner	40 41 43—124	M Pence	42 46 35—123
C Busche	32 43 44—119	S Lee	40 34 41—115
G Busche	43 38 38—119		

B.

Massachusetts Rifle Club.

The following scores were recorded at the regular weekly shoot:

Long-range match, 1,000yds.: F. Daniels 48, W. Charles 43, B. E. Hunter 39.

German ring target, 200yds.: A. Nieder 217, J. E. Lynch 205, F. C. Fitz 200, J. B. Hobbs 198, M. T. Day 196.

Mr. R. L. Dale secured a total of 1136 in 50 consecutive shots, as follows: 229, 234, 218, 226, 229—1136.

Standard target, medal match: Louis Bell 86, R. S. Hunter 80, J. E. Lynch 78, J. B. Hobbs 77, M. T. Day 77.

All-comers pistol match: R. S. Hunter 90, H. S. Adams 86, W. A. Smith 85, J. B. Hobbs 84, H. E. Comey 84, S. D. Martin 84.

Rifle Notes.

The Wilmington Rifle Club, Wilmington, Del., are arranging for a series of indoor matches to be shot this winter. This is a step in the right direction. Get in line, gentlemen.

On Nov. 26 and 27 the Williamsburg Shooting Society will hold an open gallery tournament for liberal prizes, at headquarters, 122 Hamburg avenue, Brooklyn.

The first championship gallery match under the auspices of the Indoor Rifle League will be held at Pittsburg, Pa., Jan. 16 to 20, 1905.

The 100-shot championship match shot on the Greenville ranges was won by Mr. H. M. Pope, of Chicopee Falls, Mass., with a total of 2270. Dr. W. G. Hudson, last year's leading man, was second with 2250, closely followed by F. C. Ross, 2233. The weather conditions were all that could be desired. Twenty-seven men faced the targets in the race for championship honors. Dr. Hudson recorded the highest 10-shot total, 237. A full report will be given in our next issue.

Trapshooting.

If you want your shoot to be announced here send a notice like the following:

Fixtures.

Nov. 17-19.—Tampa, Fla.—Tampa Bay Rod and Gun Club, \$400 added. J. A. Hansbrough, Sec'y.
Nov. 24.—Ossining, N. Y., Gun Club merchandise shoot. C. G. Blandford, Capt.
Nov. 24-26.—Tucson.—Arizona Sportsmen's Association tournament.
Nov. 30.—Edgewater, N. J.—All-day shoot of the Mullerite Gun Club. A. A. Schoverling, Mgr.
1905.
Jan. 17-20.—Hamilton, Can., Gun Club live-bird tournament. J. Hunter, Sec'y.
Jan. 23-28.—Brenham, Tex.—Sunny South Handicap.
Jan. 31-Feb. 2.—Taylor, Tex.—Central Texas Handicap.
June 8-9.—Dalton, O., Gun Club annual tournament. Ernest F. Scott, Capt.

DRIVERS AND TWISTERS.

Club secretaries are invited to send their scores for publication in these columns, also any news notes they may care to have published. Mail all such matter to Forest and Stream Publishing Company, 346 Broadway, New York. FOREST AND STREAM goes to press on TUESDAY OF EACH WEEK.

The trap editor of this journal is absent this week shooting at ducks or shooting into the welkin.

Mr. J. W. Farrell, of Muncie, Ind., has challenged Mr. Austin Flinn, of Wabash, to contest for the English Hotel Cup.

Live-bird sweepstakes have been arranged for Thanksgiving Day, at Muncie, Ind. The programme is devised for those who like good competition.

Among the distinguished visitors in New York this week were Messrs. Herbert Taylor, of Wilmington, Del.; Mr. E. H. Tripp, of Indianapolis, and the Hon. Tom Marshall, of Keithsburg, Ill.

Mr. A. A. Schoverling, manager, writes us as follows: "All-day shoot of the Mullerite Gun Club on the grounds of the North River Gun Club, on Wednesday, Nov. 30, at 10 A. M. Programmes later."

Mr. Elmer E. Shaner, secretary-manager, announces that the annual meeting of the Interstate Association will be held on Dec. 8, the purposes of which are more fully set forth elsewhere in our trap columns.

On Nov. 13, the Hudson Gun Club, of Jersey City, commenced a series of three shoots for a Reble gun, \$100 grade. The conditions are: Handicap point system, 25 targets, entrance \$1.50; re-entries unlimited, \$1. Targets 1 1/4 cent.

The secretary, Mr. Jas. W. Bell, has sent out the following invitation: "Indianapolis Gun Club. Come and win your Thanksgiving Dinner, Saturday afternoon, Nov. 19. Five 20-target events, entrance 30 cents each. Three prizes each event—turkey, duck and chicken. Winner each first prize handicapped 1 yard."

Mr. Hugh M. Clark, of Wabash, retained the championship of Indiana, in his defense of that title in a contest with the former holder, Mr. Max Witzgreuter, of Ft. Wayne, on the grounds of the Corner Rod and Gun Club, Nov. 6. Mr. A. C. Spencer, of Muncie, has challenged Mr. Clark to contest for the Lieber trophy, emblematic of the Indiana State championship. The contest will take place in the near future.

On Nov. 12 the Princeton Gun Club team won the intercollegiate championship. Harvard was second with 190, Yale third with 171, and Pennsylvania fourth with 170. Each man shot at 50 targets. The best individual work was done by Stutesman, of Princeton, who broke 44. Princeton—Stutesman 44, Gaines 41, Pardoe 38, Frick 35, McIlvan 33; total 191. Harvard—Foster 40, Webster 38, Ward 39, Bartlett 37, Wyckersham 41; total 190. Yale—Thompson 37, King 35, Ady 38, Pugsley 37, Alden 24; total 171. Pennsylvania—Longnecker 38, Koom 35, Perkin 30, Adams 23, Way 34; total 170.

BERNARD WATERS.

ON LONG ISLAND.

Crescent Athletic Club.

BAY RIDGE, L. I.—The Election Day shoot held by the Crescent Athletic Club, Nov. 8, was well attended. Thirteen events were shot. The Holiday cup had thirteen contestants, an unlucky number for twelve of the contestants. Mr. C. T. Foster won it.

The weather was clear and cool. There were eleven trophy events. The winners of the main events were as follows: Mr. W. W. Marshall, won two at 15 targets, A. G. Southworth one at 15 and one at 25, O. C. Grinnell, Jr., one at 15 and one at 25, C. Kenyon, Jr., one at 15 and H. B. Vanderveer and E. W. Snyder one each at 25 targets. Each trophy event had handicap allowances added to the scores. Scores:

Trophy shoot, 15 targets: C. Kenyon, Jr. (3) 14, E. H. Lott (0) 13, O. C. Grinnell, Jr. (3) 13, G. W. Callaghan (3) 11, H. B. Vanderveer (1) 11, W. T. McConville (2) 9, G. W. Gair (5) 8, E. G. Werfield (4) 7.

Trophy shoot, 15 targets: O. C. Grinnell, Jr., (3) 15, H. B. Vanderveer (1) 14, E. H. Lott (0) 13, C. Kenyon, Jr. (3) 13, G. W. Callaghan (3) 11, W. T. McConville (2) 9, E. G. Werfield (4) 8, G. W. Gair (5) 7.

Trophy event, 25 targets: O. C. Grinnell, Jr. (5) 25, H. M. Brigham (0) 23, A. G. Southworth (0) 12, E. H. Lott (1) 21, W. T. McConville (4) 21, H. L. Kenyon, Jr., (5) 20, H. B. Vanderveer (3) 19, E. G. Warfield (7) 17, G. W. Gair (8) 13, G. W. Callaghan (5) 10.

Trophy shoot, 15 targets: H. M. Brigham (0) 14, E. H. Lott (0) 14, D. V. B. Lott (4) 14, W. T. McConville (2) 13, L. C. Hopkins (1) 12, A. G. Southworth (0) 12, O. C. Grinnell, Jr. (3) 12, G. W. Gair (5) 11, E. G. Warfield (4) 11, G. W. Callaghan (3) 8.

Shoot-off: Brigham 14, D. V. B. Lott 13, E. H. Lott 11.

Trophy shoot, 15 targets: W. W. Marshall (3) 15, H. M. Brigham (0) 14, A. G. Southworth (0) 12, E. W. Snyder (4) 12, L. C. Hopkins (1) 12, E. G. Warfield (4) 11, E. A. Cruikshank (4) 11, D. V. B. Lott (3) 10, O. C. Grinnell, Jr. (2) 10.

Trophy shoot, 15 targets: W. W. Marshall (3) 15, H. M. Brigham (0) 14, L. C. Hopkins (1) 14, A. G. Southworth (0) 13, E. H. Lott (0) 13, E. W. Snyder 4, 12, E. G. Warfield (4) 11, D. V. B. Lott (3) 9, O. C. Grinnell, Jr. (2) 9, E. A. Cruikshank (4) 8.

Trophy shoot, 25 targets: H. B. Vanderveer (3) 23, A. G. Southworth (1) 23, W. W. Marshall (5) 22, H. M. Brigham (0) 21, C. F. Foster (7) 20, G. W. Callaghan (7) 20, L. C. Hopkins (2) 19, E. W. Snyder (7) 19, O. C. Grinnell, Jr. (4) 18, E. A. Cruikshank (7) 17, J. Nicholson (7) 16, E. G. Warfield (7) 13, C. Kenyon, Jr. (4) 9, R. A. Clarke (7) 7.

Shoot-off: Vanderveer 23, Southworth 22.

Trophy shoot, 25 targets: E. W. Snyder (7) 25, H. M. Brigham (0) 23, W. W. Marshall (5) 23, C. Kenyon, Jr. (4) 23, E. H. Lott (1) 22, L. C. Hopkins (2) 22, A. G. Southworth (1) 21, O. C. Grinnell, Jr. (4) 21, E. A. Cruikshank (7) 19, Jere Lott (4) 18, J. Nicholson (7) 15, C. F. Foster (10) 14, G. W. Callaghan (7) 16, R. A. Clarke (7) 8.

Holiday cup, 25 targets: C. T. Foster (7) 24, L. C. Hopkins (2) 23, G. W. Callaghan (7) 23, H. M. Brigham (0) 22, E. H. Lott (1) 22, C. Kenyon, Jr. (4) 22, H. B. Vanderveer (3) 22, E. W. Snyder (7) 21, A. G. Southworth (1) 20, O. C. Grinnell, Jr. (4) 19, W. W. Marshall (5) 15, J. Nicholson (7) 15, W. C. Dammeron (7) 11.

Trophy shoot, 15 targets: H. M. Brigham (0) 15, A. G. Southworth (0) 14, E. H. Lott (0) 14, C. T. Foster (4) 14, H. L. Kenyon (2) 13, W. W. Marshall (1) 12, O. C. Grinnell, Jr. (2) 12, L. C. Hopkins (1) 12, W. C. Dammeron (4) 12, J. Nicholson (4) 10, E. A. Cruikshank (4) 9, G. W. Callaghan (5) 10, H. B. Vanderveer (1) 9, Dr. C. C. Henry (4) 8.

Trophy shoot, 25 targets: A. G. Southworth (1) 25, C. T. Foster (6) 24, H. M. Brigham (0) 23, L. C. Hopkins (2) 23, C. Kenyon, Jr. (4) 22, W. W. Marshall (5) 20, O. C. Grinnell, Jr. (4) 20, W. C. Dammeron (7) 18, G. W. Callaghan (7) 19.

Trophy shoot, 15 targets: A. G. Southworth (0) 15, L. C. Hopkins (1) 14, E. W. Snyder (4) 14, W. W. Marshall (3) 13, O. C. Grinnell, Jr. (2) 13, H. M. Brigham (0) 12, W. C. Dammeron (4) 8, E. A. Cruikshank (4) 6.

Match, 5 pairs and 15 singles: H. M. Brigham 20, A. G. Southworth 20, E. H. Lott 17, O. C. Grinnell, Jr., 12.

Shoot-off: Brigham 3, Southworth 2.

Nov. 12.—The regular weekly shoot, Mr. H. L. Kenyon scored the limit alone for the November cup. The scores follow:

Trophy shoot, 15 targets: Bennett (1) 15, Marshall (3) 12, Southworth (0) 11, Grinnell (2) 11, Vanderveer (1) 9.

Trophy shoot, 15 targets: Grinnell (2) 14, Marshall (3) 12, Southworth (0) 12, Vanderveer (1) 11, Bennett (1) 10.

Trophy shoot, 15 targets: Grinnell (2) 14, Southworth (0) 14, Bennett (1) 13, Marshall (3) 12, Kenyon (3) 11, Hopkins (1) 10, Vanderveer (1) 10.

Shoot-off, same conditions: Grinnell (2) 13, Southworth (0) 12.

Trophy shoot, 15 targets: Kenyon (3) 15, Grinnell (2) 13, Southworth (0) 12, Marshall (3) 11, Hopkins (1) 10, Vanderveer (1) 10, Bennett (1) 9.

Shoot for November cup: H. L. Kenyon (5) 25, Bennett (3) 22, Hopkins (2) 22, Southworth (0) 20, Grinnell (4) 21, Marshall (5) 15, Vanderveer (3) 13.

Trophy shoot, 15 targets: Southworth (0) 13, Kenyon (3) 13, Werleman (4) 13, Hopkins (1) 13, Damron (4) 10, Grinnell (2) 7.

Shoot-off, same conditions: Werleman (4) 15, Southworth (0) 13, Kenyon (3) 12, Hopkins (1) 10.

Trophy shoot, 15 targets: Southworth (0) 13, Kenyon (3) 13, Werleman (4) 12, Marshall (3) 11, Grinnell (2) 10, Hopkins (1) 10, Vanderveer (1) 9, McDermott (4) 9.

Shoot-off, same conditions: Kenyon (3) 15, Southworth (0) 8.

Team shoot, 10 targets:

Duffs—Vanderveer 7, Kenyon 7, Hopkins 8, Werleman 5; total 27.

Stuffs—McDermott 2, Southworth 7, Grinnell 5, Marshall 4; total 18.

Bound Brook Gun Club.

BOUND BROOK, N. J., Nov. 11.—Thirty-two shooters faced the traps at the shoot given by the Bound Brook Gun Club on Election Day. Fourteen shooters shot the entire programme. The targets were thrown about 45yds. About 6,000 targets were used in the day's shoot, and not over 20 targets were broken by the trap all day.

The prizes were evenly distributed among the shooters. Bissette, of South River; A. E. Stables, of New York; Dr. Betts, of New York; Piercy, of Jersey City; Ackers, Dunn and Brown, of Rahway; W. G. Tingley, of Trenton, and Dr. Pardoe, of Bound Brook, were among the prize winners.

The trade was represented by Welles, Elliott, Apgar, Butler, Fanning and Glover. Although Glover is last on the list, he came out ahead, making high professional average, making 181 out of 200.

Dr. J. B. Pardoe had charge of the office, assisted by F. K. Stelle, who acted as entry clerk and arranged the squads.

An intermission was taken at noon, and while the shooters were eating their lunch Dr. J. B. Pardoe took a picture of the shooters.

S. W. Dunning and Byron Prugh kept the score, and Mr. J. Brokaw refereed.

Bissette made high amateur average. His score was higher than any of the professionals. Piercy, of Jersey City, won second, and Hendricks, of Rye, won third.

Staples won the silver loving cup. In the handicap event there were eleven ties, shot off miss and out. Phillips won the medal.

	Shot at.	Broke.		Shot at.	Broke.
Bissette	200	189	Exber	175	124
Wells	200	149	Hendricks	200	160

F. R. STEELE, Sec'y.

Felford Memorial.

WILMINGTON, Del.—Messrs. Keller, Butler, Elliott and Fanning, the gentlemen on the committee in charge of the E. D. Fulford Memorial, have asked me to act as custodian of the funds. Of course, in handling a thing of this kind, considerable detail work is entailed, and on this account I have taken hold of it with some reluctance; but in view of my personal friendship for Mr. Fulford, and of my desire to see that a fitting memorial is gotten up, I shall of course be glad to receive funds, which might be sent by any of his many friends.

Subscriptions can be addressed to me, care E. I. duPont Co., P. O. Drawer 1001, Wilmington, Del., and at periods of every two or three weeks it is my intention to publish in the various journals a list of subscribers. Any one not wanting his name to appear in this list must so signify, and it can be entered as a cash donation; but my records, such as will be turned over to the committee, will show each donor and the amount.

This fund will be in my hands until Feb. 1, 1905, on which date I shall be ready to turn it over to the proper parties.

Even before the committee's notice was published in the papers this week, I received several donations, and I append to this a list, in order that interested friends might see just how well Ed. Fulford was thought of.

It is not my intention, and I don't think it is the desire of the committee, to make solicitations, and parties wishing to contribute, do so of their own free will.

Cook County Championship at Targets.

THE conditions governing the contests for the Cook county championship at targets, as announced to take place at the Watson Park Shooting grounds during the fall and winter of 1904-1905, have been changed to allow such shooters who are unable to attend on Saturdays to contest for same on Sundays, if they so desired.

The following are the dates as corrected: Saturdays—Nov. 5 and 19; Dec. 3 and 17; Jan. 7 and 21; Feb. 4 and 8; March 4 and 18. Sundays—Nov. 20; Dec. 4 and 18; Jan. 8 and 22; Feb. 5 and 19; March 5 and 19; April 2.

Rules and Conditions—Fifty-target Race for the Championship of Cook County.—Entrance, price of targets only. Open only to bona fide resident amateurs of Cook county. Trophy cup valued at \$50 will be presented by the Chicago Trapshooters' Association to the winner. There will be ten races on Saturdays and ten on Sundays. A shooter can compete on either a Saturday or Sunday date, but he cannot shoot in more than ten races in all. A shooter competing on a Saturday cannot compete on the following Sunday. Winner of most races to receive the trophy. All stand at 16yds. Shooters will be handicapped one yard for every win. All ties to be shot off at 25 targets. The first squad will be up at 3 P. M. sharp. No shooter can enter after first squad is at the trap. Targets will be one cent. Shells for sale on the grounds. A contestant must notify the secretary when on the grounds of his intention of competing for the trophy. Remember this, or your score will not be counted.

The grounds are at Burnside, Ninety-fifth street, near South Park avenue. Take I. C. R. R. trains or Calumet electric to Burnside.

Ossining Gun Club.

OSSINING, N. Y., Nov. 12.—The scores herewith were made at the regular bi-monthly shoot of the Ossining Gun Club, to-day. The targets were thrown fast and a puffy wind cut the scores up considerably. Mr. D. McFarland came up with his new gun and did nice work considering the conditions. Event No. 9 was for 100 loaded shells. Washburn and Blandford tied with 18 out of 25; Washburn won by one target on a shoot-off at 25. Figures after names denote yards handicapped. We have had some nice prizes donated for our Thanksgiving Day Handicap merchandise shoot, among which are a \$25 pair of binoculars, \$5 gold piece, two silver dishes, two hunting coats, etc., and we have just begun to collect.

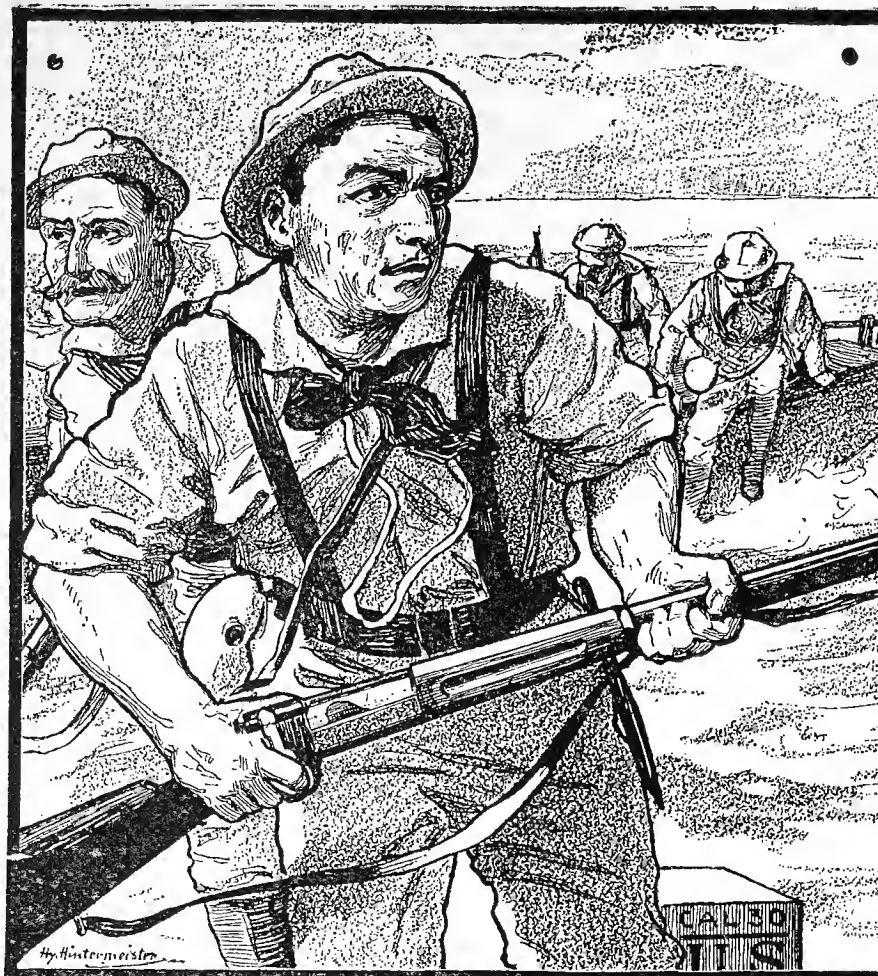

Events:	1	2	3	4	5	6	7	8	9
Targets:	10	10	10	10	10	10	10	10	10
D McFarland, 6	4	8	6	2	6	5	6	..	14
C G Blandford, 20	5	9	7	8	5	7	7	8	18

I T Washburn	8	..	8	7	6	7	7	10	18
H Sherwood, 18	5	4	6	5	5	7	7	..	13
D Brandreth, 18	5	16

C. G. B.

Poughkeepsie Gun Club.

POUGHKEEPSIE, N. Y., Nov. 10.—The scores made at the shoot of the Poughkeepsie Gun Club to-day, each event at 25 targets, were as follows:

Snyder, 1	21	22	18	19	Travers, 0	18	23	22	19
Hans, 1	21	25	24	22					

U.S. CARTRIDGES

114-116 Market Street, San Francisco.

WESTERN TRAP.

St. Charles beats Warrenton.

ST. CHARLES, Mo., Nov. 8.—There have been three contests between the town of Warrenton, as represented by the gun club, and the town of St. Charles, the last one being held on Nov. 5. On July 3 the home club was defeated by 2 targets. On Aug. 28 the tables were turned by 2 targets, which tied the clubs. The last shoot found St. Charles' boys in the best trip, and with 29 to the good, made a decided victory.

The St. Charles now feels able to shoot with any club located in Warren or Lincoln counties. The scores:

St. Charles—Paul 35, Hubbard 38, Wilke 47, Schoenberg 43, Barklage 43, Wilmes 37; total 243.

Warrenton—Langford 40, Linnert 39, Boloom 19, Yocum 39, Harbaum 38, Morrissey 39; total 214.

Invitation Shoot.

EVANSTON, Ill., Nov. 9.—There are a couple of good fellows at Warsaw, Ill., as evidenced by the clever act in inviting C. D. Baxter and O. T. Campbell, of this city, to shoot with them. Saturday was the day chosen, and the day was pleasantly spent.

Each man shot at 20 live birds, with the result that Gash was high with 19, Baxter 17, Wernhauer 16, and Campbell 14.

Campbell got even on the target shooting, as he was high with a score of 56 out of 65 targets.

East St. Louis Championship.

EAST ST. LOUIS, Mo., Nov. 7.—For some months there has been a proposition on foot which finally terminated in a shoot held Sunday at the Central Gun Club grounds. It was the opening shoot for the championship of East St. Louis, St. Louis and Belleville. The conditions were 100 targets, and the opening contest was won by W. H. Clay. It was a good first with 94, making the last 25 straight. Lenhorth was not far in the rear with 92.

The next shoot will be held at the Progressive Gun Club, East St. Louis.

The scores, each shooting at 100 targets: Lenhorth 92, P. Baggerman 90, W. H. Clay 94, W. Baggerman 86, Deletine 78, Strop 70, Huff 82, Covy 90.

At Francesville.

FRANCESVILLE, Ind., Nov. 12.—The regular shoot for the club's trophies was held Tuesday. All the members present shot in six events, with a total of 85 targets. Brown, from the 21yd. line, was high man with 76. E. Brown, of Pleasant Grove, won the cup event, and the club badge was carried away by Frank Rice. The scores, at a total of 85 targets, distance handicap, follow: Nichols (21) 74, Brown (21) 76, Rice (17) 67, Kopka (17) 57, Prewett (17) 55, Shumacher (17) 68, Myers (17) 65.

Effingham Tournament.

EFFINGHAM, Ill., Nov. 10.—The first annual tournament of the Effingham Gun Club was held here last Saturday with a good attendance both of trade representatives and amateurs. The visitors were well pleased with the good grounds and the way the targets were thrown. All were pleased with the division of money on the Jack Rabbit system, as this gives all some opportunity to enjoy the sport without it becoming too expensive.

The trade men, Vietmeyer, Riehl, Cadwallader, Boa and Standish and Bronaugh were ever ready to give some detailed information as to guns and ammunition on trapshooting pointers.

The day was a fine one for the sport, and on the whole the shoot was a success. William Hawcs was high man with 141, while George Johnson made 139. The scores:

	Shot at. Broke.		Shot at. Broke.
Vietmeyer	195 168	Greenherst	195 99
Riehl	195 182	Gandell	195 89
Cadwallader	195 170	Burden	195 91
Boa	195 185	Parkhurst	100 47
Ryman	195 120	Walters	120 59
Johnson	195 139	Pretzky	45 21
Austin	195 101	Le Crone	55 23
Haines	195 141		

At Freeport.

FREEPORT, Ill., Nov. 10.—A few years ago targets were sent to the town of Freeport by the carload, which was an index to the shooting done at the trap.

Following this, came a season of inactivity and no more shooting was done for several years. With about twenty out to-day and a powder representative present, it is a pleasure to note that the shooting men have come forward to once more enjoy the pleasure of burning powder.

Mr. Keck, the one-armed shooter, made a good score, though out-classed by Waddington.

Scores: J. A. Poling shot at 100, broke 59; Keck 150, 117; Waddington 115, 104; E. B. Hall 50, 39; A. C. Knoor 100, 67; Younglove 75, 47; H. F. Jansen 115, 70; A. Moogk 75, 14; C. E. Bentley

25, 7; W. F. Karchner 75, 20; W. N. Tice 15, 8; Piersol 10, 2; Brown 25, 14; J. Sweeney 25, 18; Dillon 25, 20; W. A. Kintzle 10, 3; R. Rosenstell 15, 10; Ray 25, 15.

At Joplin.

JOPLIN, Mo., Nov. 9.—The Webb City, Mo., Gun Club held an open contest Tuesday. The attendance was fair and the scores only medium, the average being less than 50 per cent. It requires some persistence to shoot at 70 targets and only score 12, or to make ten straight ciphers. The scores: T. B. Brewer shot at 110, broke 73; J. McLoughlin 80, 51; R. M. Jones 70, 45; B. Gammon 100, 42; Jim Smith 50, 35; F. Hamilton 40, 21; F. Boyer 50, 17; John Donahoe 70, 12; Frank Houston 10, 4; Lowery 20, 3; J. McCormack 10, 3.

At Guthrie.

GUTHRIE, Okla., Nov. 9.—The race Saturday for the White trophy was a close one. N. D. McGinley and H. U. Carle shot at 15 live birds; result, McGinley 14, Carle 11. The next contest for the medal will be between Harold Eisenschmidt and the holder.

The target scores follow: Harry Carle broke 39 out of 50; Kusy 68 out of 100, Rosenberg 67 out of 100, Daniels 52 out of 75, Donnelly 102 out of 125, Eagan 124 out of 150, McGinley 18 out of 25, Olssmith 58 out of 75, Hutton 29 out of 50, Sam Smith 63 out of 75, H. C. Eisenschmidt 61 out of 75, MacMorris 56 out of 75.

In Other Places.

When the last meeting of the Oak Knoll Gun Club, of St. Louis, was held, the club members were pleased to meet Mr. and Mrs. Crossman, of Clayton, Mo. Mrs. C. was high gun on the per centage, with 72½. Scores: Mrs. Crossman shot at 40, broke 29; C. Crossman 60, 39; Essig 75, 54; Barrowe 75, 54.

Tuesday the Nicholas Park Gun Club met and spent a pleasant afternoon. Several good scores were made, the best being that of William Craig. Another tournament will be held at Jacksonville, Ill., Nov. 20 and 23. This club has completed a good club house and can take care of a large attendance.

Burlington, Ia.—A one-day tournament was held here recently. Considerable interest was taken, as there were special prizes awarded. The best prize was won by Mr. Wagoner, and he was proud of it. There are many shooters around Burlington, and there should be more tournaments held.

Teranceville, Nov. 7.—The gun club held a shoot Saturday and six events were on the programme. Nichols and Brown were handicapped at 19yds., with the rest at 16yds. In the cup shoot Brown was high with 24 out of 25. The club will hold an all-day tournament on Nov. 24. All who attend will have a good time. This is assured by the fact that Everett Brown will be the manager.

Taylorville, Ill., Nov. 7.—The shoot held here Saturday was a record-breaker in this respect, that H. W. Cadwallader, professional, shot at 25 targets from the 20yd. mark and broke them all. "Cad" has made a reputation in other parts of this and other States, but they were made at 16yds. For the day the highest score for a professional was made by Frank Riehl, 169 out of 175; second, H. W. Cadwallader, 164. The amateur average was won by W. J. Manning, Morrisonville, 158; second, J. P. Speer, Taylorville, 155; third, W. E. Keller, of the same place.

M. B. Acumpaugh, of Leads, S. D., says that deer shooting will be good in the Black Hills this winter. The open season is Nov. 15. All poachers are being watched.

The pigeon shooters of Rockford, Ill., on last Monday were invited by the farmers south of town to rid their premises of the pigeons. The boys report having had a most enjoyable time, and the farmers enjoyed a potpie which was flavored with pigeon.

The members of the lately organized gun club of Rockford, Ill., were so well pleased with their tournament that regular shoots will be held. The contest for the Lefever gun will not soon end, as to own it the same party must win twice in three attempts.

The U. M. C. Gun Club held their semi-monthly shoot Tuesday with targets and live birds trapped. The Chas. White cup was up as between N. D. McGinley and Harry Carle. McGinley was the last winner.

The Topeka, Kan., Gun Club has taken to the woods for the next few weeks. It would seem that target practice is little tame for the gunners of the West during the game season.

Shooting poorly pays at times. At Freeport, Ill., W. W. Waddington, has donated a fine sofa pillow, which will be awarded to the poorest shot of the gun club.

C. F. Gilstrap writes that there was an error in the scores as sent in by him of the shoot at Bryan, Tex., and that T. E. Hubby should have the credit of making the highest score.

There will be one more shoot held by the Missouri League of Trap Shots, at which time all the guns and special prizes that were up for the season will be decided. The place is Elliott's Blue River Park, and the time Nov. 24 and 25.

The shoot for \$25 a side between Rupert and Knister, of Decatur,

did not materialize, owing to the non arrival of pigeons. The match will be pulled off this week.

Freeport, Ill., Gun Club will invite all the surrounding clubs to join them in a tournament. The dates will be announced soon.

The Matthews, Ind., Gun Club held their fourth annual tournament last Wednesday. The attendance was not good and yet the manager has failed in his duty to furnish scores.

The medal offered by the Ewell, Tenn., Gun Club for 1904, was won by W. C. Bobb. He made one perfect score and high average.

The Winsor Gun Club at Boise, Idaho, believes in doing the social act as well as shooting at the trap. Last Saturday there was a meeting at the Vendome Hotel, where plates were laid for forty. The secretary reports that the occasion was one never to be forgotten.

The Highland Gun Club, of Elkhart, Ind., held a shoot last Friday, with twenty present. Kit Shephardson, of La Grange, was high gun, with "Smoke" Loshbaugh second. "Shep" lost but 10 out of 180. There were several representatives pushing the interests of their various concerns.

The secretary writes that the Menominee, Mich., Gun Club will not attempt to keep up their shoots during the winter. He was well pleased with the showing made during the past season. The Northern Peninsula tournament will be held by this club during the season of 1905.

Mounds, Ill., has come into the shooting fold, and a wag has given the club the name of the Hit or Miss Jerusalem and Jericho Gun Club. Some of the members do not lay much claim to marksmanship, yet they hope to improve their opportunities.

The trapshooters at Pipestone, Minn., have thought well of the proposition to organize a gun club.

During the last week of January and the first ten days of February there will be much doing in the trapshooting line in Texas. Jan. 23 to 28, the Sunny South Handicap at Brenham; Jan. 31 and Feb. 1 and 2, Central Texas Handicap at Taylor, and then the following week at Houston comes the Otto Sen's Grand Southern Handicap. This should keep the shooters busy.

On Nov. 10 the Lincoln, Neb., Gun Club held a tournament. The weather was very disagreeable, being windy and snow falling. Dan Bray, the Nebraska veteran, now of Columbus, was the winner of the Denver Post trophy with a score of 71 out of 100 targets, to Geo. Carter's 68. Those who know these Western trap shots well know that the shooting must have been fiercest ever, as the scores plainly show.

Tuesday last the Leroy, Minn., Gun Club met and shot at 50 targets: C. Cannon 30, C. I. Roy 42, F. O. Welles 24, J. L. Denel 37. Archie Welles, a thirteen-year-old boy, used an 8-gauge gun and broke 11 out of 25.

The day following the World's Fair Handicap there was a special match between Joe O'Neil, of St. Louis and Dr. E. Duncan, of Louisville, Ky., consisting of 50 live birds each. The result was a tie, and on the shoot-off at 15 birds, O'Neil killed out and Duncan lost one. Thus O'Neil went 65 straight.

On last Saturday there was some trouble at the Youngstown, O., shoot. It was reported that one party would have been high man over all if all the targets he hit with shot had "busted." The scores as reported were Francis 21, Seaborn 19, Selby 15, Hughes 15, Barnett 13.

The gun club of Kent, O., closed the season with a 100-bird race, in which Fred Bean won with 88. Will Lec, of Kent, won the medal with 23. Lyman received a medal for being the champion kicker.

The Crescent Gun Club, of Evansville, held together well into the fall. Last Friday, 25 targets were fired at the following results: Haddy 22, Heaur 20, Beard 17, Wanders 16, McKim 14, Hill 14, Keuln 9, McKinney 8, Ruhl 6.

Ralph Storm and E. E. Hagaman, of Waterloo, Ia., shot a match at 100 targets. Storm broke 85 to Hagaman's 76; but as Hagaman was allowed 16 added as broken, he had a grand total of 92. Mr. Storm is storming around now, and will not give so much allowance again.

It is reported that in the vicinity of Des Moines, Ia., the weather has not been suitable for quail shooting, and owing to this the gun club is yet able to hold regular shoots. The latest matches have been arranged on the unknown angle system.

The shoot held this week at Tampa, Fla., promises to be a big one. Good grounds are to be used, and money to the extent of \$400 will be added, being larger than ever before offered. Many visitors were reported present.

Now and then the members of the Wizard of Oz company take a half day off and visit some shooting park. The last account places them in Detroit, Mich. At the trial of 25 bluerocks, Mrs. Fred Stone, from 14yds., made 19; Mr. Stone, 21yds., 18; Mr. Meek, 16yds., 14. The prize was a cup, donated by the members of the Wizard of Oz company.

The Portsmouth, O., Gun Club will hold their regular shoot Friday of this week.

The shooters of northern Ohio are keeping in line despite the approach of the hunting season. Take Cleveland, O., for a sample. Notices are published weekly of the shoots to be held by the Cleveland, the Recreation, and the Fairmount gun clubs.

The Cleveland, O., Gun Club will hold a shoot on Thanksgiving Day. There will be ten events, the prizes being poultry and silver. Of late sweepstake shooting has not drawn so well as merchandise prizes.

The Kingdom Gun Club, of Fulton, has awakened, and will surely prosper. Last Friday the following members put in the afternoon with the targets. The scores: N. B. McKee broke 30 out of 40; Dr. H. A. Bragg 38 out of 62; R. A. Moore 50 out of 62; J. H. Atkinson 35 out of 62; D. C. McCue 15 out of 40; James Ratikin 35 out of 50; Frank Gingrich 13 out of 25.

Cincinnati Gun Club.

Saturday, Nov. 12, was cloudy and cool, but there was little wind blowing, and some of the few members who visited the grounds made good scores. The main event was a series of five 20-target shoots, the prize in each being a ticket in the Burmister Hotel drawing. Ten men shot the full 100 targets. Ahlers and Leever tied for first on 95 each. Gambell second with 91; Don Minto third with 89, and Maynard fourth with 86. The tickets were won by Leever in the first and fourth, and Ahlers captured the prizes in the other three events.

Eight scores were shot in the cup race to-day, making the total entries 88, Faran still leading with a straight. Gambell (18) 20, 22; Ahlers (19) 18, 18; Harig (19) 18, 15; Williams (18) 17, 20.

Phil was in town a few days this week, and on the 8th came out to the grounds and smashed a few to keep his hand in.

F. W. Cook, who has been with the Pickering Co. for some time, has been promoted to salesman in the firm's sporting goods department. He is a member of the club, and did some fair shooting to-day, breaking 19 out of 29 in one of the practice events.

Luther J. Squier is in town on a little vacation, and greeted his friends at the club to-day, but did not shoot.

Everybody was glad to see Aekley again, and sorry that he had not sufficiently recovered to take part in the sport.

John Falk was on hand and as jolly as ever, though not yet fully recovered from the effects of a severe cold.

Gambell announced the Thanksgiving day programme, and it is a good one, as might be expected. Ten events, 15 targets each, \$10 entrance. Six prizes are offered. First, second and third are 50, 30 and 20 per cent. of purse respectively; fourth, a turkey; fifth, Burmister Hotel ticket; sixth, dressed duck. Shooting to begin promptly at 1:30. Lunch served at noon. Everybody come.

All Saturday contests during the winter will begin at 2 P. M. Maynard, Herman and Dr. Davis start on Monday for the southern part of Illinois, where they will put in a few days with the quail. They have engaged a guide and team, and anticipate great sport.

Don Minto, Ahlers and Bell will open the quail season at Leesburg, O., and remain in that locality a week. The scores:

Prize race, 100 targets: Ahlers 95, Leever 95, Gambell 91, Don Minto 89, Maynard 86, Williams 77, Harig 76, Andrews 67, Cook 61, Cottingham 41.

Welfare Gun Club.

At the shoot of the Welfare Gun Club on Nov. 5, twenty-four men took part. The large number of spectators bore evidence to the popularity of trapshooting among the N. C. R. contingent. The big event was a team match between ten men of the polishing department, and ten men from other departments of the N. C. R. The wind was blowing a gale, and prevented any large scores from being made. The first eight events were for practice, then came the medal race, won by Le Seur; then the team match, and then the closing event at 15 targets, for a 33lb. turkey, won by D. Tibbals.

The regular shoot of the Central Covington, Ky., Gun Club was held on Sunday, Nov. 5. O. H. Grau was high man with 74 out of 80. Ed Trimble second with 72, C. Brittfield and J. E. Schreck third with 71 each. H. Heidel 68, S. Robinson 65. A number of those present shot at 30 targets, with the following results: J. Wise and J. E. Schreck, Jr., first with 22 each; K. Sutton 20, H. Kroger 19, J. P. Heidel 18, J. Elliott 17.

The Dayton, O., Gun Club put its medal in competition in July, the last contest for the season taking place on Oct. 29. During that time the medal has been won as follows: C. H. Cord, July 30 (the first contest), Oct. 8; D. Tibbals, Aug. 6; Ed. Keller, Aug. 13, Oct. 15; John Sirran, Aug. 20; O. H. Bailey, Aug. 27; M. J. Schwind, Sept. 10, Oct. 1; Ed. Rike, Oct. 29. The medal contests will be resumed early in March, when the 1905 season will open.

Dayton Gun Club.

The Club's third monthly all-day shoot on Nov. 11 was held under favorable weather conditions, the day being light and sunny. The last affair of the season was an enjoyable occasion, and was well attended, over twenty shooters taking part. The sport began at 10 A. M. and was kept up until dark, besides the regular programme a number of sweeps being shot.

The programme consisted of twelve 15-target events and eight 25-target sweeps were shot besides, though none of the shooters took part in all of them.

Interesting features of the day were the close race between Heikes and Rike, only four targets separating them; and Schwind and Craig, the former breaking 147, the latter 145. These latter had a side bet between them in each event, and each won five times and were tie twice. On the last event for a \$5 purse they tied on 14. The scores:

Shot at. Broke.		Shot at. Broke.	
Heikes	180	Watson	60
Rike	180	Hubler	45
Lindemuth	180	Hodapp	30
Schwind	180	Shirer	15
Craig	180	Watkins	30
Ike	180	Woodburn	30
La Rue	180	Oldt	15
Curphey	180	Bailey	15
Young	180	Davis	15
Carr	120		

Sweeps, eight at 25 targets each:

Shot at. Broke.		Shot at. Broke.	
Davis	125	Heikes	50
Craig	100	Mathews	50
Schroeder	100	F. Whitacre	50
Hodapp	100	Woodburn	50
Carr	100	Wagner	25
Schwind	75	Ike	25
Smith	75	Lindemuth	25
La Rue	50	Young	25
Rike	50	Stover	25
Anspurger	75		

Rike was using his new gun, and broke 212 out of 230. Heikes shot at 230 and broke 210. Charlie Matthews, of Lewisburg, broke 43 out of 50.

Notes.

The Welfare Gun Club held an all-day shoot on Nov. 11, with turkeys for prizes. The affair attracted quite a crowd, and fine sport was had. The club has fine grounds, easy of access, and the members are as genial a bunch of shooters as you will run across in a long journey. All visiting club members were entertained at dinner by the home club.

John F. Beaver, of Dayton, and Daniel Francis, of Arcanum, went to northern Wisconsin for deer hunting. This is Mr. Beaver's fifty-fourth expedition, and Mr. Francis is also a veteran big-game hunter.

Wm. H. Van Riper and son, Chas. Spidel, L. Groneweg and C. Long, of Dayton, have just returned from their hunt in Maine. Each killed their two deer. They had a fine camp and good weather, and enjoyed the outing immensely.

Indiana State Championship.

FT. WAYNE, Ind.—The match for the trophy emblematic of the championship of Indiana, on Nov. 6, was won again by Mr. Hugh Clark, of Wabash. He defended it against Mr. Max Witzgreuter, the prior holder. The scores were 46 and 42. A large and enthusiastic audience witnessed the contest. Clark killed 23 out of the first and second 25 birds respectively. Witz scored 22 and 20 respectively. The retrieving work of Ed. Evans' and Henry Tarmon's dogs was excellent.

In the big team shoot the Wabash men were also victorious, winning from the Corner Club team by 3 points. The visitors shot 108 out of a possible 125, while the locals bagged 105. The teams were made up as follows:

Wabash—Ferrell, Shephardson, Williamson, George Abdon and Clark.

Corner Club Team—Witzgreuter, A. H. Witte, Charles Rundell, August Freese and Rodney Fleming.

The match target shoot between A. H. Witte and H. Hockemeyer was declared off because Hockemeyer was unable to be present. The minor target events, which served as preliminaries, were all good, and great enthusiasm was shown in the results of each race. Ferrell officiated as referee. August Freese as official scorekeeper, and William Wiegman as trap-puller.

This is the last event at that place until Thanksgiving Day. The Wabash team was Wabash in name only. Properly it was an all-state team, composed of Clark, of Wabash; Shephardson, of La Grange; Farrell, and Williamson, of Muncie, and Abdon, of Ft. Wayne.

Two amusing incidents occurred in the course of the live-bird race. In one instance, Ed. Evans' setter dog broke away from his handler when the shooter had missed the bird. The dog ran out to the boundary and then started back to the score. In passing the traps, he scented a bird in one trap, took the trap rope in his mouth and tugged away at it until the trap opened, and then the dog gave the bird a great chase. The other feature that enlivened the spirits of the crowd occurred when the other dog, in bringing in a dead bird, stopped at the location of the target traps and buried the dead pigeon in the sawdust in which the bluerocks had been packed. Suggestions for the owner to feed the dog were offered.

A. C. Spencer, of Muncie, has challenged Hugh M. Clark for the Lieber cup, emblematic of the Indiana championship at live pigeons. The race is being arranged for, and will possibly be held at Elwood, and possibly earlier than Thanksgiving. J. W. Farrell, of Muncie, has challenged Austin Flinn, of Wabash, for the English Hotel cup. This is a target trophy, and the match must be shot on the grounds of the Indianapolis Gun Club.

A sweepstake shoot at live pigeons will be held at Muncie on Thanksgiving Day. This programme is about the warmest one that has been offered in many months, at any point in the middle West.

Rochester Rod and Gun Club.

ROCHESTER, N. Y.—Rickman won the point in the Rochester Rod and Gun Club's handicap contest for the Hunter Arms Co. trophy. He has now won six points. Borst has won seven. The contest ends on Nov. 16, and Rickman still has a chance to tie Borst for the prize. Stewart made the best net score, but as he was scratch man, his 24 did not equal Rickman's 19, with his allowance of 6 added. The scores:

Brk.	Hdp.	Tot'al.	Brk.	Hdp.	Tot'al.
Rickman	19	6	25	Norton	18
Stewart	24	0	24	Borst	14
Adkin	22	1	23	Clark	18
Kershner	22	1	23		

The Interstate Association.

PITTSBURG, Pa., Nov. 10.—Kindly announce to readers of FOREST AND STREAM that the annual meeting of the Interstate Association will be held on Thursday, Dec. 8, at which time Grand American Handicap matters, applications for tournaments and other business of importance, covering the year 1905, will be passed upon. Applications for the Association's assistance in giving tournaments during the season of 1905 should be in the hands of the secretary-manager (address 219 Coltart Square, Pittsburg, Pa.) no later than Dec. 3, in order that they may be brought before the Association's tournament committee at this meeting.

ELMER E. SHANER, Sec'y-Mgr.

SIDE LIGHTS OF TRADE.

Mr. Topperwein "got busy" Nov. 10 at St. Louis, and without a miss broke 3,507 flying targets (the size of the targets being 2½ inches), a display of marksmanship which is truly marvelous and without parallel in the shooting annals of the world. It is probable that his record will stand until such a time as he sees fit to make another try. In this remarkable performance Mr. Topperwein used, as he always does, Winchester, 22 caliber greaseless bullet rifle cartridges and a Winchester .22 caliber automatic rifle.

Mr. Charles Lancaster has removed to larger and more convenient premises, at 11 Panton street, Haymarket, London, S. W. The following very pleasing information was recently received by him and is self explanatory:

British Royal Pavilion,
Louisiana Purchase Exposition,
St. Louis, U. S. A., Oct. 22, 1904.

Dear Sir—I have the pleasure to inform you that I am advised by the American Exposition Authorities that the International Jury of Awards have awarded your exhibit a gold medal in Group 120. Yours faithfully

C. M. Watson, Colonel,
Commissioner-General for Great Britain.

Charles Lancaster, Esq.

PUBLISHERS' DEPARTMENT.

New Train Service to Florida, Aiken and Augusta.

THE Southern Railway announces, effective Nov. 6, a new train will be put on between New York city and Jacksonville, Fla. Leaving New York daily at 3:25 P. M., carrying through Pullman Drawing Room Sleeping Cars New York to Jacksonville and Augusta, with connections for Aiken, Camden and Charleston. This train will also carry Southern Railway Dining cars.

Early in January, 1905, the elegant train so appropriately named the "Southern's Palm Limited" will resume service for the tourist season. The train is composed of the very highest class equipment, including Pullman Compartment and Drawing Room Sleeping cars, Dining cars, Club car, Library and Observation cars, and is operated solid between New York and St. Augustine, and also handling one Pullman Drawing Room Sleeping car between New York, Aiken and Augusta.

A book of information descriptive of the winter health and pleasure resorts of the South, where the tourist or invalid may avoid the rigors of the Northern winter, enjoying the perpetual comforts of the South, is just being issued by the passenger department, and will be mailed to any address upon receipt of two cents postage. New York office, 271 and 1185 Broadway. Alex. S. Thwatt, Eastern Passenger Agent.

Pennsylvania Railroad's Winter Excursion Route Book.

In pursuance of its annual custom, the Passenger Department of the Pennsylvania Railroad Company has just issued an attractive and comprehensive book descriptive of the leading winter resorts of the East, and South, and giving the rates and various routes and combinations of routes of travel. Like all the publications of the Pennsylvania Railroad Company, this "Winter Excursion Book" is a model of typographical and pictorial work. It is bound in a handsome and artistic cover in colors, and contains much valuable information for winter tourists and travelers in general. It can be had free of charge at the principal ticket offices of the Pennsylvania Railroad Company, or will be sent postpaid upon application to Geo. W. Boyd, General Passenger Agent, Broad Street Station, Philadelphia.

BAKER GUNS SHOOT HARD

and are SAFE.

They are noted for this wherever known, and that is almost everywhere. Ask the man who owns one. Fine Trap and Medium Field Grades, \$25.00 to \$200.00 and up. Inquire of your dealer or send for full descriptions.

No. 846 BROADWAY, NEW YORK.

HENRY P. WELLS.

HENRY PARKHURST WELLS, successful lawyer, enthusiastic angler and outdoor man and graceful writer, died November 20 at his home in Brooklyn, N. Y., after a long illness.

Mr. Wells was born in Providence, R. I., in 1842. He was a graduate of Amherst College, and a soldier in the Civil War. He was admitted to the New York bar in 1869, and to the bar of the United States Supreme Court in 1883.

Mr. Wells was one of the most ardent lovers of outdoor life, and not satisfied with enjoying this himself, desired to share his pleasures with others, and to give them the benefit of his long experience and his keen observation. His manual of "Fly-Rods and Fly-Tackle" has had a wide circulation, and his other books, "American Salmon Fisherman," and "City Boys in the Woods," were not only charming in themselves, but appealed strongly to the popular taste. Mr. Wells was a long time correspondent of FOREST AND STREAM, to which he contributed many articles on angling, in one series of which were detailed his experiments on the sight of fishes.

Personally Mr. Wells was a most attractive man, a ready and entertaining talker, and possessed of keen and almost boyish enthusiasms. He was a delightful companion, and will be sadly missed by a large number of old-time anglers.

NOT NECESSARILY A PART OF SHOOTING.

WHEN we consider that tens of thousands of guns are in use every day of the autumn shooting season, we may reflect that it would be strange, indeed, were the papers free from reports of shooting casualties. "About this time," as the almanacs say, "look out for" headlines like these: "Gunner Shot by Friend." "Shot by Son while Gunning." We shall not look in vain. The papers are full of them. It would be no difficult task to fill a column or two of the FOREST AND STREAM every week with detailed stories of shooting casualties of this character, but no good purpose would be served by doing so, except for the admonition afforded by so many horrible examples. A journal devoted to field sports is naturally reluctant to make much of the dangers of shooting, nor is there any good reason why gunning casualties should be given prominence in its columns. They are not necessarily any part of shooting.

Occasionally there is chronicled an aggravated case, the circumstances of which compel more than casual attention. Such a happening is reported to us by a Minnesota correspondent. We repeat it in briefest outline only. A well-known ferry boat master of the Duluth-Superior harbor was out hunting, traveling up and down the road in a buggy, carrying a double-barreled shotgun, looking for partridges. The gun slipped back and was in danger of falling out of the buggy. The man reached quickly forward, and, catching it by the muzzle, drew it forward. Both hammers caught and were drawn back and then released before they came to a full cock, with the result that both charges were exploded, and blew off his left arm at the shoulder, set his coat afire, and started the horse running away in a mad gallop. A mile and a half further on the horse was stopped, and the wounded man was taken to the hospital. It is a moving story; and the pity of it is, as of so many others, that the casualty came from a disregard of those simple rules of gun handling which no sane man should ever think of violating. To carry a loaded gun in a wagon is of itself to invite fate. To pull a falling gun muzzle forward is to make imminent fate doubly assured. A pathetic element of most of these woundings and maimings and killings by gunners lies in the fact that they are caused by a violation of the simple rules which ought to be the gunner's invariable and inviolable guide of conduct. If these rules are observed, sport with the gun in the field is not more hazardous than riding in trolley cars or walking the streets.

There are some men who are constitutionally careless, and others who are flippant with deadly weapons. If some practicable system could be devised of testing a would-be shooter's temperamental fitness to carry arms, its adoption would preserve to many a home the son or brother or father of whom it would otherwise be bereft. Such a system we may look to see in a thousand years. In the

meanwhile, let us exhort one another in season and out:

Don't point a gun at a human being.

Don't pull a gun muzzle end first toward yourself.

Don't carry a loaded gun in a wagon.

Don't stand a loaded gun up in the corner for the baby to play with.

Don't handle a gun you know to be empty in any other way than you would handle it if you knew it to be loaded. Handle it always as if it were loaded, thus cultivating a habit of caution which shall in time become second nature.

If such rules be observed, shooting accidents will be extremely rare, and the casualties which are not accidents, but are the natural results of criminal carelessness, will be unknown.

MONOLOGUES OF KIAH.

THE flickering camp-fire shed its cheerful light and heat a few feet on all sides against the circumambient darkness. Tremulous high lights on the faces and figures of the campers playfully responded to the fire's flickerings, revealing expressions which were either vacuous or contentedly free of cares past or future. Each man squatted or lolled about according to his fancy; for supper had been eaten, pipes under forced draught emitted volumes of smoke and fumes, and the stomachs of the party in unison were functionally busy in elaborating material for repairs of mind and body. Peace and quiet reigned, save for the whisperings of the leaves and breeze. Contentment, consequent to satiety and sluggishness, dominated the camp; and each man seemed to be too apathetic either to talk or to listen. One might easily imagine that the muteness was perpetual; fallaciously so, however, for no group of men ever remains long silent. Ruben broke the inaction by grasping a carboy of water near-by and pouring out a large swallow for himself, thereafter wiping his mouth with much gusto; then solemnly stuffing his pipe with another cargo of tobacco preparatory to further fumes. Apropos of his own musings, he began thus: "Give me camp life for true enjoyment. Here we find pure air, sunlight everywhere by day and unpolluted darkness by night. Here good health comes to us while we are free from the shams, fictions, and maraudings of society. I enjoy it heartily for its simplicity, its sterling genuineness—" "Exactly, precisely," exclaimed Kiah, with irrepressible eagerness, "and we, when gathered together happily in camp, are always free to have heart-to-heart talks on the themes of sport dearest to us. In my opinion, the communion of thought is the strongest bond of true sportsmanship. Yet how few there are who properly appreciate this higher form of it—the pleasures of mind, of memory, of anticipation; in short, of its intellectual feasts. I regret to say that few rise above the gross materialism of sport. It is a pleasure to me to shoot over my dogs, to admire their beauty, to study their pedigrees, to observe their cunning ways; and, to confer a favor on my friends, to share with them my pleasures, as it were, by telling them truthfully of all these things. Now, there's that new setter puppy that I bought soon after it was weaned. It was as precocious as anything that you ever saw, from the very moment that it opened its eyes to the light of day. I noted many of its acts, which were manifestations of high reasoning powers; but my wife was a closer observer, and noted many more than I did. Why, every time that that pup barked, she could interpret its language and explain the ideas that it was endeavoring to articulate. It was a born hunter. It began to point about as soon as it was able to waddle about. That was a matter of course, because it was bound to be a good field dog, having in its pedigree fifty-nine field trial winners on its sire's side and 198 on its dam's side. I have the pedigree with me, and I will read it to you in full in the morning at breakfast. It shows blood that is the bluest of the blue. You know that it is a matter of months to accomplish the education of the average dog in work to the gun. My puppy was in the hands of the trainer just three weeks when he graduated perfectly, and I immediately took him on a quail hunt. He would range in rings around my other setter dog, which therefore was considered the widest and fastest ranger that ever lived. And find birds! Why, that pup would pick up points on single birds with the same ease and accuracy that a turkey picks up corn. But its acts, while phe-

nomenal, were a mere bagatelle in comparison to the grace and beauty that it infused into its points and backs and gallops. On point, it stood with nose proudly tilted high in air, tail extended straight as an arrow pointing slightly above the line of its back, one forefoot held delicately off the ground, eyes glistening, lips quivering—oh, it was grand! In the city I called on my friend Bill Smith—you know that he is a dog fancier, or rather pretends to be such—and after buying several hundred dollars' worth of goods of him, I began to tell him about my pup. I had not in a half hour of talk finished its pedigree before he told me that his office was a place in which to transact business, and not an annex to a dog kennel. Such a man as that has no genuine sportsmanship in his soul. Now in camp it is so different. Here each has a pleasure when the other is pleased because of the sole reason that that other is pleased. We are all congenial spirits together, and pleasant conversation on our sportsmanship makes one endless feast of reason and flow of soul. I, better than anyone else, Ruben, can understand your exaltation of spirit on happiness unalloyed in camp, on your passion for camping—" "Camping be hanged!" Ruben tartly retorted. Again peace and quiet reigned, save for the whisperings of the leaves and breeze.

YELLOWSTONE PARK BIG GAME.

MOST of us read with very great pleasure President Roosevelt's interesting and delightful paper entitled "Wilderness Reserves," published in the last volume of the Boone and Crockett Club's book, and copied in FOREST AND STREAM. Those who did so, and all visitors to the Yellowstone Park are glad to at any time hear of game conditions in the Yellowstone Park.

During the summer the game is driven by the flies to the high mountains; but with the first snows of autumn they begin to descend again toward lower ground, where open pasturage can be had, and when winter fairly sets in they occupy the flats of the Yellowstone River and its tributaries, or make their way out of the Park southward toward the Jackson Hole country.

In the Park the antelope have already begun to leave the higher land and to pasture on the flat, not far from the town of Gardiner, which for many years has been their wintering ground. A year or two since Major Pitcher, the superintendent, brought water on this flat and sowed it with alfalfa, and last year more than 1,100 antelope wintered on this small area.

The deer and sheep are beginning to come down to their winter homes. Eleven white-tail deer and from 50 to 100 black-tails have been feeding on the parade ground of Fort Yellowstone. On the benches of Mt. Evarts there is a band of about thirty mountain sheep, among them a number of lambs, while recent accounts from the Hayden Valley show that it is dotted with bands of elk, and a scout recently from there estimated their number at 3,000.

The increase in the game which has followed the close protection of the Park makes the question of their winter subsistence a problem of ever-increasing importance. Major Pitcher's experiment of sowing alfalfa on the winter range of the antelope has solved this question for these animals; and, since this flat is used by the antelope only in winter, it will produce during the summer crops of alfalfa hay which will serve to feed the sheep of the Gardiner Valley and the deer of the post all through the winter. The very large bands of elk which winter in the valley of the Yellowstone, and on its tributaries, still remain unprovided for, and in exceptional winters these animals must be fed if we would not see them die of hunger. As things are at present in ordinary winters the elk can get along well enough. There will always be some starvation just at the end of the winter and in March and April, and many old and poor animals will perish; but this will only be a natural death rate. Once in a while, however, at intervals of ten or fifteen or twenty years, there comes a winter with heavy, deep snows and early spring crustings, and at such a time the elk must be fed, or they will be swept away almost to the last hoof. The cost of providing hay for these animals—to be used only in case of necessity—will be comparatively trifling, and the Department of the Interior, with an eye to just such a possible danger, should see that the superintendent of the Park takes proper measures to provide against it.

THE SPORTSMAN TOURIST

A Cheap Winter in Florida.

A WINTER in Florida is not what it used to be, for wealth and fashion have converted it into an expensive abiding place for the tourist or transient visitor, and the appalling array of handsome hotels from Palm Beach or Ormond to St. Augustine on the Atlantic Coast, and from Punta Gorda to Tampa on the Gulf side, appear to verify this statement. Fifteen years ago the writer spent a winter in Florida, and a return to it last winter made vivid impressions of sharp contrasts on the mind.

Florida has kept pace with the other Southern States in development, changing its topographical features to suit the needs of a new generation, and losing thereby, it must be confessed, much of its pristine beauty and attractiveness. There is one thing about it that does not seem to change materially, although tropical fruit growers will not agree to this. The superb climate in winter lures one into outdoor life that recalls our northern springs and autumns. The destruction of the pine woods in northern and southern Florida may have had something to do with climatic changes which ruined the orange industry in parts of the State, but to the transient visitor such changes in the temperature are scarcely noticeable.

The orange belt has been pushed gradually further south, and in the northern tiers of counties it is hardly safe to depend upon oranges or pineapples for a living. A disastrous "freeze" comes along about once in every four or five years, and the work of half a decade is thus ruined within twenty-four hours.

The absence of pine woods is the most striking feature of Florida's landscape to-day. The pines were doomed fifteen and twenty years ago. When it was found more profitable to plant orange groves than raise pine trees, the work of denudation was carried along at a reckless pace. The lazy man's method of clearing the land was adopted. The trees were simply "ringed" with an ax or burnt by fire around the base, and within a year or two they would decay and fall of their own volition.

Young pines have sprung up in places and clothed the land with a new virgin green, but their usefulness as wind-breaks or climate-regulators is for the future rather than for the present. The orange trees are not planted as generally as ten years ago, and many groves of them have been left in neglect. Their low, stunted heads are frequently found mingled with thick growths of young pines and palmettoes, indicating financial disaster to some unfortunate who placed too much confidence in oranges.

Florida has cultivated the hotel in recent years more than anything else. Trusting to the climate to draw winter visitors to the State, southern and northern capital has been invested heavily in great hostleries which rear their heads above the canopies of tropical vegetation along either coast. Built of wood, stone, bricks, and the queer conglomerate called "coquina," they present a rather imposing sight to the visitor, for they are surrounded by tropical gardens and lawns where one may pluck oranges, grape fruit, lemons, alligator pears, kumquats, guavas, and other tropical and semi-tropical fruits fresh from the trees.

But one must pay for such accommodations. Rates for living have advanced to keep pace with the changed conditions. The hotels are for those liberally provided with immediate funds. One wonders sometimes where all the money comes from to make these huge hotels profitable investments during the short winter season of a few months. The season does not properly begin until the first or middle of January, and by the latter part of March the transients return north again.

Furnished cottages are provided for the favored few who prefer housekeeping to hotel life. When one pays five hundred dollars for a furnished cottage in Florida he does not contract for the same accommodations that he receives for a summer home along our northern beaches. There is rarely gas, electric lights or germ-proof artesian well water. Moreover, the cottages are furnished in the southern way, which frequently means hard mattresses stuffed with dried Spanish moss and a startling deficiency of needful furniture.

If one wishes to visit Florida and follow the footsteps of fashion, listening to concerts and watching the dignified yacht racing at St. Augustine, or joining the crowds at the automobile races on the beautiful beach at Daytona or Ormond, or luxuriating in the Oriental splendor of hotel life at Palm Beach, he must be prepared to pay for it; but if he is seeking a quiet outdoor life under simple conditions, he can find it at a cost that is not much different from that of a dozen years ago. Florida is a big State, and it is not all settled yet. There are great regions in the lower part of the State which combine all the pleasures of an ideal climate and environments with little trouble and expense. Whether one seeks the coast or interior, it is practically the same.

By preference the writer sought out old camping places in the interior, where, along the edges of beautiful inland lakes, existence was rendered ideal. With the lowering of Lake Okeechobee by the numerous drainage enterprises in the past few years, the region along the edges of the Everglades has been made peculiarly attractive. The swamps are less repulsive in appearance. During dry winters it is possible to hunt and fish where a dozen years ago no one except the plume-hunter and Seminole Indians ever thought of going. The soil is sandy and the rains quickly disappear in the porous earth, while the luxuriant vegetation spreads a garment of rich green and

brown over the whole scene. One can pitch camp on the banks of the winding lagoons and spend the winter hunting and fishing in the Everglades without experiencing swamp fever, malaria, or mosquito bites. The draining of the Everglades has thrown open thousands of acres of fertile soil to the settler, and the edges of the swamp have been cut down in many places to make room for market gardens and fruit orchards.

A few miles west of the Kissimmee River one stumbles into a veritable paradise of clear-water lakes nestling among the pines where the hand of man has not yet made any great changes. A small settlement called Avon Park has been built up in the heart of this region, but not being on the line of any railroad it possesses few of the modern luxuries that have transformed other parts of Florida. The series of lakes in this region find an outlet into Lake Ishtopoga—a body of water about one-sixth the size of famous Lake Okeechobee. This beautiful sheet of water is surrounded by pines, saw palmettoes, black-jack oaks, and cypress trees. It is located in a natural hollow, with its basin margined with thick vegetation. To reach it, one must cross twenty miles or more by muleback from Fort Meade, Bowling Green or Zolfo Springs. Once in this paradise of lakes and woods, it matters little whether one sees a railroad or hotel again for months. One can cut loose from his base of supplies and live upon the country. The land is teeming with game, wild fruits, and flowers, and the waters are alive with fish waiting to be caught. There is no such gamey creature here as the tarpon of the Gulf, but huge catfish, bullheads, pike and pickerel make fishing an idle pastime that baffles description. One can find good board among Northern people in Avon Park at five and six dollars a week, and at the hotel for seven to ten dollars; but the true way to do is to push out from the settlement and spend a month on the edge of the Everglades.

This whole region is the land of birds rather than of flowers. How the State ever received its name in the Spanish seems strange to a visitor, for the flowers are not conspicuously abundant. When the orange and lemon trees are in bloom, an orchard composed of these trees is rather imposing, especially as the ripe, yellow fruit mingles with the fragrant flowers. The guava has a rather delicate flower, and also the alligator pear and the half-wild kumquats. The wild jasmine is the most conspicuous flower, and this trails over everything in the swamps, giving a yellowish tinge to the whole landscape. A few magnolias tower up above the other vegetation in places, and innumerable air-plants display subdued colors among the tall branches of certain favorite trees. Otherwise the landscape gets its color hue from the delicate green of the new cypress leaves, the darker emerald of the pines, or the sombre green of palmettoes.

But once inside of the swamp, flashes of gold and purple, crimson and yellow, blue and white, and all other combinations of hues, greet the eyes. The plumage of the gaudy birds are beyond compare. They are like jewels among the trees.

On all sides paroquets chatter, displaying richness of plumage that startles the spectator. The famous ibis and flamingoes still range the swamps and watercourses of the Everglades, although their presence is growing less every year, owing to the greed and butchery of the plume hunters. A sight of a troop of these birds is sufficient to pay for a trip to the great dismal swamp. Standing knee-deep in the sluggish stream, with craned head and long, curved neck, the ibis or flamingo makes a pretty sight which should excite our admiration instead of murderous instincts. I never saw one yet that I didn't feel like dropping down behind a bunch of palmettoes to watch it. Unfortunately the birds are keen on the scent of danger, and past experience has made them wary, and it grows more difficult each year to study them at close range.

Cardinals and nonpareils fill the boughs of the swamps, and several varieties of woodpeckers hammer away at the bark of decaying pine or cypress. Mockingbirds fill the swamps with their incessant imitative songs. Robins and thrushes are everywhere, richer it seems in their southern plumage than when in our northern orchards; bullfinches warble and trill from the thickets, and rare birds of plumage flitter across open spaces to display their bright colors. Above the swamps and lagoons poise strange shadows which make the smaller birds of the bush silent and frightened. An osprey or eagle swoops down upon the singing birds, or perhaps a great man-of-war hawk drops like a shot to strike some innocent prey. Across the larger lakes troops of gulls, curlews, herons and cranes fly, and even on the mud-banks one may find quail, mud-hens and jacksnipes.

Camping near the edges of the swamp on the northern edge of Lake Ishtopoga, we found every possible advantage for a pleasant outdoor existence in midwinter. Numerous lagoons made it possible to penetrate far into the interior of the surrounding swamp, and occasionally wild turkeys were started up from the dense bush. The wild turkeys are probably scarcer to-day than the plumage birds. Ten years ago it was an easy matter to start up an old turkey gobbler by imitating the challenge of the fighting bird, and the flock of hens that inevitably accompanied the gobblers always gave the hunters a few good shots.

We got our first turkeys early in the season, and for Thanksgiving dinner we had wild turkey cooked brown and tender over the camp-fire. There were no cranberries

to be had in that region, but the native "Crackers" make a sauce out of the oranges of the wild seedling variety that adds piquant spice to any kind of meat. The wild orange is both bitter and sour, and when properly shredded and slightly sweetened in the form of a sauce it takes the place of apple sauce or cranberry jelly very well.

There is prevalent a general misconception that down in the Everglades wildcats, pumas, bears, rattlesnakes and alligators are so numerous that night and day are made rather hideous and dangerous. Nothing could be farther from the truth. The diamond-back rattler is so scarce that hunters have to make diligent search for one when a reward is offered by some visiting tourist for a skin and rattles, and the alligators are so few and small of size that they are not worth considering. Pumas, wildcats and bear there are in the Everglades, but they confine their attentions to the small game of the thickets instead of trying to tackle hunters. One may camp out with perfect safety, and never once be disturbed unless it be by some too inquisitive night prowlers anxious to know the meaning of the strange white tent in their native habitat.

The cost of living in such a home of luxury is an unimportant item of a winter's sojourn in Florida. The cost of reaching the southern part of the State with the necessary traps and equipments represents the chief outlay of capital. With game in woods and swamp abundant, fresh-water fish to be had almost for the asking, and plenty of wild fruits to be plucked from trees and vines, the campers can live on less than two dollars a week, counting the cost of ammunition for guns and bait for hooks. Oranges, pineapples, and tropical fruits can be purchased from the few scattered Cracker plantations for nominal prices, and if one wishes them, fresh vegetables can be planted in the mucky soil and raised ready for eating within a month or less. We camped in one spot during most of the winter, and we had crisp radishes and lettuce from seed within three weeks, and when we left the beginnings of a garden were left to spread around at will. Some future camper may discover traces of these cultivated vegetables running wild among the palmettoes and wonder if they have not fallen upon some strange freak of nature or made a botanical discovery that will require a revision of our standard text-books on this subject.

Our winter in Florida was thus an endless series of joyful days and restful nights—healthful, life-giving, and stimulating—and all for a price that would hardly have paid for a third-rate apartment in New York or for a summer cottage at the seashore.

W.

Floating Down the Mississippi.

A Sportsmen's Club of the Swamps.

AS SOON as I could, I took to the woods again, with the feeling that I belonged in them. I put my duffle aboard a train and headed for Pickett, beyond Marked Tree, from which place one reaches the Hatchie 'Coon Club. It was the 7th of December when I bade good-by to my friends of the cabin boat and to Carlos, who was hammering away on the big Cole boat. Cole was spending about \$600 on the craft—the savings of years. A lean, gaunt young fellow, he was a type of what a boy who had been beaten repeatedly out of his rightful earnings becomes. He began life the son of parents who died soon after he was born. He was put in an asylum, from which he was turned out uneducated and with only his native ability to start on. He began at the curbstone and worked up to being an errand boy, then truck driver, then towboat hand, and finally independent cabin boater, with a good wife and fine boy to care for. No one had ever given him anything, nor showed him mercy in business dealings. His one object now was to get the best of everyone. He paid what he said he would—but one could see his future: that of a lean, grasping old man, owning half a town, likely enough, and hated by most of his neighbors.

My train backed out of the depot and crossed the Memphis bridge, from which I saw the wide river at evening from a considerable height. The sun was setting, and a sandbar and the water were in the pathway of the yellow reflection; the clouds were clean-cut and radiant colored, like a cold autumn sky in the north—white, yellow and gold. Later the sky turned gradually to rufous and red, against a background of blue-gray. Seen among the knotty limbs of gum and cypress trees across the level of swamp land, it was brilliant, but chilling, growing more so as the blue of the clouds became dominant.

It was an interesting ride for me. The train ran high above the surrounding levels on a dirt embankment. The car windows were on a level with the branches of the trees. There were houses at intervals on stilts which had the whitewash stained with yellow far up their sides, the result of the last flood. We crossed high above the "company" levee—a dirt embankment with a narrow top, on which walkers had worn a path, built by private subscription.

A smallish, agile man with a sandy mustache was in the chair beside me; the train was provided with chairs that were immovable save for tilting. He was a cotton buyer, and talked about the crop. After a time he raised his feet to the back of the unoccupied chair in front of him and slid down into his own chair till he was sitting on the small of his back. The flow of talk was not interrupted. The train was well filled with people who had been

to town "to buy." Here and there among the rest a man would sink down in his chair out of sight. In a moment there would appear the white bottom of a flat quart bottle above the back of the chair, and wiggle around in concentric circles, seeking a center, the dark fluid within agitated considerably by ascending bubbles that burst in spray sparkling in the lamp light. Then the bottle would curve down over out of sight, and pretty soon the man who went down would come up again smiling.

A couple of ladies were across the aisle, and one scat further back from the cotton buyer and me. "Will you lend me your knife?" one asked me. She wanted to peel apples.

We were whirled along, not very fast, passing sawmill towns and railroad stations that were twenty feet above the level of the ground. Marked Tree, the famous sawmill town of the Arkansas Swamps, was a blaze with electric lights from dynamos in one of the big sawmills—a town built on stilts, and one side of it owned by Ritter, who came there a \$1.25-a-day man, and now runs a store and most of the place, after a very few years of business dealings and much fish-netting.

Beyond this was Pickett, nine miles distant; and at Pickett I came out on a platform the edge of which was a jumping-off place 15 or 20 feet high. Here some other men got off, and Mr. Mitchell met us, and some fussing around by the light of lanterns followed as baggage was looked after. We all went down a flight of stairs and the baggage was slid down two inclined peeled saplings. At the foot were rails, and on them a hand-car with seats along each side and handles to work it by. On this piled all hands, and almost everybody grabbed the handles. The car began to click and wriggle, and clump over the iron rails. One felt the butted air cold on his face, while a big lantern reflector light showed the rails leading along on top an embankment between two forests; very dense and dark the depths seemed, too. After a time a light was discovered far ahead. By and by that proved to be a light in a window—the club house of the Hatchie 'Coons.

The Hatchie 'Coon Sunk Lands were the result of the New Madrid earthquakes, and that is where the name of the club came from, but there is an analogy between the club house and 'coon trees, for both have their dens pretty well up in the air to be above the overflow, and, for the needs of the users, are comfortable, as they should be. We went up a flight of many steps to get to the living level, and there, in a large room, was a fire-place, roaring red and warm. On the walls were deer heads, some birds and other things which he had mounted for himself or others. The style was different from that followed by eastern taxidermists—at least Adirondack ones—for the deer heads were very short-necked—only an inch or so behind the ears—but natural. In the ears had been placed metal plates, preventing the curling down so aggravating in some work. On the mantel were some medicines in bottles—"chill cures," and things good for the stomach-ache, chiefly. The water was imported from Memphis in order to avoid possible contamination in the St. Francis water. In summer and till freezing weather, acetylene gas is burned throughout for light, and a gasoline pump supplies water for various sanitary purposes; but in mid-winter these are not kept going, lest they freeze.

Across the back of the room were many cots with heaps of bedding on them. It had been nearly a month since I had slept on anything softer than a layer of quilt on boards, and I was irritated to find that the springs and mattresses of the iron single bed simply made me wakeful. I got only half a night's sleep because I was too comfortable. I was dozing in the morning just before daybreak when Mitchell roused us out. After breakfast the paddlers, or hired men, appeared, and the four went away, sitting in cane-bottomed chairs in small boats, while a paddler stood up behind poling them into the mazes of St. Francis Lake, each sportsman with a gun, hunting.

I took a walk out on the bottoms after a while, and had my first look from close to the ground at the swamp lands. The trees were tall, the ground mealy, the leaves cloth-like, the twigs rotten. One could see a long way in places, the trees and brush alone obstructing the way. By looking close I could see that the ground undulated slightly, and, forewarned, could see that there were differences in the timber growths on the waves and in the hollows. The man who knows the bottoms goes by the tree growths, having no mountain range to guide his footsteps. I suppose the swamp hunters to be better woodsmen than hill men for this reason. They are obliged to observe small things, as the hill country man is not to so great an extent. The sun and the compass were my only guides, and I had to keep watch of them all the while. I could not get on a ridge and follow it for an hour straight away, though what is called "ridges" were there in plenty. I could not see them.

The swamps had been burned over in places, and fire caused Mitchell to get out one night while I was there to save his fence. Some few small twig shoots may be killed by these slow fires, but the big trees are not, unless the flames get into a hollow and burn the tree inside out. Even this does not destroy the heavy woods, but may even serve as an antiseptic against the fungus rot which destroys so many of the trees of the bottoms. One sees from the way the fire crawls along the muggy bottoms that "dry" as regards leaves there, is but a relative term.

I came to a lot of tall grass, and strolling through it, took hold of one of the spears to pull it loose, an Adirondack habit partly broken right there. It was saw grass, and though soft enough to the touch, there were splinters in it hard as thorns, one of which went into my hand. The reformation was completed some days later when I absently took hold of a vine and picked out thorns for the next half an hour. The native goes through brush elbow and shoulder first, his face protected by a broad-brimmed hat usually, the flap of which comes down to his neck.

I saw some droves of hogs and their tracks all through the woods at times seemed deer-like. I do not suppose anyone used to following tracks would be fooled by them, however—blunt, spreading, and short-stepped as they are. About a mile and a half from the club house there was a bunch of cypress trees with some knees sticking up out of the damp ground—root nubs with round tops from a couple of inches to three feet high—and in a cattle path here

I found the familiar deer print of sharp hoofs and long steps. I saw fox squirrels also. They looked enough like my Adirondack red squirrels at a distance to make me a bit homesick.

It quite takes one's nerve when he realizes he is in a swamp a hundred miles long and forty wide, with only a hummock here and there. I had the tram road, the railroad and the river on three sides of me, and my compass to take me south, the direction to hit the tram. Still it was nervous tramping. When I was ready to start back I headed south and hit the two-mile tramway square in the center.

That "evening" the hunters came in with from one to four ducks apiece. They ate their night meal, and it was not late when all hands turned in. The next day was like the first, save that I went to Cane Ridge—every place and thing has a name in the bottoms. Each locality has its Cane Ridge, Horse-Shoe Lake, bayou or slough; its cypress brakes and dark corners. Some scratching in leaves on the ridge was as near as I came to seeing a turkey. That night the train brought some more hunters, one of them the secretary of the club. Some stories were told of the kind which would seem to indicate that the present is less attractive than the past—that times have changed, and nobody has any fun these days. The younger men did not join in this, but listened. One or two guessed that it might be the men who had become different, and that there is an old time in some memories, but that the times of to-day will be old in the future to those who are young now—especially the high old times.

What stories and things one does hear at a club! One man had fished the whole gulf of Mexico shore line from 100 miles south of Tampa to the border. Another had gone the length of the St. Francis when it was through a "wild country" not a somewhat settled one as it is now. "The way my wife makes a mint julep, she puts sugar in the bottom of a glass and mint on this, breaks up ice fine in a napkin, and then pours whiskey over the ice in the goblet." "Finest eating in the world is one of those loggerhead snapping turtles right out of the St. Francis." "First polecats ever were in this region, so far as I know, came right last year, and became plenty." "The water over to Walnut Ridge is sickly, but looks all right. After a dog drinks it he eats mud to take the taste out of his mouth." "Most expensive hotel you ever saw, and the meanest. Why, they cut a boiled egg in two and serve half in a side dish. They charge fifty cents for a meal of that kind." "I used to shoot pigeons off that church with a .22 BB cartridge. I don't see why it is, but a BB cap will kill a pigeon, but a .22 short or .22 long will let one of them fly half a mile. Just the same with a snake or squirrel. The BB cap kills them dead." "I used to know him well before he got killed." "That's so; I did see something about it. I'll bet it made him sore to have to give those ducks up when the sheriff nailed him," and so on.

The old Ocoola Gun Club is the best known sportsmen's club in the bottoms. It seems to have fallen apart these days, but the time was when to be a member of the Ocoolas was to be a good shot, a good fellow, and a man who could travel the overflow at night. Some time a man will gather up the traditions about old-time American sportsmen's clubs, and among the things he will look for will be the stories which can be had of venturesome trips by sportsmen into the Arkansas swamps. The doings of the Ocoola Gun Club would tell the story of the swamp hunting. There were features of the swamp life not found elsewhere, of course. In the first place, desperadoes were to be reckoned with; they wouldn't steal, but they would kill a man for an "insult." Yet the swamp people were most hospitable to strangers, and the old-time sportsmen had no trouble with them. Occasionally, however, men who thought liquor, noise, and slaughter necessary for a good time came, and then things happened. One of these parties was put off a train a few years ago, in the days of Barney Mitchell, one of the most noted bad men. The train crew dropped the crowd, its boats and duffle, in the middle of the swamp because it was making trouble for the other passengers. The men claimed to be fishermen, but each one had a gun or rifle. It was the time of the overflow, and they dumped their duffle into their boats and put out into the swamp, which was ten feet deep with water. They were to camp, but had no ax, lantern, beds or substantial provisions—just guns, ammunition and beer, stuff that was an insult to a swamp man if he smelled it. Moreover, they had a negro servant. This outfit got into the swamp, became lost inside of an hour, and then for two days yelled themselves hoarse, and shot their guns till the barrels were hot. Finally Barney Mitchell heard them, and blew his hunting horn, and they came to the music, not thankful, but disgusted with the country, and angry because help hadn't come before.

There was a steamboat at the Madison Landing, and the men asked Barney if it was a steamboat. Then they asked which way the boat was going. They were told to ask the captain. They wanted to know how far it would go, and under the steady questioning the native ire began to reach the safety valve pressure. Finally they asked if the captain would take them as passengers; whereupon, as one man, the Swamp Angels said that if he didn't take them and their nigger, things would happen. The natives put the crowd on board forcibly, and told the captain not to let them off for a hundred miles. A week later Robert Mitchell came that way, and some of the swamper slept on the floor in order to give him their bed; it all depended on how one took the native. And it depends on that to this day.

Twenty years ago Mitchell, of the Hatchie 'Coons, made a trip down the St. Francis with a companion. It was before the levee had fenced off the swamp, and the great bayous were nearly all open streams, kept so by the overflows. He came down the Tyrone, which is now impassable because of fallen trees, and entered the St. Francis, down which he went to the mouth. Wild turkeys came to every sandbar; deer fed on every flat; countless ducks and geese were in every reach and bend. The two ate venison; duck breasts, wild turkeys, or squirrels as they pleased. They had less than fifty cents in their pockets, and the few natives they met would have been insulted if an effort to repay their hospitality had been made. The clearings were fifty miles apart, and there was a stretch of a hundred miles without a house in

sight. Fur-bearing animals—'coons, 'possums, mink, and otter and beaver were to be found everywhere; but times have changed.

One sees a greater variety of things in the swamp these days than during the "unbroken wilderness" period. I found it a strange land compared to anything I had hitherto seen, and I felt that it was more interesting now than in the early days, when it was only a wilderness.

RAYMOND S. SPEARS.

Ruminations of November.

FROM the falling of the first ripened maple leaf until the ground is thickly strewn with crisp, brilliant foliage, one harvest succeeds another, leaving the earth at last clad in a russet mantle to await the advancing snows of winter. Thus, when the splendor of October has vanished, it is left bare and frosted; keen winds sweep through the stripped orchards or across the withered fields, and no longer does the soothing murmur of insects awaken the evening quietude. But there still remain harvests to be gathered, and the sap of autumn as yet has not ceased flowing.

Perchance these harvests, however, which are often the best and richest of all, are overlooked by man in his haste to garner only the crops he has raised from the soil, for many of the former may not be harvested with the hands or other implements, but are fruits that the eye and spirit must gather. He who would reap such harvests, therefore, should walk abroad, not looking at his own meagre landscape of thought, but opening his inner vision to view the distant horizon and seek out the beauties therein.

No doubt the atmosphere which during late autumn is almost nightly purified by a hard, sharp frost, quickens and as it renews the embers of thought and meditation. Moreover, it is a stimulus to health and bodily vigor, casting aside any lassitude that might linger from the summer season. A flavor of winter is obtained without the colder intensity of a later period, while smouldering leaf piles remind one that the time has not yet arrived to kindle a perennial fire on the hearth, for their pungent scent is alone symbolical of the autumnal months. From almost any favorable outlook on a still day these thin, blue columns of smoke may be seen curling slowly upward, and we often smell the fragrant incense of a neighbor's fire, perchance many miles distant. There are few indeed spending all or portions of their lives in the country who have not raked and burned leaves as systematically as the farmer digs his potatoes. For the most part, however, they are harvested merely to be got rid of, and their poetry and beauty go up with the smoke, unseen.

Every deciduous tree, from the smallest sapling to the oak or beech, whose dimensions awaken admiration and wonder, bear an unflinching crop of crimson, yellow or russet foliage. What if the leaves did not turn after the first frosts, but remained green until they finally withered and fell? It would be as disappointing as a flower garden without bloom or an orchard that bore no fruit. Then surely the life and inspiration of autumn scenery would be lost to a great degree.

After several cold rains, preceded by frosts, the leaves fall in golden showers on a breezy day, or still more often they float silently to earth, limp and moist, in accompaniment with the raindrops. It takes, however, but a few hours of clear, penetrating sunlight to restore their crisp texture, and the woodlands again rustle musically at every step. Although the sombre tints of November are only enlivened by the warm, red-brown foliage of oaks, or richly-colored sumac, there is a new beauty in the rugged symmetry of the leafless trees which summer has failed to reveal. Their aspect seems more inspiring and masculine than during the former season, when, as it were, they have a tropical and should we say, more feminine beauty.

On the whole, a fire is considered a better companion by many than the sharp winds and gray, chilly weather which predominates in late autumn; but despite this partiality, November is nevertheless a most desirable month for outdoor occupation, whether it be labor or pleasure. The simple pastime of walking is enhanced, not alone with physical benefits, but reflects on the mental faculties, and arouses hope, ambition and aspiration. Both the spiritual and material appetites of man are keener; he breathes the thin, rarified ozone and assimilates its bracing virtues throughout his system, instinctively drawing closer to nature, as though the season incurred a more intimate relationship. Neither does winter signify that one must remain continually sheltered from snows and cold weather, like some hibernating mammal, not appearing until spring thaws are in session; but rather let us leave the fireside and gain the open if we would obtain health, hardihood and sincerity.

If returning from a walk on a November evening, as a purple mantle of twilight descends over the mountains and shrouds the uplands with a misty veil, how at home we then feel in the world! The plaintive lowing of kine in a distant milkyard has a melodious intonation; we hear a belated apple or chestnut fall by the roadside, and in the gathering dusk search for it as eagerly as a child. The frosty atmosphere breathes an odor of newly plowed fields, while across the darkening mountain slopes a vapory snow squall drifts by, as though the walls of autumn had at last crumbled and allowed the winter hosts entrance. At such times we imbibe the very spirit of the hour, neither regretting summer's vernal beauties nor yet overstepping the snow-bound threshold which confronts us. The present fulfills our desires, and as the sunset frightens the fading landscape, its radiance likewise illumines those real and imaginative creations that flow around us in unending continuation.

During the interval that marks the final decade of autumn, the elements display a temperament which completely overthrows most weather calculations and which no other month, perchance, excepting March, can well boast of. Tranquil skies and balmy zephyrs recall those lines of Keats addressed "To Autumn," in his delicate and refreshing verse:

"Season of mists and mellow fruitfulness,
Close bosom friend of the maturing sun;"

and thus for a time the subtle influence of Indian summer causes the winter gods to shrink and fade from our vision. Nevertheless, their obscurity is of short duration; another day dawns with a gray, overcast zenith, high winds and exhilarating ozone; or else a gale from the northeast fills the air with whirling snowflakes and freezes the earth in an icy grip. But again, a breath from the south may dispel the northern forces before they obtain full sway, and in fact one does not ever know what new mood the weather will assume, or what fresh outlook will greet him each morning.

Radiant dawns and glowing sunsets are characteristic of this month; it appears at times as though the sky drew nearer, while the colors and clouds became more intensified and individual. Now that the earth has faded, and there remain only russet pasture lands and oak leaves to warm the scene, the heavens seem to replace this loss with rich, luminous skies, reflections, as it were, from some Elysian field clothed in perpetual brilliancy and beauty. The dawns "come up like thunder," and before the blaze of mellow gold, which so often ushers in a day of gray quietude, Thoreau's "morning twilight" retreats with haste to nightly realms. Some time previous to the sun's appearance, the branches of the trees, woven in a network against the sky, will take on a green-bronze sheen most alluring and wonderful to the eyesight. Is it not Horatio who says to his companion as they wait for Hamlet in the gray early hours,

"But, look; the morn in russet mantle clad,
Walks o'er the dew of yon high eastern hill."

We would only have to place the word frosts in the stead of "dew" to obtain a complete and ideal description of November sunrises.

As the twilight deepens on the mountains, those clouds which have rested heavily along the horizon, lift and break up, revealing a clear vivid sunset which fills us with calm, inspiring contemplations. Ethereal islands that glow with a celestial light, drift on a sea of fiery color, while further up the sky fades into pale saffron or bluish-green tints. We look on and on through the ocean of illimitable space, and perchance our thoughts may float as serenely over the horizon of destiny as these clouds above the setting sun.

After all, then, the sky remains everlastingly fruitful throughout the year; its brilliancy lingers when the sombre cloak and withering frosts of late autumn deprive the landscape of richer colors, and its warm sunsets animate the bleakest seasons.

PAULINA BRANDRETH.

The Last Wild Turkey.

A Thanksgiving Story.

I WILL tell the story as it was told me by Tim Mulcahy; though not in his words, which, I confess, ran a little to prolixity.

It seems that one evening in November as there was an informal congress of the sports of the village around the stove in the postoffice, Al Budd came in from the woods and reported that he'd seen a wild turkey—a great buster of a fellow. Immediately there was intense excitement. Not for many years had a wild turkey been seen in the woods, and it was supposed that the race had become extinct, in those parts at least. Besides Thanksgiving was coming on. Who was to be the lucky man to give thanks over "that old Mohican—the last of his race in Buckram county"—as one speaker eloquently described him.

But presently the excitement subsided as suddenly as it had arisen, for it had occurred to the assemblage that after all Al Budd was only "taking a rise out of them" and was even then laughing in his sleeve. So he became the object of the severest and most penetrating scrutiny. And at the suggestion of one wise man (delivered in a whisper), he who was noted most for his powers of cross-examination (having once been a clerk in a lawyer's office), began to put Al through his facings. Where had he seen the turkey? Was he sure it was a turkey? How far off was it? Was it a hundred yards? Would he swear it was a hundred yards? What did the turkey do? Did it gobble or make any other noise? Would he be able to identify it if he saw it again? Etc. etc., much to the admiration of the crowd.

But Al bore it all without flinching, and as besides he had a tolerable reputation for telling the truth, it was finally concluded that he had really seen a wild turkey, strange as the thing appeared. Whereupon there was a revival of the excitement and the sports began to drop off to look to their weapons and map out plans of campaign. All, that is but Tim Mulcahy, who as he expressed it to the writer afterwards, scorned to be found among "a lot of murderin' pot hunters, drivin' a poor stray bird to death."

Well, bright and early next day Gus Schwake, Ed Moebus and "Dutch Pete," with some others of lesser fame, were off to the woods. And perhaps they didn't beat them! But the turkey was nowhere to be found, much to the chagrin and disappointment of the beaters. Towards evening they happened to converge at an open spot and began to compare notes. "Dutch Pete" declared that there was no use in going after a wild turkey. The only way was to wait for it. Ed Moebus inquired a little sarcastically of Pete where he was going to wait. Gus Schwake thought Pete was right but said it would first be necessary to find out where the turkey roosted and then build a blind. He had hardly ceased speaking when their three hearts leaped into their mouths as they heard a commotion as of some big bird alighting in a tree nearby. Instantly they crouched and Ed Moebus, who was the best Indian, started off on all-fours to make a reconnaissance. He returned in half an hour and reported that he had been unable to locate the bird, but that doubtless it was somewhere in the neighborhood. It was then agreed that they should remain where they were until morning, only separating and concealing themselves around the open space, where probably the bird would come to feed, as nuts appeared to be plentifully scattered about. The night passed slowly and uncomfortably for the

watchers, but day at length dawned and they sat up on the alert and full of expectation. The light was still rather thick when they were thrilled to the soles of their feet at hearing a heavy flapping of wings and presently the object of their watch sailed down majestically and lit in the middle of the open space. For a moment the noble bird stood looking about him warily. Being evidently satisfied with his observations he was in the act of lowering his head when there was a three-cornered explosion which shook the forest. Almost simultaneously the three sports dashed out to seize the prize. But judge of their feelings when they beheld the turkey take wing and disappear over the tops of the trees apparently uninjured!

"I schvear dot bird ain'd humans!" cried "Dutch Pete" excitedly.

Ed Moebus and Gus Schwake were too surprised to speak.

To soothe their feelings they filled their pipes and had a smoke, and then concluding that there was no more hunting for that day they slowly and sadly turned for home. It was agreed that nothing should be said about what had happened, for while they felt that there must have been some enchantment at work, they realized that it would not be easy to make the village take that view. Unfortunately, however, "Dutch Pete," who had a loose tongue, blabbed the matter to his wife, who told it to Mrs. Belschnickel, and then the cat was out of the bag.

So the three sports became the laughing stock of the village. All they could say in self-defense was that the turkey must have been a phantom. "Dutch Pete," who by reason of his indiscretion felt that the onus of defense lay upon him, was sure it was a phantom. They had heard of phantom ships and phantom deer, why not phantom turkeys? And now he recalled several circumstances at first unmentioned, such as that the turkey's eye shone like a cat's in the dark, and that its feathers emitted a sort of blue fire, like they saw on plum-puddings at Christmas. All this only set the village laughing the more heartily, and Tim Mulcahy was especially unmerciful in his raillery.

"Talkin' of blue fire, Pete," said he, "did you ever hear of such a thing as a blue funk?"

It was the eve of Thanksgiving, a beautiful dry crisp evening, and the boys were all loafing down the road from Jake Kummelwasser's.

While the fun was at its height someone descried a tramp coming up the road. On observing the crowd the tramp hesitated and appeared to be about to turn back, but apparently realizing that if he did it would be no use as he should be pursued, having excited suspicion, he continued on. When he came up it was seen he had a bag slung across his shoulder.

"What have you got in the bag, cap?" demanded Tim Mulcahy.

The tramp appeared to be in trouble at once. He flushed, stammered something about "old rags" and shifted from one dusty foot to another.

"Boys," said Tim, "I'm a respecter of every man's liberty, even when he's a hobo, but I think it'll do no harm to see what's in that bag. Come, open up, me man."

Thereupon the tramp grew saucy, as you please—told Tim and his companions that they were only a lot of "fresh country ducks," and that if they attempted any interference with him he would bang them over the head with the bag.

After this bold bluff he suddenly changed his tune and began to cry.

It was obvious to the assembled sports that the poor wretch was a little simple, as the saying is.

"There—there," said Tim soothingly, "we don't want to take anything from you, me poor man. We were only foolin'! Whatever you've got you're welcome to it. So good day to you."

The tramp was moving off, then suddenly turned and called out:

"Will you buy it?"

"Buy what? What is it?" said Tim.

"Something you don't see every day," answered the tramp.

With that he lowered his bag and pulled out a wild turkey.

There was a sensation! You may be sure all the boys opened their eyes.

"And how did you kill it?" queried Tim, examining the bird.

"I killed it with a stone," answered the tramp.

Tim ceased his examination and regarding the tramp repeated:

"Killed it with a stone?"

"Yes," said the tramp, "see where I hit it on the head."

Tim now turned his eyes on the crowd and burst into a laugh that echoed away back in the valley. In this he was joined by all, except Ed Moebus, Gus Schwake and "Dutch Pete," who hung their heads and looked terribly abashed.

"Oh, Lord," exclaimed Tim, "I'll never get over this. To think that a stone could do more execution than three guns! But come, never mind, boys," he said, observing the suffering of Ed and his companions, "We've got the turkey anyway and that's the main thing. I invite yez all to Jake Kummelwasser's tomorrow for a slice. And you too," he said, addressing the tramp, who on hearing this concluded that that was to be his only payment and appeared again about to cry, so Tim hastened to add:

"In the meantime here's a dollar for you and me respectful compliments on your skill."

It only remains to be recorded that the following day at Jake's became historic in the village as the Wild Turkey Thanksgiving.

FRANK MOONAN.

The Camp-Fire.

The menu card of the Canadian Camp-Fire Club dinner last week was graced with this cameo by Edwin L. Fabin:

"Cold night weighs down the forest bough,
Strange shapes go flitting through the gloom;
But see—a spark, a flame, and now
The Wilderness is home."

Trails of the Pathfinders.—XX.

Ross Cox.

(Concluded from page 425.)

It was October 17, the anniversary of the sailing from New York of the Beaver, that Cox and Farnham set out on their trading expedition to the Flatheads; and on the 10th of November they reached the small village of these people. They were charmed with their frank and hospitable reception, and with the superiority in cleanliness of these Indians over other tribes that they had seen. They determined to remain here for awhile, and began the building of a log house in which to winter. Meantime the Indians kept coming in, and they made quite a trade in beaver. In December, Cox, having had a good canoe built of cedar planks, took leave of Farnham, and with six men set out to descend the river to Spokane, which was reached about New Year's day.

Soon after returning to Astoria a tragedy occurred. The people at the fort had been losing many things through the pilfering of the Indians. It seemed impossible to detect them, and appeals to the chief did not stop the stealing, nor bring back the stolen property. At last things came to such a pass that two armed sentinels were placed at either end of the camp, with orders to conceal themselves and to keep a sharp lookout. Shortly after midnight they saw a man creep out of one of the tents, carrying a bundle of clothing and some other things. They watched and followed him until they saw him step into a small canoe at the water's edge, when they stepped forward and captured him. All hands were now called, and an inventory was taken of the property. Most of the things that were missing were found in the canoe with the man, but he declined to tell what had become of the remainder. The thief had never been suspected, and in view of this, and the aggravated character of the robbery, Mr. Clark determined to hang the man, as he had said a few days before at the council of the Indians he would do if he detected him. The man was accordingly hanged, the Indians having previously been asked if they did not regard this as a proper punishment for one who had committed these offenses. All agreed that it was right that he should die.

During a trip to the Flatheads Cox witnessed an extraordinary display of fortitude by a Blackfoot prisoner whom they were torturing. It is a graphic picture of the savage cruelty of the savage man, and is far too horrible to print. An effort was made by the traders to put an end to these tortures, and the Flatheads were induced to set free, and send away to their people, a number of Blackfoot women. To these prisoners, now being set free, it was explained that torture between the tribes ought to cease, and as they were turned loose unharmed, it was hoped that they would persuade their people on the prairies to abstain in future from torturing Flathead captives. Cox is enthusiastic about the attractiveness of the Flatheads. It was here that he was successfully treated for rheumatism by an old Indian doctor; the cure being a morning bath in the river, now frozen over, through a hole in the ice, followed by rubbing of the affected parts by the old doctor. After twenty-five days of the treatment the trouble had entirely disappeared.

There came to this remote northwest corner in the autumn news of the War of 1812, and British war vessels took possession of Astoria in the name of the King, and named the trading post "Fort George." It is rather touching to read that the Indians at the mouth of the Columbia River flocked to the post and offered their services to resist the war vessel, in order that the Americans might not be captured and made slaves, as the Indians supposed they now would be. The offer, of course, was declined, since most of the employes were already British subjects, and were only too glad to be captured by their countrymen.

The arms of the Indians about the mouth of the Columbia River were bows and arrows, and a short, double-edged sword, or club, about two and a half feet long. The Indians wore armor, a shirt of elk skin, which was doubled and thrown over the shoulders, with holes for the arms, and reached as far as the ankle, and was perfectly arrow-proof. The head was covered by a war cap or helmet, made of bark, grass and leather, and would also resist a ball. They had another kind of arm or which was formed of thin slips of hard wood, ingeniously laced together, and much lighter and more pliable than the elk-skin coat. The extraordinary canoes built by these people have often been described, as have also their great houses.

In August, 1814, a party of sixty men, including proprietors and clerks, left Fort George to go up the river with trade goods. On the way they met some Indians, who attempted to steal various small articles, and were warned to stop it, but paid no attention to the orders. Three caught in the act of pilfering were flogged. At night the party was attacked by Indians, and a Canadian was killed. There were many narrow escapes. Passing up the river they met with the Walla Walla, who received them in their usual friendly way. A little later the party separated, that to which Cox was assigned going to Spokane House, where the Indians, who had expended all their ammunition, received them with great joy. An amusing sketch is given of the personality and character of the Scotchman, McDonald, celebrated for his great size, his flaming red hair, and his daring bravery. A small tribe of Indians were camped between an immense fall in the Columbia, known as La Chaudiere and Spokane House; their chief was a philosopher, frugal, thrifty, opposed to gambling, and so in many respects different from the average Indian. Here occurred the death of Père Hoole at the age of ninety-two, while he was setting his traps.

In October the various parties returned to Fort George with the proceeds of their trade, and on the 18th of November again set out for the interior. Not far above the mouth of the Walla Walla, they met a number of Indians coming down. They stopped the first canoes to ask for tobacco, and as they passed the last ones, endeavored to take from them some bales of goods. The arms of the canoe men were not within reach, but each of the proprietors or clerks carried his arms. Every effort was made to avoid open hostilities. The canoe men tried to beat the Indians off with their paddles, and the Indians had not yet attempted to use their arms. When a tall Indian refused to let go the bale of goods that he was trying to

take from McDonald's canoe, M'Kay struck him with the butt end of his gun, and obliged him to drop the bale. The Indian instantly placed an arrow on his bow, which he aimed at McDonald, who quickly stretched forth his arm, seized the arrow, broke it to pieces, and threw them into the Indian's face. The Indian, by this time very angry, had ordered his canoe to push off, and was just about to shoot an arrow at McDonald when M'Kay fired and killed him. His two companions were about to use their bows, but McDonald, who had a double-barreled gun, shot them both, killing one and severely wounding the other. The fight was on, but the Indians threw themselves in the bottom of their canoes out of sight, and the vessels soon drifted down the river, and out of gun-shot. The traders at once went ashore and armed themselves. The Indians lurked about and shot at them, but without effect. Embarking, the white men paddled to a narrow island in the river, built breast-works, and prepared to pass the night. The next day the wind blew hard, and they were obliged to pass the night on the island. Meantime the Indians were signaling, and canoes could be heard crossing and recrossing the river. The spirits of the white men were low, and they believed that they were likely all to be killed. The next day the traders sent out a flag of truce to the enemy, and asked for a talk, being determined to pay the relatives of the dead for the loss, rather than to have any fighting. The Indians refused this, however, and declared that two white men must be delivered to them to be treated as they thought best. One of these white men, it was explained, must be McDonald. The offers made by the traders had been sufficiently liberal, but the general sentiment of the savages seemed to be that these offers must be refused, and that white men must be killed to accompany the dead Indians on their way to the home of the dead. After a heated discussion, it became evident that there was little hope of a compromise or of peace. One by one the Indians sulkily drew away from the council and joined their friends who were sitting at a distance behind them. Just as the conference was over, however, it was interrupted by the arrival of a dozen mounted Indians, who dashed into the space between the two parties, and halted there. These men were under the leadership of a young chief whose courage and wisdom was respected by all the Indians of the country. He made a strong plea for a peaceful settlement of the difficulty, finally declaring that no one of the Indians should dare to attack the whites. This speech put a different look on matters, and the Indians presently consented to the proposed compromise, and smoked with the traders. The wounded and the relations of the dead proved quite willing to accept the payments offered, and friendly relations were at once renewed.

In May, 1816, the author found himself once more at Oakinagan, and this time occupying the chief position there. He at once set at work to rebuild the post, where he spent the summer. The point between the Oakinagan River and the Columbia, where the trading post was built, was absolutely free from rattlesnakes, although the surrounding country abounded with them. The snakes were frequently eaten by the Canadians, who skinned them as eels are skinned, and then spitted them on a stick run through the body, and then roasted before a fire. Cox tells a curious story of the treatment of a young woman supposed to have consumption by an old Indian. The treatment consisted in killing a dog and placing the foot and leg of the patient within the newly killed carcass until the flesh became cold. They were then taken out and bandaged with warm flannel. Besides this, she took daily a small quantity of bark in a glass of port wine. The result was that her condition greatly improved; she regained her appetite, and in the autumn was strong enough to travel across the mountains with her husband. The following summer Cox met her at Rainy Lake in the full enjoyment of health. Cox also tells of a white man, absolutely dying of a decline, who was cured by being

placed at short intervals in the body of a newly killed horse. After two treatments of this kind, at intervals of a few days, he began to regain his strength, and by adhering to simple and careful living, was finally restored to his ordinary health.

Wolves were very abundant, and were very troublesome to the horses. "These destructive animals annually destroy numbers of horses," Cox writes, "particularly during the winter season, when the latter get entangled in the snow, in which situation they become an easy prey to their light-footed pursuers, ten or fifteen of which will often fasten on one animal, and with their long fangs in a few minutes separate the head from the body. If, however, the horses are not prevented from using their legs, they sometimes punish the enemy severely; as an instance of this, I saw one morning the bodies of two of our horses which had been killed the night before, and around were lying eight dead and maimed wolves; some with their brains scattered about, and others with their limbs and ribs broken by the hoofs of the furious animals in their vain attempts to escape from their sanguinary assailants.

"While I was at Spokane I went occasionally to the horse prairie, which is nearly surrounded by partially wooded hills, for the purpose of watching the maneuvers of the wolves in their combined attacks. The first announcement of their approach was a few shrill curish barks at intervals, like the outpost firing of skirmishing parties. These were answered by similar barking from an opposite direction, until the sounds gradually approximated, and at length ceased on the junction of the different parties. We prepared our guns, and concealed ourselves behind a thick cover. In the meantime, the horses, sensible of the approaching danger, began to paw the ground, snort, toss up their heads, look wildly about them, and exhibit all the symptoms of fear. One of two stallions took the lead, and appeared to await with a degree of comparative composure for the appearance of the enemy.

"The allies at length entered the field in a semi-circular form, with their flanks extended for the evident purpose of surrounding their prey. They were between two and three hundred strong. The horses, on observing their movement, knew from experience its object, and dreading to encounter so numerous a force, instantly turned around and galloped off in a contrary direction. Their flight was the signal for the wolves to advance; and immediately uttering a simultaneous yell, they charged after the fugitives, still preserving their crescent form. Two or three of the horses, which were not in the best condition, were quickly overtaken by the advanced guard of the enemy. The former, finding themselves unable to keep up with the band, commenced kicking at their pursuers, several of which received some severe blows; but these being reinforced by others, they would have shortly despatched the horses, had we not just in time emerged from our place of concealment and discharged a volley at the enemy's center, by which a few were brought down. The whole battalion instantly wheeled about and fled toward the hills in the utmost disorder; while the horses, on hearing the fire, changed their course and galloped up to us. Our appearance saved several of them from the fangs of their foes; and by their neighing they seemed to express their joy and gratitude at our timely interference."

In portions of the country inhabited by the Walla Walla, Nez Percés and Shoshones, wild horses were at this time very abundant. Sometimes from seven hundred to a thousand were seen in a band, and persons who had crossed the continent by the Missouri route told Cox that in the Snake Indian country bands varying from three to four thousand were frequently seen. The Spaniards at San Francisco informed the traders of the Northwest Company that in the year 1812 they were obliged to kill upward of thirty thousand horses in order to preserve sufficient grass for the buffalo. Just what is meant by

California in this connection is uncertain, since it is not known that the buffalo were ever found in the California of modern times.

In his description of the horses of the country, Cox tells of a ride of seventy-two miles which he made between twelve o'clock in the morning and soon after dark, to outstrip some rival traders who were on their way to the Flatheads. The Flatheads were out of tobacco, but Farnham, who was in charge of the party, felt sure that if a supply of this commodity were brought them at once, they would promise their skins to him. Cox, riding a splendid horse, known as Le Bleu, reached Farnham two hours in advance of his rivals, and secured the trade.

In the summer of 1816 Cox determined to abandon Indian trading, and applied to the proprietors for leave, which was granted with regret. Nevertheless, he wintered at Oakinagan.

In April, 1817, a party of eighty-six men embarked in two barges and nine canoes from Fort George to ascend the Columbia. They continued up the river with various adventures, seeing Indians constantly, but having no trouble with them, and on the 17th day, twenty-three of the party who were to cross the Rocky Mountains to the plains left the loaded canoes and continued up the Columbia, past Oakinagan, the mouth of the Spoken River, to Great Kettle Falls. Continuing, they passed through the lakes on the Columbia. The river grew narrower and narrower, and the current swifter, and at length they reached the Rocky Mountain portage, where they were to leave their canoes. The hard work done so far on the trip had exhausted many of the men, who were now practically unable to work; so that seven men, six Canadians and an Englishman, were sent back in the best canoe to Spoken House. Only one of them reached there alive, having been found by two Indians on the borders of the upper lake, and by them transported to Spoken House. Now came an overland journey on foot, where the nine remaining men were obliged to carry loads of about ninety pounds each. The journey was very difficult, over steep mountains, across rapid streams, and through deep snow fields. On the 31st of May they reached two small lakes on the summit of the mountains, at which they encamped. From these lakes a stream joins a branch of the Columbia River, while another, called Rocky Mountain River, empties into Peace River, and so takes its way to the Arctic Ocean.

The next day they reached a beautiful meadow ground, where five of the company's horses were found grazing, and their pack saddles were placed conspicuously near a large fire which was still burning. The animals had been sent up from Rocky Mountain House to meet them.

The next day, in crossing the Rocky Mountain River, a series of accidents happened, by which the first raft made was lost, and the second got away, carrying several men with it, the result being that the party was now separated. From this time on until they reached Rocky Mountain House, they did not get together, and there was some suffering from hunger and cold. Nor was their situation much better at Rocky Mountain House, for they were unable there to obtain provisions, the people here being themselves on short allowance. On the 7th of June they left Rocky Mountain House, and soon entered the Athabasca River, and continued down it until they reached Elk River, which they ascended, and at last met Alexander Stewart and the Slave Lake brigade. From here they proceeded eastward, down the Beaver River to Ile à la Crosse, reached the English River, Cumberland House, and the Saskatchewan, and thence went through Lake Winepic to Fort Alexander by way of Rat Portage to Rainy Lake and Fort William.

From here eastward the journeying was through the more or less settled country occupied largely by Canadian farmers. The party continued eastward, until on September 19, five months and three days after leaving the Pacific Ocean, Cox reached Montreal, and his journeyings were at an end.

GEORGE BIRD GRINNELL.

NATURAL HISTORY

The Drumming Grouse.

SKOWHEGAN, Me., Nov. 12.—*Editor Forest and Stream:* I have noted with interest in the later numbers of your most excellent publication the query relative to the drumming of the ruffed grouse, and the several replies by observers.

Some excellent observations on the ruffed grouse were read at our seventh annual meeting of the Maine Ornithological Society, held in Portland, November 29, 1902, by Dr. Wm. C. Kendall, of the United States Fish Commission. These were published later in the Journal of the society, and as the notes throw light on the subject in question, I quote the following from Dr. Kendall's most interesting article:

"This year I had a number of opportunities for observing the male grouse drum. In all but one instance the birds were on old logs. The exception was one in Freeport which was sitting on a stone wall. You are all doubtless familiar with the sound. It was made in all cases that came under my observation exactly as I described it last year in the Osprey. There was no 'strutting up and down the log.' If the bird detected a sound, he would straighten up, look and listen, then resume his crouching position with head drawn down. When about to drum, he would raise himself, straighten himself back, sometimes glancing about suspiciously, sometimes not, then produce the drumming sound and resume his former position.

"The drumming seemed to be produced by expelling the air from between his wings and body by short, quick strokes of the wings, which at no time 'met behind' or touched the body. It has been stated that the drumming cannot be a 'love note' because it occurs so often in other

seasons than in the spring. Now, I have been in the Maine woods since May 1, and have had all the opportunities one could wish for to hear and observe these birds drum, and have heard more drumming birds in the late fall than at any other season, though I heard a few in the spring. If pairing takes place in the spring, it seems to me that it must be before the female is ready to lay her eggs. I have this year seen instances of undoubted pairing in October and November, especially during the last of the former and first of the latter month. Drummers were heard most frequently in October. I recall hearing none in August and September. At this time the birds observed, for the most part, were in flocks of young with their mothers. In October there were seldom more than two together, and when in pairs they were always male and female.

"You have seen that picture of grouse which advertises some gun firm or another. It is a good one. This fall I saw the same pretty sight in living birds. The cock on a log, tail a-spread, wings drooping slightly, and an immense ruff about his neck—so much that I could hardly detect his head, though I was within ten or fifteen feet of him. Below, by a rock, stood the female, motionless, and although not just at that moment casting admiring glances at the swain on the log, I have no doubt that she had been doing so.

"One night while tenting on Webster Brook—it was October 17, a bright moonlight, still, cold, frosty night—I had fallen asleep and dreamed I was in my native town in one of my boyhood haunts with my gun, looking for 'partridges.' In my dreams I heard one drum and started to steal upon him. But for some reason I awoke before I reached the bird, and lay awake for a while, when I heard the drumming 'sure 'nough,' which at intervals of

six, eight or ten minutes, I should judge, was repeated. I looked at my watch and it was 1:15 A. M. The bird was still at it when I last looked at my watch at 3:30 before falling asleep again. I thought this night drumming an unusual occurrence, but my guide said he had often heard them drum on just such nights, but I doubt if he were forewarned by a dream.

"I had the good fortune to observe a drummer approaching his bandstand. He flew down near our tent, the same sleep disturber, I presume, stood for a minute upright, listening, then with head stretched out straight ahead, crouching close to the ground, he swiftly glided through the bushes to the log. I followed him and saw him drum. Sometimes prior to this, after watching one drum, I drove him from his log. Instead of running or flying as the birds do at other times, he dropped without a sound to the ground and sneaked swiftly and silently away. The only drummer I ever saw fly at once from the perch where he had been drumming, was not over a month ago in Freeport, when my dog frightened him from the stone wall previously mentioned.

"My observations then lead me to suspect that the mating season is not confined to the springtime, and possibly the principal season is in October and November. But I am open to correction."

The above is in accord with my own observations. I have on several occasions heard the drumming in the night. I recall one instance, while camping several years ago in northern Franklin county in Maine. We were tented near a trout brook. I was awakened by the drumming of a grouse. It was on a dark, foggy night.

I have just returned from a ten days' trip to the lower Dead River. We were camping near the Dead River Dam, just above Grand Falls. One bright moonlight

evening as we were returning to camp, and were following along the Spencer Stream, we heard a grouse drumming near us. I was very much pleased to find the Canada grouse—"spruce partridge"—rather plentiful in the Dead River region. We saw them nearly every day during our stay. I was very glad to learn from our guide, Alvah J. Dumphy, that very few sportsmen ever shoot them. They are exceedingly tame there, and will fly up to a low branch of a spruce and sit and look at a person as unconcerned as can be. We found them usually in the dense spruce bushes in some solitary out-of-the-way place not far back from the river. The ruffed grouse were very plenty and very tame there. While hunting deer, we came upon flocks of them; they would hop up on a log or a low limb and look at us, showing very little signs of fear.

Beaver in Maine.

Having digressed from my subject, I will mention the quantities of beaver and their signs we saw in that region. I had not supposed there was a place in Maine where they were so plenty. We examined seven or eight dams, which are very interesting and ingenious contrivances. We saw several houses and many poplar trees which they had gnawed down along the banks of the river, felling them into the river and cutting the trunks up into sections and floating them to a place near their houses and sinking them. I measured trees they had felled that were 16 inches at the base where they had gnawed them off. One evening while in camp we had a discussion as to how the beaver contrive to sink their logs after cutting them off. Our guide gave his theory, and I would like to hear through these columns from those who have had opportunity to observe along these lines. It would doubtless interest other readers.

It is an interesting experience to float down the river noiselessly in a canoe on a clear, cold, moonlight night, and as one rounds a bend in the river catch sight of a beaver. Flap goes his broad, flat tail, spluttering the water high in air and making a noise that sounds as though someone from the bank had thrown a large rock into the water ahead of one. I shall long remember one such evening, when, with a hunting companion and our guide, as we silently paddled our canoe down the river from Long Falls to the dam; it was a clear, sharp, moonlight night, and every now and then could be seen a muskrat swimming along ahead of us. Several beaver were sighted, and as the first one that we came up to splashed the water ahead of us, my companion started and said, "Tho't it was someone on the bank who threw a rock into the river ahead." We occasionally heard the hooting of an owl above the sound of the rushing water above us on Long Falls, locally called "The Hurling Machine," from the fact that when the logs go over the rapids in the spring the logs having the bark on come out below with the bark well peeled off. Below us was heard the dull roar of the Grand Falls below the dam.

We occasionally startled deer on either bank as they were coming down to the water's edge to drink. Big game we found very plentiful, frequently seeing signs of moose. One large bull was shot near our camp while we were there, and one of our party fired at one but did not bring him down. Deer were very plentiful. We brought out a large 10-point buck which dressed 211 pounds. Canada jays were numerous, and so were pileated and northern hairy woodpeckers. J. MERTON SWAIN.

WHITEFIELD, N. H., Nov. 14.—*Editor Forest and Stream:* I have been in the woods a greater part of the time for many years, and there has been no autumn that I have not heard partridges drum. During the present autumn I heard them nearly every sunny day during September and October. I have always found it to be the old bird, but perhaps the young one may drum; but I cannot call to mind a case of seeing one. As to the wings striking the body, I will state the facts as I have seen them many times by watching the bird. I have seen drumming birds from all points—front, side, and rear—and they all seem to be in the same position and to perform the same movements.

The partridge selects a large log, though I have seen him choose a rock; and after finding one to his liking, generally occupies it day after day, though I have known of them shifting their location a number of times in a single hour, contrary to the general rule.

In the act of drumming, a partridge stands nearly if not quite erect, with his wings at right angles to his body, the first movements being quite slow, but the last so fast that the motion of the wings cannot be followed with the eye; but at no time do the wings come in contact with the log, and by being extended it is impossible for them to hit his body; neither can they come in contact with each other, unless it be the extreme tips; therefore the drumming must be caused by the motion of the wings through the air. W. H. YOUNG.

EAST MONTPELIER, VT., Nov. 17.—*Editor Forest and Stream:* While the talk is on about the habits and drumming of partridges or grouse, I will fold my vote and hand it in. Men are not plenty who ever saw a partridge drumming near enough and with clear light to tell exactly how their wings went to produce the drumming sound. Many years ago, when a boy, I was fishing for brook trout; not with rod and reel, but with a pole cut on the bank of the brook and thrown away when the crotched limb to carry the trout was full. The brook in which I was fishing run over stones and rocks through a deep gully or ravine, with a dense growth of spruce and hemlock up the sides. All of a sudden I heard the drum of a partridge wonderfully near. Instantly I forgot fishing. No still-hunter for big game ever approached more stealthily than I did that partridge. Stepping lightly on the stones in the brook so as not to snap a twig, and moving slowly, I gained little by little, when bang! another drum, and so near I dropped on my hands and feet and crept forward with renewed caution, occasionally rising enough to peek over the bank through the undergrowth, when whack! whack! whack! buzz! another drumming. This time I located the bird exactly, only I could not see him distinctly. I moved a little under the bank and risked an eye over; saw enough to know that if I could move a foot or so more it would bring him between me and a clear space through the tree tops at the top ridge. This done, I waited for the supreme moment

for drumming, with my heart beating so loud it seemed to me the bird must hear it. Well, at last he raised himself on his toes, with wings extended and brought together over his back, with a spring or spasmodic snap just before the backs or butts touch, giving the whack or drum beat. This was done slowly three or four times, and then running into a rapid succession of strokes like the roll of the tenor drum, or nearly indescribable. Many times since I have seen the domestic cock, just before crowing, beat his wings together over his back three or four times in the same manner as this partridge; but instead of giving the rapid beats for a final, he would crow. Partridges drum in the fall, but with nothing like the frequency or regularity of spring. GEO. DAVIS.

HOUQUAM, Wash., Nov. 2.—*Editor Forest and Stream:* Ruffed grouse do drum in the fall, as I have had ample chance to observe in over forty years of my life that I have lived in or near the woods. As to whether both old and young drum, I never had that phase of the subject presented to me before, much to my regret, for I have had ample opportunity to learn the facts in the case, and if a chance should again occur I will try to improve it.

Further, when he (for it is only the male that drums) drums, he strikes in front, his wings not touching the log on which he stands. I have watched one drum for the space of an hour, when there had been a flurry of snow—as often happens in some sections of the country inhabited by grouse—and his wings left no marks in the snow, which they would have done if he had struck the log. This observation was made to prove whether or no an article that I had read in a newspaper was correct. The article stated that the bird struck the log on which he stood, and that it was invariably a hollow one, and that the sound produced was on the principle of the drum. What first started me to doubt the correctness of the statement was that I never had known a bird to select a hollow log for that use.

About his striking his breast, the motion is so quick that it is difficult to decide whether he beats his breast or strikes his wings together in front of him. Some of my observations were made in New York State, others in Minnesota, Wisconsin, and Michigan; the one where the snow was on the log was in the latter State. The snow had fallen the night before, and there were no other tracks in it except those made by the bird that I saw drum, so there was no chance for me to be misled about it. W. A. LINKLETTER.

BUFFALO, N. Y., Nov. 17.—*Editor Forest and Stream:* In your issue of November 12, R. D. quotes Audubon and Mr. John Black quotes Nuttall as authority that a drumming grouse does strike his sides with his wings.

The Old Angler says that they do not, and I will quote an authority to bear him out. I see by L. F. Brown's article on sleeping ducks in the issue of November 19 that he says Mr. Elliott "is the present real authority on our wildfowl," and he ought to be just as trustworthy in his observations of grouse. In "Game Birds of North America," Mr. Elliott says: "The male grouse drums at all times in the year: in the spring as a defiance to his rivals or as a call to the hens to come and admire him as he struts in magnificent form upon his chosen log; and in summer and autumn, or even winter, as an indication of his lusty vigor and general satisfaction with himself. The sound heard on these occasions is like a deep muffled roll of a drum, even likened by some persons to low thunder, and has a great ventriloquial power. It is produced solely by the wings, and these are not permitted to touch the body * * * suddenly he throws his body forward and stretches out his neck and commences to beat the air with his wings, but does not touch his flanks."

Now, I think that Mr. Elliott's opinion on a question of this kind is of more value than that of Audubon, for the reason that this is a question which has been much discussed during the past fifty years, and Mr. Elliott must be very sure of his position, as he mentions the fact twice that the grouse does not strike his body with the wings. On the other hand, I should suppose that Mr. Audubon probably settled this for himself without much stress being laid on the point as to whether the wings really did come in contact with the flanks or not. DIXMONT.

The Government's Importation of Camels.

From the Twentieth Annual Report of the Bureau of Animal Industry.

BY CHARLES C. CARROLL, A.M.

No experiments were made to ascertain how long the camels could go without water, and the information gained by the investigations of the expedition show that the tales on this subject are largely fables. The camel needs water each day, and gets along best when so supplied. He has a set of several stomachs, in one at least of which are cells where water is stored to the extent of about a gallon and a half, and this can be drawn upon when the animal does not get his daily supply. Habituated to traveling across the deserts, he has through centuries developed the power of going from five to eight days without a drink, and nature has assisted him by giving him a skin so constructed that he perspires very scantily. But there is nothing in his supposed habit of drinking vast quantities of water and concealing it about his body for use in emergencies. His hump does, indeed, supply him with nourishment when at work where food is scarce, this being very well shown by the fact that during a long, hard trip this unsightly protuberance gradually decreases in size, so that it is necessary to change the length of the packing thongs accordingly, until at the end of the trip the hump has almost entirely disappeared. The substance of the hump is pure fat. After a course of high living without work, the hump so increases in size that it is awkward to place a saddle on the animal. It is said to be customary then to slit the skin, lay it back, and cut off slices of fat. This fat has somewhat the appearance of thick cream and was said to be much esteemed by the Arabs, who use it in tea and coffee, but our investigators had no opportunity of testing it.

The strict regulation against wetting the camel deck was necessary, because the camel can travel over any

kind of surface except one that is slippery. In Asia Minor, Syria, Persia, North Hindoostan, and Tartary he travels loaded across valleys and mountain ranges and desert alike, exhibiting no hesitancy except when he encounters ice or mud. Here he loses control of himself, spreads his legs wide apart, and if not helped generally ends by the dislocation of shoulders or hips or by literally splitting himself up, an injury which is always fatal.

Six Arabs, one of them a Bedouin of the desert, were engaged to go along with the ship, with the idea that they would be useful in caring for the animals, but they proved helpless in bad weather, and their services were unnecessary in good weather. A Turk was also employed because he represented himself to be a "camel M.D.," perfectly familiar with the management of camels, their disease and treatment. This gentleman turned out to be an Oriental Sangrado. His cure for a cold was a piece of cheese; for swelled legs, tea mixed with gun powder; and for some further trifling complaint he gravely proposed to tickle the animal's nose with a chamoleon's tail. He was soon set aside by the common sense of Lieutenant Porter. In giving birth, one of the camels died, this being attributed to an injury received in loading. Two young ones, born soon after leaving Smyrna, were so much treated by the camel doctor that they also died; four others born during the voyage were kept out of his hands and would have come on very well, but one was starved because the mother could not be induced to rise and suckle it during a ten days' storm; another was accidentally lain on by an old camel and crushed. The other two were successfully reared, and, having the run of the camel deck, amused the whole ship by their friskiness and precocity; they were thoroughly at home in the worst of weather, perfectly steady on their legs, going about the deck without falling during gales that forced even the sailors to hold on to some support. Such remarkable seamanship was attributed to the fact that they were born at sea.

The show animals of the lot were two handsome dromedaries—one a Nomanieh from Oman, the other a Sennai from Nubia. Of all dromedaries the swiftest and most enduring in the Nomanieh, as it is also the best for riding, its natural gait being a movement of the hind leg and foreleg on opposite sides at the same time, or a movement of each leg in rapid succession. This gait must be taught to other breeds, as they naturally move in a rough trot. A good Nomanieh can travel from 90 to 100 miles a day, but cannot keep such traveling up day after day. From fifteen to twenty days he can keep up a gait of 50 to 60 miles a day. Many stories are, of course, related of feats of endurance and speed, but these are to be taken with allowance. Our explorers found that the mail was regularly carried between Cairo and Suez on a camel. The distance is eighty-four miles and was covered in eighteen hours. The burden camel usually carries from 250 to 400 pounds, and travels regularly from 20 to 30 miles a day.

In the cargo were four Pehlevans—camels which had been taught to wrestle, a sport which is common in the East. It seems that without any training at all the animals engage in contests which are a sort of wrestling bouts. Whenever two males meet for the first time, especially if there are any females about, an encounter of this kind is indulged in. The camel that is thrown to the ground acknowledges his inferiority by scarcely daring thenceforth to look at the females. This natural propensity is cultivated by the Arabs and Turks, and the young camel is taught to wrestle, with some degree of science, by hoisting the right foreleg over the neck of his antagonist and coming down upon him with all the weight of the body. One of the Arabs employed by Major Wayne amused himself on the voyage by training "Uncle Sam," a month-old camel, to wrestle, a pastime at which he soon became so proficient and which he liked so well that it was found necessary to tie him up, as he developed the trick of making sudden rushes at the men and throwing them to the deck.

It was in the midst of the rutting season when the animals were taken on board at Smyrna. At this period both sexes are cross and disposed to kick and bite. "The camel's kick is soft," says the Arab proverb, "but it takes life away;" its bite is not less terrible, as its heavy jaws and the leverage of its long neck enable it to pull and tear with great force. The females were exposed to the males constantly at this period with the purpose of securing as many young as possible at the earliest time. Except at this season, the camels were found, as a rule, docile and well behaved. The animal's patience is sometimes strained beyond endurance by the brutality of its drivers; at such times it displays some cunning in waiting until the man is well within its power, when it takes summary vengeance. It appears to believe, however, with the American Constitution, that no man should be put in jeopardy twice for the same offense; and the driver who has mistreated a camel will place some part of his clothing where the beast will find it; and, after trampling and tearing the offender's coat, the camel is well satisfied and harbors no further grudge. When it does become necessary to discipline the beast, our experimenters were cautioned that the punishment must be severe; they were instructed to take a heavy club flattened at the end and with this to strike the animal with great force on the left side of the neck and six inches back of the jaw and to keep up the beating until the refractory animal rolled on the ground in sign of submission.

Mr. Albert Ray, the keeper of the camels, who performed his work with sagacity and zeal, does not appear to have made any warm friendship among the animals, although they were individually named and kept track of in his journal, in the picturesque nomenclature of the Orient, as Gournal, Adela, Mahomet, Massandra, Ibrim, Ayesha, and so on. Such friendships are common enough, however, among the Arabs, as the camel, when well treated, is inclined to become attached to his master, though perhaps to a lesser degree than the dog or horse.

By his intelligent and energetic care, Lieutenant Porter thus kept his charges in excellent health, and landed safely at Indianola, Tex., May 14, 1856, thirty-four camels (a gain of one on the voyage), all ap-

parently in really better condition than when taken from the sandy wastes of their native deserts.

After some days of rest the herd was marched by easy stages to San Antonio, Tex., about 120 miles, where Major Wayne set about making arrangements to establish a camel ranch and to attempt the breeding of the animals. His plans were interfered with by Secretary Davis, whose idea was to find out first whether or not the animals, in the language of his instructions, "were adapted to military service, and could be economically and usefully employed therein," although he directed that they be given ample time to recover from their long voyage.

Some experimentation along this line was at once attempted. Major Wayne reported that, having removed his camp to Green Valley, 600 miles from San Antonio, he one day sent three 6-mule teams, with a wagon to each team, and six camels to San Antonio for a supply of oats. In going the camels were held back to accommodate themselves to the slower pace of the mules. Returning, the camels carried 3,648 pounds of oats, while the wagons brought 1,800 pounds each. Thus 3 camels were equal to 6 mules and a wagon, and, in addition, the camels came to camp in two and one-half days, while the mules were nearly five days in performing the journey.

One day at Indianola Major Wayne, who had been greatly annoyed by the skeptical attitude assumed by many persons throughout the country, and particularly by the jests of the unbelievers in the Texan town, thought to teach these latter a lesson. He brought up one of his finest pets, and, having caused it to kneel, ordered 2 bales of hay, weighing 314 pounds each, placed upon it. The knowing by-standers were convinced that the animal could not rise with such a load, but they laughed in scorn when the Major ordered 2 more bales piled on, making an aggregate weight of 1,256 pounds. To the amazement of all, and to the utter confusion of the scoffers, the camel, at the word of command, easily rose and walked off with his burden. This signal victory for the camel partisans created no little talk, and the incident was chronicled in verse by a local Texas poet, though unhappily, says Major Wayne, when he made his report, "I have not at hand a copy of the paper in which the ode was published," and it thus failed of official immortality.

"On another occasion," to use the language of Secretary Davis in his annual report of December, 1856, "the capacity of the camel for traveling over steep acclivities and on muddy roads was tested with the most satisfactory result. Instead of making the détour rendered necessary by the location of the road to avoid a rugged mountain impracticable for wagons, the camels followed a trail which passed directly over it and, a heavy rain occurring while they were at the depot to which they had been sent for supplies, the road was rendered so muddy that it was considered impassable for loaded wagons. The train of camels were nevertheless loaded with an average of 323 pounds each and returned to their encampment, a distance of 60 miles, in two days, suffering, as it is reported, no interruption or unusual fatigue from the mud over which they had passed or the torrents of rain which fell upon them. These tests fully realize the anticipations entertained of their usefulness in the transportation of military supplies. The experiment of introducing them into the climate of the United States has been confined to the southern frontier of Texas. Thus far the result is as favorable as the most sanguine could have hoped * * * The very intelligent officer who was sent abroad to procure them, and who has remained in charge of them, expresses entire confidence both of their great value for the purpose of transportation and their adaptation to the climate of a large portion of the United States."

It should be noted that, in addition to this favorable opinion expressed by Major Wayne, that "intelligent officer," in his letters to the Department, placed especial stress on the comparison in usefulness between the camel and the mule, claiming superiority for the former and pointing out that the camel required less food and no more attention than the mule.

Something over \$20,000 of the sum appropriated by Congress was yet unexpended, and in June Lieutenant Porter was furnished with \$10,000 of this and directed to fetch home on the Supply another shipload of camels. The storeship then lay at New York, and, as food for the return trip, she took on board 150 bales (about 20 tons) of hay, 6,000 gallons of oats, 10 barrels of beans, 500 gallons of barley, 50 pounds of powdered sulphur, and 50 pounds of lard. The Department commissioned Mr. Heap at \$2,000 a year and expenses and sent him on ahead directly to Smyrna, where, by the time that Porter arrived in November, he had collected from the interior a shipment of fine young animals. The Sultan of Turkey, through our minister at Constantinople, presented 6 dromedaries, which were included in this shipment. On the whole, this shipload was a much finer lot than those procured on the first trip. At Smyrna Lieutenant Porter employed nine men and a boy at \$15 a month each and brought them along to help care for the animals. The Government continued to employ some of these men, together with some of those who were brought over on the first trip, for many years at \$10 to \$15 a month. One of them at least, Hiogo Alli, remained in the service as camel driver, interpreter, or mail carrier until 1870, when, on being discharged, he filed a claim for further employment on the ground that such was due him under the contract made in 1856.

Lieutenant Porter sailed for home November 14, and, although meeting the roughest weather he had ever encountered, he lost but 3 camels on a voyage of eighty-eight days, and was able to turn over to Major Wayne, at Indianola, February 10, 1857, 41 animals, all in fine condition. The new animals were taken to Camp Verde, which was now officially designated the camel station. Up to this time Wayne had lost 5 of his first herd—2 by Spanish fever (a disease incident to acclimation), 1 by epilepsy, 1 from the bite of a particularly ferocious companion, and one from blows probably inflicted by a mule driver who did not take kindly to the foreign beasts. The second shipload thus raised the camel herd to 70 in number.

In February, 1857, the Senate directed the Secretary of War to furnish it with a report regarding his camel experiment. This report was submitted the same month, and is a well-written and comprehensive document comprising the letters of Lieutenant Porter and Major Wayne, together with the information they had obtained and the conclusions they had drawn.

About this time the administration of President Buchanan came in and with it John B. Floyd as Secretary of War. Major Wayne, who had thus far conducted the camel experiment so vigorously and efficiently, was now transferred to the office of the Quartermaster-General at Washington, and could not, of course, give his personal attention longer to the Government camels, though he continued his interest in them, and was honored with a first-class medal from the Société impériale zoologique d'acclimation of Paris, for his successful introduction and acclimatization of camels into this country.

During the summer of 1857 the camels were used sparingly in carrying the supplies and in short scouts. In the fall of that year Lieut. Edward Fitzgerald Beale, afterwards a brigadier-general, and also minister to Austria under President Grant, was employed to open a wagon road from Fort Defiance, N. Mex., to the eastern frontiers of California, and a part of the herd of camels were put at his disposal for this expedition. The journey occupied forty-eight days through an unexplored wilderness of forest and plain and desert, the Colorado River being reached October 18. Lieutenant Beale speaks in the most enthusiastic terms of the work performed by the camels on this arduous trip. He says that they saved the members of the expedition from many hardships, and excited the admiration of the whole party by their ability and willingness to perform the tasks set them. He started with the determination that the experiment should be most thorough, and subjected the camels to trials "which no other animals could possibly have endured." On the desert they carried the water for the mules; traversed stretches of country covered with the sharpest volcanic rock without injury to their feet; climbed with heavy packs over mountains where the unloaded mules found it difficult to go even with the assistance of the dismounted riders; and, to the surprise of all the party, plunged into rivers without hesitation and swam them with ease. The lieutenant concludes that he would rather have one of the camels for such work than four of the best of his mules. One of the men who had charge of the camels on this trip, writing home to the Richmond (Va.) Examiner, paints the same rosy picture of their entire docility and utility.

This and other favorable reports induced Secretary Floyd in his annual report in December, 1858, to make some interesting comments. "The entire adaptation of camels," he says, "to military operations on the plains may now be taken as demonstrated." The beast, to his mind, had already proved its "great usefulness and superiority over the horse for all movements upon the plains or desert," it would be of great value against the marauding Indians, and would materially reduce the expenses of the quartermaster's department in furnishing transportation. He recommended that Congress at once "authorize the purchase of 1,000 camels." So far was Congress from authorizing such a wholesale purchase, however, that it did not appropriate a cent, and a year afterwards, in December, 1859, the favorable reports continuing, the Secretary renewed his recommendation:

The experiments thus far made—and they are pretty full—demonstrate that camels constitute a most useful and economic means of transportation for men and supplies through the great desert and barren portions of our interior. * * * An abundant supply of these animals would enable our Army to give greater and prompter protection to our frontiers and to all our inter-oceanic routes than three times their cost expended in any other way. As a measure of economy I can not too strongly recommend the purchase of a full supply to the consideration of Congress.

But that body could not, as so often happens, see the matter in the same light as the Secretary, and did nothing towards loosening the purse strings for this purpose. By December, 1860, the Secretary was still further confirmed in his opinion of the good work of the camels, and reiterated his recommendations of the two preceding years.

Secretary Floyd probably based his belief and recommendations largely upon the reports of Lieutenant Beale, for, after the successful trip of that officer from Texas to California to open a wagon road through the wilderness, the secretary had placed twenty of the camels in his hands to be employed by him in national explorations. These expeditions were made over a large part of the Southwest, more particularly in the Rocky Mountains, and extended over a period of four years. During this time the animals rendered efficient service and were so well cared for by Lieutenant Beale that in 1861, with the incoming of a new administration and a new Secretary of War, he turned over to the Government quartermaster in California a herd of 28, all in good condition. For the next two years these 28, with several others that had been brought on from Texas, were held at the various forts and military stations in California, no one of the officers in charge appearing to be able to find any work for them to do. In 1862 Lieutenant Beale wrote to Secretary Stanton describing the idle and unfavorable conditions under which the animals were then kept, stating that instead of any natural increase since he had returned them, 3 of the finest had died, and proposing to take all of the remainder, give bond for their safe return at any time demanded, and to use them in further exploration and in packing supplies across the great basin. At this time, he states, they were "of no earthly use either to the Government or any one else," and the expense of their maintenance was about \$500 a month. This proposition was rejected, and a year later a plan was set on foot by Deputy Quartermaster E. B. Babbitt, stationed at San Francisco, to employ the camels in carrying the mail between Fort Mohave, N. Mex., and New San Pedro (Wilmington), Cal. Objection was made to this plan by both Lieut. D. J. Williamson, commanding at the former place, and Capt. William G. Morris, at the latter, their reasons being based on statements entirely the reverse of those officially made by Major Wayne and Lieutenant Beale.

[TO BE CONCLUDED.]

Monarch, the Big Bear.

Editor Forest and Stream:

It seems to have been fully demonstrated that Mr. Seton's last book was nearly all taken from Mr. Allen Kelly's "Bears I Have Met, and Others," and without Mr. Kelly's knowledge or consent. Also that this "book" of Mr. Seton's is practically only what Mr. Kelly, by Mr. Seton's urgent request, had saturated Mr. Seton with in the parlor of a Los Angeles hotel, after Mr. Seton had "hunted him up," and not, as Mr. Seton alleges in the preface of his "book," told to him in wildernesses by wild savages, and in "tongue unknown to script."

Yet this kind of authorship was soberly defended here last week by Mr. R. T. Morris, as being the privilege of "genius that transmutes lead into gold." The Doctor should not have asserted this before reading Mr. Kelly's book, and despite his denial, is intended as "a reflection on Mr. Kelly's writing." They compare favorably with the work of the appropriating "genius." They are not lead, to be "transmuted," but are already "gold."

It seems to depend on whose ox is gored. How quickly Mr. Kelly would have been confronted with a claim and suit for damages, and an injunction, if one of Mr. Seton's books had been so "appropriated" by Mr. Kelly. Mr. Kelly's years of actual experience and very exceptionally complete knowledge, and his vivid, charming selection and style, as well as his money expenses and copyright of his book, are not Mr. Seton's to "transmute," be they lead or gold. Yet Dr. Morris compares them to the trivial taking of a canoe paddle by an Indian, and which it would be "a breach of etiquette" to claim; to playful fence jumping and pasture breaking by a neighbor's horses, and to the water, to which Mr. Seton is "welcome," that runs from the Doctor's land into Mr. Seton's land at Stamford, Conn.

This is special pleading. Suppose that the Doctor should wake up some fine morning and find that all his trout and all the partridges on that beautiful country estate, had been "appropriated" and exposed for sale by Mr. Seton in the New York and other markets. Suppose that, not content with this, Mr. Seton had, during the night, spirited away all the woods, waters, land and houses constituting the Doctor's country place, and had set them up elsewhere as an owned addition to Mr. Seton's estate; and that when the Doctor remonstrated, his own words, used here last week, should be quoted to him as follows: "We do not always consider how much benefit may result from having things taken from us." Certainly not! But how long does the Doctor think a court and jury would listen to such spohistry by Mr. Seton's attorney?

Courtesy and goodwill between sportsmen and neighbors is one thing. To seek and secure substantial rewards in reputation and money royalties, by taking admirable property painfully accumulated by another, is something very different.

L. F. B.

Wants to Join the Party.

ST. LOUIS, Nov. 19.—*Editor Forest and Stream:* I have just finished perusing Mr. Brown's "Sleeping Ducks" article. I never like to push in the door, but I have a feeling away down that I would like to join in on that trip with Mr. Ackert, and, were it possible, would like to see Coahoma made a welcome party thereto. It's a moot question between Mr. Brown and Mr. Ackert as to whether (dusky) mallards sleep all together and at one and the same time. Now, if Coahoma still insists that ducks can't smell, we, too, could join in the hunt, armed only with a can (hermetically sealed) of imported Limburger, the same to be opened up before those present when it is blowing a stiff gale toward the ducks.

I feel like the alderman we once had in St. Paul who accentuated each statement made by remarking, "And I can prove it, Mr. President." The habit of proof was so strong upon him that one day when in a leaky boat fishing he was so intent upon his sport that he did not notice that the boat was rapidly filling through the many fissures in its sides. When he discovered the situation, bailing was out of the question, it being only a matter of a few seconds before the gunwales and water met. "Pat," he yelled out to his friend, "this boat is sinking, and I can prove it," and suiting the action to the word, he jumped free of the boat and floundered through mud and water to terra firma.

That's the way I feel about the question of ducks smelling. They can smell and I can prove it.

CHARLES CRISTADORO.

Sleeping Ducks on Hudson Ice.

JERSEY CITY, Nov. 7.—*Editor Forest and Stream:* In his reply to L. F. Brown, in FOREST AND STREAM of Nov. 5, James Ackert, Jr., writes of killing black ducks on ice floes in the Hudson River in March; he also invites Mr. Brown to come up and be convinced in March next.

As I understand the New York game laws, it is illegal to kill ducks at that time of year, and if Mr. Ackert kills them at that time of year, as I am led to believe by his article, one thing is certain, whether ducks sleep or not, and that is there must be a game warden along the Hudson somewhere who needs waking up.

OTTO KEIM.

Canadian Camp-Fire Club.

At the annual dinner of the Canadian Camp-Fire Club, in New York on Wednesday evening of last week, the *pièce de résistance* was roast Adirondack black bear, sent to the club with the compliments of Grover Cleveland. Dr. William J. Long was the toastmaster, and the speakers and their topics were: Professor George Willis Creelman, "The Winnebago and the Mississoga;" William M. Fuller, "Backwoods Life;" L. O. Armstrong, "A Woman's Canoe Trip in Canada;" Alvah D. James, "On the Amazon;" Dr. Robert T. Morris, "Grubbing for Rations."

GAMIE BAG AND GUN

Marksmanship.

Editor Forest and Stream:

Among the numerous interesting letters which have appeared in your paper lately upon the subjects of barking squirrels and snuffing candles with the old backwoods flintlock rifles, that of your correspondent J. W. Shurter, in *FOREST AND STREAM* of August 13, appears to me to be of the greatest value, because it gives reliable details of the degree of accuracy actually obtained with those weapons. There is, as Mr. Shurter says, no doubt but that, when sending specimens of the rifles and the targets made by them to the Emperor Napoleon, the best work of the best marksmen would be selected. The targets—10 bullets in a square of 4 by 4½ inches at 75 yards, and 10 in a 6-inch square at 125 yards, were really good for round balls of moderate size fired from rifles with the open hunting sights then in common use; but they are also quite sufficient to dispose of the myths about the marvelous accuracy of the old weapons related by various writers of histories and novels.

With regard to barking squirrels, if a bullet weighing 50 to the pound, which is stated to have been the size used by Boone, passed through the bark close behind the elbows of a squirrel lying flat on a branch, I believe he would be killed almost invariably; because he would receive a great shock produced by a sudden blow upon the network of nerves called the solar plexus. Audubon also was so careful and truthful a writer that it is difficult to doubt any statement made by him, even if some well-known riflemen have tried to kill squirrels by barking them and have frequently failed. Possibly their bullets were not of sufficient diameter and did not strike the exact spot necessary for giving the shock. A deviation of half an inch would make a great difference. Is it, however, quite certain that Audubon really wrote the account so often quoted? I read in an American paper twelve years ago that the whole narrative appeared in "Hilliard's First Class Reader," published in 1859.*

I first became interested about rifles through reading, more than fifty years ago, the accounts of writers like Fenimore Cooper and Mayne Reid; and for years I really believed that the marvelous accuracy described could be obtained from backwoods rifles owing to their thick and heavy barrels diminishing recoil and vibration. But when I saw these rifles in the hands of hunters with whom I lived in the Adirondack Mountains and in Canada, I was disappointed at finding that, although they shot well enough for killing game, there was nothing in their accuracy which I had not seen equalled by British rifles of lighter weight and much larger bore. Other men who have had far more experience than myself with hunters in various parts of America, appear to have been equally unsuccessful. They describe the marksmanship as good, but almost invariably at short distances. In 1839 the Hon. C. A. Murray traveled in the States, hunting deer in the Alleghany Mountains and buffalo on the prairies. In his journal, when writing about the Alleghany, he says: "We killed a good number of deer, and sometimes amused ourselves shooting at a mark for small wagers. On these latter occasions I witnessed the skill of most of the professional hunters in the district. At a short distance—from twenty-five to thirty yards—they shot with much precision, but although their rifles are so long and heavy in metal, their performance at 150 yards was very inferior to that of many sportsmen whom I could name in Britain." In 1847 an Irish gentleman named John Palliser, traveled through Louisiana, Arkansas, and Missouri, spending a winter near the Ozark Mountains at Fort Union, then a depot of the American Fur Company. He was acquainted with many of the hunters and trappers, and engaged one of the most celebrated of them named Boucherville as guide and companion, of whom he writes in the highest terms. Palliser killed buffalo, grizzly bears, wapiti, and other game, large and small, but does not even hint at any extraordinary short or long range shooting on the part of the trappers. Boucherville, whenever time allowed, made a rest for his heavy rifle by driving his ramrod and wiping rod into the ground crosswise. The best marksmen mentioned was a Mr. Denig, physician at the fort, who often shot prairie fowl in the neck at 50 yards or more, which was certainly splendid work.

In 1846 Mr. G. F. Ruxton, an officer who had retired from the British army, traveled through Mexico to the Rocky Mountains, where he spent a winter, and returned across the prairies to St. Louis in the following summer. He was acquainted with numerous trappers and hunters, with whom he was often engaged in the pursuit of game. He describes the trappers as fine shots; but neither in his journal nor in a novel called "Life in the Far West," where some of the most noted among them are introduced, does he mention one shot at game or man which could not fairly have been expected from a well-made English rifle of far less weight than those of the trappers, which were very heavy and carried balls about 32 to the pound. His own rifle was double-barreled and fired balls 25 to the pound.

Murray, Palliser and Ruxton were all ardent hunters, and it is incredible that they would not have used the long, heavy rifles of the trappers and hunters and recommended them to their own countrymen if they had found them practically superior to those they had brought from England.

About, I think, the year 1850, the American and British Governments appointed a commission to settle the boundary line of Oregon. It was accompanied by John Keast Lord as naturalist, and he lived in that then unsettled part of America for three years, along with the hunters who supplied the commission with food. They were liable

to be engaged in fighting the Indians, and Lord himself formed one of a party which rescued some white women who had been captured. It may therefore be supposed that the rifles were of the best quality and kept in good order; yet Mr. Lord, in his book "At Home in the Wilderness," states that he never saw the long, heavy rifles of the hunters shoot with any extraordinary accuracy; that the men using them missed as often as other people, and that the sole advantage he could discover in them was economy of ammunition, owing to their small bore.

I spent much more money than I could well afford in purchasing American rifles, both muzzle and breechloading, and experimented for many years before finally coming to the conclusion that rifles are not made which will do such work as is ascribed to the old backwoods weapons. Fenimore Cooper, when describing some off-hand rifle shooting at 100 yards in the "Pathfinder," makes his hero say, "I can see the head of the nail, and what I see I can hit." In reality the most accurate rifles of the present day when fired from a rest with globe and aperture sights, will often miss a mark the size of a nail-head, and are doing very fine work if they put several successive shots on an inch bullseye at 100 yards. In *FOREST AND STREAM* of September 10, Mr. Perry D. Frazer clearly proves the impossibility of driving a nail, except by chance, at far shorter distances than 100 yards.

It is certain that the principle of thickness and weight in barrels is right; but it was carried to excess in the old rifles. In 1864 I examined two of these in the shop of a rifle-maker named Booth in the city of Ottawa. They had flintlocks and weighed 12 to 14 pounds each. When the butts rested on the ground the muzzles were level with my eyebrows, so that the barrels were four feet or more in length. And all this for firing round balls of about 100 to the pound.

Much stress has been laid by some writers on the argument that the distance between the fore and hind sights on the old rifles gave greatly increased accuracy of aim; but against this must be put the extra difficulty of truly boring and rifling such long barrels with the tools in use 140 years ago, owing to the spring of the rod which held the steel borer and cutter. The argument as to accuracy of aim would apply equally to rifles with aperture sights on the stocks; and yet, since these came into general use within the last sixty years, we find that the most celebrated target shots in America have seldom had barrels more than 32 to 34 inches in length. In Britain a barrel of 34 inches is almost unknown.

About 1848, a gentleman named Chapman, in New York, wrote a very interesting and instructive book on "The Improved American Rifle." I lent my copy many years ago to a man who never returned it, but, to the best of my recollection, Chapman stated that the most accurate of the rifles with round balls did not put them into less than a 10-inch ring at forty rods. Certain it is that some of the finest target work has often been accomplished with short barrels. Early in the sixties Mr. H. W. S. Cleveland, author of a work upon American rifles dated 1864, which I still possess, won a match with a .40 caliber Maynard rifle having a barrel only twenty inches long, against the members of a rifle club using the old-fashioned muzzleloaders with very heavy barrels. The distance was 220 yards, and all Mr. Cleveland's shots were in the right half of an 8-inch bullseye—in about a 4-inch ring.

General Jacob, of the Indian Army, tried numerous experiments with rifles of various patterns during a period of 25 years, and at ranges up to 2,000 yards. He finally found that with rifles of a weight that could be carried without too much fatigue—that is, from nine to ten pounds—he obtained the greatest regular accuracy with barrels 24 inches long, as that allowed of their being made sufficiently thick to prevent injurious vibration and jump. There must be many of the old rifles with barrels four feet and upward in length still existing, and if some of them had their grooves cleared out with rifling machines so as to cut away the rust and leave them as perfect as when new, a test of their accuracy and trajectory with round balls would be deeply interesting and worthy of record in rifle literature. But the test should be a fair one; that is to say, the balls should fit only with such a degree of tightness that they could be pushed into the muzzle by a steady pressure of the ramrod; for anything tighter than that would be impractical for either man or hunting purposes.

In *FOREST AND STREAM* of September 17, 1885, there was an account of a trial at 100 yards of a .42 caliber muzzleloader by Romer with balls weighing 130 grains and the same weight of Hazard FG powder. Great accuracy, combined with a very flat trajectory up to 125 yards, was the result. But a ball which, with a linen patch, can be forced with a fair degree of quickness into the grooves of a .42 gauge rifle weighs about 112 grains, or 63 to the pound. The ball actually used weighed rather more than one of 54 to the pound, and was a proper fit for a .44 gauge muzzleloader. It must therefore have required driving into the grooves with a mallet or some instrument to which considerable pressure could be applied. A delay of that kind in loading would often cause loss of life when skirmishing with Indians, or loss of the game when hunting.

In 1887 I tried a series of experiments with a .35 caliber Maynard rifle, loading it with round balls at the muzzle and using lubricated cloth wads next the powder, with patches of unbleached linen; the balls weighed 63 grains, or about 111 to the pound, and fitted so tightly that I had to drive them into the muzzle with blows of the hand upon a piece of wood hollowed so as not to deform the balls. The rifle weighed 8 pounds 3 ounces, had a 26-inch barrel, and the grooves had one turn in 32 inches. The fore sight was of white metal with a broad, flat top, and the rear sight a very open notch. I used Curtis &

Harvey's No. 6 powder, gradually increasing the charge from 30 grains to 82 before there was any sign of stripping. With 78 grains the balls could be kept in about a 3-inch ring at 100 yards in calm, clear weather. The only rest procurable was the seat of a chair which I used while sitting on the ground, so it seems probable that the rifle might have proved as accurate as the Romer .42 caliber if fired, like that, with aperture sights and from a machine rest. When, however, I used thinner patches so that the balls could be forced into the grooves as quickly as is necessary in hunting, there were at once evidences of stripping, so that the shooting could not be depended upon beyond very short ranges.

After all, it is certain that powder charges equal to the bullet in weight could have been used by the old hunters in only exceptional instances. Their rifles usually carried balls between 40 and 60 to the pound; sometimes 32 to the pound, especially on the prairies or mountains. If we take a ball of 45 to the pound, a powder charge of equal weight would be more than 5½ drams. Men living remote from towns where ammunition was scarce, or those who lived for months in camp, could not have afforded such charges, and they would have been unnecessary, because less than half the quantity would have been amply sufficient for killing deer, bear or man at the ranges ordinarily found in the brush. I have tried the effect of a round ball of 48 to the pound from a .45 caliber carbine with 2 drams of powder. It had a trajectory quite flat enough for practical work, and drove a plug of flesh through both shoulders of a deer, killing it almost on the spot. I therefore think that a charge exceeding one-third the weight of lead was seldom used in the old rifles because it would have been unnecessary and wasteful. With that charge they were far superior in trajectory to the British rifles made for spherical balls during the first half of the nineteenth century. The recognized best charge for muzzleloading shotguns was equal measures of powder and shot. British gunmakers having had little experience of rifles, began, and for many years continued, to make them for the same proportions of powder to lead; so the general rule was to load each rifle with its own bullet mold full of strong powder. This gave 1½ drams for a 16-bore, 2 drams for a 12-bore and 2½ drams for a 10-bore. The grooves were usually made with so rapid a twist that these charges could not be exceeded without a risk of the bullets stripping. The trajectories were therefore high, but the accuracy at known ranges was, I believe, fully equal to that of the heavy American rifles. The late Horatio Ross, who was one of the best shots at game or target in the British Islands, describes in a book on deer stalking a trial he made of a double rifle by Purdey, the marks being chalk disks exactly the size of the bullet patches at 100 yards. He fired twelve shots from right to left barrels alternately, and broke eleven disks. The patch, which fitted an ounce round ball, was only 1½ inches in diameter. This trial occurred as long ago as 1833, and shows the care with which rifles were made seventy years ago. Mr. Ross believed that the accuracy of the old spherical ball rifles had never been equalled by those of the time when he wrote this, in 1880, at sporting ranges. The want of power, owing to the small powder charges, forced British sportsmen, when hunting dangerous animals, to use rifles of much larger caliber than would otherwise have been necessary. And, similarly, when American hunters had reduced the bore of their rifles in order to economize ammunition they were obliged to increase the proportion of powder in order to make their small bullets effective. When the rifles had a turn in the grooves sufficiently slow to allow the use of a large charge without the balls stripping, they gave a combination of accuracy with flat trajectory far superior to that of the British rifles. Captain Forsyth, of the Indian Army (who was Conservator of Forests in Central India), recognizing this fact, effected a great improvement in English rifles by reducing the twist in the grooves. Of course the larger the ball the less is the spiral required to maintain its accuracy, and Forsyth found by experiment, about 1860, that a ball of about 15 to the pound could be fired with five drams of powder and carry perfectly true at sporting ranges from a barrel rifled with one turn in 8 feet 8 inches. Weapons of this kind were used with great success until the invention of the express rifle, which, owing to its bullet being of an elongated shape, had a flatter trajectory than any spherical ball at ranges exceeding about 125 yards.

Although elongated bullets are said to have been invented in the eighteenth century, they could not have been equal to the spherical in accuracy, otherwise they would certainly have been adopted by American makers when the hunters spread across the prairies and into the Rocky Mountains. Those mentioned in old works on gunnery were egg-shaped and therefore ill adapted for keeping in a line with the axis of the bore when passing out of the barrel. The first elongated bullet of which I have read that gave good accuracy, was invented about 1823 by a Captain Norton, of the British Army. It was cast with projections which fitted the grooves of the rifle mechanically, and made with hollow points which were filled with percussion powder; Norton's object being to blow up the ammunition wagons of field artillery, which he proved to be readily done at 1,000 yards or more. The British military authorities, however, made no use of his invention.

In 1848 Chapman published his work describing the American rifles of the best kind, such as those made by Wesson, Billingshurst, James, and others. The bullets were called "pickets," shaped like sugar-bowls, with the points sometimes sharp and sometimes flat. The bases being placed upon a linen patch, they were driven into the grooves by blows of the hand upon a kind of piston rod, the end of which was reamed out to fit the point of the bullet. The rod worked in the center of a cap which fitted the muzzle of the rifle, thus insuring that the bullet was truly centered in the bore with a perfect mechanical

*The sketch was first published in Audubon's Ornithological Biographies, which bear date from 1831 to 1839.—E.P.

Hawaiian Game Seasons.

HONOLULU, Hawaii, Nov. 4.—*Editor Forest and Stream:* The game birds of Hawaii are fairly well protected by law. The laws are observed by the real sportsmen, but in the country districts our Oriental population disregard them and shoot game in and out of season. Another safeguard is the law specifies a hunting license for each island, the fee for which is \$5.

Among the birds, both native and foreign, the following are protected by law during the closed season: Wild dove, wild pigeon, pheasant, quail, native duck, native goose, foreign duck, plover, snipe, akekeke, curlew, kuku-luaio and the mud-hen.

The wild ducks, plovers, snipes, and curlews are migratory birds, and it seems incredulous that the little feathered birds that cannot rest on the water are able to sustain the long flight from Alaska, some 2,500 miles. But they go and come with the seasons, leaving us in the spring and returning in the early fall.

When the plover first reach our shores they are in fine, fat condition; but after a few weeks become thin. It is said that birds, when about to migrate, take on a "fever," and even their notes of call are changed, and they fly with great speed, some of the best flyers making 240 miles an hour. In this case, the birds from the northwest make the journey in from 12 to 15 hours. There is no place for the land birds to alight to break their long flight. These same birds mentioned are found on the islands 1,000 miles further south of us. They are all here now, and the island hunters are making good bags.

Eight sportsmen went duck hunting last week and bagged over 150 wild ducks besides some plover. The duck hunting, however, is closely confined to hunters leasing ponds, which they bait and protect the game. These ponds are only shot over every few weeks, for if they were constantly hunted the ducks would leave the island.

Pheasant shooting is confined more to the uplands. They would become more plentiful were it not for the mongoose, a pest that was imported to rid cane fields of the rats, and these pests now destroy the bird eggs, the young, and even the full grown pheasants. Mongoose are about the size of a rat, know no fear, and have been known to take a good sized rooster off and kill it in broad daylight. It is essential for pheasant hunting to have dogs to get the birds flushed in the low shrubbery on the hills and higher plains. Hunters, however, are able to make bags of from 10 to 20, according to locality.

The most popular hunting is dove shooting. They are very plentiful about the time the rice crop is harvested, when they are found on the fields of cut grain. It is no unusual thing for hunters to make a bag of 100 per gun. A great many of my acquaintances make bags of from 70 to 90 regularly each Sunday during the height of the season.

Plover, snipe and curlew are found on the marshes and along the shores. The use of decoys is very helpful in bringing them within range of a blind. The bags have not been very heavy this season. They seem to keep in small flocks and are very wild. ALBERT DELMAR.

The Adirondack Deer Season.

THE season for deer hunting in New York State, which opened on Sept. 1, closed Nov. 15. Taken all in all, the season has been a fairly good one, although it is probable that the aggregate number of deer killed was considerably smaller than in any open period for several years past. Several causes conspired to bring about this result, and no doubt all had a greater bearing thereon than is generally known. It is universally conceded that a great many deer perished in the Adirondack region last winter, and as a natural consequence there were fewer in the woods this fall than there otherwise would have been. There are certain localities where deer were apparently as numerous this season as they ever were, but in other sections a pronounced falling off was noticeable. There has been a wide difference of opinion as to the cause of the mortality last winter, but that many died cannot be successfully disputed. The theory that the severe cold weather and the deep snows proved fatal to many has had numerous advocates, and very likely they may have to some extent contributed to that end, but there must have been other influences. Some people claim that the streams were frozen so hard that the deer were unable to get water and perished from thirst, while others say the snow was so deep the animals could not obtain food to sustain life. A few believe that the deer froze to death. Experienced woodsmen, however, do not hesitate to express the opinion, that if the deer had been left undisturbed in their yards, or chosen winter quarters, and not frightened out by men or dogs, the mortality would have been comparatively slight. Another explanation which appears very reasonable, is that many dead deer found when spring opened were animals which were mortally wounded or badly crippled during the previous hunting season. But whatever the cause of death may have been, the depletion in the ranks of the deer was one of the prime reasons why there were fewer killed this fall than usual.

The remarkably heavy foliage on the deciduous trees and undergrowth proved a great disadvantage to hunters during the greater part of the open season. The leaves remained on the trees and shrubbery until very late, and thus made it difficult for a person to discover a deer, even though it was close at hand. Another thing which had an important influence in protecting the deer was the reluctance of hunters to travel about in the woods in quest of game through fear of being mistaken for a deer and shot at by some over-anxious and reckless marksman. The numerous shooting accidents which have occurred in the Adirondacks prevented many people from visiting the woods this fall, particularly while the leaves were on the trees; and those who did go were very careful not to incur any undue risks. Many hunters who had occasion to go through the shrubbery took the precaution to whistle or sing while doing so, preferring to take the chance of frightening game away rather than to give some careless secreted marksman an excuse for shooting in their direction on the theory that a moving bush

might possibly conceal a deer. It was noticeable that a very large percentage of the hunters waited until after the leaves had fallen, believing that the danger of their being mistaken for deer would then be less than earlier in the season.

The city sportsmen, as well as the guides here, come to realize the wisdom of wearing a red hunting suit, red sweater, red shirt, red coat or, at least, a red hat while tramping through the woods, and there is no doubt that it is one of the most efficient safeguards that can be adopted to prevent a person from being mistaken for a deer or bear. The custom of wearing clothing of this conspicuous color has become very popular in the Adirondacks, and is bound to increase in favor from year to year. It is believed by experienced woodsmen that red will not frighten a deer, and that oftentimes it will serve to attract and hold the animal's attention, so that the hunter who wears it will stand just as good a chance of seeing game as the one who declines to do it.

After the leaves had fallen, the conditions for hunting were presumably at their best; but hunters found themselves seriously handicapped when looking for deer by the fact that the woods were so noisy. The ground was heavily carpeted with dead leaves, and when these were dry, as was the case most of the time, it was an utter impossibility to still-hunt successfully. It was out of the question for a man to walk through the woods without making such a noise in the dry leaves as to alarm any deer that might be within a radius of a quarter of a mile or more, and so hunters found it very difficult to obtain anything like a satisfactory shot. There were a very few days, however, perhaps half a dozen in all, during the latter part of the season, when the conditions for still-hunting were ideal. Twice or three times there was a light fall of snow during the night, and on the following morning the ground was covered to the depth of five or six inches with soft, damp snow. At such times hunters were enabled to move through the forest noiselessly and to readily follow the fresh track of a deer when they found one. November 14 was one of these days, and hunters who were in the woods at that time made a good record, or had no one to blame but themselves. It is believed that a very large proportion of the deer killed during the season were shot on the days when there was snow on the ground, and on the few other occasions when it had rained sufficiently to moisten the fallen leaves and make still-hunting practicable.

It is predicted that when the reports are all in from different portions of the Adirondacks, it will be found that a good many deer have been taken this year, although, as has been intimated, the number is not as large as it was last year or the year before. The probabilities, in any event, are that the slaughter was fully as great as it could be and not exceed the present annual rate of increase.

Thinking sportsmen are of the opinion that there is danger of going beyond these bounds, and in order to guard against it, they are advocating shortening the open season still further. Probably some additional protective measures will eventually have to be adopted in order to properly conserve the game supply, and it will be wise to take the necessary action before the deer have been too greatly reduced in numbers.

W. E. WOLCOTT.

UTICA, N. Y., Nov. 21.

In Nebraska.

OMAHA.—Nov. 1 the open season for quail began in this State and local sportsmen have been busy ever since. Duck shooting this fall has been poor, but the prospects are flattering for great sport with Bob White. Notwithstanding the excessively frigid weather during the latter part of winter the birds are reported in unusual plentifulness in all favored localities. The heavy snow of February lay but a few days upon the earth; the havoc among the birds in consequence was small. Had the white blanket lain for any considerable period and the weather maintained its intense severity, the quail in the least covered districts would have been all but exterminated. It is the inclement weather in this section of the country which works the greatest disaster to the birds. The sportsmen, hawks, owls and coyotes cut but little figure by way of comparison.

From a personal standpoint, each lover of the field and wood has a preference in regard to the species of game he prefers to hunt and shoot to obtain the greatest amount of profit and pleasure, and this preference naturally forms the individual's opinion as to which is the best of all for the purpose of healthful sport. One prefers wild fowl, and not taking into consideration his own personal fancies and idiosyncrasies, his peculiar success in this branch of gunning, or his advantages, which undoubtedly are mainly instrumental in determining his preference, he emphatically affirms that this class of shooting is the best of all. And of this constituency I am honest in admitting that I am an ardent follower. And so with all the rest of the craft whose choice is the shooting of some other bird—whatever it may be it is certain to be extolled above all others. I am willing to confess, however, that it is my belief that from the standpoint of the greatest amount of pleasure to the greatest number, quail shooting, for numerous reasons, is the finest sport of all.

It affords so much mixed shooting—in the open and in the cover, and slow and swift—that there is plenty to tax the skill and tickle the fancy of all, however crochety or fastidious. In the open country the shooting is not too difficult to dishearten one of even the most moderate skill, while, on the other hand, in our tangled and matted creek bottoms, the pastime is well calculated to test the nicest skill of the best shot who ever picked up a hammerless. So, taken as a whole, in the open or in the brush, the gunner of average deftness can manage to make a satisfactory showing, and thus secure the consequent excitement which comes with reasonable success. In this connection, I will add, and meet the approval too, of all the experienced sportsmen, I think, that a certain degree of success is essential to the shooter's pleasure. Many writers deprecate the consideration of the bag, treating it as an

fit. The grooves were cut with a "gaining twist," which commenced with a turn in five feet, and ended with a turn in about three feet at the muzzle. The result was a degree of minute accuracy which had never before been approached, and which has hardly been surpassed by the most perfect rifles of the present day. A favorite size for deer hunting was one which carried round balls of 75 to the pound and pickets weighing about half an ounce. The powder charge for the latter was 82 grains. The bullet fitted the grooves for 3-16 of an inch from the base upward. With this large charge and the very slight friction between the picket and the barrel, the trajectory was flat, so that no allowance was necessary up to 150 yards when firing at the shoulder of a deer. I had a highly finished rifle of this kind by James, of Utica, N. Y. It was about ten pounds in weight and made for pickets weighing 140 grains, or 50 to the pound; the round balls weighing 90 to the pound. The powder charge for the picket was 55 grains. For off-hand work at the target, or for quiet standing shots at game, it was excellent; but its long top-heavy barrel and short stock with crescent-shaped butt made it exceedingly awkward for shots at running, or even quick shots at standing, game. Within a year I exchanged it for a double English rifle weighing only 8½ pounds and carrying round balls 17 to the pound, and never regretted doing so. Not long afterward I was sent to a station in India where antelope of three species were fairly numerous, but very wild through having been hunted for two or three years by the men of a Highland regiment. In the open it was frequently difficult to stalk as near as 150 or 200 yards, and in the jungle snap-shots were often necessary. During the first cool season I went out with both shotgun and rifle whenever duty allowed time, and bagged thirty antelope without one escaping wounded, so far as I was aware.

It appears highly probable that the American rifles with picket bullets first suggested the idea of the express system. Purdey made some express rifles in 1859, and by about 1866 they were used by numbers of English hunters. Those of .40 and .45 caliber gave a practically flat trajectory up to 150 yards, and were accurate enough to hit the vital part of a deer at that distance, but they never equalled the American muzzleloaders with picket bullets in delicate accuracy at any distance, although far better for game shooting, owing to their lightness and handiness.

All that I have written about the old rifles refers to those used when round balls were universal. I am convinced that notwithstanding their 4-foot barrels and heavy weights, the very best of them would be beaten, in trajectory as well as accuracy, at all ranges beyond 150 yards, by the Winchester and Marlin rifles with 26-inch barrels and of nine pounds weight, chambered for either the .40-65-260 or .38-56-255 cartridges. The myths respecting their wonderful performances arose through a few well-known facts:

1. The men who used them depended greatly for food upon close shooting at game, and often for their lives upon holding straight when fighting with Indians. The time required for reloading would frequently cost them their lives or the loss of food unless the first shot were well placed. Therefore they were forced to acquire the habit of always taking careful aim instead of firing recklessly, as has become the habit of many hunters since the invention of quick-loading rifles.

2. Owing to the plentiful supply of game and the necessity of using it for food, America contained during the eighteenth and first quarter of the nineteenth centuries, a far greater number of good marksmen in proportion to the population than had ever existed in any other country.

3. The fire of such men, whether their rifles were long or short, light or heavy, would necessarily be far more deadly than that of any troops taught the use of guns after enlisting in an army.

4. The British officers who, during the Revolutionary War, were astonished at the shooting of the backwoodsmen, had, in most cases, not seen a rifle before going to America; and few of those who had seen one were practically acquainted with its use. Even in the Highlands of Scotland, ball shooting smoothbores were, long after that period, often used for stalking deer.

5. Every one who fires a rifle for many years will, at times, make very extraordinary shots, or even several in succession, and those who are practically unacquainted with the rifle often imagine that such shooting is habitual, and can be repeated regularly. The description of a marvelous shot is liable to be much exaggerated when passing from one individual to another. (Mr. H. W. S. Cleveland, in his work on the rifle, states that he once killed a partridge at an extraordinary distance in Maine, a shot which he knew he might not have been able to repeat in firing fifty times. But that shot was talked about far and near for years afterward as a proof of Cleveland's skill and of the accuracy of the Kentucky rifle, one of which he was then using. He says that rifles were then almost unknown in Maine.)

J. J. MEYRICK.

BUDLEIGH SALTERTON, Devonshire, Nov. 6.

Bringing Game Through New Jersey.

THERE are certain New York counties—Orange and Sullivan—which are reached from New York city by way of the Erie Railway. The Erie passes through New Jersey, so that a sportsman bringing his game home with him is obliged to take it out of the State of New York (which is forbidden by the New York law) into New Jersey, and then out of New Jersey (which is also forbidden by law) into New York again.

In former years the New Jersey wardens at the Jersey City ferries have seized and confiscated such game in course of transit through the State; but this season, acting under instruction, they permit the game to pass. Under date of Nov. 18, President Benj. P. Morris, of the New Jersey Fish and Game Commission, writes: "*Editor Forest and Stream:* The Commission promulgated a rule last year that it was not a violation to bring game from some other State across New Jersey and take it over the ferry into New York; that our law was simply designed to prevent taking of game killed in New Jersey out of the State. Of course parties with game in possession may be examined, and it is the duty of the wardens to do so, and explain from whence they got the game."

BENJ. P. MORRIS.

irrelevant incident, gross and unsportsmanlike, and these are so enthralled with the beauties of nature and the ethics of gunning in the abstract that they think it should be mentioned in hushed tones only or viewed with eyes askance. But, according to my idea the beautiful and the useful should go hand in hand. Each is a component part of the whole, and as such should be equivalent as factors in the joys of the field and stream. A full bag and a full creel distinguishes the expert and the enthusiast. To the sentimental, which surely ennobles and adorns the useful in life, there must be added the material, the serious and the practical; the hunter must be rewarded for his efforts or he will soon cease to be a hunter. It is not all shooting to shoot, or all fishing to fish.

There is still another important feature about quail shooting. The man whose business cares allot him but a few days for shooting, and these at no regularly stated time, certainly has more possibilities for recreation and sport on quail than any other bird that flies, notwithstanding there may be a lack of fervid enthusiasm and superlative exaltation as is conspicuous among the wildfowl, the jacksnipe and the grouse shooters.

Quail are undoubtedly more uniformly and widely distributed throughout the United States than any other high-class game bird. Its habitat comprises both open and timbered districts from piny Maine to silvery-sanded California, and from the borders of British Columbia to the Gulf of Mexico. It differs from the ruffed grouse, whose home is exclusively confined to the woods, and therefore in a much smaller territory than that of Bob White, and from the pinnated grouse (prairie chicken), which is purely a bird of the prairie. The quail flourishes wherever it can obtain a sufficient food supply, either in a timbered country, or in the treeless and shrubless prairie adjacent to some river or water-ways. It readily adjusts its habitat according to the dominating circumstances of food and cover, whether it be on our plains, or in the woods or in a region embracing both open and cover. Here in Nebraska it frequents both field and wood, preferring such as have a good food supply, with hedges, river and creek beds choked with plum and grape and crab-apple, to which it can run or fly to shelter or safety. Here it rarely penetrates far into the woods, preferring to skirt along the outer edges of them merely for protection, as both the redtail and Cooper's hawk are its deadly enemy, and it must be ever alert to escape them.

But the idyllic season is now here, so whistle up the old dog and prepare for a day in the thicket and stubble. The blackbird, with the scarlet splotch on either wing flashing in the hazy sunlight, has chucked a last sad farewell overhead; russet has succeeded the gold in the thin branches of the cottonwood; a dull dun lights the faded green of the pasture land, and a marked change has come over the old setter. No longer does he tap out an indolent welcome on the porch floor at your coming at noonday or evening, but springs down the walk with eager bark and sparkling eye to meet you, soiling your business apparel with his forepaws as he leaps for your face, and evoking a harsh word of command for his effrontery. But he knows you don't mean it, and cavorts around you in an ecstasy of emotion, rushing off through the drooping peony and chrysanthemums, and back again to peer into your face in an effort to fathom your intentions—whether you are merely home for grub or after canvas coat and hammerless.

A few more days and the sport will be at its height, and from out the tangly Elkhorn's mazes, where the orange arils of the bittersweet are darkening among its maroon and still clinging leaves, will come the plaintive signals of the scattered bevy that will set your soul ablaze. How different from the cheery whistle that so lately floated across the harvest field, yet how thrilling, how penetrating. Strangely exciting, indeed, is this autumn call of the quail. He who has never heard its melody when the hills are bathed in purple and gold, when the sumach burns its brightest, and a mellow sunlight floods the land, has missed one of the sweetest emotions of the human breast. Strong, indeed, must be the fetters of office or counting room that holds back the born sportsman when the perennial rustle of the late November winds sound like mystic music from angels' lutes and the blackening walnuts have dropped from their bare branches, when the querulous caw of the crow comes like a phantom cry from over the silent fields, and the acrimonious scolding of the irascible bluejay, tilting up and down, through the elm's gray network, is nearly all that is left of the pleasing summer sounds, and when the golden flash of the yellowhammer's wing the last gleam of brilliant life.

Gossiping about quail shooting reminds me that most of it is at close range. A majority of the birds killed are within twenty-five yards, and often much nearer than that distance. A gun weighing 6½ to 7½ pounds is of ample weight, and the 12-bore is most commonly used, though the 16 and even 20 are excellent, and preferred by many sportsmen, especially those in the South. But under almost any circumstances, the gun should be a cylinder. There is little need of a chokebore in quail shooting. However, it is an exceedingly difficult matter to induce the average shooter of the day to use a cylinder-bore gun. Its use seems to be construed as reflecting on one's ability to shoot a close gun instead of being accepted as a matter concerning the gun fit for the particular kind of game. It requires time to effect a cure in the use of chokebores in quail shooting. One has to treat indulgently the emotional attacks, sentimental and practical, which appertain to shooting, from the romance of it which requires that the landscape be bathed in mellow sunlight, the prairie bespangled with flowers, the breezes laden with the fragrance of the wildwoods, the glories of nature coloring all, to the assaults in the practical details which require the closest of guns in shooting Bob White, the heaviest of loads when the lightest are better, and what commonsense dictate, or that a point, to be ever so well done and so accurate withal, is sporting heresy unless made by a black, white and tan dog. The sportsman should go forth equipped for his sport according to its needs and not the whimsicalities of senseless custom. He should never take a full-choke gun in cover nor a cylinder-bore to shoot ducks. There should be intelligent adjustment of means to ends. Industry and skill and hunting craft should not be balked by inappropriate theories and weapons.

SANDY GRISWOLD.

Some New England Clubs.

BOSTON, Nov. 19.—*Editor Forest and Stream:* Your readers have heard frequently of the good work which has been performed by the Fitchburg Rifle and Gun Club. A few evenings ago the club held its annual dinner at the Johnsonia under conditions especially pleasing. For the first time in the history of the club, the tables were graced by the presence of ladies. Previous to the banquet, an informal reception was held under the direction of Messrs. H. A. Hill, W. C. Kimball and Dr. J. W. Barton. The president, Dr. Russell Bingham, was master of ceremonies, and introduced the Rev. A. T. Kempton, who presented his illustrated lecture, "Hiawatha," which held the closest attention of his hearers until nearly midnight. The slides are exceptional for their exquisite colored effects, and the experience of his trip last summer to the land of the Ojibways, on Lake Huron, was graphically described, and won the unstinted praise of his hearers.

President Bingham, ex-President I. O. Converse and Mr. J. E. Morse constituted the banquet committee.

Another large and influential club of our State, the Greenfield Sportsman's Club, has just celebrated its annual, which was one of the most enjoyable in the history of that organization. Venison, coon, rabbit and pigeon "done to a turn" under the direction of landlord and Mrs. Leipple, of the Union House, kept the 200 sportsmen gathered about the tables in Hungari Hall, delightfully busy for over an hour, when the president, Dr. L. A. Newton, presented Capt. J. W. Collins, chairman of the State Commission. After expressing his pleasure in being able to greet so many of his fellow workers, the Captain said he appreciated the existence of such clubs, as without them the work of the Commission would amount to very little. "We count on your support, and we hope the interest you have manifested in the past will continue."

The chairman declared the work of the Commission in the protection of fish and game was a benefit not only to sportsmen, but "to the State at large." If game and fish can be provided in our own State, the Captain argued, no inconsiderable portion of the \$2,000,000 or so expended annually by Massachusetts sportsmen outside her boundaries would be spent nearer home, and inure to the financial benefit of her own citizens. "It is your plain duty," he said, "to hand down to those who shall come after you as good or better game conditions."

Col. F. D. Pierce was received with three cheers as his name was called, and he spoke in his usual entertaining way of the benefits of the club in promoting a "better knowledge of many things," as well as good fellowship.

Mr. Wm. A. Davenport, while recognizing the value of the work of the Commission, prophesied that it would be hampered in the near future unless accompanied by "forest planting"—the only way, in his opinion, to keep up the covers needed for the adequate protection of game in the winter.

Senator-elect Gerrett, who was a member of the House two years ago, paid a tribute to the chairman of the Commission for his efficient service, and urged a rigid observance of the game laws, especially that making Sunday a close season, which, he said, "was greatly in the interest of protection." If the position taken by Capt. Collins is tenable, fish and game protection should be the care of every citizen, whether he be a sportsman or not.

A more enthusiastic gathering of sportsmen than that which annually convenes in Hungari Hall it would be hard to find. Many years of success and usefulness to the Greenfield Sportsman's Club, and to all its members.

The Vermont Fish and Game League.

The annual dinner of this influential club was held in Armory Hall, Montpelier, after a business meeting at the Pavilion. President F. L. Fish, of Vergennes, urged greater observance and enforcement of the laws and alluded to the work already accomplished in the propagating of fish and protection of game. He requested members of the Legislature to consider the question, "How long can Lake Champlain stand seine fishing?" He emphasized the importance of stopping the pollution of trout streams and of protecting the ruffed grouse.

Mr. James F. Hooker, of Brattleboro, who was the toastmaster, made allusion to the President of the United States as the best-known sportsman in the world.

Governor Bell made pleasant allusions to certain interesting phases of Vermont politics, and remarked upon the number of legislators before him, and said he could easily see by looking over the assemblage "why 375 of the 460 bills related to fish and game."

Mr. Hale K. Darling, of Chelsea, spoke for the Legislature. Mr. Robert A. Lawrence, of Rutland, advocated the formation of county leagues, and the printing of game laws in Italian. Hon. J. W. Titcomb, of Washington, spoke of fishculture in the Argentine Republic, and described his work transporting trout eggs 300 miles across a desert. He said that Argentina had a great future, and is to become a rival of the United States in agriculture. Commissioner Thomas, of Stowe, gave the number of deer legally killed this year in the State as 446.

Seventy-five new members were added to the list of the League. This Association has the proud distinction of having among its members about all the active politicians in the State.

In Maine.

A heavy fall of snow occurred last Sunday—a foot in the West Branch and Aroostook regions and half as much in the region about Moosehead and Katahdin. A deer head brought from Crema Pond had antlers with thirty-three points. The prongs in the central part had palms like those of a moose. There is exceptional hunting in the region about Silver Ridge in Kingman. It is reported that eighteen exceptionally large deer were brought out in one day. Shipments for the week from Bangor, the biggest of the year, were 615 deer and 13 moose. A heavy snowfall is reported also in the Rangeley region and in New Hampshire, and the hunters are getting many deer.

CENTRAL.

In Massachusetts.

BOSTON, Nov. 20.—*Editor Forest and Stream:* Another State reservation is to be asked for next winter when the Legislature convenes. Petitions for the setting apart of Sugar Loaf Mountain in Deerfield have been extensively signed by citizens of that and several neighboring towns who are interested in the project. They would like very much to have the summit of North Sugar Loaf also included in its taking by the State. These are twin mountains, standing side by side, close together, rising abruptly from the rich plain on the west bank of the Connecticut River, not far from the Sunderland bridge. Both are heavily wooded, and the southern one is accessible by means of footpaths and a good carriage road, which leads out of the main highway between Greenfield and Northampton, branching off a little south of the village of South Deerfield. The Greenfield, Deerfield and Northampton electric cars pass the point of divergence hourly. From Amherst the Amherst and Sunderland street railway carries passengers within a short mile of the mountain road. Thus it will be seen that the advantages of the mountain park would be within easy reach of a large population in the Connecticut valley. The young ladies of Smith College and the Amherst students frequently make pilgrimages to Sugar Loaf on what they call "Mountain days." At the top of the mountain is a farmhouse, known as the hotel, fronting the south and facing the view that makes the mountain famous. Nearby one may take his stand on a great shelf of rock, jutting out from the face of the mountain and which holds the observer out over the valley, so that he may look almost straight downward five or six hundred feet. A path winding around under this shelf to a recess in the cliff leads to a rough stone seat known all up and down the valley as "King Philip's Chair." There is a legend that the great Indian Chief was wont to sit on this rocky throne to read the smoke signals of his warriors or watch the burning of the English settlements. It is well worth a journey of many miles to behold the exquisite view to be had from the summit of Sugar Loaf, embracing as it does the placid waters of the river stretching southward until lost to sight far down the valley, where the spires of Holyoke and Northampton rise out of the hollow just below Mt. Tom. To the southeast may be seen the college buildings at Amherst. In whichever direction you look, the view is most enchanting. As regards the expense of the taking by the State, those who are interested say it would be small in comparison with other mountain reservations. It would not necessarily include a large tract of land, but only the wooded summits, as it would not be necessary to secure adjacent land (as in the case of Mt. Tom), in order to insure fire protection. The estimated value of the land is \$10 an acre, or a little more, and it is thought not much more than 300 acres would be required, and that probably \$3,000 would buy the hotel property. It would be necessary to secure an appropriation covering only the first cost, as the expense of maintenance would doubtless be assessed upon Franklin county. Should the plan prove successful, there will be another tract, though not a large one, where game will be secure.

SPECIAL.

Wisconsin Against Spring Shooting.

MILWAUKEE, Nov. 19.—*Editor Forest and Stream:* A determined effort will be made at the coming session of the Wisconsin Legislature to stamp out spring shooting in this State, and for that purpose an association is being formed to popularize the movement which is expected to terminate in revoking the amendment made to the game laws two years ago giving permission to shoot all varieties of ducks with the exception of wood ducks, mallards and teal.

The State administration is at the head of the plan to preserve the game birds of Wisconsin, and at a meeting of the sporting writers, which was held in Milwaukee on November 16, attention was called to the additional necessity for protecting feathered game in Wisconsin by Game Warden Tracy, under whose able administration the laws have been carried out to the letter since he was inducted into office. The fullest co-operation of the newspaper men was promised, and steps were taken to secure signatures to a gigantic petition to the Legislature requesting that the laws be amended to prohibit the destruction of ducks and geese in the spring.

In Milwaukee there is an overwhelming sentiment against spring shooting, and in many sections of the State the feeling is similar. The improvement in fall shooting has been marked since the game laws were amended six years ago and spring shooting stopped for years, while the sale of game was regulated to such an extent that dealers have been out of business for two years. Residents in the interior of the State have gradually realized that in the game they have a valuable asset which should not be disposed of as was the "goose that laid the golden egg." Ten years ago the farming communities were howling for the retention of the spring shooting section in the game laws, asserting that the closed season in the spring months of the year was the invention of the "city feller" and the devil; but now, with the return of the days when twenty-five to thirty birds a day are an average bag, bringing city men to their localities and the distribution of the coin of the realm for circulation, they are taking the other side.

The protection of game and fish in Wisconsin has been radically improved since the advent of Governor La Follette at Madison four years ago. Radical changes in the laws regulating the shipment as well as the shooting of birds and animals have been enforced with impartiality, with the result that the game laws of Wisconsin mean something now. Infractions are rare, and the detection of contraband shipments from the interior to Milwaukee long since caused them to almost totally cease.

About the middle of December another meeting of the association will be called to perfect the organization, which may be retained permanently.

J.

All communications for FOREST AND STREAM must be directed to Forest and Stream Pub. Co., New York, to receive attention. We have no other office.

As It Is in Africa.

OUR destination was 75 miles northeast of Monrovia by a straight line, but the circuitous route which we were compelled to take made the distance 100 miles. This distance will not seem great in a country where the inhabitants enjoy facilities of travel, but in a country where the substitutes for railroads, electric cars, stages, beasts of burden, and all other means of modern travel are human beings, it is considerable to the traveler, who is compelled either to walk or to be carried in a hammock.

The traveler who travels by hammock finds himself swinging to and fro, suspended from a horizontal bar whose ends rest on the shoulders of two stalwart natives, who rush him at breakneck speed through narrow and uneven paths, over dangerous ravines and huge logs which block the way. Sometimes the unequal height of the carriers occasions much suffering to the victim, which the native enjoys richly.

The absence of railroads and of every other vehicular convenience for travel in Liberia is a serious drawback to the development and prosperity of the Republic. For this reason very few Liberians venture into the interior. Except soldiers and traders, the Liberians are absolutely ignorant of the interior of their country. They prefer to go to Europe for pleasure and recreation, although the interior of Liberia is said to be rich in products, beautiful in scenery, and healthful in location. Only the foreigner ventures. Because of his willingness to assume the difficulties of the journey he becomes at once the object of curious wonder.

Our party consisted of T. R. McWilliams, professor of science in the College of West Africa, as scientist; E. Harrison Lyon, as photographer; Mr. Zacihus Kennedy, a Liberian road commissioner; a botanist; a student of native customs; and nine natives to carry food and luggage, making fifteen persons in all. Several rare specimens of flora and fauna were collected, and many interesting pictures were taken of the chiefs and their people.

We left Monrovia April 28. The route took us up to the head of the St. Paul River and thence to Harrisburg, the base of operations for Dobbles Island. Here we calculated upon securing a sufficient number of natives to accompany us as carriers; but this being the season for planting, we found it impossible to hire anyone, and were compelled to walk to and from Kpondia Hill, a distance of more than 200 miles.

After leaving Harrisburg, a Liberian town inhabited by civilized people, we found no roads entitled to be called such leading into the interior, either to or from native towns. They are all crooked and labyrinthine. They are made crooked to mislead the enemy, and to render his approach to a town difficult during a tribal war. The aborigines give themselves no concern about obstacles in the road. They cut down a tree and leave part of the huge branches lying across the path. They never think of removing them except when compelled to do so by a Liberian commissioner. They prefer either to climb over or to go around, and to swim a creek rather than to take the trouble to cross it by the bridge. When an old road is abandoned, it is flagged by placing a branch as an obstruction at the fork of the path. The native knows what this means and takes the new road. The reason given by the natives for leaving obstructions in the road, and for making them narrow and winding, is not only to bewilder the tribal foe, but also to render it difficult for the Americo-Liberian to find them in their native fastnesses.

The way to Kpondia Hill lies through 37 native towns and half towns, having each from 100 to 600 inhabitants. They are built largely in the midst of dense forests or upon the top of steep hills. The distance from one native town to another of the same tribe hardly ever exceeds three miles, and the population is never more than 2,000. The houses are constructed of mud and thatch. No marked improvement is visible in this section on the primitive style of house builders. The interiors of the houses are clean, and so are many of the towns. Although a goodly number of the men in these towns speak and understand English, some few reading and writing it with astonishing accuracy, the knowledge does not make any difference in their mode of living, climatic conditions and social environments force them to a strict adherence to primitive customs. The municipal officer of every town is styled the chief, and of the half town, the headman. All disputes are settled by them.

We arrived at Tecker Town in time to witness the burial ceremonies over the remains of the King's daughter, who had died three days previously. Her death was evidently occasioned by physical exhaustion. She undertook a journey of 40 miles three days after becoming a mother. Her relatives, however, concluded that her somewhat sudden death was due to witchcraft, and the whole town accordingly set about finding the witch. The memory of the death was honored by the customary dance, which consisted of hideous yells and physical contortions, leaving the women in a state of exhaustion and the men in a state of frenzy. The ceremony closed with repeated volleys from firearms, to announce to the spirits on the other side the coming of the departed. Upon the grave was left a brass kettle, some of the wearing apparel of the deceased, and some articles of food.

To discover the witch, the suspected party was forced to swallow poison made from the sassy-wood bark. According to the theory, the guilty cannot live with a dose of this concoction, but upon the innocent it will have no effect. Many innocent persons have been the victims of this superstition, until recently an antidote has been discovered, which the suspects carry concealed.

Kpondia Hill rises abruptly about 600 feet above the surrounding country, which gives the traveler a magnificent and picturesque view of rolling hills, fertile valleys, and verdant plains, through which meander heathful streams, wherein fish and game abound.

The King received us kindly, and gave us his house, which was an improvement on the surrounding huts. He is himself a tall, spare, but well built man, with keen eyes and sharp features, rather dignified, and good looking. The flat nose, thick lips, and big teeth the

native African is frequently represented as possessing are no part of the features of this man, and his people partake of the same even and intelligent profiles. The usual picture does injustice to the native Africans in Liberia.

The next and most important step before retiring is to "dash" the King until "his heart lies down"—an aboriginal expression which signifies satisfaction. The dash, which is equivalent to a tip, consisted of a piece of white cloth, tobacco, pipes, salt and matches.

The traveler would conclude from appearance that Africa must be a land of warriors. Every man appears as a warrior. He seems to live always in the fear of the enemy and in the shadow of the great evil, which prompts him to go armed from head to foot. With his sword he defends himself from the enemy, and with his charms he protects himself from the evil. His arms, which are a part of his dress, consist of a short sword, a country knife, a spear, and a bow and arrow, which he uses with great precision. It is of frequent occurrence for boys between the ages of 8 and 9 years to stick a piece of chip about an inch and a half in width in the ground or on the limb of a tree and, at a distance of 200 feet, to split it in halves with the arrows from their bows.

The country knife is indispensable to the native. It is his most effective weapon of defense. With it he can successfully meet the attacks of the boa constrictor and many of the ravenous beasts and poisonous reptiles, of which he has but little fear. The only animal which he seems to fear is the baboon. He will entrap an elephant, chase a leopard, and pursue a hippopotamus, but he will fly in mad haste from the hideous yells of a baboon, which resemble the cry of a man in distress. This sound unnerves him, and despite his reputation for courage, he will desert you in the densest forest. Our party had an illustration of this during the trip. When in the midst of a thick bush, ten miles away from any settlement, we heard this doleful noise, which we mistook for the cry of distress of perhaps some misguided traveler. The natives came to a halt. They knew what it was, and in their discomfiture started to leave us in the thickest forest, but the sudden discharge of our fire-arms brought them to their senses.

Continual tribal wars in the interior have resulted in the depopulation of whole sections and in the extermination of thousands of families. Africa is the most thinly populated of the continents, there being only thirteen persons to the square mile. Liberia is never without tribal wars. The natives are always fighting, to the detriment of the country. Gold, ivory and cattle which formerly came to the markets of Monrovia have been diverted into other directions because of better protection to life and property. This fact contributes to the scarcity of fresh meat at the capital.

Women are invariably the cause of every contention. Wealth among the aborigines is based solely on the number of wives, boys and cattle possessed. The man who has the most wives can easily be king. The abduction of one of the wives of a Pessy man, and the refusal to give her up when demand is made, is casus belli. The men of a captured town are frequently put to death in the most cruel manner, while the women and children are reduced to abject bondage. Of these the king takes the lion's share, and distributes the remainder among his followers. The children are frequently sold, pawned, or given to satisfy financial demands, very often among themselves, or to members of neighboring tribes, or sometimes to Liberians, who pay the price for them, and then keep them under the apprentice system until they reach maturity, when they are given their liberty, if they do not abscond in the meantime.

The social life of the interior has a degenerating tendency on the morals of the foreigner also. Illustrations in social and moral degeneracy are numerous among white and black foreigners. These victims have not been confined to the secular life, but have been found in the religious life also. Men and women who came to teach and to lift up have been found among the victims not merely of heathenism but of wanton immorality.

Currency is absent from this section. The natives bring their products—coffee, palm oil, palm kernels, palm wine, kasada, starch, piassava, ivory, skins, venison, camwood, rubber, beeswax, honey, gold, precious stones, sheep, goats, cattle, ginger, kola nuts, and other things—and for these they get from the merchant cloth, salt, tobacco, pipes, gin, cutlasses, brass kettles, iron pots, trinkets, beads, handkerchiefs, powder, caps, shot, stockfish, looking glasses, combs, Florida water, and other commodities, all of which are sold at large profit. For instance, cloth purchased in England at three to five cents a yard is sold in trade for twenty-four cents.

A Talk to Foys.

Editor Forest and Stream:

I had a good illustration the other day of how some boys—and the practice is not altogether confined to boys—handle their guns. I first noticed the boys while they were shooting at some birds; only shooting at them, though—they were not hitting any of them. Had they been men, I would not have let them even shoot at them, for the birds were protected ones and were on posted ground, also. I let the boys shoot away; I did not expect to see them hit anything, and they did not. After they had kept it up half an hour and had crawled all over the place on their hands and knees, the birds left and the boys started to go home. Then I interviewed them. There were four of them, three with guns and one to carry the game if they had got any to carry. The oldest boy had his gun under his arm, with the muzzle pointing right at the next boy in front of him, and had the hammer down on top of the cap. I had seen a few guns like his before, and examined it. It was an old musket, and bore the legend "U. S. Harper's Ferry, 1855." It had been at one time a flintlock, but had been altered to percussion, and the place where the pan had been was now plugged up with brass. They were about as dangerous at the breech as at the muzzle when I had one of them.

I carried mine up to the Peninsula in 1861, when we went there to take Richmond, but did not take it just then. I did not carry it long, though; the first time I found a rifle whose owner had been shot I exchanged my musket for that. I raised the boy's hammer to half-cock, then tried it to see if it could be pulled off at half-cock; some of them can; but this one could not.

"This is a fine gun," I told its owner, "but it is out of place here. It should be up in the museum. Now, after this don't let me ever catch you carrying it with that hammer down. Keep it as it is now, and quit pointing it at a boy's head. Point it down. If you should happen to let the gun fall with the hammer the way you had it just now, some one would get shot. And take that cap off before you put the gun away." He took it off there and then.

"What have you in the gun?" I asked.

He took a small bottle out of his pocket that was half full of No. 6 shot.

"That is large enough for ducks. Had you hit one of these birds with a dose of that there would not have been enough of the bird left to pick up."

Two of the small boys had Flobert rifles, both of them loaded. "Do you leave the loads in?" I asked. Yes, they left them in for the next time. "Well, get them out now and keep them out until you want to use the gun again. Suppose your mother or sister should pick up that gun, not knowing it was loaded, what would happen? Or suppose a baby got hold of it and shot himself?"

They had not thought of that. "Yes, I know you did not; and a good many others don't think of it. That is how we get shot with a gun that we don't know is loaded. Now think of it after this. And another thing, let these birds here alone just now; wait for the open season; and in the meantime shoot English sparrows. I let you boys shoot at the birds to-day because I knew you could not hit them. Had you killed one of them I could have made it cost your father just \$7.40. I would not do it, of course, after I had let you keep on shooting and had not stopped you."

"I was going to quit as soon as I saw you," the big boy said, "but these boys told me that you did not care if we did shoot them."

"Yes, I care. Don't shoot any more of them, though."

One of the small boys wanted to know if he might not shoot crows. "Oh, yes, you can shoot at them. All the crows you shoot with a Flobert rifle, though, won't depopulate that crow colony very much. The crows get up at daylight here, and they know a boy and a gun when they see him. You won't shoot many of them."

CABIA BLANCO.

Massachusetts Game.

NEW BEDFORD, Mass., Nov. 14.—*Editor Forest and Stream:* Our season opened on all game in our county of Bristol on November 1. Woodcock were never more numerous than at this season, but on the second day not any were to be found, as the ground froze up solid and they went off south. Quail are very scarce; the severe cold weather of last winter had much to do with this year's crop. Partridges are fairly plentiful, and wintered well. Rabbits and hares are thick and the woods are full of gray and red squirrels. Foxes are very plentiful, and while very few have been killed this fall, the hunters have no trouble to go out and start two or three in a day's hunt. I think they have as much to do about the scarcity of quail as the cold winters do. The game wardens are after law breakers, and arrested and convicted a father and son for shooting and having quail in their possession before the first day of November. They were fined \$20 each in the District Court, and were let off easy. There is plenty of work here for the wardens to do, as the market-hunters and market men both need looking after.

CONSTANT READER.

Birds of British Columbia.

THE Provincial Museum of Victoria, B. C., has recently published a Catalogue of British Columbia Birds, compiled by Mr. Francis Kermode, the museum's curator. It is an interesting paper, but, we may assume, contains only a portion of the birds of that great Province, which holds within its borders alike mountain and plain, foggy seashore and deep, hot, dry valley. Such a territory, extending from the seacoast to the crest of the continent's backbone, and from the Straits of Fuca nearly to the Arctic, has room within its borders for many forms of life. Over much of the Province little collecting has been done, and further search will undoubtedly considerably enlarge this list, which has grown from 339 species and sub-species noted in the list of 1898, prepared by the late John Fannin, to 362, the present number.

The notes are briefly annotated, and the localities given where the species have been taken. The publication is a very useful one, and Mr. Kermode deserves thanks for the pains taken with it.

The Woodcock's Whistle.

BUFFALO, N. Y., Nov. 6.—*Editor Forest and Stream:* Please tell George L. Brown I'd like to shake his hand for his interesting dissertation on "The Bird That Passes in the Night." He evidently appreciates the little brown wizard as thoroughly as I do.

Apropos of the woodcock's whistle, it may interest some of your readers who have followed the discussion in FOREST AND STREAM's pages to hear the little evidence I can offer. A few days ago I shot a cock which my good old Dan brought to me very much alive. In taking the bird from the dog's mouth, I grasped it by the bill, and imagine my astonishment when, as the dog released it, the bird fluttered its wings rapidly and produced the familiar whistle. I know that while this occurred the bill was held tightly shut by my hand.

I do not offer the above as conclusive evidence that the sound is made by the bird's wings, but in my own mind I feel very sure that such is the case.

SEA AND RIVER FISHING

Fish and Fishing.

Fontinalis in British Waters.

BRITISH anglers are certainly to be pitied for their failure to satisfactorily stock their running waters with the American brook trout. Its appearance, when first introduced into English streams, was heralded with jubilant anticipations; its capacities for rapid growth were hailed as a good omen, and its gorgeous dress and graceful form won golden opinions from all piscatorial classes, who willingly paid large sums of money for what was then considered the coming trout. No authority disputes its value as a game and food fish. But the complaint is made, wherever it has been introduced into British waters, that it will not remain in them unless confined. Piscatorial authorities on the other side of the ocean seem to be at a loss to account for the vagaries of the vanishing American fish, especially in view of the reputation it enjoys in its own country as a home-loving fish. It is suggested that British waters may be found unsuitable for this beautiful char, though this can scarcely be the case, when it is remembered that it thrives most successfully in Scottish tarns and other inclosed waters.

It is scarcely surprising, however, to those acquainted with the habits of the American brook trout, to learn that it does not remain in waters having an easy and uninterrupted communication with the sea, even though they may possess the requisite degree of temperature and purity. It is doubtful if it is always to be found in any similarly situated Canadian waters. Usually, however, *Salvelinus fontinalis* ascends, in Canada, for the purpose of spawning, the streams down which he runs to sea. And the peculiarity of the British experience of the fish is not so much the fact that it fails to remain in the waters in which it is planted, when they afford such easy access to the sea, as that it departs, in English coastal streams, from its Canadian practice of returning to fresh water to

those who are accustomed to fight *fontinalis* in coastal streams, when freshly in from the sea, and, in fact, those anglers who fish for him in any running streams, need not be surprised to learn of the somewhat low opinion of its game qualities entertained by those British anglers who, failing to find him in running waters at all, have taken him only in ponds. Thus the well-known angling writer, John Bickerdike, says that he is inclined to place *Salmo fario*—the so-called brown, German, or English trout—before *fontinalis*, adding, however, what fully explains his preference, "But, then, I have only caught *fontinalis* in ponds, for in our streams it obstinately refuses to remain." There is just as much difference in the sport afforded by a pond trout and a freshly run specimen of the same variety from the sea as there is between a truly landlocked salmon and a perfectly bright fish of equal size, with the sea-lice still adhering to him.

Mr. Bickerdike should come to America and fish for *fontinalis* in some of the streams running into Lake Superior from the north, into Lake St. John, or into the Gulf of St. Lawrence or the Saguenay River. He would scarcely then place *fario* before *fontinalis*, so far as game qualities are concerned; especially as he admits that *Salmo irideus* is a harder fighter than *fario*. There is a wide difference of opinion among anglers and ichthyologists in regard to the game qualities of the rainbow trout. Jordan and Evermann say that it is a trout of exceeding gameness, and possibly a greater fighter than others of the group, when its weight is considered. The late Dr. G. Brown Goode, on the other hand, describes it as a fish of little gameness and activity.

It would be interesting to learn whether any American ichthyologist is aware of the correctness of the story told to Mr. Bickerdike by a fishculturist of experience to the effect that rainbows, when not furnished with a stream in which to spawn, become egg-bound, this condition being followed by blindness and death.

Virgin Fishing Waters.

The members of the Laurentian Fish and Game Club have been taking a fresh route into their preserve during the last two summers, and one which I had urged upon them as long ago as March, 1899, at their banquet of that year at the Holland House, New York. Instead of ascending the St. Maurice River, to Lake Wayagamack, they go by way of the Quebec and Lake St. John Railway to Lake Edward, and there take guides and canoes for the splendid cross-country trip to their club waters. Almost the entire distance can be covered by a water route, and many of the lakes crossed afford excellent fishing. The country traversed is an excellent one for game. During the season just closed, some fifty to sixty guides were engaged at one time by members of this club who crossed over from Lake Edward to their club house.

These waters are controlled by Mr. Rowley, who outfits the guides and parties engaging them, so that the latter secure at the same time the necessary permits for fishing en route to their own territory. While not virgin waters, some of these lakes and the connecting streams afford excellent fly-fishing. What I had in mind when I wrote the heading "Virgin Fishing Waters," were a number of lakes somewhat south of the route just described, which are about to be opened up to anglers by a new line of railway now building from a point on the line of the Quebec and Lake St. John Railway, where it touches the Batican River near the Jeannotte, to La Tuque, on the Upper St. Maurice. This branch line will be very convenient to the members of the various fish and game clubs on the St. Maurice River, and as already mentioned will open up a great number of virgin fishing waters. The Quebec Fish and Game Protective Association is taking

every possible means to prevent the illegal fishing of these waters by the men employed in building the railway, and have a guardian backward and forward nearly all the time.

Four-footed Trout Fishers.

From many fishing grounds in the north country, I have reports of a large increase in the number of the fur-bearing animals of the woods and waters. Beavers, which were a few years ago threatened with destruction, have so rapidly increased since the enactment of the law prohibiting their hunting, that they are fast becoming a nuisance to hunters and fishermen. Their dams are so numerous that many a lake has had its waters raised considerably, thus contributing to the killing of the shrubs along the banks of the water, and many a good place for the feeding and the hunting of the caribou has been flooded. There will probably be an end to this rapid increase in the number of beaver after the expiration of the present law next autumn. The prohibition to hunt beaver has also contributed to the increase of many other fur-bearing animals, such as the mink and the otter. Trappers have not troubled themselves much about these latter furs, when unable to hunt beavers at the same time. The consequence has been that otters have increased to such an extent that they are working great devastation upon some of the spawning beds of the trout. Besides being great gluttons, these animals are extremely successful fishers, and it does not take a few of them very long to completely destroy all the trout upon a pretty large spawning bed. So many of them are reported upon the spawning beds of the big trout of Lake Edward and the Jeannotte, that trappers in the vicinity are being supplied with traps for the catching of these four-footed anglers, whose pelts are now extremely valuable, though the catching of them is by no means so easy as many might suppose. It is reported that many blood stains on the newly formed ice already mark the scenes of the slaughter of trout by these successful fishers, who practice their art all the year round, respecting no close season and no fishing regulations.

E. T. D. CHAMBERS.

Looking Backward.

Editor Forest and Stream:

The article of L. F. Brown referring to the pleasures and enthusiasm of the youthful sportsman takes me back. Saturday morning—early and no school. Joe stands out in the early morn upon the walk and hurls pebbles at my bedroom window and I start up with a jump—and we are off for the pond armed with rods made from trusty hickory saplings and with bended needle hooks. We were after goldfish and the silvered variety, there being many granddaddies in the pond we were to fish. Bait! Dough with worms as a reserve.

No fly-fisherman ever was more intent upon the arranging of his book of flies as we boys with pincers and kerosene lamp as we tested and bent our needles into barbless hooks. With what care did we carve our floats of cork, arranging them to a nicety. How the old pond comes back to me and the flat rock upon which we sat well shaded with the overhanging willows and a large chestnut. How we sat by the hour patiently waiting for the goldfish to give the sign that sent our floats well below the surface. A strike of a tarpon would to-day send the blood coursing through our veins with less vehemence than did that cork as it disappeared beneath the surface, leaving a rippling ever increasing series of rings upon the shaded surface of the old millpond.

And the day we went home to dinner leaving our poles set and lines in the water—only to find one of the poles being towed upon the surface on our return. The pond was celebrated for its snapping turtles and as a swimming hole was not popular. The ways and means to secure that floating pole with something on the end of that line would have done credit to a marine engineer. But we got the pole at last, and with a mighty haul we snaked his eelish up upon the grass. And then the struggle! Slippery he was, and we certainly would have lost him had we not grabbed handfuls of sand and thus overcome his slimy coat. Excitement! Well, I guess.

And how we strung worms patiently on thread and formed them into a "bob," and at night bobbed for eels. And as we jerked them out upon the grass what an exciting chase to secure them with the lantern's aid before they wriggled back into the water. Jacking a deer or moose for real excitement could not be in it with this.

I have crouched in a pit upon the Dakota prairies and watched a faint speck come from out of the eastern horizon and caught a feeble honk honk with my ears, and have watched motionless and seen the speck form a V, and heard the honk clearly and more clearly yet, and then recognized the outstretched necks of the leery geese, nearer, nearer, but yet afar. This set one's heart thumping, 'tis true, but was not in it with the time I watched Lou level the old musket on the stone wall near the willow that overhung the pond, at the laughing kingfisher that had alighted. It seemed ages until he pulled the trigger, much longer than when our rifleman at Dublin pulled the trigger that sent the deciding bullet that plowed the air through a lane of expectant, anxious onlookers, to finally land upon the bullseye and give America the Palma Trophy.

Yes, friend Brown, 'tis hard to-day to equal the joys and pleasures of the boy who does things with either rod or gun for the first time. I have only to recount to any boy how he stopped his first quail, to see his eyes sparkle and his cheeks get aglow. How many of us can forget after repeated trials how we stopped our

first partridge whirring through the white birches? Who shall forget the first trout he lost and the one he at last landed? The spring days of life afield can rarely be forgotten.

CHARLES CRISTADORO.

Increase of Whitefish in Lake Ontario.

ENORMOUS quantities of whitefish were caught this season at the western end of Lake Ontario. Whitefish have increased to such an extent in this part of the lake since the United States hatchery at Cape Vincent has been in operation, that Booth & Co. have been shipping whitefish by the carload to Detroit and Chicago this season. No one at this end of the lake doubts now that the Cape Vincent hatchery is doing great things for Lake Ontario.

Canoing.

Officers of A. C. A., 1905.

Commodore—C. F. Wolters, 14 Main St., East Rochester, N. Y.
Secretary—H. M. Stewart, 85 Main St., East Rochester, N. Y.
Treasurer—F. G. Mather, 30 Elk St., Albany, N. Y.

ATLANTIC DIVISION.

Vice-Commodore—W. A. Furman, 846 Berkeley Ave., Trenton, N. J.
Rear-Commodore—F. C. Hoyt, 57 Broadway, New York.
Purser—C. W. Stark, 118 N. Montgomery St., Trenton, N. J.
Executive Committee—J. C. MacLester, U. G. I. Building, Philadelphia, Pa.; L. C. Kretzmer, L. C. Schepp Building, New York; E. M. Underhill, Box 262, Yonkers, N. Y.
Board of Governors—R. J. Wilkin, 26 Court St., Brooklyn, N. Y.
Racing Board—H. L. Quick, Yonkers, N. Y.

CENTRAL DIVISION.

Vice-Commodore—Lyman T. Coppins, 691 Main St., Buffalo, N. Y.
Rear-Commodore—Frank C. Demmler, 526 Smithfield St., Pittsburgh.
Purser—J. C. Milsom, 736 Mooney Brisbane Bldg., Buffalo, N. Y.
Executive Committee—F. G. Mather, 30 Elk St., Albany, N. Y.; H. W. Breitenstein, 511 Market St., Pittsburg, Pa.; Jesse J. Armstrong, Rome, N. Y.
Board of Governors—C. P. Forbush, Buffalo, N. Y.
Racing Board—Harry M. Stewart, 85 Main St., East Rochester, N. Y.

EASTERN DIVISION.

Vice-Commodore—D. S. Pratt, Jr., 178 Devonshire St., Boston, Mass.
Rear-Commodore—Wm. W. Crosby, 8 Court St., Woburn, Mass.
Purser—W. S. Stanwood, Wellesley, Mass.
Executive Committee—Wm. J. Ladd, 18 Glen Road, Winchester, Mass.; F. W. Notman, Box 2344, Boston, Mass.; O. C. Cunningham, care E. Teel & Co., Medford, Mass.; Edw. B. Stearns, Box 63, Manchester, N. H.
Racing Board—Paul Butler, U. S. Cartridge Co., Lowell, Mass.; H. D. Murphy, alternate.

NORTHERN DIVISION.

Vice-Commodore—Chas. W. McLean, 303 James St., Montreal, Can.
Rear-Commodore—J. W. Sparrow, Toronto, Canada.
Purser—J. V. Nutter, Montreal, Canada.
Executive Committee—C. E. Britton, Gananoque, Ont.; Harry Page, Toronto, Ont.
Board of Governors—J. N. MacKendrick, Galt, Ont.
Racing Board—E. J. Minett, Montreal, Canada.

WESTERN DIVISION.

Vice-Commodore—Burton D. Munhall, care of Brooks Household Art Co., Cleveland, Ohio.
Rear-Commodore—Charles J. Stedman, National Lafayette Bank, Cincinnati, Ohio.
Purser—George A. Hall, care of Bank of Commerce, Cleveland, O.
Executive Committee—Thomas P. Eckert, 31 West Court St., Cincinnati, O.; Dr. H. L. Frost, 10 Howard St., Cleveland, O.
Board of Governors—Henry C. Morse, Peoria, Ill.

How to Join the A. C. A.

From Chapter I., Section 1, of the By-Laws of the A. C. A.: "Application for membership shall be made to the Treasurer, F. G. Mather, 30 Elk St., Albany, N. Y., and shall be accompanied by the recommendation of an active member and by the sum of two dollars, one dollar as entrance fee and one dollar as dues for the current year, to be refunded in case of non-election of the applicant."

A. C. A. Membership.

THE following have been proposed for membership in the A. C. A.: Wm. A. Roos, Jr., Fred W. Lohr, H. C. Hinck, Jr., Albert Krunke, all of New York, and all members of the Hiawatha C. C.; D. Webster Anders, Philadelphia, Pa.; L. N. A. Bedard, H. R. Hume, H. D. James, E. M. Olin, H. R. Stuart, all members of the Sylvan C. C., and of Pittsburg, Pa.; Thos. I. Taylor, Brookline, Mass.; Wm. Ord, Buffalo, N. Y.

JOHN S. WRIGHT.

Exhibits at the Sportsmen's Show.

THE following list gives the names of the exhibitors who have taken space on promenade floor of the Garden for the Sportsmen's Show: American Company, Armour & Co., Mahlbach Saddlery Company, G. W. Cole Company, Foster Rubber Company, Bird, Jones & Kenyon, Douglas Manufacturing Company, Wm. Hjorth & Co., Abercrombie & Fitch, E. R. Durkee & Co., Richelieu & Ontario Railway, Canadian Pacific Railroad Company, Grand Trunk Railway Company, Herz & Co., H. L. Rand, Schoverling & Welles, C. L. Altemus & Co., Doubleday, Page & Co., Charles F. Splittorf, Dayton Electric Machine Company, Rudder Publishing Company, Victor Metals Company, Lambert Snyder Vibrator Company, Charles E. Miller, Remy Electrical Company, Wm. Roche, S. L. Crosby Company, State of Maine, State of New York, State of Virginia, H. M. Stevens.

All communications for FOREST AND STREAM must be directed to Forest and Stream Pub. Co., New York, to receive attention. We have no other office.

YACHTING

ON November 18, at the meeting of the Society of Naval Architects, at the rooms of the American Society of Mechanical Engineers, Mr. Clinton H. Crane, the well-known designer of yachts and power launches, read a very instructive paper. He spoke of the assistance of the automobilist in the development of light weight motors for high speed launches. Mention was also made of lubrication troubles, especially the usual trouble of excessive oil in the rear cylinder. This common defect ought to be easily overcome, and no doubt will be as soon as designers realize its importance.

Mr. A. A. Packard, in his paper, called attention to lessons learned from the July motor boat races held under the auspices of the Eastern Y. C., regarding imperfect carburation and frequent adjustment of carburetors necessary when the boats changed their direction at the turns.

There is another lesson to be learned which might be mentioned, and that is that the same carburation and adjustment used on an automobile, where rarely the full power of the engine is utilized at a certain engine speed, is insufficient in marine work. In the motor boat the maximum engine speed gives the best result with each individual propeller tried. In order to get this best result, the proportions of air and gasoline vapor must be very nearly perfect. In an automobile the engine will run with a mixture much too rich, and if it is in danger of stopping from overload, the clutch is thrown out or gears are changed. In a motor boat, if the mixture is too rich the speed of the engine slackens and the boat immediately feels it. In every high or low speed motor boat engine an auxiliary air supply is absolutely necessary to perfect the mixture and get the maximum power out of the engine. Where once installed, we are safe to say, it has always proved of value, not only in increased power, but in decreased consumption of gasoline. The reason therefor is that the "wire-drawing" being less, larger charges of explosive gas are utilized, and a much finer adjustment of the proportions is permitted than with a needle valve in the gasoline supply.

Recently, in one of our daily papers, we noticed that an excuse was offered for the failure of a high speed auto-boat not making better time than there was no pressure on the gasoline tank. We can readily see how no pressure on the tank may affect an automobile when going up hill, particularly if the engine is under the hood in front while the tank is in the body of the machine, and the machine is inclined as on a hill; but where the level is always the same, as in a motor boat, it is hard to see how pressure would affect gasoline feed to a float feed carburetor, providing there was sufficient sized piping from the tank.

In the Yachtsman of November 3 there appears a very interesting article by Rankin Kennedy, C.E., of Rankin Kennedy & Sons, on the hydraulic jet propeller. This method of propulsion has been twice tried by British naval authorities. The last time, in 1883, it developed but 32.2 per cent. total efficiency against 50 per cent. with a similar screw propelled boat. In analyzing the results, he found from the official reports that the pump losses were no less than 54 per cent. and the loss in the jet 30 per cent. He found pump makers ready to furnish their product rated at 10 horsepower and higher with a guaranteed efficiency of 80 per cent. He made actual tests with various jets, with 12ft. to 16ft. head of water, and by means of specially designed jets noted efficiency of from 65 to 90 per cent. With 85 per cent. as standard jet efficiency, and 80 per cent. pump efficiency, he secured a result of 68 per cent. In 1883 the very best having been but 32.2 per cent., he shows over 100 per cent. improvement.

The form of propeller showing best results is decidedly novel, and although it is not destined to take the place of the screw-propeller, it may be found useful in many cases for marine propulsion.

It is said that recent experiments at the Massachusetts School of Technology have shown an efficiency in water jets of better than 98 per cent. From this Mr. Kennedy makes the deduction that 80 per cent. pump efficiency and 95 per cent. jet efficiency will produce a result of 76 per cent. against the very best screw-propeller efficiency ever obtained of 71 per cent. These experiments will no doubt be of interest to many engine builders and propeller designers.

From Fishing to Gasolene.

BOSTON, Nov. 18.—*Editor Forest and Stream:* I have been so interested in F. K. Grain's articles on gas engines that for the first time in years, fishing crank though I am, the fishing columns of my FOREST AND STREAM no longer claim my first attention. I feel that Mr. Grain's articles give a better and clearer explanation of the vagaries of the gas engine to the novice than anything I have yet seen, and wish to know if they are to appear in book form. With his book in my pocket, I am confident I shall no longer be obliged to search my brain for new invectives to hurl at that balky, oath-compelling motor of mine, and instead of a domineering, pitiless master, it will become a reliable and obedient servant.

HERBERT AUSTIN.

GAS ENGINES AND LAUNCHES BEING EXPORTED.—The Lozier Motor Company report recent sales abroad as follows: 36ft. cabin launch with 10 horsepower two-cycle double cylinder engines, for Punta Arenas, Chile; engines have also been shipped to Manila, Buenos Ayres, Cabanas, Cuba, and Mexico City. This firm's export trade is reported unusually good, and demand constantly increasing, notwithstanding high freight rates and duties.

Gas Engines and Launches.

(Continued from page 414.)

BY F. K. GRAIN.

A Few Engine Wrinkles.

A FEW wrinkles gleaned from a vast store of experience will unquestionably be of help to some.

Painting and Cleaning Engine.

To repaint your engine, first clean it thoroughly with gasoline, then sandpaper it down and give it a coat of shellac, after which one good coat of enamel paint will produce a lasting finish. In order to preserve bright parts, keep them well greased with vaseline. Never clean your engine up or wipe it off after it has been used; allow the oil to stand on the surface and wipe it off before using. Brass work may also be kept bright by a coating of vaseline.

Batteries.

Dry batteries, when used, should be boxed, and it is a good plan to connect them in a box to the binding post on the outside, placing the coil also in the box, with the switch fastened to the outside. A strap handle can then be fastened to the box and the whole outfit removed and put under cover ashore. This will always preserve your batteries from moisture, save you not a little money, but a great deal of annoyance and trouble.

Spark Coils.

Spark coils that have become thoroughly saturated with water may be dried out by putting them in an oven and, unless saturated with salt water, will probably not suffer very much.

Insulations.

Mica insulations, as used in the majority of engines, are made of hydraulic pressed mica. To make a home-made washer, take the ordinary stove mica and cut the washer out with a gouge. The mica tube can be wound over the spindle, by holding it under water while winding—this will prevent cracking. Round bullseyes of glass for sight feed lubricators can also be cut from glass by using a stout pair of shears, holding the whole under water.

Pipe Sizes, Joints, Etc.

In making pipe joints for gas or gasoline, use shellac on the joints, or if that is not at hand, ordinary brown soap will do where the joint is for gas only. Glue will make a very secure joint; but never use any form of lead on the joints.

Steam, water and gas pipe is made in the following sizes: $\frac{1}{8}$, $\frac{1}{4}$, $\frac{3}{8}$, $\frac{1}{2}$, $\frac{3}{4}$, 1, 1 $\frac{1}{4}$, all butt welded, and from thence up, varying half an inch, all lap welded, the measurements being the inside diameter. Brass pipe of the same sizes can also be had, usually seamless drawn. It is called brass pipe iron-size. Of course brass pipe is made in all kinds of varying sizes and thicknesses, called tubing, which is, however, not adapted to the stand and pipe threads. Brass and iron pipe can be bent into almost any shape by filling it with melted resin, and after bending, dissolving the resin. The iron fittings, such as elbows, tees, etc., used in iron piping for gas engines, are generally of malleable iron and designated as gas fittings. Gasoline pipes, connecting the engine with the tank, are of either lead, brass or copper. The lead pipe, of course, can be bought at any plumber's; but for a really good outfit there is now on the market a seamless copper-annealed tubing, which is very strong, and yet can be bent into any shape. It has the advantage of being very small in diameter, and is generally used double to prevent failure in case of stoppage of one of the tubes.

Tools.

Every launch should have an outfit of tools suitable for an adjustment to the engine. A good selection is an 8-inch and a 14-inch pipe wrench, a 10-inch monkey wrench and a small bicycle wrench. We add to this the usual small screwdriver, a pair of pliers, two or three files, and a sheet of emery cloth. The tools should be kept well greased and wrapped in an oiled cloth, and should be taken along every trip, as they will often save you being towed in.

Propellers, Bearings, Packings.

It very often happens that a propeller wheel will foul up with eel grass, or perhaps a rope, in this case it can be usually removed by reversing the direction of the propeller wheel. If the propeller wheel is put on by the ordinary taper and should come loose, uncouple the shaft from the engine and slide it back until clear of the coupling, holding the shaft firmly and giving the end of it a sharp blow with any piece of metal that is handy, being careful not to upset the end of the propeller shaft. Of course this operation is to be followed up as soon as practical by hauling the boat out and setting up on the jam nut, on the outboard end of the shaft.

Packing.

Packing for stuffing boxes, where the stuffing box is sufficiently large enough to admit it, use square Italian hemp, which is laid up in Albany grease, for sale at all outfitters. This packing is not made smaller than one-quarter of an inch; for smaller sizes it is best to

rebraid a part of the strands of small hemp and thoroughly saturate with grease. Both of these packings should be cut so that they form a ring exactly surrounding the shaft, using say two to three rings and placing them so that the joints are broken. Never put in packing by winding it around continuously, as in this form it is sure to cause trouble.

Set Screws.

Set screws, usually employed in small engines for fastening the propeller shaft into the coupling of the engine, are very much inclined to slip, and it is generally the case that once slipping, they will continue to do so. Therefore, in putting in your shaft, set up on the set screw until a mark is made on the shaft, then remove the shaft and file a flat spot sufficiently large for the point of the set screw to rest on. Where set screws are exposed, in any locality where they are liable to come in contact with the occupants of the boat, they should in all cases be protected by a covering of some kind, as they are very dangerous.

Speaking of pipe and monkey wrenches, never use a pipe wrench on a nut bolt, or any part of the machine which it is liable to mar, as it will surely leave its mark.

If it is desired to use a pipe wrench on a round finished surface, wrap a piece of tin around the surface then grip this with the wrench. A very good substitute for a pipe wrench is the ordinary monkey wrench, laying a square nail or the end of a file on the object so that the wrench will jam. This little trick will often act as a good substitute for the pipe wrench.

Installation of Marine Gasolene Engines.

BY A. E. POTTER.

AT this season of the year there are many who contemplate ordering new power boats or engines for the coming season. To them in particular, as well as to the manufacturers or salesmen, it is essential that the installation be made as safe as possible. Some manufacturers realize this necessity and insist on the very safest possible; others realize it, but count the cost; while others still are careless or ignorant of what is necessary to protect the lives of their patrons or their own reputation.

It is to be regretted that there are no federal requirements covering the installation of all gasoline explosive engines. As the regulations now stand, the only inspection necessary is for boats of over fifteen tons, used for commercial purposes. The local inspectors make any rules they see fit in the absence of specific ones, vary them as they please, enforce them or not as suits them.

No boat propelled by steam used for any purpose whatever, even the ferry boat hauled across the river by a chain, is exempt from inspection, and must have a licensed man in charge, no matter whether he uses the boat for his own pleasure, taking out his family or friends, or in carrying passengers or freight.

This regulation, I understand, was originally made to allow the use of naphtha and similar powered boats to be used for yacht tenders, made before the general use of the gasoline explosive engine for boat work.

There are to-day plenty of people who would enjoy motor boating were they sure of a safe installation. I maintain that no one should be allowed to expose other people to unnecessary danger, growing out of his want of knowledge of the requirements of safety installation. The licensing of the operator is unnecessary, but the inspection and registering of the boat is decidedly important.

The same rules should not apply to all boats. Regulations to be followed in installing an engine as auxiliary power in a cabin boat would necessarily be more exacting than in a small open launch. In a boat with a cabin and the engine installed in the cockpit, the regulations would need to be different from where the engine was inside the cabin.

I should suggest the adoption of three sets of rules. These would work no great hardship to manufacturers or owners and the increased number in use would more than pay the slightly increased cost. The rules could be made to apply to all boats built or engines installed after a certain time with certain modifications for installations already made.

Open launches should have tanks made of copper or heavy iron, galvanized after it is made. These tanks should be in separate tight compartments, suitably vented with vent holes covered with gauze to keep fire from entering. Tank should have a circulation of water around it to wash out any accumulation of gasoline in the compartment. Piping should pass outside close to the keel, and be protected from injury. For this purpose, annealed seamless brass pipe should be used. From where it enters the boat to the vaporizer, soft copper pipe should be used, with one or two bends in it to allow for a little vibration. A tight bulkhead should extend from directly back of the engine to directly in front, provided with a hand pump, so that water or any leaked gasoline would be easily removed. The air inlets to the carburetor, vaporizer, or auxiliary should be always covered with wire gauze strainers to prevent flame passing from the cylinders into the lower part of the boat where it might ignite an accumulation of gas.

These same rules would apply to installation in a cabin boat with the engine outside the cabin. In addition there should be an independent bilge pump run by the engine to keep this engine compartment free from water and any chance gasoline floating on top.

When the engine is installed below deck or inside the cabin, an additional precaution should be taken. All relief or pet cocks connecting with the explosive chambers

of the engine should be either piped into the engine exhaust or outboard by an independent line. Under no circumstances should an engine installed in a cabin be allowed to belch fire from a pet or relief cock with any liability of igniting accumulated gas.

All tanks should be provided with shut-off cocks or valves at both tanks and just inside the skin of the boat where the gasoline pipe enters.

These are simple precautionary rules, and are not expensive. If you follow them out and are reasonably careful in operating your engine, you may laugh at all ordinary dangers from the use of gasoline in the motor boat. Ounces of prevention, perhaps, etc. Under no conditions whatever should any air pressure be allowed in the gasoline tank.

Log of the Launch Clara.

THE following account of the cruise of the 37ft. launch Clara from Miami, Florida, to New York via the Gulf of Mexico, Mississippi River, Great Lakes, Erie Canal, and Hudson River, was taken from her log book. The boat is owned by Mr. F. D. Hughes, and he was accompanied on the memorable trip by his wife and one paid hand.

Clara was designed and built by the New York Yacht, Launch and Engine Company, at Morris Heights, in 1902. She showed up to remarkable advantage on the long trip. Since she was built she has been driven continuously for thousands of miles in all kinds of wind and weather, and has stood all the severe tests given her splendidly.

The boat is 37ft. over all, 34ft. waterline, 9ft. 6in. breadth, and 3ft. draft. She is fitted with a 10 horsepower gasoline motor. She carries a little canvas, being rigged with a lug sail forward and a jigger aft.

In company with Clara during parts of the trip were two other gasoline power boats, both designed and built also by the New York Yacht, Launch and Engine Company. Palmetto, owned by Mr. T. A. Snider, was 65ft. over all, while Mr. H. C. Roome's Roamer was some three feet longer.

MIAMI, FLA., MARCH 29, 1904.

Day broke with a fresh N.E. wind blowing. Everything was aboard, and the boat was soon in shape for starting. Broke out the anchor and got under way at 9:30 A. M. Set both sails and headed for Caesar's Creek, which place we reached at 1 P. M. and anchored. During the early part of the afternoon a nasty squall, which had been making up, broke out of the N. and W. The rain that accompanied was very heavy. It soon cleared up, and at 4 P. M. we hoisted anchor and ran down Hawk's Channel to Angelfish Creek. After passing through the latter, Card Sound was reached. Thence to Steamboat Creek, where we had fine fishing catching mangrove snappers and grouper. We reached Barne's Sound via Steamboat Creek, thence to Jewfish Creek, anchoring for the night at the mouth of the latter stream. The foregoing is strictly the inland passage, and the stretch from Caesar's Creek to Indian Key should not be attempted by boats drawing more than 3ft. First day's run about 55 miles.

JEWFISH CREEK, FLA., MARCH 30.

A beautiful day, fresh E. wind. Started in good season and went through Jewfish Creek to Blackwater Sound and across the Sound to a cut called Boggy, and between the keys to Lignum Vitæ Key, where we anchored. In this vicinity are located Indian Key and Tea Table Key, and off on the reef is Alligator Light, where big fish of all kinds are to be found. We fished two hours on the flood tide, but did not land a tarpon; caught three big grouper and two jacks. Experienced several rain squalls with a shift of wind to N.E. When moon rose, clearing the clouds away, it turned out to be a beautiful night.

LIGNUM VITÆ KEY, FLA., MARCH 31.

At 5:30 A. M. we hoisted sail and weighed anchor; the wind was fresh from the E. Had a fine run across the shoals to Cape Sable, wind and tide both with us. When off Northwest Cape the wind shifted to N.E., blowing very fresh, and we anchored off Pavillion Key at 4 P. M. We lowered small boat to hunt for clams, but had poor luck; we did, however, find a queer shell-fish known as the angel-wing clam, although we had to dig down three feet for it.

PAVILLION KEY, FLA., APRIL 1.

Another beautiful day; wind S.E. All hands turned out early to look for clams again, and by 6:30 had a ton of hard clams, which proved to be very tender and delicious. Later we left for Punta Rassa, and anchored off St. James City about 6 P. M. Passed Mr. N. M. George's yacht Granatsa, of Bridgeport, Conn., off Naples, headed east. Found Aristook anchored off St. James City.

ST. JAMES CITY, FLA., APRIL 2.

At 7 A. M. left for Useppa Island, which place we reached at 9:45 A. M., and tied up to a dock. Engaged a guide for tarpon fishing, as our man George was too sick to handle the oars. I lost the noon fishing, and was not able to fish until the moon rose at night. Went down to Boca Grande, towing the guide and his boat astern, anchored off quarantine. Mr. Emory, of Boston, came aboard at 7:30. Mrs. H. went out with guide in small boat and fished for tarpon until midnight; had one strike, and just before leaving hooked a big fish; after fighting for over half an hour, lost it. Twenty boats were out for tarpon and a picturesque sight it was in the moonlight. The sponge schooners coming down the bay looked for all the world like phantom ships. Only two tarpon landed; last night, however, six were caught. After fishing the midnight tide, we pulled up anchor and sailed back to Useppa. The big English auxiliary Valhalla was anchored at Boca Grande.

USEPPA ISLAND, FLA., APRIL 3.

Sailed out of Boca Grande at 9 A. M.; fresh N.W. wind blowing, so concluded to make Gasparilla Pass, which we entered at 10 o'clock, and found a fine harbor, hard beach and beautiful water. Shot a few snipe, which proved very good eating.

GASPARILLA PASS, FLA., APRIL 4.

Wind N.E., blowing strong and very cool; lay at anchor all day, turning in about eight after a lazy day.

GASPARILLA PASS, FLA., APRIL 5.

Crossed the bar at 6 A. M., wind blowing fresh from E. N.E. Off Horse and Chaise Point 8:25, both sails drawing well, passed Egmont Key and up Tampa Bay to Tampa, tying up to the hotel dock at 6 o'clock; 97 miles day's run.

TAMPA, FLA., APRIL 6.

Fine and clear. Tampa has made wonderful progress during the last few years, and is now a lively, go-ahead city. Clara was hauled out to fix stern bearing; think the trouble lies in too much packing. She was run off ways in one hour.

TAMPA, FLA., APRIL 7-13.

Remained at anchor, having decided to await the arrival of the launch Roamer, owned by Mr. H. C. Roome. Weather was delightful during our stay, but as the days slipped by, began getting very restless. One night we dined at the Gran Oriente, Ybor City, and found the bad Spanish cooking anything but palatable. On the 13th we filled Clara's tanks with gasoline.

TAMPA, FLA., APRIL 14.

A trifle warmer to-day; armed with marine glasses we boarded a trolley car for Port Tampa, hoping to sight Roamer or Palmetto. Was surprised to see Mr. T. A. Snider, owner of Palmetto get aboard the same car, also bound for Port Tampa to meet his wife and wait for his yacht, which was expected that night.

TAMPA, FLA., APRIL 15.

Ninety degrees in the shade, wind N.W., but too hot. Left at 2 P. M. for lower bay; just at sundown sighted two yachts off Mullett Key; one proved to be Roamer, headed up the bay for an anchorage. Wind shifted to N.E. We dropped anchor off Mullett Key; about mid-

PALMETTO.

Designed and built by the New York Yacht, Launch and Engine Co., of Morris Heights, N. Y., for T. A. Snider, Cincinnati, O.

night the wind shifted to S.E., causing us to roll so much sleep was out of the question.

OFF QUARANTINE, MULLETT KEY, FLA., APRIL 16.

Wind S.E., with smooth sea; left at daybreak. Caught a kingfish off Pass-a-Grille; the bay is full of small kingfish averaging ten pounds apiece. They are very good eating. Also saw many pompano jumping, and finally caught three Spanish mackerel. Sighted Anclote Light at 9:45; rounded light at 10:30; continued on up the Anclote River, where we anchored and had dinner and a nap to make up for lost sleep. Wishing to get on to the good fishing grounds, we hoisted anchor, started up the engine, and headed for the channel to the northward of Anclote Key, where we anchored. In coloring these waters are like Biscayne Bay, and teem with fish of all kinds. All the spongers and fishermen in schooners and sloops, the former type of boat predominating, are bound in for Sponge Harbor to stay over Sunday; all boats are crowded with canvas, impatient to get home. Had poor success at fishing, so up anchor and sailed into Sponge Harbor. The smell of sponge curing is not pleasant. Weather fine, air delicious; 45 miles to-day.

SPONGE HARBOR, ANCLOTE KEYS, FLA., APRIL 17.

Left 7:45; off Withlacoochee Bar at noon; big steamer coming out; at first sight she looked as if she was aground, as the deep channel winds among the shoals. Fine run and beautiful day; N. wind. Tied to dock at Cedar Keys about 4:15; bought the papers and looked the town over, then left for Sea Horse Key, where we anchored for night. Wind shifted from light N. to fresh S.W. Twenty-five schooners, all spongers, anchored in the harbor.

SEA HORSE KEY, FLA., APRIL 18.

All hands up by 5:30, but found too much fog to make a start, so had a leisurely breakfast. The spongers had disappeared, some getting away by midnight. By 10 o'clock the fog had lifted, and it turned out a beautiful day. About 3:30 fresh S. W. breeze sprang up; toward night it died down. Much disappointed that the yachts Roamer and Palmetto have not shown up. Sailed up to Cedar Keys for the papers and to mail letters. The town is in a dilapidated condition. At one time it must have been prosperous, as some of the houses now abandoned are very solid looking. Went through the oyster factory and saw the process of canning oysters.

SEA HORSE KEY, FLA., APRIL 19.

Off by 5:30. N. wind; afterward shifting to N.W.; toward evening shifted to W. A beautiful day and we had a fine run. The sea was a little lumpy for twenty miles then it was smooth until W. wind sprang up, kicking up quite a chop. Anchored off St. Mark's Light at 6:30; run 100 miles. Caught several Spanish mackerel and one cavale troling; saw a big fish jump out of the water; made a jump of five or six feet. The color of the water has changed from a beautiful blue to a dingy green.

ST. MARK'S, FLA., APRIL 20.

Light N.E. wind, and after a good breakfast—a fine porterhouse steak and delicious grape fruit—we left St. Mark's at 6:40. The kingfish were jumping all around

us, the water being fairly alive with them; put out a line and caught several Spanish mackerel in a few minutes. The kingfish are evidently bound up the numerous rivers on the Florida coast to spawn. Up to date have caught all the fish we could use, and at Tampa stocked up with fine meats, etc., so that we have lived like lords. Entered Apalachicola Bay through East Pass, and on up to Apalachicola, a town of 5,000 inhabitants. This place is noted for its oysters, and they excel in flavor the famous Lynn Haven Bay's. After looking the town over, we left for the lower anchorage, St. George's Light, where we spent the night. About 3 P. M. a strong S. wind sprang up.

ST. GEORGE CAPE, APALACHICOLA BAY, APRIL 21.

Light N. wind. After breakfast crossed the bar, going out of the West Pass at 6 A. M. Beautiful day, and very smooth, the sea like molten metal; passed Cape San Blas close to and over the shoals. Crossed St. Andrew's bar at 1 P. M., and anchored in Hurricane Harbor. The exhaust pipe is leaking, so devoted the afternoon to repairing same. The waters are very beautiful, shading from a sapphire blue to various shades of green. Wind has shifted to S.W. About 5:30 the yachts Roamer and Palmetto arrived and anchored near us, the Roomes came aboard in their power tender, and we were glad to see them. The wind shifted to N.E., blowing hard. About midnight it worked round to the E.

ST. ANDREW'S SOUND, FLA., APRIL 22.

Wind E., blowing hard. Palmetto left at daylight for East Pass. Roamer did not start and we decided to wait for better weather. However, it turned out all right; had we made the run we should have had the benefit of a fair wind. At noon we ran alongside Roamer and invited Commodore and Mrs. Roome to go up to St. Andrew's

with us. We ran up to the dock and tied up, then went ashore to inspect the town and buy some stores, ice, etc. It is a small place, with no communication with the outer world except a steamer twice a week. Oyster canning seems to be the main industry. This is a fine body of water, as clear and beautiful as the waters around Key West. During the night the wind blew hard from the E.

ST. ANDREW'S SOUND, FLA., APRIL 23.

Over the bar at 5 A. M.; quite a sea on, but did not realize how bad it really was until we had been gone about half an hour. At times the seas were very high, and we had both sails set running before it. It was the biggest sea we have ever been out in, but we never took a drop of water aboard. We realized that if the wind shifted to the S. any more it would be extremely nasty, so ran along shore. About 11 A. M. we were off East Pass, and decided to try and make it, although it seemed foolhardy and impossible to go in through such broken water; but there was little choice; if we kept on to Pensacola it was doubtful if we could live in such a sea, and in any event it meant hours of tossing about, so in we started. This is a bad bar to cross, as there is only six feet of water on it and nine fathoms outside close to the bar, and the sea breaks with tremendous force. After crossing the first breaker, we had to haul up on the ranges, which forced us to put the boat broadside to the sea; one immense breaker caught us and almost rolled us over; then another caught us with a sickening crash; we thought it was all up with us that time, but she righted and shot into the smooth waters of Santa Rosa Sound. Oh, the relief and the beauty of this world, doubly intensified by our nearness to death; the trees looked greener, the sky bluer, and everything took on a beauty hitherto unseen. Life is indeed sweet. We stopped at the fish dock long enough to repair damages, such as righting the stove, sweeping up broken crockery, putting the carpets out to dry, etc. No damage whatever to the boat, not even a window broken. In fifteen minutes we were off through the Narrows into Santa Rosa Sound. Stopped at quarantine, where we found Roamer, she having crossed Pensacola Bar a few minutes previous. After going through the formality of seeing the doctor, we sailed on up to Pensacola, tying up to the wharf at Baylen street. Went ashore for mail and stores; found quite a lively town.

The U. S. warships Olympia, Kearsarge, the torpedo boat Truxton, and a number of others were anchored there.

PENSACOLA, FLA., APRIL 24.

Wind blowing very fresh from S.E.; rode through town on trolley; our explorations afforded us considerable amusement.

PENSACOLA, FLA., APRIL 25.

Wind still blowing heavy from S.E. to S.W.; wrong quarter for us to make a start.

PENSACOLA, FLA., APRIL 26.

Went down to Fort Pickens to look the sea over; anchored, intending to get an early start in the morning, but we dragged, and the bay was very rough, so returned

to our snug berth at Baylen street wharf. Wind N.W. in the morning, but shifted to S.W. again.

PENSACOLA, FLA., APRIL 27.

Wind N.W.; left at 4:50 A. M.; crossed the bar at 5, wind blowing strong from N.W.; passed through the Swash Channel into Mobile Bay, where we found a big sea, so rough we could not lay our course to Grant's Pass, but had to keep her head to it until we struck the shoals, then headed for Grant's Pass, through which we sailed into Mississippi Sound and up to Pascagoula. The storm signals are up for a N.W. gale; 90 miles made to-day.

PASCAGOULA, MISS., APRIL 28.

Fresh N. wind blowing when we started, but let up considerably toward noon, then blew strong in puffs. Had a fine run across the Sound, passing many sloops and schooners engaged in oystering. Entered Lake Borgne by Grand Island Pass, but left Grassy Island on the starboard; after a short run, sighted the beacon marking the entrance to Lake Borgne Canal, into which we passed, and after a delightful run tied up at the lock at 4 P. M.; 23½ miles to our credit to-day. The lock keeper informed us that Palmetto had locked through at 3 P. M. After looking the Mississippi River over from the levee, decided to wait until morning to lock through. It seems very strange to be lower than the big river.

LAKE BORGNE CANAL, LA., APRIL 29.

Slight fog, N. wind. Locked through and entered the Mississippi River about 7:30. The experience was novel and not so bad as it looked the night before. As one looked out on the river and watched the logs fly by, it seemed impossible to ever stem such a current, but by working the eddies and counter currents, one can make from five to six miles an hour. Tied up at Algiers just above the Morgan street ferry, which is very convenient to New Orleans. What a busy city, and what a panorama the levees afford, teeming with life afloat and ashore. The toll charge through Lake Borgne Canal is 10 cents per foot. Went ashore and had lunch at the Cosmopolitan Café, then boarded a car for Lake Ponchartrain, where we found Roamer. The weather is cool for this time of the year.

NEW ORLEANS, LA., APRIL 30.

Beautiful day, slightly warmer; leaking badly again through the stern bearing. Went through the French market and old French quarter; its glories have departed, and we found the old Royal Hotel being torn down.

NEW ORLEANS, LA., MAY 1.

Quite warm, and heavy showers during the day. We left Algiers and headed up river to Audubon Park. About 5 P. M. weather cleared, and it turned out to be a beautiful moonlight night. We suffered from the mosquitoes quite a little.

NEW ORLEANS, LA., MAY 2.

Clear and cold; cleaned up the boat and took matters easily all day.

NEW ORLEANS, LA., MAY 5.

After an early breakfast we went down to the French market to purchase stores, and afterward returned to the boat and got away by 10 o'clock. We had a good run of 83 miles, and dropped anchor three miles from College Point near a cottonwood grove. The air was thick with blackbirds on their way North, and they sang and chattered until dark. The pump bothered us a good deal, the check valves getting stopped up with fine sand.

COLLEGE POINT, LA., MAY 6.

Proceeded at 6 A. M. Made good time, both sails drawing well. The wind is fair and heavy; in the afternoon it proved too heavy for the driver, and it pulled out the block, so had to take in sail. Off Missouri Bend the weather looked so threatening we tied up to the bank or levee to see what it would amount to; in a few minutes we were deluged with rain, but no wind, so cast off and proceeded on to Baton Rouge, where we tied up to dock, or rather coal barge, for night; 73 miles day's run.

BATON ROUGE, LA., MAY 7.

Beautiful day, very clear and cool. After breakfast we went ashore to see what could be had for the table, but were informed that it was against the law to sell meat after 8 A. M. Found a nice town, most interesting because it was so very southern. At 10:30 we cast off and made a good run to Iowa Point, 50 miles. Just below St. Francisville we passed an old cemetery belonging to St. Francis Church, and the river had encroached on it to such an extent that one half of it was washed away and in the vaults (the dead are buried above ground in Louisiana) we saw skulls piled up; in several vaults entire skeletons were visible, a gruesome sight. This is a most interesting cruise so far. The town of St. Francisville looked beautiful nestled up on the bluff.

IOWA BEND, LA., MAY 8.

Up anchor and off by 5:15. Shortly after noon the S.W. wind sprang up and helped us considerably. We had company all day in the shape of the Mississippi steamer Betsy Ann, and while she was faster than Clara, she had to make many landings, and in that way she averaged down to our speed, so that we were together until just below Natchez, when we lost sight of her. A bad squall made up in the W. so we dropped anchor close to the shore with Natchez two miles away. The squall worked away from us and was very picturesque, much lightning and thunder and a heavy downpour for a few minutes. We ran 82½ miles in 14 hours, but in places we struck a terrific current. Turned in early and slept heavily.

NATCHEZ, MISS., MAY 9.

Fine weather continues, although slightly cooler to-day, but exhilarating. Rested and spent some time ashore, and found Natchez a charming southern city.

NATCHEZ, MISS., MAY 10.

Visited the market before 6; plenty of fresh vegetables, but not a great variety of meat. The native beef, however, is very tender, juicy and sweet. Returned to the boat to get breakfast and got under way at 11 A. M. We found the people of Natchez very courteous and obliging, and our short stay proved very delightful. Anchored for night just below St. Joseph's, 50 miles. Put 25 gallons of gasoline at 25 cents per gallon aboard.

ST. JOSEPH'S, LA., MAY 11.

Made a fairly early start, getting off at 5:30; a beautiful day. Made a good run to Vicksburg, tying up at 5:30 P. M. Off Diamond Island Towhead we touched bottom on sandbar, but did not get hung up. This is the first time we have been near the bottom on the Mississippi River. St. Joseph's is a busy city; cotton is high, and everybody seemed prosperous.

VICKSBURG, MISS., MAY 12.

Took aboard 150 gallons of gasoline at 15 cents; also stored up with groceries, provisions, etc. Weather is very warm and mosquitoes very plentiful.

VICKSBURG, MISS., MAY 13.

Off at 6 A. M.; made a good run to Lake Providence, arriving there about 4 P. M. Encountered an awful current through Island 95, off Point Lookout; the island, we found, had washed away, and is a sea of snags. We found Island No. 97 also washed away. Upon reaching Lake Providence we spoke a small launch coming out and inquired of them how great a draft could go through into the lake. They said 3 feet, and we gave them a line, as they had broken down, and towed them through the canal, built by Gen. Grant, into the lake, tying up at the levee. We found Vicksburg a clean, progressive town.

LAKE PROVIDENCE, LA., MAY 14.

After a leisurely breakfast, we made a start at 7 A. M.; weather clear and cool; made a good run to Greenville, where we tied up for the night at 6:30. Found many changes off Island 86.

GREENVILLE, MISS., MAY 15.

Beautiful spring day; lay quietly in our berth all day; the only excitement was a colored Baptist congregation assembled on the bank of the river to baptize two women. Very dirty town, but fine modern hotel.

GREENVILLE, MISS., MAY 16.

Had an early breakfast and went ashore to buy fresh vegetables and stores. Off by 6:30 A. M. Tied up at Arkansas City about 2 o'clock; 40 miles day's run.

ARKANSAS CITY, ARKANSAS, MAY 17.

Off at 5 P. M.; made a good run of 90 miles; not actual, but 90 miles further on our way, owing to the many cut-offs. We found the chutes very good and the current off Pushmata was very swift. We anchored at sundown in chute off Island 66. A steamer passed through in the night bound up stream. Off Scrubgrass Island had a heavy rain and wind squall; soon over, however, and a beautiful sunset followed.

CHUTE OF ISLAND NO. 66, MISSISSIPPI RIVER, MAY 19.

A cool and bracing day. Off by 5 A. M.; a steamer passed us bound south. Arrived at Helena, Ark., at 12:30, tied up to a raft there and went ashore to look for stores, etc. Rather attractive is Helena. We bought a fine porterhouse steak for 15 cents per pound, and delicious strawberries; in fact, all food seemed first-class and reasonable. In the afternoon we were made uncomfortable by the transfer ferry used to transfer the cars across the river. This ferry made a huge wash, causing us to roll heavily.

HELENA, ARK., MAY 20.

Weather decidedly cool; Roamer and Palmetto hove in sight about 10 A. M. Took on thirty gallons of gasoline at 17 cents. At 11 A. M. we cast off and proceeded up the river; tried a short cut off Harbin's Point, and Palmetto followed. It proved to be a regular cul de sac, and we had to go back and around, losing much time. Palmetto got aground and we gave her a line and pulled her off. We had the pleasure of seeing Roamer go by while we were hunting for a passage through the supposed cut-off. Then we tackled the biggest puzzle of the trip, Bordeaux Chute and Commerce Cut-Off, so completely changed were they that the Government charts were of no use. We were through the Bordeaux Chute before we knew it; before reaching the chute we saw a big bar making almost across the river. It looked impossible to get across it or around it; however, we finally got around it, and by using judgment and reading the water, we got through all right, and tied up astern of Roamer for the night off Star Landing. After dinner, went aboard Roamer to compare charts and found Mr. Roome had secured information regarding the changes in the river from Capt. Goode, one of the best pilots on the Mississippi. Mr. Roome very kindly gave us the information, and marked the various changes in the river as far as Memphis on our charts.

OFF STAR LANDING, MISSISSIPPI RIVER, MAY 20.

Up and off by 4 o'clock, reaching Memphis at 9:45 A. M. Found Memphis to be a fine city, clean and up-to-date. Many people came down to see the yachts. Capt. Goode came aboard and we also had the pleasure of meeting his wife.

MEMPHIS, TENN., MAY 21.

Hot day. We rode out to the race track, where Lou Dillon was quartered, but did not see her trot. The track seems very fine. Before breakfast, went to the market; bought fine spring lamb, green peas and fresh vegetables. The best of everything is to be had here.

MEMPHIS, TENN., MAY 22.

Weather hot; lay off the levee all day.

MEMPHIS, TENN., MAY 23.

Went ashore early, as weather is decidedly hot. The new pump arrived and was put in place immediately.

MEMPHIS, TENN., MAY 24.

Left at 4:30 A. M., and after a long day's run tied up astern of Roamer at 7; mosquitoes very thick; 92½ miles the day's run.

OFF FORKED DEER ISLAND, MAY 24.

Started at 5 A. M., arriving at New Madrid, Mo., at 6:45. We encountered many long bars, but owing to our light draft, we were able to work the shoal places, keeping on the edge out of the strong current and sometimes cutting across. The day's run was 82 miles.

NEW MADRID, MO., MAY 26.

Off at 5 o'clock; cool S. wind blowing. Passed an old ferry boat worked by two mules on a treadmill, thus turn-

ing the stern wheel, and steered by a man forward working a leeboard. The boat was a very interesting and primitive affair. After bucking a strong current for two hours we reached Cairo about 4 P. M. and tied up to a coal barge, but were immediately informed it would cost us \$5 a day to remain there, so we cast off and tied up to a barge belonging to a Mr. Barrett opposite the Halliday Elevator. There we learned we might not have to pay more than \$2.50 a day. This struck us as being extortion, and we cast off the lines and left with the purpose of going to some point further up stream. Remembering we had left our charts aboard Roamer, we attempted to anchor on the Mississippi side of Cairo, but owing to the swift current the anchor would not hold, so back we went into the Ohio River, and anchored across from Cairo in Kentucky waters. In the meantime the wind sprang up and blew half a gale, and the sea was big in both rivers; the boat rolled uncomfortably until midnight, when the wind let up. Our experiences at Cairo have completely disgusted us with the place.

CAIRO, ILL., MAY 27.

The day dawned cool and cloudy; hoisted anchor and went across the river and tied up alongside Roamer, intending to stay only long enough to get our charts and necessary stores, and then leave for a more friendly port. The wharfmaster, however, informed us we would have to pay \$2.50 for tying up to Roamer for an hour or he would libel the boat. We told him to go ahead and collect if he could, and if necessary we would stay there and fight it. He then changed his attitude, and informed us if we left immediately it would be all right. We expressed our willingness to leave, and within a few minutes were on our way up the Mississippi. Roamer followed shortly after, and both of us were glad, indeed, to depart. This wharfage outrage is not the fault of the Cairo residents. They deplore it as much as the victims. It is the result of one man owning all the water front and charging what he pleases, leaving the unfortunates that approach by water with no facilities whatever for getting ashore. I would strongly advise yachtsmen to give Cairo a wide berth. We made Daniel's Light about 3 P. M., and finding a snug place to lie for the night, we anchored. Roamer came in later. We found the river so changed we had to guess as to our whereabouts.

DANIEL'S LIGHT, MISSISSIPPI RIVER, MAY 28.

Left this port at 5 P. M.; early starts are our forte. We made good time through to Cape Girardeau. We stopped off at Cape Girardeau long enough to look the town over and get the papers and other necessities. Off the Devil's Backbone the scenery was gorgeous, and from Commerce the river is a panorama of wonderful effects. After leaving the Devil's Backbone the beautiful scenery is on the Missouri shore, and by working the eddies we kept up fairly well with Roamer until we struck a straight stretch. There we had a strong current to buck, and off St. Mary's Roamer anchored, but we kept on, anchoring some two miles below Chester.

CHESTER, ILL., MAY 29.

Made another early start, getting off before 5 A. M. Had a fine run, although at times the heavy rain blotted out much of the best scenery. Parts of this river surpass in grandeur the famous Hudson. The cliffs assume many fantastic forms, and one cliff resembled a Moorish castle. The current was very strong, and our progress was consequently slow. We reached St. Louis at 6:30 P. M., and tied up alongside of a sand barge astern of Roamer.

ST. LOUIS, MO., MAY 30.

Cloudy and cold. After breakfast, moved up the river and tied up alongside the yacht Annie Russell, where we lay fairly quiet. We rested all day; had lunch ashore, and then went through the market; everything looked very attractive.

[TO BE CONTINUED.]

MANHASSET BAY Y. C. OPEN THE YEAR ROUND.—The amount required for installing hot water heat at the club house, has been raised by private subscription, and the new plant will be in operation by December 1. Pending its completion, the house will be heated as heretofore, by stoves.

The club steward has been retained for the winter, and members may at any time obtain restaurant service and club supplies as desired. The privileges extended to ladies will be continued during the winter.

A table d'hôte dinner will be served every Sunday, provided the attendance warrants, at 75 cents per cover.

Several of the members having proposed that trap-shooting be arranged for, notice is given that there will be a match at the club on Saturday, November 26, at 3 P. M. for prizes provided by private subscription. The arranging of future dates will be dependent on the attendance at the first match.

It is also proposed that a class of scooters be inaugurated for use during the present winter season, and a meeting of those interested was held at the club house on Sunday, Nov. 20.

LAKE MICHIGAN Y. C. OFFICERS.—At a meeting of the Lake Michigan Yachting Association, held at the Hotel Wellington, Chicago, on the evening of November 12, the following officers were elected: President, C. E. Soule, Columbia Y. C.; First Vice-President, J. R. Brunnick, Jackson Park Y. C.; Second Vice-President, R. B. Brown, Milwaukee Y. C.; Sec'y, Charles Scates, Macatawa Bay Y. C.; Treas., Wilbur Bassett, Chicago Y. C. Arrangements were made for the annual regatta August 4 and 5, 1905. A committee to revise the rules was also appointed which will report at an adjourned meeting, December 1.

STEAM YACHT AIDA SOLD.—The 95ft. steam yacht Aida, owned by Mr. Edward Swann, has been sold through the agency of Mr. Henry J. Gielow to Captain L. Darien, Alexandria Bay, N. Y. The same agency has also sold Mr. Thomas Cusack's 45ft. cabin launch Ventura II. to Mr. Beverly D. Beebe, who will use the boat for cruising in Florida waters this winter.

Cruising Launch Nancy Ann.

THE Gas Engine and Power Company and Chas. L. Seabury & Co., Consol., shipped to Galveston, Texas, on Saturday, November 12, an ideal cruising power boat for southern waters. The owner, Mr. W. L. Moody, of Galveston, Texas, has secured an able, commodious, and handsome craft. Very rarely has it been our privilege to inspect a boat so near an ideal cruiser, or one of her size in which comfort and beauty are so well combined.

Her frames are of bent oak, and planking of cedar. All fastenings are of copper. One of the features of her construction is an extra wide guard and wearing strip, appreciated where landings are made at docks or piers in any thing but smooth water.

Butternut and mahogany enter largely in the interior finish, while a handsome teak rail adds decidedly to her appearance. The cushions and hangings in the pilot house are red, while the saloon furnishings are in a green shade. The effect is very pleasing.

Her motive power is two six-cylinder four-cycle Speedway motors, 6in. diameter cylinders and 6in. stroke, developing at 600 revolutions per minute approximately 30 horsepower each. Ignition is by double equipment of separate storage battery, with an emergency battery of primary cells. The jump spark system is used, with special Seabury commutators or distributors.

Nancy Ann has a gasoline capacity of 250 gallons, with the usual water-tight bulkhead and water circulation about the tank so familiar in all the Morris Heights launches.

She developed a speed on her final trial trip of between 14 and 15 miles, proving conclusively that Nancy Ann, while lacking nothing to complete perfect appearance and comfort, is not deficient in power or speed.

Queries on Marine Motors.

C. G., Newark, N. J.—My two-cycle single-cylinder engine is behaving very queerly of late. I have been in the habit of starting it by rocking the flywheel back and forth three or four times, bringing it up at last smartly and letting go. Instead of starting ahead, it runs nearly one revolution ahead, and then in the opposite direction or backwards. If I start it to run in the opposite direction, it runs without reversing. Can you explain why? It was only a short time ago that when I attempted to start it, it would run nearly a revolution ahead, then back, then ahead, and would not pass the upper center. Is my compression too high?

Ans.—Your ignition is undoubtedly of the make-and-break type, and, like nearly every similar make, the engine will run in either direction. It would appear from your description that the eccentric had slipped on the shaft, so that the high point came just ahead of the upper center when going ahead and just after when going astern. You would have two remedies in this case. One would be to make your ignition a little later in starting, gradually increasing the lead in until the engine seems to be doing its best; and the other to move the eccentric, carrying the ignition apparatus a little in the opposite direction and fastening it securely when the high part is exactly on the upper center. In the second case referred to, the ignition was set too early, and the eccentric had not slipped.

Nearly all manufacturers set their eccentrics exactly on the center, but some who always use reversing gears and wheels set theirs a little after the center, claiming that the engine is surer to start in the right direction. It may become necessary to run the engine backwards some time, and it will be found quite inconvenient to start, except with the relief cock open and ignition very late. Occasionally is found a two-cycle engine so built as to run in one direction only. It is only a short time ago that a man who knew all about gasoline engines worked over two hours trying to start at two-cycle engine that would only run in one direction, by rocking the flywheel back and then bringing the starting pin up smartly, letting go.

Occasionally is found the two-cycle engine with the starting pin located 90 degrees after the upper center; and unlucky is he who does not notice or know the difference, should he try to start with the usual late ignition and not let go soon enough.

E. W. B., Boston, Mass.—Do you know of any make of two-cycle marine engine that can be run in either direction and be made to ignite going ahead or backward after the upper center is past?

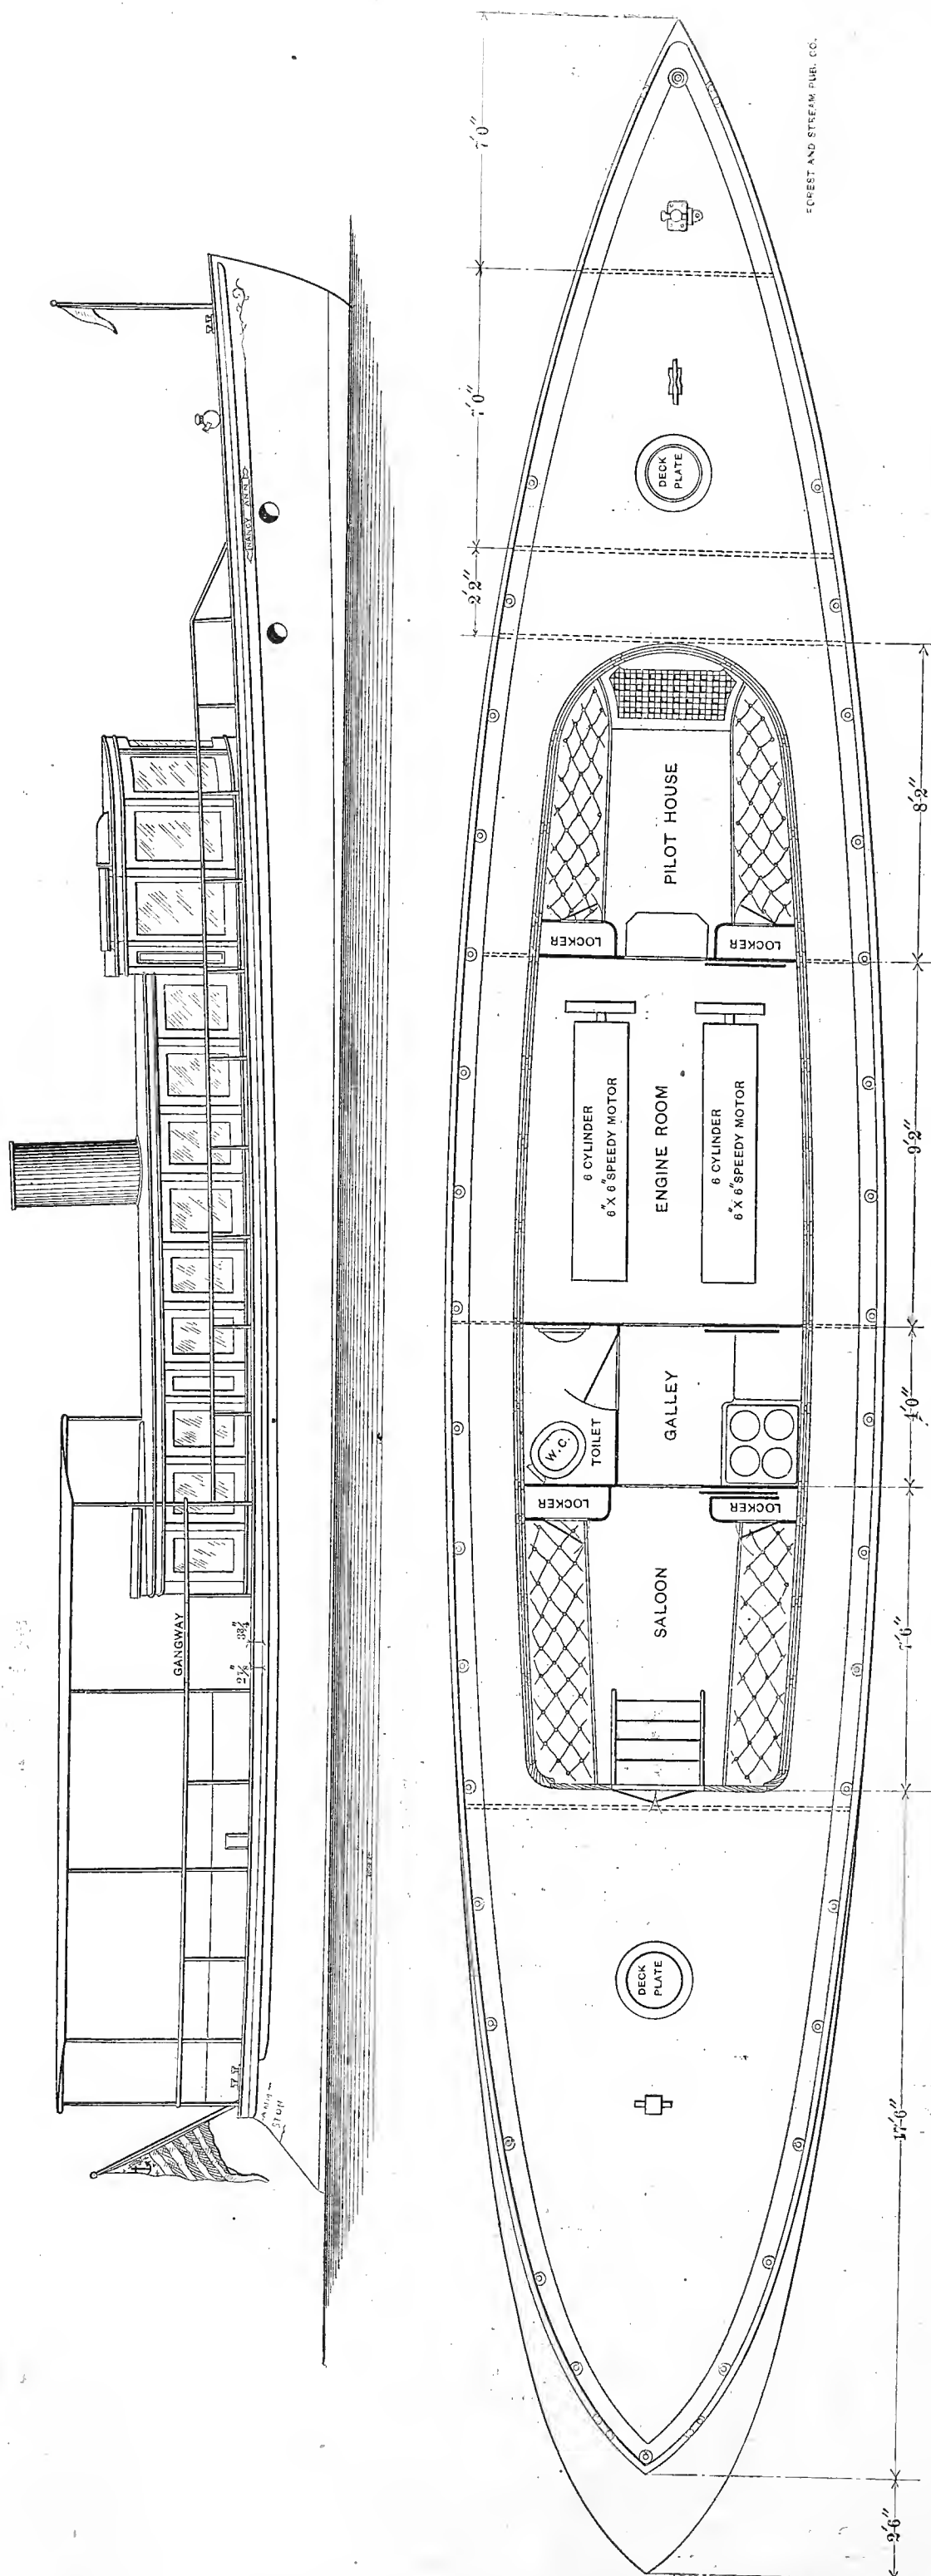

Ans.—There is at least one manufacturer who advertises this feature. We do not know whether patented or not. It is a good departure, for by its use an engine could be started without any danger of "back-kick," and the lead of the spark could be changed to suit. It would be an easy matter to have the igniting eccentric loose on the shaft, with the key-way about three times the width of the key, or possibly twice would be enough; or there could be stops put on the flywheel to accomplish the same object. With a rigid eccentric the spark trip lever must be released before the upper center or while the eccentric is going up, either going ahead or back, or both if set exactly on the center. A very great improvement in the two-cycle construction—the elimination of the danger of getting hit by the dangerous starting pin—could be made, if the engine could be started by turning the flywheel over by hand, leaving the relief cock on the side open.

R. B., Tottenville, S. I.—In my four-cycle engine my float feed carburetor "pops" frequently. Would adding an independent air supply remedy the trouble?

Ans.—Your float feed carburetor "pops," in all probability, from an irregular mixture of gasoline and air, due to variations in the height of the gasoline. When the level is low the mixture is too poor, and when high, nearer correct. To stop the occasional "popping" will reduce the power of the engine, for it will be necessary to increase the richness of the mixture. If this noise is objectionable, an independent air supply, which would in itself increase the efficiency of the engine, would reduce the occurrence at less loss of efficiency.

R. D., Greenport, L. I.—Which is correct, "carburetor," "carburettor" or "carburetor"?

Ans.—According to authorities such as Webster, Century and Standard dictionaries, it is "carburetor," although sometimes spelled "carburettor."

NANCY ANN—CRUISING LAUNCH—DESIGNED AND BUILT BY THE GAS ENGINE & POWER CO. AND CHARLES L. SEABURY CO., CONSOLIDATED—OWNED BY W. L. MOODY, GALVESTON, TEXAS.

YACHTING NEWS NOTES.

For advertising relating to this department see pages ii and iii.

NEW LAUNCH FOR USE IN NEW MEXICO.—The Standard Boat Company, of Steinway, N. Y., have on the stocks a high speed passenger launch for a lake in New Mexico, a commodious steam launch for the Peruvian Government Health Department; also several smaller craft. Prospects with them are excellent for a busy season.

CABIN LAUNCH SHIPPED TO MEXICO.—Through their Mexican agency the Racine Boat Manufacturing Company, of Muskegon, recently shipped to Frontera, Mexico, a 45ft. stock cabin launch. A very interesting thing to note in connection therewith is the item of transportation from factory to destination. Freight to New York was \$78.12; lighterage and freight from New York to final destination, including insurance, \$525.30, or a total of \$603.42, exclusive of duties. They have just received from the west for shipment abroad an 18ft. launch for Seville, Spain; a 11½ft. ducking boat for Tabasco, Mexico, and an 18ft. "Turbine" launch for Buenos Ayres.

NEW ELECTRIC AND STEAM LAUNCHES.—The Electric Launch Company will have ready for delivery December

de B. Parsons and C. L. F. Robinson. Meas., Francis W. Belknap. Committee on Admissions—Henry C. Ward, chairman; Frederick Gallatin, Cornelius Vanderbilt, Tracy Dows and John Jacob Astor. House Committee—Thomas A. Bronson, chairman; John M. Goetchius, Jr., and William H. H. Beebe. Library Committee—T. O'Connor Sloane, chairman; Charles SooySmith and John H. Cole. Committee on Models—Theodore C. Zerega, chairman; Robert Goelet and J. Rutherford Buchan. Committee on Club Stations—William H. Thomas, Henry H. Rogers, F. August Schermerhorn, Augustus C. Tyler, Charles Lane Poor, C. L. F. Robinson, W. Frazier Harrison, Henry C. Ward, William Lanman Bull and J. Rogers Maxwell. The annual meeting of the club will be held on the evening of Thursday, Dec. 15.

NEW BOAT FOR F. J. HAVENS.—There is building at W. F. Down's yard at Bayshore, L. I., a racing boat for Mr. Frederick J. Havens, from designs made by Mr. Henry J. Gielow. The boat is intended for racing in Class Q of the Gravesend Bay Y. R. A., and is 33ft. over all, 25ft. waterline, 7ft. 6in. breadth and 5ft. 6in. draft. She will carry 575 sq. ft. in the mainsail and jib.

ALTERATIONS ON SCHOONER PRISCILLA.—The old schooner Priscilla, once an aspirant to America Cup honors, now

NANCY ANN.

Designed and built by the Gas Engine & Power Co., and Charles L. Seabury & Co., Consolidated.
Owned by W. L. Moody, Galveston, Texas.

1 three 60ft. steam launches for harbor work for the New York Police Department. They shipped last week two electric launches 18ft. and 25ft. long respectively to Palm Beach, Fla., for Mr. Joseph Jefferson.

NIRODHA CHANGES HANDS.—The house-boat Nirodha has been sold by Messrs. Macconnell & Cook to Mr. Waldo P. Clement and Mr. J. E. Childs, of the New York Y. C.

AUXILIARY KETCH FOR HARRISON B. MOORE.—Mr. Henry J. Gielow has recently finished the plans of a cruising ketch for Commodore Harrison B. Moore, Atlantic Y. C. She is 92ft. over all, 66ft. waterline, 20ft. breadth and 6ft. 8in. draft. The boat is intended for cruising in southern waters, and will be fitted with a 25-horse-power Craige motor. Mr. Gielow has also completed designs for a 50ft. high-speed gasoline launch and an 86ft. waterline steam yacht.

OLD MILL Y. C. OFFICERS.—At a meeting of the Old Mill Y. C., held on Nov. 13, the following officers were elected: Com., C. J. Mehrrens; Vice-Com., W. Wheeler; Rear-Com., John Stahle; Cor. Sec'y, Henry H. Robertson; Financial Sec'y, T. Boyle; Treas., Harry Walker; Meas., William Myers; Trustees, D. S. Van Wicklin, John May, Henry Lange, John Schepp and W. Reynolds.

SCHOONER QUICKSTEP PURCHASED BY E. B. HAVENS.—Rear-Commodore Edwin B. Havens, of the Atlantic Y. C., has purchased the schooner Quickstep. The boat was built of steel in 1889 by H. Piepgrass at City Island from designs by the late Edward Burgess. She is 85ft. over all, 65ft. waterline, 20ft. breadth and 7ft. draft.

NEW YORK Y. C. OFFICERS.—The Nominating Committee of the New York Y. C. have selected the following gentlemen to serve as officers and on committees during 1905: Com., Frederick G. Bourne; Vice-Com., Henry Walters; Rear-Com., Cornelius Vanderbilt; Sec'y, G. A. Cormack; Treas., Tarrant Putnam. Regatta Committee—Oliver E. Cromwell, chairman; H.

The Launch Presidente.

SOME two months ago the Lozier Motor Co. shipped the launch Presidente to South America. Her destination was Brazil, where she will be used by the customs officers. Presidente is 31ft. long over all, and is fitted with a double cylinder two-cycle engine of 15 horsepower. The boat is beautifully built, and no detail was overlooked in her construction and equipment to make her as complete as possible in every detail.

The builders sent an expert with the launch to Brazil, in order that full instructions regarding the handling, etc., could be given to the native operator.

"Forest and Stream" Designing Competition No. IV.

Sixty-foot Waterline Cruising Power Boat.

\$225 in Prizes.

THE three designing competitions previously given by FOREST AND STREAM have been for sailing yachts. In this competition, the fourth, we are to change our subject and give the power boat men an opportunity. The competition is open to amateurs and professionals, except that the designers who received prizes in any of the three previous contests may not compete in this one.

The following prizes will be given:

First prize, \$100.

Second prize, \$60.

Third prize, \$40.

Fourth prize, \$25, offered by Mr. Charles W. Lee for the best cabin arrangement.

Mr. Henry J. Gielow, N.A., has very kindly agreed to act as judge. In addition to making the awards, Mr. Gielow will criticise each of the designs submitted; and the criticisms will be published in these columns.

The designs will be for a cruising launch propelled by either gasoline or kerosene motors, conforming to the following conditions:

I. Not over 60ft. waterline.

II. Not over 4ft. draft.

III. A signalling mast only to be shown.

IV. Cabin houses, if used at all, to be kept as low and narrow as possible.

V. Construction to be of wood, and to be strong, simple, and inexpensive. The cost of the boat complete in every detail must not exceed \$9,000.

VI. The location of tanks and engine or engines to be carefully shown. Either single or twin-screws may be adopted. The power and type of the motor must be specified.

VII. The boat must have a fuel capacity sufficient to give a cruising radius of 700 miles at a rate of 8 miles an hour. The maximum speed shall not be more than 14 miles nor less than 10 miles. The estimated maximum speed must be specified.

VIII. All weights must be carefully figured, and the results of the calculations recorded. A thousand-word description of the boat and a skeleton specification must accompany each design.

The design must be modern in every particular, without containing any extreme or abnormal features. We wish to produce an able, safe, and comfortable cruising boat, one that will have ample accommodations, so that the owner and his wife and two guests, or three or four men, can live aboard, and one that can easily be managed at all times by two or three paid hands in addition to the steward. The draft is restricted to 4ft. in order that the boat may have access to nearly all harbors, canals and rivers North and South, and may thereby widely increase the cruising field. We have in mind a boat that can be used North in the summer and South in the winter, and a craft well able to withstand outside passage along the coast in all seasons of the year.

Special attention must be given to the cabin arrangement. The interiors should be original, but devoid of any impractical features. Arrangements should be made for a direct passage forward and aft without going on deck.

Drawings Required.

I. Sheer plan. Scale, ½in.=1ft.

II. Half breadth plan. Scale, ½in.=1ft.

III. Body plan. Scale, ½in.=1ft.

IV. Cabin plan and inboard profile and at least one cross-section. Scale, ½in.=1ft.

V. Outboard profile. Scale, ½in.=1ft.

The drawings should be carefully made and lettered; all drawings should be preferably on tracing cloth or white paper, in black ink. No colored inks or pigments should be used.

The drawings must bear a *nom de plume* only, and no indication must be given of the identity of the designer. In a sealed envelope, however, the designer must inclose his name and address, together with his *nom de plume*.

All designs must be received at the office of the Forest and Stream Publishing Company, 346 Broadway, New York, not later than February 3, 1905. All drawings will be returned. Return postage should accompany each.

The FOREST AND STREAM reserves the right to publish any or all the designs.

NEWPORT Y. C. OFFICERS.—The Newport (R. I.) Y. C. held a meeting a short time ago and elected the following officers: Com., Herbert L. Marsh; Vice-Com., John A. Allen; Rear-Com., Alexander Fraser; Sec'y, William M. Arnold; Treas., John S. Coggeshall; Meas., Albert Hass; Fleet Surgeon, Dr. S. C. Powell; Regatta Committee—John G. Costello, W. Douglass Hazard, William Edson; House Committee—William M. Borden, Frank H. Scannevin, James D. Hidler, Alexander Fraser, Ray B. Wilson, Jr.; Finance Committee—Alvah H. Sanborn, Dalton E. Young, Hugh L. Taylor; Library Committee—William H. Arnold, John S. Coggeshall, and Hugh L. Taylor.

Rifle Range and Gallery.

Fixtures.

Jan. 16-20.—Pittsburg, Pa.—First annual tournament of the Iroquois Rifle Club.

The Palma Trophy.

LAST week the following interesting communication appeared in our esteemed contemporary, Shooting and Fishing, under the heading, "English View Marking of Rifles in Relation to the Palma Trophy Controversy":

"I hoped the Palma controversy was dead, but Colonel Bruce's letter shows it is not. I ask for a little space in which to clear up one or two points.

"The fundamental difference is this. The American contention is: 'It was the duty of the British to protest. They did not do it; therefore we kept the rules.' The British view is this: 'It is the duty of every competitor to keep the rules, and not to await protest.'

"The British viewer's mark has nothing to do with proof at all. It is put on by a government official as a guarantee that the rifle is in all respects of bona fide government pattern. It does include rifling, which is about the most important part of the construction. I inclose an actual view certificate of a rifle I recently finished and sold:

No. 14100

Army Inspection Department,
27 June 1904.

This is to Certify that the Rifle magazine L. M. Mk. II. Barrel and Breech Action submitted by The Birmingham Small Arms Company, Ltd., has been viewed and found to be correct, and in conformity with the Government pattern so far as regards length, weight, bore, rifling, form of chamber and fitting of breech action; that it takes the Government ammunition, and may be used in any match restricted to Government Military Rifles or Carbines of this pattern. The barrel is numbered A036. W. McD. Allardice.
for Inspector of Small Arms.

"Now, every rifle in the British Palma team bore this viewer's mark. I sold Lieutenant Miller his rifle, and it was in every single detail of actual government pattern. It had on the sight a narrow bar to allow of shooting at 500yds. with the leaf up. These are no advantage at 800yds., and they are supplied to soldiers out of army stores at four pence each by the government. They are allowed in army competition and at Bisley, and in the Palma conditions to which all teams agreed. Every rifle was strictly and perfectly of actual government pattern and would have been accepted by the government from any contractor making rifles for the government.

"It would have been quite easy to put five points per man at least on to the average British score by simple changes in the bore and rifling; but that would have been a fraud under the conditions, and the rifles would have been refused the viewer's mark.

"The rifle used by Wallingford was exactly similar to that with which he won the British army championship. That used by Miller was exactly similar to that with which he won the Prince of Wales one hundred pounds, and the Cheylesmore top score of the .303's the next week. I sold him both, and I know Martin, of Glasgow, sold Wallingford his. They were better rifles than ordinary government rifles, because better made and adjusted in many important points, but they were absolutely to government gauges and pattern.

"Now, the American rifles were not of government pattern in rifling, either in form, or spiral, or number of grooves. They shot better than any Krag of government pattern and dimensions. They were in no sense of the ordinary government pattern or dimensions internally, and did not fulfill the conditions to which the team officials had agreed.

"That was well known to me, and some others. But we had no information that this new pattern rifling had not been adopted in the United States since the date of our specimen Krag rifles. Britons would not charge opponents with breach of conditions without absolute proof, and proof was not then available. It was assumed that the American officials of the team would put before the meeting of captains of teams any point on which there could be any doubt, but they failed to do it. The American rifles were accepted in competition at the North London meeting, because they were understood to be the American Army pattern, and the shooting would give a very useful comparison.

"I was not in the British team, but I watched the match very closely and some of the practices. I do not blame the members of the team for using the barrels served to them; they left all such matters to their captain, no doubt. He failed to keep the conditions, and probably he failed to comprehend them. I do not write to try to convert him, but to put facts within my own knowledge before the many friends I have among the riflemen of the United States.

"Until the rifles used by your team were barred out at Sea Girt as not of government pattern, we had no real knowledge that that pattern had not been recently adopted.

"Personally I would have objected before the match or never. But our excellent captain is tenderer in hand and heart than—
"L. R. TIPPINS."

"While I should be very sorry to prolong the discussion of the unfortunate Palma trophy question, there is such a complete misapprehension on your side of the water as to the government viewing and marking of rifles, that some explanation of the matter seems very desirable.

"Viewing and view marks are totally separate and distinct from proving and proof marks; the latter is not done by the government at all, but at either the Birmingham proof house controlled by guardians (composed of members of different sections of the Birmingham gun trade), or else at the London proof house, controlled by the Gun Makers' Company. The proving merely tests the strength and soundness of the barrel and action; a firearm may not be sold here without proof marks.

"The viewing is done by the government viewers at the Government Small Arms Factory at Enfield—the same officials who pass rifles manufactured at Enfield, and also small arms supplied to the government under contract. The view marks are placed on both barrel and action; they certify that the weapon is of strictly government pattern in every particular from buttplate to muzzle, inside and out; for example, sights, chamber, lead, bore, shape, number and depth of grooves, weight and shape of stock, etc. The stock and butt may be made of selected grain wood; but must not be checkered; they may be polished.

"A rifle so viewed may be used in any individual or team service rifle competition at Bisley and other rifle meetings; while one not viewed, if used, will lead to the competitor being warned off such competitions for life. All the rifles used by the British team in the Palma match were used in other service rifle competitions and matches, from the King's prize downward. It is commonly

believed on this side that the United States rifles could not have been used in corresponding competition in America.

"However, whatever either rifles were, the shooting of both the leading teams was beyond question superb; the organization of the United States team was as near perfect as anything in this world, and certainly far ahead of that of the other teams. Personally I think the better organization quite counterbalanced the disadvantage of being less familiar with the range; while the small difference of the scores was, I fancy, mostly due to the difference of the rifles, especially of the sights.

"MAURICE BLOOD."

New York Schuetzen Corps.

FRIDAY, Nov. 11, was a scene of great activity on the Zettler ranges, the above organization holding their first practice shoot. Seventy-five members were on hand to make things interesting. Scores: R. Gute 487, G. Ludwig 473, O. Schwansman 470, P. Heidelberg 463, B. Zettler 462, C. König 456, F. Facompre 455, H. Hasse 455, J. N. F. Seibs 454, J. C. Bonn 453, L. C. Hagenah 453, J. C. Brinckman 449, J. Paradies 448, J. H. Hainhorst 446, J. Facklamm 445, C. Seivers 445, J. G. Tholke 445, M. J. Then 443, H. D. Meyer 441, N. C. L. Beverstein 441, G. N. Offerman 439, H. Nordbruck 436, H. C. Hainhorst 438, W. Dahl 436, J. H. Meyer 437, C. Schmidt 434, H. Beckman 434, H. Leopold 432, H. Offerman 432, H. B. Michaelson 432, J. C. Brinckman 432, Wm. Grell 431, A. W. Lemcke 431, Wm. Schultz 430, A. Beckman 428, G. Thomas 426, Geo. Junge 426, C. Roffman 426, J. N. Herrman 424, J. H. Krozer 420, J. Schmidt 419, H. Gobber 418, H. Koster 418, Dr. Chas. Grosch 417, J. Jantzen 417, H. Mesloh 417, A. Evers 416, C. Maun 415, F. W. Dierks 415, H. M. Meyer 411, Hecker 410, H. Hess 408, J. Bradley 407, H. Kahres 407, W. P. Rottmann 401, H. Caplan 400, L. Goldstein 389, A. Geibchaus 389, D. Ficken 387, Chas. Beach 382, D. Von der Leith 380, G. N. Bohlen 377, W. J. Behrens 373, F. Schultz 367, M. Von Dwingelo 363, N. W. Haaren 357, P. Pranz 356, F. Lankeman 355, G. H. Ficken 349, C. Knell 339, C. Heilshorn 328, W. Schaefer 319, B. Krumm 303, J. F. R. Ernst 282, R. Ohms 125.

On the bullseye target, the following centers were made: L. C. Hagenah 35 degrees, F. W. Dierks 41½, F. Schultz 41½, H. Nordbruck 42½, H. Hasse 54, H. Beckman 55½, J. H. Hainhorst 62, J. N. Herrman 65, John Bradley 66, Jacob Schmidt 75½, H. D. Meyer 76, H. Mesloh 80½, J. Jantzen 86, J. Facklamm 89, H. C. Hainhorst 91, J. N. Seibs 92, Hy. Decker 102, William Dahl 109, H. Gobber 110, J. C. Brinckman 118, H. Kahres 119, C. Maun 122½, C. Schmitz 129½, P. Heidelberg 163½.

Championship 100 Shot Match, 1904.

THIS match, held annually under the auspices of the Zettler Rifle Club, was shot on the Greenville range Election Day, Nov. 8, under ideal weather conditions.

The range was open for practice at 9 A. M., with plenty of competitors on hand long before that time. In last year's contest several were handicapped, on account of a late start, and were unable to finish; but this year the match started promptly at 10 A. M., the only shooter unable to finish being M. Dorrier, who did not enter the match until the afternoon.

The allowance of telescope sights this year seemed to meet with the approval of many, several men at once availing themselves of the privilege. Mr. H. M. Pope, of Chicopee Falls, Mass., was the winner of the match.

At the close of the contest a banquet was served at the park, and a very pleasant evening was had in discussing past performances. Scores follow: H. M. Pope 2270, W. G. Hudson 2250, F. C. Ross 2233, George Schlicht 2197, W. A. Tewes 2188, J. T. Humphrey 2146, R. Gute 2101, W. A. Barker 2100, L. P. Hanson 2088, L. P. Buss 2084, A. Hubalck 2082, L. Schmidt 2034, Owen Smith 2002, H. F. Barning 1988, George Bain 1966, H. Fenwirth 1964, J. Kaufman 1935, C. E. Taintor 1919, A. Begcrow 1902, P. Andrassey 1894, B. Zettler 1874, L. Maurer 1850, O. Mertens 1801, P. J. Donovan 1790, M. Behm 1728, A. Fritsky 1504.

Rifle at Shell Mound.

SAN FRANCISCO, Nov. 15.—Capt. Louis Siebe, proprietor of Shell Mound Range, yesterday gave a shoot and a dance, to signalize the closing of the picnic season. The attendance was large, as the Captain is a very popular host. All enjoyed the choice dinner served by the proprietor and his wife.

The regular club competitions were held, and the average scoring was high. The interest was keen, as Dec. closes the competition for the much-desired annual medals. Notable scores were: F. E. Mason 233 with rifle, 200yds., and D. B. Faktor 231.

I am very much pleased to see that there is serious talk of putting the Government arm into the hands of civilian marksmen. It would also be the best possible investment for the Government to furnish an abundance of ammunition to the State militia without cost. The question of ranges is a perplexing one; but a 500 or 600yd. range can readily be established near every town or city, and a man who does good work at this distance can be counted on to do effective work at longer distances. I earnestly hope the general Government will take the necessary steps to make a marksmen out of every citizen.

ROEL.

New York Central Schuetzen Corps.

A good attendance and keen competition marked the opening of the season's gallery practice for the above society, held on the Zettler ranges, Wednesday, Nov. 16:

Ring target: R. Gute 487, R. Busse 481, Geo. Zimmerman 476, J. Hess 474, H. D. Muller 473, D. Scharninghausen 466, J. N. Seibs 461, C. Gerken 460, Geo. Viemeister 458, F. Rolles 454, M. Oltmann 452, G. Rohdes 450, W. J. Daniels 449, H. Roffman 447, A. Ritterhoff 440, J. von der Leith 436, P. Bauman 434, H. Brummer 428, H. von der Leith 425, C. Tietjen 404, H. A. Fiecke 396, D. Wuehrmann 395, J. Eismeyer 366, G. Dillhoff 362, F. Ricker 342, J. C. Miller 328.

Bullseye target: H. A. Fiecke 65½ degrees, J. N. Seibs 67, H. Roffman 72½, R. Busse 88, D. Scharninghausen 93½, J. Hess 99, G. Rohde 99, B. Eusner 118, G. Zimmerman 122½, J. von der Leith 125, W. J. Daniels 127, A. Ritterhof 129, H. Brummer 130, F. Rolles 134, R. Gute 144, C. Gerken 152½, H. D. Muller 159, Geo. Viemeister 160, M. Oltmann 164, H. von der Leith 182½, F. Ricker 189, P. Bauman 200, G. Dillhoff 229.

New York City Schuetzen Corps.

SCORES follow for the regular practice shoot at headquarters, 155 West Twenty-third street, New York, Nov. 17:

Ring target: A. Kronsberg 482, C. G. Zettler 477, R. Busse 473, R. Schwaneman 468, J. Metzger 449, G. Schroeter 431, Wm. Heil 403, A. Wiltz 402.

Bullseye target: R. Schwaneman 69 degrees, R. Busse, 100, J. Keller 116, J. Metzger 130, G. Schroeter 141½, A. Kronsberg 148, Wm. Heil 195, A. Wiltz 222.

Cincinnati Rifle Association.

THE following scores were made in regular competition by members of the Cincinnati Rifle Association at Four-Mile House, Reading, on their last regular shoot day. Conditions: 200yds. off-hand, at the 25-ring target. Hasenzahl was declared champion for the day, with the good score of 228. He was also high on the honor target with 67 points. A tricky 6 to 9 o'clock wind blew all day, making good scores difficult to make:

Hasenzahl	228	217	217	215	207
Payne	224	222	222	220	218
Nestler	220	218	215	214	213
Bruns	220	214	211	209	209
Roberts	215	213	213	212	212
Hofer	215	215	202	201	200
Odell	213	212	210	209	208
Hofman	210	204	197	194	192
Freitag	208	200	191	186	185
Trounstine	199	185	175	158	...

New York Independent Corps.

THE second practice shoot of this club was held Thursday evening, Nov. 10. Scores follow: H. D. Muller 484, L. Schmidt 484, F. Liegebel 482, A. Begerow 478, F. A. Young 471, J. N. F. Siebs 469, J. Bittschner 467, J. Facklamm 467, Wm. Soell 467, G. T. Zimmerman 464, J. Schmid 457, B. Eusner 452, H. J. Behrens 439, H. Kabiske 427, F. C. Halbe 422, A. Rodler 410.

Zettler Rifle Club.

THE appended scores were recorded on Nov. 15 in the regular weekly shoot on the regular 25-ring target, 75ft., offhand: L. C. Buss 1229, C. Zettler, Jr., 1217, L. P. Hansen 1216, G. Schlicht 1214, R. Gute 1213, C. G. Zettler 1210, R. Zettler 1191, H. C. Zettler 1188, A. Begerow 1183, H. Fenwirth 1180, L. Maurer 1176, T. H. Keller 1169, G. J. Bernius 1163, F. Herpers 1145.

Rifle Notes.

The team match shot on the Creedmoor range Nov. 12, between the Ninth and Seventy-first Regiments, resulted in a victory for the Seventy-first by a margin of 31 points.

S. M. Van Allen, of Jamaica, N. Y., the expert fancy rifle shot, left Saturday for the south on a hunting trip in company with a party of well-known sportsmen. The trip, we believe, is to be an extended one.

The Iroquois Rifle Club, of Pittsburg, will hold their first annual rifle tournament under the auspices of the Indoor .22 Caliber League of the United States, Jan. 16-20.

Trapshooting.

If you want your shoot to be announced here send a notice like the following:

Fixtures.

Nov. 24.—Ossining, N. Y., Gun Club merchandise shoot. C. G. Blandford, Capt.
Nov. 24-26.—Tucson.—Arizona Sportsmen's Association tournament.
Nov. 29-Dec. 1.—St. Thomas, Ont., tournament.
Nov. 30.—Edgewater, N. J.—All-day shoot of the Mullerite Gun Club. A. A. Schoverling, Mgr.
Dec. 6-8.—Salina, Kans.—Anderson's tournament.
Dec. 17.—Lakewood, N. J.—All-day shoot of Mullerite Gun Club. A. A. Schoverling, Sec'y.
1905.
Jan. 17-20.—Hamilton, Can., Gun Club live-bird tournament. J. Hunter, Sec'y.
Jan. 23-28.—Brenham, Tex.—Sunny South Handicap.
Jan. 31-Feb. 2.—Taylor, Tex.—Central Texas Handicap.
Jan. 31-Feb. 2.—Taylor, Tex.—Central Texas Handicap tournament. C. F. Gilstrap, Mgr.
Feb. 6-9.—Houston, Tex.—Len's Grand Southern Handicap. Alf. Gardiner, Mgr.
June 8-9.—Dalton, O., Gun Club annual tournament. Ernest F. Scott, Capt.

West Virginia Sportsmen's Association.

SISTERSVILLE, W. Va., Nov. 21.—We should like to claim the following dates and announce to the shooting fraternity that the ninth annual tournament of the West Virginia State Sportsmen's Association will be held on the grounds of the Ohio Valley Shooting Association, Parkersburg, W. Va., May 16, 17 and 18, 1905.

I am informed that, besides a number of merchandise prizes of value, there will be something like \$600 in cold cash added to the purses.

The affair will be under the management and personal direction of the three famous Indians: F. E. Mallory (Chief Tell'm How), Jno. F. Mallory (Chief Hole Digger), and Hon. S. T. Mallory (Chief Life Saver). These noted warriors are thoroughly civilized and quite peaceable, and no one would suspect that they are full-blooded Comanches. It has been a long time since they have killed any one. While, on festive occasions, a great many would naturally expect them to appear on the shooting grounds in paint and feathers, to eat raw meat and drink blood, we positively assure all that they will do nothing of the kind. On the other hand, they walk and talk as other people, and have actually been known to take their own lives in their hands in rescuing those of their tribe. Upon this particular occasion, we guarantee that they will do their utmost to provide every comfort for their visitors, and to do all in their power to make our ninth annual a banner tournament. We will have something more to say about this shoot later.

ED. O. BOWER, Sec'y.

DRIVERS AND TWISTERS.

Club secretaries are invited to send their scores for publication in these columns, also any news notes they may care to have published. Mail all such matter to Forest and Stream Publishing Company, 346 Broadway, New York. FOREST AND STREAM goes to press on TUESDAY OF EACH WEEK.

The regular shoot of the Montclair, N. J., Gun Club will be held on Thanksgiving Day, commencing at 9 o'clock.

There will be an all-day shoot at Point Breeze, Philadelphia, on Thanksgiving Day. Competition will begin at 10 o'clock. A special match is fixed to take place between Messrs. Fred Murphy and C. W. Wilson, at 25 birds, \$50 a side.

**NEVER FAILS and
ALWAYS ACCURATE**

497-503 Pearl Street, 35-43 Park Street, New York.
114-116 Market Street, San Francisco.

A team shoot as an important feature of the Grand American Handicap, is advocated by an esteemed Western contemporary.

Capt. E. B. Wadsworth, who is famous as a trapshooter and catcrer, issued an invitation to many of his personal friends to be present on the 19th inst., at the re-opening of the historical Hancock Tavern, now situated at 60 State street, Boston.

On account of bad weather, the Hudson Gun Club series of three contests for a gun was postponed. The first shoot is to be held on Nov. 27. The competition is open to every one. Handicap, point system; 25 targets, re-entry; three best scores to count.

An all-day shoot of the Mullerite Gun Club will be held on the grounds of the Lakewood Gun Club, Lakewood, N. J., on Saturday, Dec. 17, commencing at 10 A. M. Programmes later. A special 100-target handicap will be one of the events. Messrs. Frank Muldoon, Freehold, N. J., and A. A. Schoverling, 2 Murray street, New York, are the managers.

The programme of the second Mullerite Gun Club shoot, to be held on the grounds of the North River Gun Club, Fort Lee, N. J., Nov. 30, has four events: One at 10, two at 20 targets, 65 cents and \$1.30 entrance, \$1 and \$2 added. No. 4, the Mullerite Handicap, 100 targets, \$4 entrance, will begin at 1 P. M. Re-entry, \$2. Targets 1½ cent. Shooting begins at 10 A. M.

At Philadelphia and vicinity, the Philadelphia Trapshooters' League matches resulted as follows: 'Clearview defeated Media by a score of 181 to 167; North Camden defeated the Hill Rod and Gun Club, of Chester, by 184 to 159; the Highland team defeated the Hillside team at Chestnut Hill by a score of 163 to 160. Meadow Springs defeated Narberth by a score of 163 to 148; the Florists defeated the S. S. Whites by 179 to 170. Each team consisted of ten men, and each man shot at 25 targets.

The ninth annual live-bird shoot, to be given by the Magic City Gun Club, Muncie, Ind., on Nov. 24, has a programme as follows: Nos. 1, 5 birds, entrance \$5; No. 2, 7 birds, entrance \$7; No. 3, 20 birds, handicap, entrance \$15; No. 4, 10 birds, handicap, entrance \$7. Extra events to suit the shooters. Interstate Association rules will govern. Division of money, 50, 30 and 20 per cent. in 5 and 7 bird events; 35, 30, 20 and 15 per cent. in 10 and 20 bird events. Ship shells, etc., to F. L. Wachtell, Secretary. High grade loaded shells on the grounds. The programme contains the following invitation: "Come and assist us to dispose of another of those big country turkey dinners with our compliments." The officers are: President, J. W. Farrell; Treasurer, Mr. G. G. Williamson; Secretary, Mr. F. L. Wachtell.

Indianapolis Gun Club.

INDIANAPOLIS, Ind., Nov. 19.—Scores made to-day were as follows:

Events:	1	2	3	4	5	Shot
Targets:	20	20	20	20	20	at.
Vietmeyer	13	19	17	17	19	100

Prizes won as follows: Turkey: Parry, Bell, Partington and Farrell. Duck: Cooper, Harcourt, Farrell and Moore. Chicken: Bell, Leib, Steffin and Harcourt.

The club desires to express its thanks to Mr. H. W. Van Nest for his very kind assistance.

Mr. J. W. Farrell, of Muncie, Ind., has challenged Mr. A. S. Flinn, of Wabash, Ind., present holder of the English Hotel cup.

WESTERN TRAP.

ADAIR, Ia., Nov. 16.—With weather the very best, and a good attendance, the Adair shoot came off on time yesterday. There was a good crowd of visitors out to witness the shooting of such experts as Budd and Adams. The other trade men present were Fred Whitney and M. Sharp.

The amateurs were so evenly matched that two targets would cover the difference, viz.: H. H. Frickle 179, F. McLuren 178, Talbott Baker and McDowell 177.

The gentlemen who were at the top as amateurs are new men at the game, and if they have, as claimed, had little opportunity to practice, they are surely comers.

In the champion event there were five ties of 19 out of 20, viz.: Burger, McDowell, McLuen, Talbott and Vermylia. On the shoot-off Vermylia brought the Winchester to the front and won out. Scores, at 200 targets: C. B. Adams 177, F. H. Adams 166, Fred Vermylia 172, C. E. Talbott 177, C. W. Budd 188, C. Harkin 159, J. Biggs 187, C. Rober 153, T. Baker 177, A. P. McDowell 177, F. McLuren 178, J. Burges 173, J. Fickle 179, J. Hansen 145.

At Detroit.

Detroit, Mich., Nov. 16.—The hunting season being on, there is not a full turnout at the traps as formerly, yet the Grosse Club held a shoot yesterday at the Seven-Mile House, that was well attended. Carl Weist Jr., came off victorious with the A medal; Fred Koster was down for the B, and Dwyer carried away the C medal.

At El Paso.

El Paso, Tex., Nov. 14.—There has been something doing here for the past six weeks or more, as the boys have had the presence of Frank Faurete, and besides, the big tournament coming on to stimulate the members of the club to action. Now that the shoot is so near at hand, we have another addition in T. E. Hubby. There will be more here soon, as Harold Money and Wm. Heer are expected to-morrow, together with many of the good shots from the State of Kansas.

In order to keep in line with these gentlemen, our best shots, such as Rand, Shelton, Campbell and Pennebacker, have kept in good practice, as the following scores will show: Faurete shot at 100, broke 85; T. Hubby 75, 71; Rand 100, 96; Shelton 75, 52; Campbell 100, 86; Edwards 50, 29; Pennebacker 50, 45; Hitt 50, 28; Vilas 50, 29.

At Freeport.

Freeport, Ill., Nov. 15.—There will be a tournament held here in two weeks at which the diamond badge will be put in competition. Rockford, Beloit, Belvidere and other clubs will take part. This badge is now held by J. R. Graham, of Ingleside, Ill., he having won same at the late Rockford tournament. Scores: W. Waddington shot at 115, broke 87; F. Lord 65, 48; W. H. Vietmeyer 165, 139; C. T. Keck 100, 77; L. Younglove 100, 48; R. Wilson 75, 41; R. Farrell 100, 61; H. Janssen 100, 42; Dr. Karchner 65, 28; E. White 25, 21.

In Other Places.

Chicago shooters are active, and the old familiar Watson's Park is in line as of yore for at least two days of each week, as there is one club that shoots each Saturday, and another every Sunday. The shooting within the city limits is confined to that of target shooting. A series of shoots is now being held, the final one being in March, 1905, for which several prizes will be awarded.

The Aetna Gun Club, of St. Louis, has established winter quarters, having completed a comfortable club house. This will accommodate those who wish to spend a portion of Saturday or Sunday at the traps. Messrs. Doggs and Lanberg are the proprietors and will be pleased to meet all who wish to practice.

On Nov. 27, at the Progressive Gun Club grounds, East St. Louis, Ill., the second shoot for the championship of St. Louis, East St. Louis and Belleville will be held. Mr. Clay won the first shoot, and it will keep all busy to prevent him from winning.

The Sterling, Ill., Gun Club has abandoned the traps for the winter season. The money in the treasury was divided, and now it will be up to individuals to conduct the winter live-bird and target tournaments.

During the past ten years, while in many localities trapshooting is entirely abandoned, there has been more tournaments held in the central part of Illinois in the winter than during the summer. This is accounted for on the theory that the farmers who shoot are not so much engaged during the winter, hence more time for shooting.

The Hempstead County Hunting Club, of Hope, Tenn., has filed articles of incorporation. The incorporators are: J. F. Ward, President; D. M. Goodlett, J. H. Wallace, J. C. Jones, W. Y. Foster, R. M. Wilson, C. V. Jagersville, W. S. Eakin, J. F.

Jehonson, S. Knobel, J. R. Hewing, J. H. Black, C. E. Ratcliff and W. M. Green.

Chas. M. Whitlaw, member of the Spokane, Wash., Rod and Gun Club, died last Friday, at Wallace, Idaho, of pneumonia. He was one of the leading fanciers and had dogs in hands of Eastern trainers. He was prominent in the meetings of the Northwestern Sportsmen's Association.

The newly organized gun club, the Amateur, of Davenport, Ia., has started in on a social season by holding a dance on last Saturday night at the Northwest Turner Hall.

At the next shoot to be held by the Barborton, O., Gun Club the cup given for the championship of Portage, Summitt and Stark counties will be decided. Akron has a lead, though Canton and Barborton tied at the last meeting.

The eighth shoot of the Missouri League was held Thursday, Thanksgiving Day, at Kansas City. This winds up the season.

Chas. W. Budd, the veteran trap shot, after his two weeks' rest at the World's Fair, quit his "fudging" long enough to win the high average at the Adair, Ia., tournament, held Nov. 12.

A new shooter in the person of W. H. Biggs won the amateur high average at the Adair, Ia., tournament, held Nov. 15.

There was a fair number of shooters at the Springfield, O., shoot, held Saturday last. The prizes were turkeys. The winners were Watkins, Young, Foley, Henderson and Oates on straight scores.

The Ohio Valley Shooting Association, of Parkersburg, W. Va., after meeting, called off their shoot of last Saturday. The biggest shoot of the season will be the "Jack rabbit," to be held Thanksgiving afternoon. It is said that shooters from Maritta, St. Marys, Sistersville, Wheeling and Parkersburg will participate.

Indianola Gun Club, Columbus, O.

THE Indianola Gun Club, of Columbus, O., held their last shoot of a very successful season on Nov. 12, with a good attendance of shooters and spectators. The features of the day were the match for the Wolf trophy and the final in the series of contests for merchandise prizes.

Those present were disappointed in the match between Webster and Buchanan for the Wolfe trophy, as neither of the contestants shot in his usual form. The weather condition were not of the best, still it was felt that the men should have made a better showing. In the first half they tied on 23, and in the second, Webster led by two targets, winning the trophy—45 to 43.

The prize contests were exciting throughout. Several shooters were disappointed, of course, but proved to be cheerful losers. Darby, Buchanan, H. E. Smith, Mooney, Newlove, and Harrison all got in the shoot-off. In the first all dropped out but Newlove and Harrison, who broke 9 out of 10 each. In the second Harrison went straight and took second prize. H. E. Smith, J. H. Smith and Newlove, each of whom had won the badge once, decided the winner in the third shoot-off, H. E. Smith breaking 9 out of 10, taking third prize. First prize, a Winchester shotgun, was won by G. B. Buchanan. Second prize, case of shells, F. H. Harrison. Third prize, a pair of hunting boots, H. E. Smith.

Darby had a good show for a prize in the first shoot-off, but after breaking his first 8 straight, he missed 2, and it was all off.

The club will hold a merchandise shoot New Year's Day, and invites all shooters to be present. It will be the best shoot Columbus ever saw.

In the prize contest at 25 targets, Buchanan led to-day with 25 straight. Webster and Darby tied for second on 23. Newlove and Harrison third, 21 each. Dr. Wilcox and Weinman fourth on 20 each. J. H. Smith, H. E. Smith and Mooney in order named 19, 18 and 15.

Eight 10-target events were shot. Bassell led the crowd with 49 out of 70, Dr. Wilcox 44 out of 50, H. E. Smith 40 out of 60, Webster and Darby 33 out of 40 each, Buchanan 23 out of 30, Mooney 29 out of 40, Weinman 25 out of 30, J. H. Smith 19 out of 20, Borger 17 out of 20, Jesse Smith, Harrison and Newlove shot in only one event, scoring 5, 10 and 6, respectively.

Cincinnati Gun Club.

The game season is responsible for the slim attendance at the shoot on Nov. 19. The weather was perfect, but only five men took part in the cash prize event. Gambell and Medico led with 42 each. Sycamore was second with 40. Peters did good work in a match at 50 targets, breaking 47, Gambell second with 45, Medico third with 43, and Roll 25.

Shooting at 12 pairs, Gambell broke 14, Peters 11 and Harig 10. Little practice work was done, Harig showing the best, missing but 2 out of 40 shot at.

The cash prize series ends in February, when it is probable that other prizes will be offered, the winners to be decided in three months instead of one year.

The Peters Cartridge Co. has offered a solid gold watch fob. This will be shot for three months, the handicap probably being

the same as used in the Parker gun shoot. The first contest will be held early in January.

Col. Bob West left for the Hot Springs on Nov. 21, and will remain there some time.

Five new expert traps are to be installed. They will be placed in a long, straight pit, dug just in front of the old live-bird traps, and will have a high blind. Every variety of target flight can be had, and a good opportunity for practice afforded the members.

The annual game supper of the club will be held on the second Thursday in December.

Judge Gregg, Harry Rowe, George Given and Henry Koch are hunting in Brown county, where quail and rabbits are fairly abundant. D. Brelin and Fred Prince are at New Baltimore, O., and will work northward in their search for birds. John Schatzman and Fred Dreihls are hunting among the hills and vales of Adams county. Dreihls took a dachshund with him, as he is as fond of rabbit hunting as of quail. Lewis Ireton and Taylor McDougall have gone to West Virginia after big game. The day's scores follow:

Cash prize shoot, 50 targets, distance handicap: Gambell (18) 42, Medico (19) 42, Sycamore (19) 40, Foley (19) 35, Roll (20) 27.

Welfare Gun Club.

THE Welfare Gun Club, of Dayton, held their regular medal shoot on Nov. 12. Enough were present to make an enjoyable afternoon of sport. Three practice events were shot at 15, 10 and 25 targets respectively, Spangler shooting in all and missing but 4 out of the 50. Event 3 was the medal contest, with six men entered. Monbeck won after three shoot-offs. Event 4 was a team match, five men, from the N. C. R. Polishing Department against five men representing all the other departments of the factory, at 25 targets each. The Polishers were defeated by 103 to 95.

E. F. Watson returned from a most successful hunting trip in the Blind River district of Ontario. He brought back a moose weighing 1032 pounds and having a magnificent pair of antlers, spreading 52 inches, with 11 and 12 points. Mr. Watson killed him on Nov. 3. At the time he was thirty-five miles northwest of the Blind River. Mr. Watson presented the meat to the N. C. R. officers' club, and is having the head mounted.

John J. Stoecklein and Charles W. Sander have gone to Mississippi, and will be gone several weeks hunting wild turkeys, quail and partridges.

Springfield (O.) Gun Club.

ELEVEN members indulged in a shoot on Nov. 12, a turkey being given as a prize in each of the first seven events. The eighth event was at 25 targets for the targets. Watkins won the first event with a straight score of 10 and took the turk. Young won the bird in the second event after shooting off a tie on 9, with Henderson, Watkins and Poole. The other winners were: Third event, Foley; fourth event, Young; fifth, Young and Watkins divided the bird; sixth, Henderson; seventh, Oats. Watkins was high in the last event with 24 out of 25; Young a close second with 23. Seven 10-target and one 25-target event were shot.

Philadelphia Trapsshooters' League.

THE schedule of the Philadelphia Trapsshooters' League is as follows:

Dec. 3—Narberth at Hill Rod and Gun Club, Chester; Meadow Springs at Camden; S. S. White at Highland; Hillside at Media; Clearview at Florists'.

Dec. 17—Camden at S. S. White; Florists' at Highland; Hill Rod and Gun Club at Media; Clearview at Meadow Springs; Hillside at Narberth.

Dec. 31—Narberth at Clearview; Highland at Hill Rod and Gun Club, Chester; Meadow Springs at Florists'; Camden at Hillside; Media at S. S. White.

Jan. 14—Highland at Meadow Springs; Florists' at Media; Hill Rod and Gun Club at Hillside; Clearview at Camden; S. S. White at Narberth.

Jan. 28—Narberth at Florists'; Meadow Springs at Hill Rod and Gun Club, Chester; Camden at Media; Hillside at S. S. White; Clearview at Highland.

Feb. 11—Florists' at Camden; Highland at Narberth; Hill Rod and Gun Club at S. S. White; Media at Meadow Springs; Hillside at Clearview.

Feb. 25—Camden at Highland; Clearview at Hill Rod and Gun Club, Chester; S. S. White at Meadow Springs; Narberth at Media; Florists' at Hillside.

March 11—Clearview at S. S. White; Meadow Springs at Hillside; Highland at Media; Florists' at Hill Rod and Gun Club, Chester; Narberth at Camden.

March 25—Camden at Hill Rod and Gun Club, Chester; Narberth at Meadow Springs; S. S. White at Florists'; Hillside at Highland; Clearview at Media.

April 8—Hill Rod and Gun Club at Narberth; Camden at

Meadow Springs; Highland at S. S. White; Media at Hillside; Florists' at Clearview.

April 22—S. S. White at Camden; Highland at Florists'; Media at Hill Rod and Gun Club, Chester; Meadow Springs at Clearview; Narberth at Hillside.

May 6—Clearview at Narberth; Hill Rod and Gun Club at Highland; Florists' at Meadow Springs; Hillside at Camden; S. S. White at Media.

May 20—Meadow Springs at Highland; Media at Florists'; Hillside at Hill Rod and Gun Club, Chester; Camden at Clearview; Narberth at S. S. White.

June 3—Florists' at Narberth; Hill Rod and Gun Club at Meadow Springs; Media at Camden; S. S. White at Hillside; Highland at Clearview.

June 17—Camden at Florists'; Narberth at Highland; S. S. White at Hill Rod and Gun Club, Chester; Meadow Springs at Media; Clearview at Hillside.

July 1—Highland at Camden; Hill Rod and Gun Club at Clearview; Meadow Springs at S. S. White; Media at Narberth; Hillside at Florists'.

IN NEW JERSEY.

Montclair Gun Club.

MONTCLAIR, N. J., Nov. 12.—Some ten men participated in the regular Saturday afternoon shoot to-day.

Events 1 and 2 were for practice. Kendal made the best score, 23. Event No. 3, 10 targets, handicap match, prize a pearl-handled knife, was won by Mr. Kendal. Event No. 4, 15 targets, handicap, was tied for by Messrs. Bush and Wallace with an even score of 15, but on the shoot-off, miss-and-out, the prize, a recoil pad, went to Mr. Wallace. Event No. 5, miss-and-out, went on the fourth round to Mr. Winslow, who took home a pendometer. Event No. 6, 25 targets, was tied for by Messrs. Holloway, Hartshorne and Winslow, and on the shoot-off the prize, a gun case, went to Mr. Winslow. Event No. 7, 10 targets, prize a pearl-handled knife, was won by Mr. Holloway, with 9 breaks to his credit.

Events:	1	2	3	4	5	6	7
Targets:	25	25	10	15	25	10	
C. W. Kendall, 0.....	21	23	9	14	1	22	8

Winslow, 8	13	15	4	10	4	23	7
Cockfair, 0	19	22	8	11	1	17	8
Bush, 6	18	7	15	3	19	4	
Force, 4	6	5	1	13	6	
Hartshorne, 8	8	8	1	23	4	
Holloway, 8	9	..	23	9	
Robinson
Soverel, 2	19	..

Events 3, 4 and 6 were handicaps. Handicaps as indicated at each shooter's name, are based on 25 targets. Same percentage applies on the 10 and 15-target events.

Nov. 19.—Eleven men faced the traps to-day and spent a very pleasant afternoon. The weather conditions were perfect, but no new records were made in the shoot for the silver cup.

The regular shoot of the club will be held Thanksgiving morning at 9 A. M.:

Events:	1	2	3	4	5	Events:	1	2	3	4	5

EDWARD WINSLOW, Sec'y.

Trap at Point Breeze.

PHILADELPHIA, Pa.—On Saturday, Nov. 19, fifteen contestants took part in the live-bird competition at Point Breeze. In the prize shoot, 10 birds, handicap rise, Mr. Fred Murphy was the only one who scored straight. The scores follow:

Murphy	2121211111	10	Singerly	2212022202	8
Wilson	2222222022	9	Hyland	*212122200	7
Boshell	222222222*	9	McAnany	*222020112	7
Delaney	1111111011	9	Williams	22022220*1	7
Vincent	222022222	9	Copeland	2220020022	6
Aiman	22202222*	8	Thomas	*2212022*	5
Edwards	202022221	8	Scott	00220220*1	5
Martin	0*21212122	8			

Miss-and-out sweepstake, entrance \$2: Aiman 6, Murphy 6, Boshell 6, Delaney 6, Wilson 5, Edwards 5, Copeland 5, Martin 5, Singerly 4, French 3, Ford 3, Thomas 2.

Rochester Rod and Gun Club.

ROCHESTER, N. Y., Nov. 15.—In the final contest Mr. George Borst secured possession of the Hunter Arms cup. Prior to this shoot, he had a lead of one point over Rickman, who also won a point, as did T. F. Adkin, yet he had to be satisfied with second honors.

Owing to the fact that winning the Hunter Arms cup rested between Borst and Rickman, only five competed in the event, the others participating in special sweepstakes. Adkin made the best actual score with a perfect string. Borst, with a handicap of 6 just managed to make his point, while Rickman, with the same handicap, had two more than the necessary 25. The scores:

Brk. Hdp. Tot'l.			Brk. Hdp. Tot'l.				
Rickman	21	6	27	Stewart	24	0	24
Adkin	25	1	26	Kershner	15	1	16
Borst	19	6	25

Trap Around Reading.

TAMAQUA, Pa., Nov. 5.—Sportsmen from all parts of the region saw Michael Hannon, of this city, defeat Reese Reese, of Lansford, in a shooting match at 25 live birds each for \$110 a side, and the gate receipts. Hannon killed 18 birds to his opponent's 12.

Bethlehem, Pa., Nov. 3.—Seven of the crack wing shots of the Lehigh Gun Club participated in a live-bird match at the Saeger Farm traps this afternoon. Each shot at 15, Fehr being high gun. Fehr killed 14, missing only his sixth; Beahm 13, Koch, Saeger and Breder each 12; Gorr and Jacoby 11. fl fl fl

Mahanoy City, Pa., Nov. 5.—In a live-bird shoot here to-day William Lloyd, of Morea, defeated Peter Beishline, of Jeanesville, for \$100 a side. Each man shot at 13 birds, Lloyd killing 10 to his opponent's 9.

Lavorack, Pa., Nov. 3.—Bowen with 21 breaks out of 25, carried off the high gun at the semi-monthly target shoot of the Pennsylvania Gun Club yesterday afternoon.

Club shoot, 25 targets, 16yds. rise: Bowen 21, Bailey 19, Rossberg 18, Snyder 18, Rodgers 16, Geiger 15.

Mahanoy City, Pa., Nov. 5.—Shooting at 13 birds for \$50 a side to-day, Jesse Webb defeated Richard Weeks, of Park Place, by 7 to 6.

DUSTER.

SIDE LIGHTS OF TRADE.

Capt. A. W. du Bray and Mr. Duncan, shooting for the Lyon's cup on the old Kentucky Gun Club grounds, tied on 20 straight pigeons at 31 yards rise, 30 yards boundary. On the shoot-off, Mr. M. du Bray won the event. On the old Kentucky Gun Club grounds, at an invitation shoot, Oct. 27 and 28, Dr. Duncan scored 25 straight pigeons at 31yds. rise. In the Kentucky Futurity at 50 pigeons, Mr. J. Q. Ward, of Paris, Ky., won the handsome cup, scoring 47 at 31yds. The second prize in this event was won by Mr. W. B. Allen with a score of 46. Fred Coleman at Plumsteadville, Pa., Oct. 25, scored 40 straight from the 16yd. mark and 135 out of the 140 at 20yds. rise, with quite a good stiff breeze blowing. Frank H. Snow, Brooklyn, O., at Hamilton, O., Oct. 18 and 19, won high average, breaking 360 out of 370 for two days' shooting. At Fremont, O., on Oct. 21, Mr. Snow broke 149 out of 155 singles and 14 out of 20 pairs, 163 out of 175 for the day. All of these records were made by the Parker gun.

"Tests showing the Safety of Cartridges and Loaded Shotgun Shells when Subjected to Careless Handling, Falls, Shock and Fire" is the theme of an illustrated booklet issued by the Winchester Repeating Arms Co., New Haven, Conn. Eighteen illustrations of the effects of shock, fire, etc., with full descriptive text, convey practical information on the absence of all danger in handling or transporting cartridges in cases.

The G. W. Cole Company, 141-145 Broadway, New York, have issued a booklet descriptive of the many articles to which "3 in 1" oil may be applied. They number between sixty and seventy. It will be sent free, with a generous sample of oil, to any one who will write for same to the above-mentioned company.

BAKER GUNS SHOOT HARD

and are SAFE.

They are noted for this wherever known, and that is almost everywhere. Ask the man who owns one. Fine Trap and Medium Field Grades, \$25.00 to \$200.00 and up. Inquire of your dealer or send for full descriptions.

BAKER GUN AND FORGING CO.,
Cor. Liberty & School Sts., BATAVIA, N. Y.

MY TRAP SCORES

A pocket trap score book, containing 50 pages of score sheets and the Interstate Association Rules for target and live bird shooting, and for shooting under the Sergeant System. The cover bears the title "My Trap Scores," and the pages, in number and form, are arranged to make a complete record of the shooter's doings at the traps. The pages are ruled to make a record of the place, date, weather conditions, number of traps, number of shooters, gun and load used, events, etc. The score sheets are ruled for 25 targets. Bound in leather. Price, 50 cents.

HE PAYS HIS FINE.

FOR a long time it has been known that a young New Yorker who visited Montana in the summer of 1903 was guilty of serious infractions of the game law. The Montana game wardens learned of this, and have been pressing him hard ever since. A dispatch in the papers of last Tuesday, November 29, announces that the New Yorker has plead guilty, been fined the sum of \$500 for killing a mountain sheep, and has paid the fine. The incident is therefore regarded as closed.

It is well understood—and the fact is referred to in the article on the mountain sheep in "American Big Game in Its Haunts"—that this man was taken with his guide to a well-known "lick" in northern Montana, and that during the first part of his watching a bunch of nine rams came there. There was much shooting, and finally the rams all went away. The day following seven rams came to the lick, and the New Yorker, with or without the assistance of his guide, killed three or four of them. The matter became known to the forest ranger of the locality, and to other people, and the New Yorker, hearing of it, left the State, as did also his guide.

It is well recognized that the punishment of infractions of game laws by a mere fine has bad features. It tends to make people think that there is one law for the rich and another for the poor. A wealthy man, caring little for a mere fine, is perhaps ready to break the law and to pay the penalty; the poor man, unable to pay a heavy fine, may be shut up in jail if he breaks the law. The law should provide that infractions of the game laws may be punished either by fine or imprisonment, or by both. If this were the case, the rich man, knowing that he might be imprisoned for his offense, and having before his eyes the fear of the sturdy common-sense of the average justice of the peace, would hesitate a long time before committing any glaring violation of the statutes for the protection of game.

The curious way in which laws and regulations forbidding the killing of game are regarded by the average man was well exemplified a few years ago, when an eminent New York preacher openly killed an elk in the Yellowstone Park, and then went to the commanding officer, and telling what he had done, asked to be allowed to pay the fine. The remarks made by the commanding officer to the divine are probably still remembered by him, and we venture to say made much more impression than any fine would have done.

THE CAMEL.

CABIA BLANCO has long since shown himself a much-traveled Ulysses, who has visited many places, known many men, and seen many things. Not long ago when Capt. Wm. F. Flynn wrote of having been on a bear trail on the top of a remote mountain away in the Southwest, Cabia Blanco responded the next week with the story of how he had been on the same trail on the same mountain, and had run from—or was it pursued after—the same big bear. And when we printed something about the killing of a whale, in which was discovered a harpoon which had been imbedded in its carcass many years, he capped the story with a reminiscence of a whale which his own ship had taken in the Pacific having a long time carried harpoon in its body. This wide range of experience, his faculty of seeing things, and his happy way of telling of them, all contribute to the interest of whatever comes from his pen. His simplicity, directness and sincerity are qualities we can all appreciate. To-day he writes of his "meeting up" with one of the stranded relics of the band of camels which were imported by the United States Government. The incident is a concise and graphic ending of a comic story, which is humorous in no less degree because it happens to be an historical monograph on an official enterprise involving generous expenditure of public funds. The utter futility of this camel enterprise of the United States authorities could not have been more completely summed up than it is in the picture Cabia Blanco draws of that lone beast, with camelesque obstinacy refusing to budge, or to do anything else than to stand stock still in the corral and "eat its head off" at the fodder rack.

The failure of the camel importing attempt was not

so unfortunate after all. This is a land of railroads, not of camel trails. The genius of America is expressed in the snort of the locomotive, not in the camel's squeal. As the development of the half-century intervening has abundantly demonstrated, we can conquer the deserts in an American way, which has in it nothing of the Sahara. We have outgrown the camel stage of human progression, and have relegated the beast to the category of those wild creatures which, thinking we have no better use for them, we shoot, if we can get within range; and afterward, growing older and wiser, and moved by motives partly practical and partly sentimental, we would not see utterly destroyed, but strive to save from extermination. The camel today has a place with the elk and the mountain goat and other big game of Arizona, under the protection of that clause of the law which forbids its possession dead or alive. If any living specimens be still chewing the cud of contentment in the security of the arid Arizona wastes, they take good care to avoid the proximity of man, and in particular of troopers who would persuade them to carry United States mails.

Another American camel enterprise is worth noting in this connection. In the early part of the last century, camels were introduced into Cuba to transport the copper ore of the Cobre mines to Santiago. The beasts proved to be well adapted to the work; and perhaps because the Spanish tongue had some resemblance to the gibberish they had been used to, the Cobre camels were fairly tractable burden carriers. But the animals were killed off eventually by the ravages of a most insignificant creature, the niqua, or, as it is called in the English tongue, jigger, a minute insect classified by scientists as a cross between Satan and a woodtick. This little pest burrowed into the feet of the camels and eventually proved their destruction.

MONOLOGUES OF KIAH.

AS BECAME sportsmen good and true, the campers were early risers. They had slept sweetly and were dispatching their simple but abundant breakfast by the light of the camp-fire, before the dawn. With admirable two-handed sweeps at every dish in sight far and near regardless of sequence, they maintained a graceful rhythm of knife and fork; consequently the hillocks of edibles vanished with speed, volume and accuracy. This expeditious manner of tossing food is oftentimes a peculiar feature of some sportsmen when living close to nature. Without interrupting his intake in the least, Ruben remarked: "I confess that I always feel cross and sour in the morning, particularly at breakfast. After a good meal like this, however, I feel that I am my sunny self again. I attribute it to the vital forces being low, therefore not to any true blemish of disposition. In the morning everyone needs an hour or two in which to pull oneself together after a night of slumber before one can hope to attain full, normal sweetness of temper; then one can heartily concern one's self in promoting the comfort and interests of one's fellows, while betimes not forgetting one's own. True sportsmanship enjoins, as Kiah wisely said—"I was thinking of that very subject myself," Kiah hastily interposed, "and I find that there are very, very few sportsmen who agree with me on a subject which is clear as the sun at noon. There indeed are few who accurately know what sportsmanship enjoins. Besides the heart-to-heart talks so dear to all of us, the friendships of old comrades in sport, the privilege of forming an acquaintanceship with members of the guild who are strangers, the delights of living close to nature and numerous other correlated pleasures and benefits, I know that true sportsmanship is a matter of set forms. Do you hunt birds? Then such should be done in a ceremonial manner. So of fishing. These set forms admit of no deviation whatever, if you would be a true sportsman. I would suggest to you, purely in the interest of sportsmanship—a suggestion free from all egotism—that if you desire to know the precise forms to which I so earnestly allude, you will respectfully and studiously observe your good friend Kiah fish and shoot. Then you will behold the refined gold of true sportsmanship. All others are base, spurious. Multitudes will obstinately contend that as sportsmanship has merit according to the pleasure which it confers, the methods which any individual finds pleasurable accord-

ing to his own ideas, skill and money, are legitimately entitled to recognition in sportsmanship so long as they violate no written or moral law. This, if allowed, would reduce sport to a variant according to the whim or gratification of the individual. It is a perversion of sport to have any enjoyment in violation of the forms which I practice. I elaborated them from years of experience, and I know them to be correct because of the delights I derive by observing them in pursuit and capture. Thus they are not according to the bigoted emotions of those individuals who would force sportsmanship into their selfish measurements. They base all their conclusions on impressions and aspects. All their concepts are of aspects. Therefore, considered properly, as a chaotic psychological phenomena, whose component parts are a heterogenous hodgepodge of freak concepts and distorted aspects; I submit to you, Ruben, whether or not you know what true sportsmanship is."

"I don't know anything about it, Kiah," Ruben humbly replied, "and after your heart-to-heart talk, I don't think I ever knew anything."

WE are glad to have the appreciation of Henry P. Wells, written by Mr. Hyde. It voices the feelings of a large circle of friends and angling acquaintances. One quality of Mr. Wells, which must have impressed all who come in contact with him, and a quality which is everywhere manifested in his books on angling, was the thoroughness which led him to investigate to the ultimate attainable factor a difficult problem in mechanics. Mr. Wells was a patent attorney; the work of his profession cultivated his natural bent in this direction; the integrity of a patent might depend on some recon-dite basic principle, to the complete mastery of which he applied himself with a zest like that which made him the enthusiastic angler playing a salmon. When he came to write his fishing books, this taste—or shall we say passion—for investigation contributed in generous degree to the value of his studies and writings. The preface of the book "Fly-Rods and Fly-Tackle" illustrates this quality of its author in the paragraph telling of his planned study of the conditions under which the fish in the water sees the fly:

Though these experiments were many in number, that which I regarded as of first importance was the further investigation of how lines, leaders and flies appeared to trout under the varying conditions of light and water which confront the angler when rod in hand. It is not my nature to be content with one experiment when another and a more conclusive method of investigation suggests itself. My plan was to procure a diver's outfit, together with the necessary skilled assistance, and at various depths beneath the surface of the water, and over light and dark colored bottoms, and in sunshine and shadow, myself impersonate a fish while a friend angled for me, as it were. Thus, and with aid of telephonic communication and a stenographer, I hoped in two or three weeks' time to make quite an impression on the problem.

THE idea of public preserves for wild game, whether for game in general or particular species most in need of special fostering, is growing in popular appreciation. The current report of the Biological Survey illustrates this in its record of two reservations so widely apart as Florida and California. The Florida one is the Pelican Island preserve for pelicans, situated on the East Coast. Through the co-operation of the American Ornithologists' Union, a warden has been maintained and the birds have been practically undisturbed. That the Pelican Island preserve may be a permanent institution must be the wish of every winter visitor to the East Coast, where the birds make such an attractive feature of shore life. It would be hard to say how many thousands of persons find pleasure in the sight of these immense birds flying in groups and squads and companies, in courses parallel with the shore; now sailing majestically before the wind, and now beating up heavily against the gale, or swinging in long curving lines to and from the roosting grounds. As a commercial proposition, the pelican is one of the outdoor attractions of Florida which are good investments. The other preserve noted in the report is the preserve for the elk presented to the Government by Miller and Lux, established in Tulare county, Cal., on the Middle Fork of the Kaweah River, just within the boundary of the Sequoia National Park, the details of which were given in our issue of November 19.

THE SPORTSMAN TOURIST

In the Mountains.

THE October days of the present year were passing all too rapidly. The delicate tints of the frost-bitten leaves, blending with the grays and browns of the rocky cliffs and the dark green of the firs and pines, painted the mountain sides in hues of evanescent splendor, forming a picture which drew wistful glances from the eyes of the old hunter, and pulled at his heart as a magnet upon a needle.

For anxious days the work of the ranch persisted in detaining, but opportunity came at length. Though his sons were grown to manhood and had gone out into the world for themselves, he persuaded himself that he was yet able to endure alone the labor of another expedition into the hills, and the work of preparation went busily on as the days flew by.

Billy, the old gray pony, was hardly sufficient for the task of carrying his increased weight up the mountain sides, but the sorrel mare, strong and vigorous, would do for a saddle animal; for though her stumbling awkwardness had long ago merited for her the homely appellation of the Old Sow, it was a case of Hobson's choice. Billy could carry the pack saddle. The wall tent being too heavy, three yards of six-foot wide sheeting were purchased and saturated in two pounds of melted paraffine, the cloth being held by the ends and edges in dipping, that the central part would receive all the liquid as soon as it grew cool enough to be handled, and I had a sheet 9 by 6 that shed water perfectly. The old .45-70 Sharps, with its express ball cartridge, was taken along for deer and the 12-gauge double-barrel for grouse. My beautiful little black spaniel pet was to be my companion, though he would have to be tied in camp while deer hunting went on.

Finally the cavalcade was formed, and with Billy's halter firmly tied to the mare's tail, and the eager spaniel dancing and yelping with delight under her nose, the march was begun.

For a number of miles the way along the base of the mountain was easy; but when the place was reached where the ascent should have begun the steep pitch and the rugged rocks looked so forbidding that my heart failed, and recollecting something of a legendary trail further to the northward, reputed to lead one into the deepest recesses of these mountains, I continued along the mountain base in search of it. Here the words of the sage Uncle Remus were again verified—"Right dar is whar he done broke his merlasses jug!" For a time all was easy; for soon finding a trail leading in the right direction, it was followed joyously, an occasional partridge being taken in to prevent the yelping spaniel going positively insane; but gradually it became apparent that the trail did not lead through the kind of ground usually traversed by Indian trails, and I suddenly found myself at the edge of a small clearing, near a little log cabin, unoccupied and decayed, a monument of the hopeless ventures where a place for a home is selected by some industrious immigrant without adequate knowledge of the worthless nature of much of this, as of all other, mountain land. Hurrying past the deserted cabin, I rejoiced to find the trail still leading on, and hoping still that it would lead me safely through the jungle that had now closed in on all sides, tangled and impenetrable; a mile further brought me to another similar place, where the trail ended. Here the pack was unloaded and the ponies were turned loose to graze, while dinner was cooked and eaten; and the meal for myself and my dog was made perfect by the smell and taste of a partridge cooked in the finest of all ways meat is prepared for the table—toasted on a stick before an open fire.

A way out of the surrounding jungle was now the problem. A careful search revealed a wagon track, dim and crossed by fallen poles and brush, leading northeast and seeming to invite effort, and the slow march was resumed. Confusion worse confounded soon resulted, the dim track turning down a ravine, which grew gradually narrower as the hills on either hand crowded closer and steeper, and I soon encountered places where the spring floods had torn everything loose and in the descending roadway had plowed cellar-like pits, through which a path must be found among the giant boulders where a brawling stream elbowed its turbulent way or loitered lazily in deep, dark pools, and the whole difficult gorge crossed and recrossed by fallen timber. Oh, it was fine—for the man in search of such a highway—and the whole perplexing business culminated in an indescribable tangle where, in jumping the creek, the unwilling pack pony was dragged across by main "strength"; and the Old Sow, having finally wrestled every last one of all her snaky legs through a snarl of brush and snags, left the sad-faced Billy firmly anchored between two leaning trees which stoutly refused to let the loaded pack saddle slip through the gap, and with his halter lashed to the mare's tail, his gray neck was stretched out like that of a gander. As the novelists tell us, we will now draw a veil over the scene!

If the atmosphere in that abominable gorge grew suddenly hazy with vociferation until the listening partridges hurriedly plugged their tingling ears with their toes, and the vagrant bear shrank shudderingly into the nearest gopher hole, paralyzed into hibernating weeks before his time, where is he who really loves the great wilderness

(where Dame Nature sometimes cuffs the ears of rash intrusion), who will not be easily persuaded to forgive an occasional emphatic statement of the case on the part of the long harassed hunter? How that elongated cavalcade was finally rescued from the jungle by the exercise of generalship compared with which Xenophon's story of the "Retreat of the Ten Thousand" pales into mythical insignificance, I'll never tell, for I hardly know myself. Though the three-pound package of soda crackers in the pack of the long suffering pony was ground into a dusty mass of flour, thickened by shreds of flaming bright-lettered advertisement, the toiling procession finally halted in triumph in an open glade, with Billy's pack wrestled into the appearance of a last year's birds' nest, and we felt that, in the language of the irate Southerner, we had "done done it" at last.

A few rods further a wide, well-beaten trail leading northward was found, and following it up a gradually ascending grade, a dim trail, old and time-worn, turned in the direction of the mountains, and I fondly hoped this would prove to be the one of my anxious search. Turning into the old, disused trail, I rode along its gradually ascending way until, as the sun sank below the mountain crest a beautiful grassy hillside was found, where fine feed for the ponies grew in abundance, and with wood and water conveniently at hand a beautiful camping ground awaited me. Here the ponies were watered, hobbled and turned loose, promptly taking the back track as fast as they could shuffle along; and when supper had been disposed of and the bed made down in the open, as the clear autumn sky gave no indication of foul weather, the tired man, worn with the fatigues of the day's march, lay down to rest.

As the shades of evening began weaving fantastic shadows around the sinking camp-fire and drowsiness to weigh upon his eyelids, his ear caught that sweetest of all dear Mother Nature's melodies, the languorous murmur of a tiny mountain brooklet; and as the heart of the old hunter opened to its charm, the small stream sang to him, in murmuring monotone, a soothing song of peace; and its own little answer to the problem of the mystery of human life, so unfathomable to us all. Following the direction indicated by the dreamy murmur of the stream, his mind wandered back into the far distant past, while the sweet melody sang to him of a

"former happier day,
When heaven was yet the spirit's home,
And her wings had not yet fallen away!"

And then the music of the tiny stream told of the days of his own innocent childhood, so far away drifted into the past.

"I remember, I remember, the fir trees, dark and high;
I used to think their slender tops were just against the sky;
It was a childish ignorance, but now 'tis little joy
To know I'm farther off from heaven than when I was a boy."

And still the song murmured on, and into the hunter's attentive ear was poured, in siren tones, the tale of his own joyous youth; of the long-gone time when to his eager gaze was shown—

"Every goose a swan, lad,
And every lass a queen!"

And next the melody found expression in a song of sad and sober days, of the time when, with the passing years, came the sad conviction that

"All the sports are stale, lad,
And all the wheels run down."

And now, in still sweeter tones the song floated on, fainter and still further away; on, and still onward, into the land of the great Beyond. And in wondrous notes it sang of a hunting ground where the happy hunter wandered with unentangled feet in the land of blessed camp-fires, by gently murmuring brooks, where landscapes of surpassing loveliness

"Restored every rose, yet secreted its thorn!"

And as the slumber of the tired hunter deepened toward oblivion, the melody in faintest, far-off notes of more than mortal music, whispered to his soul of the wonders of the mysterious Ocean of Eternity, where, in some fair Island of the Blest, a home of unfading joy awaited the weary feet; where "There shall be no more death; neither sorrow nor crying; neither shall there be any more pain: for the former things are passed away."

A low growl raised him to his elbow. The October moon, riding high in the unclouded heavens, flooded the lonely camp ground with light, showing the night to be far advanced, and the vigilant spaniel, with ruffled hair, gazing intently into the thicket just above the camp, from whence the night breeze brought to his sensitive nostrils some olfactory note of warning. But the midnight intruder failing to appear, the restful slumber of the forest camp again took possession of the wayfarer. The morning dawned gloriously, and after a hurried breakfast the trail was again followed. Up and still upward and with increasing steepness the way meandered the mountain side, where the hunter dismounted and led his horse up the most difficult steeps, until at length a wide basin of gently sloping land was found inclining southward; and here the man found himself almost on a level with the summit to the westward, while the view in all other directions was grand. Far away the wide ex-

pansive of mountain scenery spread out around him like a billowy ocean of green stayed in mid-upheaval; and while the peace of the mighty hills took possession of the soul, the fatigues and annoyances of the upward climb were forgotten.

Here was met the first of that finest of all our grouse, the blue or mountain grouse. A small flock scattered in front of us, and the crazy spaniel raved beneath the trees where they had taken refuge, and a few of them were added to the bag to preserve his peace of mind. But now the trail grew dim, and finally spread out and vanished entirely. In vain was the mountain side searched. Away to the westward rose the crest of the divide, while the wide basin to the southward, through which a stream meandered, was so filled with fallen timber between the creek and the open hillside where I rode, that unless a trail through the jungle could be found the lack of water would drive us down the mountain again. More tantalizing still, fresh deer tracks were now noted, which became more plentiful as the search for water led me further westward. But search as I might for a trail to water, the impassable tangle of fallen timber still interposed, until I stopped to study the signs and learn the situation.

Pony tracks months or years old were found at the foot of small trees, where their stamping feet had worked circular depressions of considerable depth in the soft earth, showing that it had been done in fly-time, and that in each case the pony must have been tied for hours. Further search discovered patches of huckleberry bushes; and a small pine tree stripped of its bark for a length of two feet at a point about breast high from the ground, made all plain. The old trail led up to the berry patch, and the bark had been stripped from the tree to make a berry basket.

Not until the afternoon waned was the search for water abandoned, but finally the retreat began. Fuel, feed and water are absolute necessities in successful camping; and slowly and sadly the journey down the mountain continued until the old camping ground was reached, and in the depression of evident defeat camp was again made for the night. Then once again came the restful charm of the moonlit camp, and the song of the brook during the silent hours.

"Still nature's vesper chimes are rung,
And songs, by unseen spirits sung,
Float round my head, that on a stone
Find rest; I sleep, but not alone."

By this time it became manifest that deer hunting on the line of this trail was impossible under the circumstances, and the dog was tied in camp, another route was selected, and all day I wandered in search of the timid deer, which are growing scarcer as the years go by. But the hunt proved fruitless, and when nearing camp, and noting what I fancied to be a ruffed grouse 75 yards in front, I fired at it and scored a clean miss. The bird flew up to a limb a short distance away, and now seemed less like a partridge than before. Carefully approaching until within 25 yards, I fired at its neck and brought it down with the head dangling from a bit of skin. In the meantime I noted a similar bird on the ground to my right; and as I gathered the dead bird and looked more carefully at both, I saw that I had found a pair, male and female, of the strange grouse known as fool hens. A shot at the head of the second clipped the skull just enough to paralyze the bird, which was secured in shape for entire examination.

The first one proved to be the male, bluish slate in color on back and sides, with the short feathers crossed by delicate pencillings in black, and a few of the wing and tail feathers tipped with white, while small black markings ornamented the short slate-colored feathers at the base of the bill, and a narrow band of naked orange-colored skin was found above each eye, very like that of the male of the larger blue grouse. This band of naked skin appeared wrinkled, as though it might be inflated or widened, and probably made to appear more vivid in color during the mating season, after the manner of the blue grouse. The female was similar in appearance, save that instead of the delicate pencillings of the short feathers of the back and sides being black in color, they were of a cinnamon tint, making the bird lighter in color, and the skin above the eye was feathered. There was little, if any, difference in size or weight, both appearing to be about the size of the ruffed grouse or partridge, but a trifle plumper. The flesh was dark colored, but rich and sweet in flavor.

I was much pleased at securing the beautiful birds in such fine shape, and they were taken home for exhibition among friends. They are not at all plentiful in our mountains, and their existence, as a distinct species, is by many considered mythical. Years ago I found one sitting on a limb of a small fir about five feet from the ground, and carefully and very slowly approaching it, got my hand within two feet of its legs, when, in spite of all my care, the snapping of a twig under foot startled the pretty creature, and it hopped up on another branch just above reach.

The following morning found me stiff and sore, and it became manifest that nothing remained for me but to "hit the trail" for home. Making camp, cooking, and hunting horses, besides the fatigue of the daily climb, proved a heavy task for a lone hunter of my years, and reluctantly and somewhat sadly the ponies were saddled, packed, and turned down the trail.

BEAUTIES OF THE YELLOWSTONE.

I gathered in a grouse or two more on the homeward journey, to the increased gratification of Jet, and when the cavalcade finally drew up at my door all I had to show for the fatigues of the trip into the hills was a bunch of nine beautiful birds, which were shared with friends who in other days had been good to us in like manner.

Now this is not much of a story to offer to the members of the great FOREST AND STREAM family in return for the constant enjoyment of the perusal of the dear old paper which keeps us all in constant touch and sympathy; but it is such as I have.

Though the passing years are dealing kindly with the veteran hunter, he cannot climb the mountain sides as in days gone by; and though smaller game only comes to bag in reward of lessened effort, and his step is slower and shorter in its pursuit, yet the fascination of the wilderness still holds sway in his heart, and the mountains, holding wide their giant arms in silent invitation, still appeal to him, and not in vain.

ORIN BELKNAP.

KETTLE FALLS, Washington.

A Forest Derelict.

ON a mountain-top, but the flight of a grouse south of the line dividing the counties of Sullivan and Ulster, and between the Willowemoc and Neversink, with hemlock, balsam and spruce interwoven among the hardwood timber upon its borders, Long Pond lies. Beneath its quiet surface pickerel lurk, while muskrats build their homes upon the marshy sections of its shores. Into its depths the deer plunge, to throw off the scent when run by stray hounds, and during the summer months seek relief in its cold waters from their greater tormentors, the flies, and feed upon the lily-pads. The bluejay flits about the foliage, his plumage and noisy call vying with the effulgence and monotonous notes of the scarlet tanager. At the approach of evening the woods resound with the sweetest melody of the American forestland, the song of the hermit thrush.

At the lower, or southern, end of the pond, partly submerged, lie a number of fallen and decayed tree trunks, their size and evident age indicating the growth of hemlock and pine that preceded the advent of the tannery and the sawmill. Amid these corpses of former forest monarchs is a log of some eighteen feet in length, the peculiar outlines of which attract attention; upon inspection marks of human handiwork are at once apparent. At first sight it impresses one as having been designed for use as a trough for the feeding or watering of cattle; but the ends have been fashioned with more precision than such an object would demand, and a seat has been worked out of the solid log at one extremity, while an auger-hole, as if intended for the reception of a staff, has been bored halfway through the bottom at the opposite end. Time and weather have worn off the sides where the log has been cut thin, so that when put into the water and entered the displacement of one's weight leaves it practically without freeboard. Yet its steadiness and buoyancy, even to-day, prove it to have once been a staunch canoe. And this is the tradition that attaches to it:

Long before a white man had effected a permanent habitation in what was then a vast wilderness, when the hardy trapper alone had penetrated the remote solitudes and run his fur line into the country of the Lenni-Lenape, a noble pine stood among many of its kind upon the margin of the little mountain lake. Had the pine been given powers of observation, with the passing of years gradual changes in its environment would have been noted. Where formerly the twang of the bow-string had barely awakened an echo, the crack of the rifle was now heard; and the greater frequency of camp-fires and larger volumes of smoke proclaimed the replacing of the savage by the white man. Still the sombre hue of the raven blended with the dark green of the spruce; the cry of panther, the howl of wolf broke the silence of the forest; eagles soared above the fir-capped mountain—primitive wilderness lingered.

In time the visits of the white man became more frequent. Isolated log huts sprang up in clearings left by forest fires, and the restless settler sought in wood and waters additions to his scanty larder. Necessity rather than pleasure brought him to Long Pond. Trout, the preoccupants of the lake, were readily caught from a rudely-constructed raft of logs. Deer were shot as they fed upon the shores or drank of the waters of the pond. As the condition of the settlers improved, a spirit of sportsmanship was engendered in place of the desire to secure fish and game for food alone, and the need of a canoe on Long Pond was felt.

On a summer morning, prior to the period of birth of the oldest living inhabitant of Sullivan county, two men broke out of the woods upon the shore of the pond. Their mixed garb of homespun and skins denoted the dual character of husbandman and trapper. Upon their shoulders rested the implements that had laid the foundation of America—the rifle and the ax. Searching among the larger timber for a tree suitable for their purpose, the lordly pine was chosen. Incessant and vigorous ax-strokes followed, and the tree that had withstood the storms of centuries succumbed to the power of man. The desired length was then chopped from the butt and the construction of a dugout commenced. Occasional pauses in the work occurred while a survey was made of the progress in the crude boat building. At noon a frugal meal of rye or corn-bread, with an accompaniment of venison or bear meat—or possibly of the greater luxury of salt pork—was eaten. Perhaps a line was cast into the lake, and that trout, fresh from the water, supplied a welcome variety to the meagre repast. The axes were then resumed and with the passing of the afternoon the building of the dugout advanced. At length it was ready for trial. Likely not without anxiety was the test of its steadiness made. Some slight alterations in the outline of the craft may have been required to enable it to maintain an even keel. A few clips with the ax effected these. A slab was now riven from the trunk that furnished the hull; paddles were made from this, and the canoe was ready for use.

Eager to test its merits, birch or iron-wood saplings were secured and the woodsmen paddled out upon the pond to fish a spring hole favored by the large trout during the heat of summer.

Upon the return to shore, a round of birch or spruce bark was peeled from a convenient tree, and from this a jack was formed. The light was obtained from a large candle, made by removing the pith from a piece of elder wood and refilling the cavity with tallow and a wick.

By this time darkness had fallen. The settlers, weary yet contented with the result of their day's work, withdrew into the cover of the woods to obtain a few hours' repose until the waning of the moon should admit of successful hunting. In fancy we see their stealthy return about midnight, the lighting of the jack, the noiseless entry into the dugout, the older hunter with his flintlock rifle of great length in the bow; while the younger man paddles the canoe silently along the edge of the lake, with the light directed almost at a right angle to their course. With weird effect, like some will o' the wisp, the dugout glides along the shore line. A black duck, feeding upon the water near the nest of his mate, gets up in alarm; a muskrat splashes noisily from the bank into the pond; the screech owl hurls defiance at the hoot owl—even the steady nerves of the older hunter feel a thrill at these interruptions of the stillness. As the canoe proceeds, the older man waves many an admonitory signal backward to his impatient companion to check his speed. Disappointment has begun to make itself felt within the breast of the latter. To himself he complains: "There are no deer in. Didn't I say there was no use hunting to-night after chopping all day? We might as well—ah!" The rifle is extending itself cautiously under the light—it is now held in the position for firing. As yet he who wields the paddle sees nothing. But the actions of his more experienced comrade in the bow dispel any misgivings that may have arisen within him. As the canoe silently advances under the influence of the noiseless paddle strokes, an indistinct form, showing grayish in the candle light, is made out by the man in the stern. The figure of a deer with head erect, held in fascination by the jack, follows, and the light from the bow is reflected toward the hunters in two balls of fire.

Holding the canoe steady with the paddle, the younger man waits expectantly. From the bow come a flash of fire and the crack of the rifle and instant darkness follows. The pungent smoke of the powder hovers about the canoe, while the report of the rifle awakens a hundred echoes against the fringes of the lake. Listening eagerly for the result of the shot, the hunters catch the sound of splashing as the deer makes his way unsteadily toward shore. They follow in the canoe, and before a landing is effected the noise ceases. The candle is relighted with the aid of flint and steel, and the search along the water's edge continues. The hunters find the deer with his forequarters upon the bog and the remainder of his body in the water, from which the rifle ball has deprived him of the power to draw himself, and the knife ends what the rifle has begun. Thus in blood was the dugout christened.

And many times in the years that succeeded was this scene re-enacted. Through several generations the old dugout was intimately associated with the lives of the pioneers of Sullivan and Ulster county. The father took his son, and the son took his son out on Long Pond to watch for deer, or to fish for trout—or later for pickerel; and as the hours passed in this remote and peaceful corner of the woods, traditions were related by parent to son, confidences were exchanged and the ties of kindred were strengthened. Their bones have long since mingled with the earth of the forest, whose secrets were open to them, and the old canoe, abandoned and neglected upon the shores of the little mountain pond, survives as the sole memorial of their primitive and hardy lives.

JAY W. DEE.

Indian Summer.

ALL day the mountain tops exhale a ghost-like vapor, which clings gently just below their summits and catches up the sun shafts into their midst, where the prismatic rays tinge the whole atmosphere with color, diffusing a warm but quiet shade of purple over the spine of the entire mountain-range. Flashes of crimson and gold shoot out from the dense green of the mountain pine, marking the rendezvous of the maple and hickory and oak, while over all and between the masses of umbrage the vine spreads its brown leaves and purple festoons; now clinging to the birch like children eling in time of fear to the parent, anon looping down like the folds of some mighty python, ready to entangle with deadly embrace some hapless victim. Near-by, and in and out among the trees, springs the squirrel, the gray squirrel; while down among the underbrush leaps the rabbit or roams the stealthy fox, intent upon the capture of the lordly grouse who congregates at this, of all times, to feed upon the mast or the purple grapes. The hawthorn which in early spring scented the atmosphere for miles around and lent enchantment to the moonlit eve, now spreads before the gaze a gaudy galaxy of berries, waxy and shiny and plump, conscious of their destiny—either to feed the æsthetic grouse or to fall and disappear, there to lie beneath the massive sheets of snow until the re-awakened the rejuvenated earth bursts forth with melody from the million throats of songsters—till nature's spring song penetrates its easement, warming its heart to life with songs of joy and hope, and bursting from its bonds with very joy at living, it springs forth delicate and feathery, until by successive stages, each month lending some added grandeur, it stands erect on the mountain-side, a tender miniature of the parent tree. The massive oaks spreading their limbs in all directions, hoary and old, scatter their succulent product to the ground to raise their sturdy offspring, or hold with extended arms their store of tempting acorns to the nimble squirrel. In and out, and up and down wanders the jay, that noisy coxcomb of the forest aisles, screaming his senseless jargon to all who chance to listen; while high in air, in sable phalanx, clumsily sail the crows home to their roosting, cawing discordant orders to their noisy host. Now do the robins congregate and bluebirds brimming o'er with

love sail high in air, sprinkling their sad songs in liquid cadence, like the chime of the vesper dying out in the distance.

Myriads of blackbirds float in the evening sky, in closely-ordered ranks, the modest brown of the subordinates contrasting strongly with the gaudy uniforms of their superiors, whose scarlet chevrons disclose a flaming mark to the huntsman's aim. Far o'er the cultivated fields and up from the sleepy valley echoes the homely note of the bell of the bell-cow, and far o'er the hills in multiple reverberations comes the stifled detonation of the sportsman's gun—the death-song of its fair victim.

Thus fades the day, and night draws on apace, the reddening sky losing in warmth and gaining in coolness, assumes a pale yellow shade, while at the horizon line streakings of gray and indigo appear. Now cease the birds their evening matin, homeward in serried columns are driven the cattle, and the night wind begins its melancholy wail among the sedge. Slowly the lengthening line along the horizon ascends as over the eastern slope peeps the crescent moon, while over and above them all settles the frosty rime.

GEO. W. BEATTY.

Trails of the Pathfinders.—XXI.

The Commerce of the Prairies.

AT the end of the sixteenth and during the seventeenth century a line of Spanish settlements ran from Mexico northward along the Rocky Mountains, terminating in the important town of Taos. To the north, northeast, and northwest of this town were other settlements occupied by the Spaniards and their descendants, and the streams and geographical features of the country bore Spanish names—almost up to the headwaters of the Rio Grande del Norte. North of the Arkansas there was a change of tongue, and the names were English, or often French, given later by American trappers, who had pushed westward, or by French Canadians and Creoles, who were early voyageurs over the plains.

Though Taos was an important place, it did not equal, either in size or wealth, the town of Santa Fé.

The first settlements of what is now New Mexico, were made about the end of the sixteenth century, and a colony was established on the Rio del Norte, in New Mexico. Agriculture was practiced, and mines were discovered and worked. But the Spanish, in their greed for precious metals, made slaves of the docile Indians, and forced them to labor in the mines, under circumstances of the greatest hardships and severity. Almost a hundred years later, in August, 1680, this ill treatment caused the insurrection of the Pueblos, which put an end to many a flourishing Spanish settlement, and, temporarily, to the country's development. For a time the Spaniards were driven out, but it was for a time only; a little later they returned, resubdued the country, and, by the close of the century were stronger than ever. Nevertheless, the Pueblo revolt was not without its good effect, and during the eighteenth century the Indians were far better treated than they had been before.

In the year 1806, Capt. Zebulon M. Pike crossed the plains, and reached the city of Santa Fé. His return told the inhabitants of what was then the further west of a country beyond the plains where there were towns and people who would purchase goods brought to them. Previous to this, a merchant of Kaskaskia, named Morrison, had sent a French Creole named La Lande, up the Platte River, directing him to go to Santa Fé to trade; but La Lande, though he reached that city, never returned, nor accounted to his employer for the goods that were intrusted to him. James Pursley, an American, was perhaps the second man to cross these plains, and reach the Spanish settlements. When Capt. Pike returned, the news of these settlements, hitherto unknown, created a great interest throughout the slowly advancing frontier.

Expeditions went out to Santa Fé in 1812, but the traders were suspected by the New Mexicans of being spies, their goods were confiscated, and they themselves imprisoned and detained for years, some of them returning to the United States in 1821. After this, other parties went out, and the trading which they did with the Spaniards was successful and profitable. More and more expeditions set forth, often manned by people who were entirely ignorant of the country through which they were to pass, and the hardships which they were to face; and they starved to death or died of thirst, or, at the very least, suffered terribly, and often were unsuccessful, but about 1822 the trade with Santa Fé became established. The distance from the American settlements across the plains to Santa Fé was hardly half that from Vera Cruz to Santa Fé, and there was great profit in the trade; but it was not without its dangers. Indians were constantly met with, and many of the traders did not understand how to treat them. Some traders were robbed; others, resisting harshly and sometimes killing a savage, were attacked, robbed of their animals, and occasionally lost a man.

Among the interesting records of the plains of these early times is Josiah Gregg's "Commerce of the Prairies, or the Journal of a Santa Fé Trader, During Eight Expeditions Across the Great Western Prairies." Gregg was an invalid, who made his first trip across the plains on the advice of his physician. The effect of his journey was to re-establish his health, and to beget in him a passion for prairie life. He soon became interested, as a proprietor, in the Santa Fé trade, and for eight successive years continued to follow this business. The period covered by his volumes is from 1831 to 1840, during which time the trade was at its height.

The caravan, with which Gregg started, set out with near a hundred wagons, of which one half were hauled by oxen, and the remainder by mules. The very night that they left Council Grove their cattle stampeded, but being corralled within the circle of wagons, did not escape.

Having a large company, it was natural that there should be among it a number of people who were constantly seeing dangers that did not exist. They had been out but a short time when, "Alarms now began to

accumulate more rapidly upon us. A couple of persons had a few days before been chased to the wagons by a band of buffalo; and this evening the encampment was barely formed when two hunters came bolting in with information that a hundred, perhaps of the same 'enemy' were at hand—at least this was the current opinion afterward. The hubbub occasioned by this fearful news had scarcely subsided, when another arrived on a panting horse, crying out 'Indians! Indians! I've just escaped from a couple, who pursued me to the very camp!' 'To arms! to arms!' resounded from every quarter—and just then a wolf, attracted by the fumes of broiling buffalo bones, sent up a most hideous howl across the creek. 'Some one in distress!' was instantly shouted: 'To his relief!' vociferated the crowd; and off they bolted, one and all, arms in hand, hurly-burly, leaving the camp entirely unprotected, so that had an enemy been at hand indeed, and approached us from the opposite direction, they might easily have taken possession of the wagons. Before they had returned, however, a couple of hunters came in and laughed very heartily at the expense of the first alarmist, whom they had just chased into the camp."

While baseless Indian scares were common, they sometimes had genuine frights, as in the case of a large body of Indians met on the Cimarron River. On this occasion, "It was a genuine alarm—a tangible reality. These warriors, however, as we soon discovered, were only the vanguard of a 'countless host,' who were by this time pouring over the opposite ridge, and galloping directly toward us.

"The wagons were soon irregularly 'formed' upon the hillside: but in accordance with the habitual carelessness of caravan traders, a great portion of the men were unprepared for the emergency. Scores of guns were 'empty,' and as many more had been wetted by the recent showers, and would not 'go off.' Here was one calling for balls; another for powder; a third for flints. Exclamations, such as, 'I've broke my ramrod!'—'I've spilt my caps!'—'I've rammed down a ball without powder!'—'My gun is 'choked; give me yours!'—were heard from different quarters; while a timorous 'greenhorn' would perhaps cry out: 'Here, take my gun, you can outshoot me!' The more daring bolted off to encounter the enemy at once, while the timid and cautious took a stand with presented rifle behind the wagons. The Indians, who were in advance, made a bold attempt to press upon us, which came near costing them dearly, for some of our fiery backwoodsmen more than once had their rusty, but unerring, rifles directed upon the intruders, some of whom would inevitably have fallen before their deadly aim, had not some of the more prudent traders interposed. The Indians made demonstrations no less hostile, rushing, with ready sprung bows, upon a portion of our men who had gone in search of water, and mischief would, perhaps, have ensued, had not the impetuosity of the warriors been checked by the wise men of the nation.

"The Indians were collecting around us, however, in such great numbers, that it was deemed expedient to force them away, so as to resume our march, or at least to take a more advantageous position. Our company was therefore mustered and drawn up in 'line of battle;' and, accompanied by the sound of a drum and fife, we marched toward the main group of the Indians. The latter seemed far more delighted than frightened with this strange parade and music, a spectacle they had, no doubt, never witnessed before, and perhaps looked upon the whole movement rather as a complimentary salute than a hostile array, for there was no interpreter through whom any communication could be conveyed to them. But, whatever may have been their impressions, one thing is certain—that the principal chief (who was dressed in a long red coat of strouding, or coarse cloth) appeared to have full confidence in the virtues of his calumet, which he lighted, and came boldly forward to meet our war-like corps, serenely smoking the 'pipe of peace.' Our captain, now taking a whiff with the savage chief, directed him by signs to cause his warriors to retire. This most of them did, to rejoin the long train of squaws and papooses with

the baggage, who followed in the rear, and were just then seen emerging from beyond the hills."

It was estimated that there were not less than two or three thousand of these Indians, who were supposed to be Blackfeet and Gros Ventres. They remained for some days in the neighborhood of the train, and kept the traders on tenterhooks of anxiety, lest there should be an attack, or a wholesale driving off of cattle. Later there were talks—or at least friendly meeting—and giving of presents; and finally, the Indians moved away without doing any harm. It was but a day or two later, however, when some Comanches had a skirmish with the train, but without evil results to either party.

It was not long after this that the train, still journeying westward, saw evidence of their approach to the Spanish settlements. On the 5th of July, as they were proceeding after a celebration of the day before, they met a Mexican *cibolero*, or buffalo hunter, one of those hardy wanderers of the plains, who used to venture out from the Spanish settlements to secure dried buffalo meat, killing buffalo, and trading with the Indians. These wanderers made long journeys, which often extended as far as the country claimed and occupied by Crows, Cheyennes and Pawnees. Perfectly accustomed to the life of the plains, armed with gun and lance, and bow and arrows, they were not less free than the aboriginal inhabitants, whose methods in many ways they imitated, and whose blood many of them shared. Like the Indians, these buffalo hunters killed their game chiefly with the arrow and the lance, and drying its flesh, packed it on their mules, or in their ox-carts, and carried it back to the settlements to trade.

It was not very long after, that Gregg, leaving the train and pushing ahead with others, found himself in the city of Santa Fé. He was much impressed by the new country, inhabited by a race as different as possible from those whom he had left in his eastern home. He was a close observer and records interestingly much of what he saw.

He was also far-seeing enough to make true predictions as to one of the chief industries of the southwest:

"By far the most important indigenous product of the soil of New Mexico is its pasturage. Most of the high table-lands afford the finest grazing in the world, while, for the want of water, they are utterly useless for most other purposes. That scanty moisture which suffices to bring forth the natural vegetation is insufficient for agricultural productions, without the aid of irrigation. The high prairies of all Northern Mexico differ greatly from those of our border in the general character of their vegetation. They are remarkably destitute of the gay flowering plants for which the former are so celebrated, being mostly clothed with different species of a highly nutritious grass called grama, which is of a very short and curly quality. The highlands, upon which alone this sort of grass is produced, being seldom verdant till after the rainy season sets in, the grama is only in perfection from August to October. But being rarely nipt by the frost until the rains are over, it cures upon the ground and remains excellent hay—equal, if not superior, to that which is cut and stacked from our western prairies. Although the winters are rigorous, the feeding of stock is almost entirely unknown in New Mexico; nevertheless, the extensive herds of the country, not only of cattle and sheep, but of mules and horses, generally maintain themselves in excellent condition upon the dry pasturage alone through the cold season, and until the rains start up the green grass again the following summer."

The mines, the domestic animals and their care, horses, mules, the art of packing, the matter of branding and venting brands, the raising of sheep, goats and fowls, are all treated with considerable detail, and the wild creatures of the country, down to the very flies. Accounts of the Spanish inhabitants of the country—glowing with their local color—and of the Indians are given; and some space is devoted to a description of the Pueblo Indians—one of the first descriptions of these peculiar people, who have since been so fully studied.

The wild tribes are described, especially the Navajoes, Apaches, Yutas, Caiguas, or Kiawas. Much is said of the raids of the Apaches and the terror in which they kept the inhabitants of the towns, as well as the Mexican troops stationed there to protect these inhabitants. The savage butchery of a lot of Apaches by a troop of men, under an American leader, may perhaps be the incident which has given rise to many similar tales concerning the similar slaughters of the olden times. It seems there was a celebrated Apache chief, called Juan José, whose cunning and audacity had caused him to be feared throughout the whole country. The government of Sonora had announced that all booty taken from the savages under his command, should be the property of those who took it. "Accordingly, in the spring of 1837, a party of some twenty men, composed chiefly of foreigners, spurred on by the love of gain, and never doubting but the Indians, after so many years of successful robberies, must be possessed of a vast amount of property, set out with an American as their commander, who had long resided in the country. In a few days they reached a rancheria of about fifty warriors with their families, among whom was the famous Juan José himself, and three other principal chiefs. On seeing the Americans advance, the former at once gave them to understand that, if they had come to fight, they were ready to accommodate them; but, on being assured by the leader that they were merely bent on a trading expedition, a friendly interview was immediately established between the parties. The American captain having determined to put these obnoxious chiefs to death under any circumstances, soon caused a little field-piece, which had been concealed from the Indians to be loaded with chain and canister shot, and to be held in readiness for use. The warriors were then invited to the camp to receive a present of flour, which was placed within range of the cannon. While they were occupied in dividing the contents of the bag, they were fired upon, and a considerable number of their party killed on the spot! The remainder were then attacked with small arms, and about twenty slain, including Juan José and the other chiefs. Those who escaped became afterward their own avengers in a manner which proved terribly disastrous to another party of Americans, who happened at the time to be trapping on Rio Gila, not far distant. The enraged savages resolved to take summary vengeance upon these unfortunate trappers, and falling upon them, massacred them every one."

It is added that, "The Apaches, previous to this date, had committed but few depredations upon foreigners (i. e. Americans), restrained either by fear or respect. Small parties of the latter were permitted to pass the highways of the wilderness unmolested, while large caravans of Mexicans suffered frequent attacks."

It is generally known that the Indians of the plains regarded the Mexicans as a different people from the dwellers of the United States, and there was even a time when a distinction was made between the inhabitants of the United States and those of the Republic of Texas.

The bounty on scalps, adopted by the Mexican government in 1837, was one of the many schemes devised by the people of the borderland to check the ravages of the Indians. By this *Proyecto de Guerra* a series of bounties were paid for scalps, running from one hundred dollars for the scalp of a full-grown man, down to fifty for that of a squaw, and twenty-five for that of a little child. For a brief time this bounty was paid, and Gregg himself saw a scalp brought in on a pole by a Mexican officer in command of troops, precisely as the Indians, returning from the war-path, used to bring their scalps into their home village.

In 1838, Gregg returned across the plains, meeting a few adventures, among which the most important was an attack on the train by Indians, who were supposed to be Pawnees. The effort was merely to steal their horses, which, happily, they saved.

GEORGE BIRD GRINNELL.

[TO BE CONCLUDED.]

NATURAL HISTORY

The Importation of Camels.

From the Twentieth Annual Report of the Bureau of Animal Industry.

BY CHARLES C. CARROLL, A.M.

Acting on this unfavorable information, General Babbitt reported to the Department that for two years he had endeavored in vain to render the camels serviceable, and gave it as his conclusion that experience had proved "the inexpediency of substituting them for our native animals." At this time the animals in California numbered thirty-five in all, and were kept in the southern part of the State. The report of General Babbitt produced an order from the Department, on Sept. 9, 1863, directing him to advertise and sell the camels at public auction. This was duly carried out, and the animals were purchased by Samuel McLaughlin, in whose care they had been for some time before.

It is probable that most of these camels found their way into menageries or zoological gardens. It has been supposed that some of them were taken to Nevada to be employed in packing salt from the deserts for use in silver extraction, but as the Nevada camels were of the two-humped kind, they probably came from a different source. In 1860 or 1861 a company was formed in San Francisco for the purpose of importing camels from Asia. They sent an agent to the high tablelands of Central Asia and procured about twenty Bactrian, or two-humped, camels, and from this herd came the

twelve animals that were employed for some time in carrying salt from a marsh in Esmeralda county, Nev., to the Washoe silver mill, a distance of 200 miles. They performed this work satisfactorily, carrying, says Mr. L. Metral, of Virginia City, who packed them, an average of 600 pounds each, and traveling from fifteen to twenty miles a day. The discovery of salt at a more accessible point deprived them of much of their occupation, although they remained in the vicinity of Virginia City for a number of years.

Professor Brewer, of Yale College, records that during a trip through the West, made about 1865, he saw a few of the animals near Virginia City. "Their backs," he says, "had not been cared for, and they had been used in packing heavy loads of salt from the deserts. Salt water and alkali had accumulated in the long hair of their humps, their pack-saddles had galled them, and great loathsome sores nearly covered the parts touched by the saddle. A pitiless snow squall was sweeping just then over this inhospitable region, and these miserable beasts, having fallen into bad hands in a bad climate, looked sadly enough." As late as June 28, 1876, the Virginia City Enterprise contained an account of an ascent of Mount Davidson made by a train of eight camels, each carrying one-third of a cord of wood. The animals approached to within 150 feet of the summit, reaching an altitude of nearly 9,000 feet.

The historian H. H. Bancroft states that in 1876 the Nevada camels were all taken to Arizona, with the exception of one pair which, placed on a ranch in the

Carson Valley, in a few years increased to twenty-six. The story of the remarkable fecundity of this pair of camels spread far and wide, finding its way into Major Leonard's important work on *The Camel*, published in 1893, as well as into the encyclopedias. It should, however, be taken with great allowance, when it is remembered that the female camel gives birth but once in three years, and does not begin to breed until five years of age. The employment of animals for practical purposes in Nevada steadily diminished. Their appearance on the public roads frightened horses, thereby giving rise to suits for damage, and leading finally to legislation prohibiting their use on the public highways and their running at large.

In the meantime the camels left at Camp Verde were employed in various errands to places over the State and became so common a sight on the streets of several towns that they ceased to excite curiosity. In some instances they were looked upon as a nuisance, because they frightened horses, and the city council of Brownsville is said to have passed an ordinance forbidding them the streets.

Thus they remained until the outbreak of the Civil War, increasing naturally to some extent, showing themselves well adapted to the climate and other conditions of Texas, and described in the papers of the day by those who saw them as healthy and strong, of greater stature and in all respects superior to the camels of the traveling menageries. At the beginning of the war the camel station passed into the hands of

the Confederates, from whom the herd received scant attention, being allowed to pick up its own living by grazing. Naturally, some of the animals wandered away. Of these there is an official account of at least three. These were captured in Arkansas by the Union forces and "sent to Mr. Paden, near the Des Moines River, in Iowa, for the benefit of his care and economy in their support." In June, 1863, Lieut. J. Grayler, from the headquarters of the Department of the Missouri, at St. Louis, asked the Department what he should do with them; the quartermaster-general, on the ground that the number was too small for use, recommending that they be sold at public auction, which action was accordingly ordered by Secretary Stanton.

Doubtless others of the herd during this period of loose discipline wandered off from Camp Verde and found their way westward to the deserts and mountains of the Texas Panhandle, of New Mexico and of Arizona, where they lived free and half wild, the prey of hunters both white and red. There are numerous recorded instances where soldiers or hunters have seen the animals and pursued them. These instances occur with decreasing frequency down to within the past ten years.

When at the close of the Civil War the Federal Government was again in charge of Camp Verde, all thought of making practical use of the camels was abandoned. The number was now forty-four, and in March, 1866, sealed proposals to buy them were invited. The bids were opened at New Orleans, at the office of the chief quartermaster, Col. E. G. Sawtelle. Three persons were willing to buy: Horace Bell offered \$5 each; Joseph Hallam, \$10 each; while Col. Bethel Coopwood's bid was \$31 each. Gen. M. C. Meigs, Quartermaster-General, at Washington, reluctantly gave the order to sell at \$31 each, expressing at the same time his belief that private enterprise would better develop the animal in this country and his regret that the experiment had failed.

The animals were delivered to Col. Coopwood at San Antonio, Texas, and kept by him in that vicinity until December, 1866, when they were driven into Mexico. In January, 1867, twelve of them were sold to the proprietor of a "circus and caravan," and the remainder appear to have been, during the next fifteen years, disposed of in the same manner. As late as May, 1903, the Express, of San Antonio, speaks of having observed in one of the midway shows which had exhibited in that city a camel with the United States brand on it and the counterbrand of a subsequent purchaser. No doubt a search through the many menageries, traveling shows, and the zoological gardens of the country would reveal other survivors of the Government camels, although their number is likely to be few, as it is now more than thirty-five years since they passed from Government ownership, and the camel does not often, even with the best treatment, attain to more than forty years.

Thus, after a checkered official life of eleven years, the camels passed finally into the hands of private owners. Of the two shiploads of animals, the Government retains nothing except the bones of one of the beasts, which stand in a case at the National Museum at Washington and perform the duty of illustrating to students the peculiar skeleton framework of the "ship of the desert," besides serving as a souvenir to those acquainted with the story of the attempt to transplant these ancient drudges from their homes in Africa and Asia to the Western World. The camel in question, while at Fort Tenjon, Cal., was killed by one of its mates that had gotten loose during the night. The animals were rutting and consequently intractable. The soldiers relate that the combat was most furious, the beasts striking each other resounding blows with their ponderous feet, while the drivers dared not interfere. The bones of the defeated animal were forwarded by Lieut. Sylvester Mowry to the Smithsonian Institution.

The most potent cause of the failure of the camel experiment was its interruption by the Civil War. Had Major Wayne been left in control of the camels which were imported under his supervision, and supplied with sufficient money to breed and increase them, as he so well knew was necessary, and had he been free to familiarize the teamsters and drivers with their management, there appears to be no particular reason why they should not have been of as much use in parts of this country as they were and are in the countries of the East. They were easily and quickly acclimatized and they performed with success their tasks in the initial experiments; indeed, so long as Major Wayne remained with them. But few officers understood their management, and they found in the mule driver an inveterate enemy. To secure their general use, a long course of experimentation, as well as teaching, was required. The beginning of the Civil War removed Major Wayne to the South, and during the succeeding years the camels were exposed to capture and recapture by the contending forces, neither of which had much time to devote to experiment. The construction of railways between the east and west, of course, limited the field in which it was proposed to use the camels, but they might still have been employed to advantage had anyone been found with the enthusiasm and information on the subject possessed by Major Wayne to collect and care for the scattered remnants of the herd and increase it to such numbers as might be of some real use. In idleness they were merely a useless expense to the Government and were very properly sold; but, as in the case of any unfinished experiment, it is to be regretted that the trial of the camel in the Western world was not carried to conclusive results.

Cabia Blanco's Experience with a Camel.

Editor Forest and Stream:

I have taken an interest in Mr. Charles C. Carroll's report that is being reproduced in the FOREST AND STREAM, from the fact that I came in contact with one of these camels. It was one of the original importation, I was told, and seemed to be old enough to have been one of them.

Three of the troops of our regiment, the Fourth Cavalry, were sent up from San Antonio to Camp Verde, Texas, in the fall of 1866. Verde was away out on the frontier then; the towns of Kerrville and Bandera were out here on each side of it, only a few miles away, but

they could hardly be called towns then; neither of them had a post-office. Our nearest post-office was down at Boerne, forty miles away, and I was detailed to carry the mail from there, making two trips a week. I used my horse to carry the mail. This is what the camel had been brought here for, but he never carried any mail, and unless he "met up" with someone who knew more about camels than I did, he never carried anything else anywhere.

After I had been given an introduction to him by our quartermaster, I put in half a day in trying to get him to kneel. He would neither do that nor anything else. I could mount him—he did not seem to know nor care whether I was on his back or not—but I could not move him out of his tracks. The quartermaster wanted me to use a blacksnake whip on him.

"No sir," I told him, "he seems to me to be too innocent to be whipped, or else too stupid. If he were only a mule, now, I would make him obey me or kill him; but I guess I don't need a camel; a horse suits me well enough."

The camel stood in the corral a week eating hay. That is all that we could get him to eat. I tried to force both corn and oats down his throat, but he refused both, and finally he was taken out to where he had been got and turned loose again.

There was quite a number of those camels running loose somewhere west of Kerrville then; they had been there since 1860.

There are still several of these camels, or their descendants, rather, in western New Mexico and Arizona. I met them there as late as 1884. Mexicans had them and used them as pack animals. They seemed to have no trouble in handling them. I was told by Mexicans that there was quite a number of these camels running wild in the Colorado desert, California. This is where those that were brought by Lieutenant Porter in the Supply were finally taken to.

It is amusing to watch a horse act the first time he sees one of these camels. There is no animal—not even a bear—that will frighten a horse so badly as a camel will.

CABIA BLANCO.

Birds in California.

AS AN humble disciple of California ornithology, let me take some of the kinks out of Coahoma's tale. In your issue of November 19 he gives the result of some observations made in our State in the previous three months, and comments upon the paucity of bird life observed.

Now, Coahoma, just remember that you visited us at a time of year when resident birds have finished the cares of paternity, and winter visitors have not yet put in an appearance! California is rich in bird life at all seasons, but the months spoken of are the ones when our birds are most silent. Worn out with family cares that have wasted the energies of the breeding species, they are silent and shy. And it is these birds that constitute the bird orchestra in all lands.

From the first of February until the first of August is the time to hear the birds' songs, and to admire the beautiful plumage of our residents. From November 1 throughout the winter months is the time to observe our winter visitors.

And now, "with these few remarks," Coahoma, let me take up your trail and help you straighten out those "kinks." At the time you visited our valleys there was no doubt a paucity of bird life observable to the passing traveler. If you had had time to investigate a little closer, however, you would have found a fair amount of bird life. This you would have found in the orchards and groves surrounding the homes of the valley farmers, in the groves of oaks that are found scattered throughout the Sacramento Valley, and in the willows and cottonwoods that line the banks of all the streams, sloughs, and lagoons found in those localities.

Here you would have found housefinches and Arkansas goldfinches by the thousand, with many bullocks, orioles, and black-headed grosbeaks—all good singers. You would also have found, in fair number, many kinds of flycatchers, chipping sparrows, horned larks, purple martins, swallows and swifts, bluebirds, and many other varieties in diminishing numbers. You were unfortunate in your observation of blackbirds, as there is no country richer in this variety of bird life than California. Besides the allied species of the cowbird and the variety you mention, there are the following varieties: The yellow-headed blackbird, three kinds of the red-winged blackbird, and the bi- and tri-colored blackbirds. As to the jays, I agree with you about their sly and secretive habits, and their raucous voices, but you must have been quite a distance from them when in flight, or you would have seen that their underparts are almost entirely white.

The bird that went flitting from post to post ahead of you as you drove along the highway, was undoubtedly the Arkansas flycatcher (*Tyrannus verticalis*). The owl which you think might be termed "hawk-owl" was the ordinary burrowing owl which is found throughout the valleys of our State. Your "gray squirrels" were not squirrels at all, but spermophiles. They are pests of the first degree; useless as food, unless a man was starving, and very destructive in wheatfields. One family of spermophiles will destroy as much wheat as would be necessary for the existence of half as many human beings annually. They are warred upon unintermittingly by trap and poison throughout the wheat-growing sections of the State, and still they multiply.

But, brother Coahoma, this was what aroused me, and started me in the notion of straightening out your "kinks." Toward the close of your article you state "the California meadowlark is certainly entitled to all the honors of a 'song bird' in an otherwise songless region. Songless region, indeed! Why, that is rank slander! All the world knows that California has the finest climate, the finest fruit and flowers, the largest trees, the tallest mountains, the deepest cañons, the richest soil, the handsomest women, and the fastest horses in all the world. Such being the case, do you think we will stand for a black eye on our birds? Perish the thought.

No, no, Coahoma, come out here in our spring and early summer months and I will introduce you to some of the sweetest singers in all birdland. I will take you to the high sierra, where you can listen to Townsend's

solitaire, the sierra hermit thrush, and the American dipper, in their native haunts, where the mountain torrents sing their songs to the everlasting peaks. I will send you into the cañons to listen to the weirdly beautiful notes of the rock and cañon wrens. I will take you further down the sierran slopes and introduce you to the California thrasher, the black-headed grosbeak, and the long-tailed chat, and let them charm your heart with their unique and entrancing songs. I will take you where you will hear many varieties of song sparrows; where the goldfinches trill their sweet lays, where the housefinch sings his artless roundelay throughout the year, and where many varieties of the warblers lisp their sweet numbers while searching the foliage of our fruit trees for the noxious insects that nest there.

Songless, indeed! Nowhere on this great green earth of ours can a greater variety of song birds be found than in our glorious State. I have not enumerated half of them, and have left the mockingbird out entirely, as being too common to mention.

AREFAR.

AUBURN, California.

"Monarch, the Big Bear."

Editor Forest and Stream:

Dr. Morris's letter on the subject of Mr. Seton, Mr. Kelly and Monarch, does more credit to his genial cheerfulness of nature and his tolerance of human frailty than it does to his ethical sense. Putting aside for a moment the question of Mr. Seton's culpability in using Mr. Kelly's material, just how much of a sinner is he still in his relation to the reading public—the public that, believing in his assumption of accurate knowledge and intimate acquaintance with the subjects of which he writes, has bought his books, created his vogue, and made it possible for him to enjoy the pleasure of a country place next door to Dr. Morris?

Mr. Seton poses as a scientific authority upon grizzly bears. Although he is one of those who break the loaf of science into small bits and soak it in sugar and water, nevertheless he sets himself forth as having, and is believed to have, accurate and intimate and first-hand knowledge of the subject, and the people who read his books believe they can depend upon his statements. His publishers advertise this book as an intimate scientific study of the habits and characteristics of the grizzly. And yet it appears that he got nearly the whole of the material for that book from an acquaintance, either by listening to the other's bear yarns in a hotel parlor or by wholesale appropriation of his printed work. And although those yarns had as their subjects bears, grizzly and brown and black, Mr. Seton shouldered them all upon a grizzly, not even knowing or caring, as long as they served his purpose, whether they were true or were mere camp-fire stories.

Now, what is all this but a literary buncoing of the reading public? For my part, I am unable to see any difference, ethically considered, between it and certain methods of enriching one's self commonly called getting money under false pretenses.

Dr. Morris's good-natured admission of the genesis of "Redruff" exposes another animal story in which Mr. Seton, instead of writing from that first-hand knowledge which he pretends to possess, merely helped himself to what he needed from another man's pages. It happened that the proceeding did not touch Dr. Morris in a sensitive place, and so he doesn't mind—he is even glad of it. But suppose Mr. Seton had heard Dr. Morris give a detailed account of his treatment of a case of surgery, and had then set himself up as a surgeon, and, by virtue of the copious notes he had taken, assumed to treat as a specialist other similar cases? Would not Dr. Morris then think him a fake and a quack, and be ready to invoke the law for his suppression? And if he should happen to achieve brilliant success, would that make any difference with the doctor's convictions as to the moral status of the affair?

Nor has Dr. Morris considered that the taking of other people's "lead" may become a serious practical question when lead means livelihood. Mr. Seton and Mr. Kelly both write for their living. To each these bear stories meant working capital, to be transmuted into income. Can Dr. Morris see any moral difference between helping one's self to capital of that sort and taking horses, or land, or tools, or bottles of medicine out of a drugstore?

It is not surprising that there should have been hazy notions about property in ideas in the days of Grub street, when a literary man's livelihood depended on the favor of a wealthy patron, and not on the market value of what he wrote. But in these later days, when ideas and knowledge and information and facility in dressing them up have come to have as distinctly a money value as wheat or hogs or cotton, it is surprising to find any law-abiding citizen attempting to justify a dealer in these things who takes that which belongs to another.

WESTERN.

NEW YORK, Nov. 28

The Mockingbird Breeding in Massachusetts.

PROVIDENCE, R. I.—Editor Forest and Stream: Early in October, while on a visit to Pasque Island, in the mouth of Buzzard's Bay, I saw two mockingbirds, and Captain Wilcox gave me some interesting information regarding them. In the spring he saw one flying about the garden, and even investigating the glass plant room or conservatory, as though it might have been at one time a captive bird. Soon it disappeared and was not seen for about two weeks, when it came back with a mate, and they proceeded to make themselves at home, and were frequently seen about the bushes and in the clumps of stunted pines on the hill, where the male sang splendidly all summer.

As the season wore on the Captain counted six birds, and saw two of them feed the others, which would seem to indicate that they bred on the island. On the 29th of September four were seen, and after that they seemed to separate, only one or two being seen at a time.

GAME BAG AND GUN

A Colorado Lion Hunt.

THE mountain lion of the West is the panther or cougar of our Eastern States, sometimes called "painter" by the old-fashioned backwoodsman; in some localities it goes by the name of "Indian devil," no doubt on account of the weird, unearthly noise it makes at night. In Mexico it is known as the "puma," and grows to a larger size than elsewhere. The mountain lion is in appearance very similar to the African lioness, having a smooth, tawny skin without any mane; a full-grown animal that will measure about 8 feet from its nose to the end of the tail and weighs about 200 pounds, is considered a large specimen. They seldom exceed this, and more frequently fall below it.

Although often engaged in hunting big game, I never saw a mountain lion at large except when one has been rounded up by a pack of dogs. In their habits they are stealthy and secretive, carefully keeping concealed, and never willing to fight unless cornered with no chance of escape. Occasionally, when the odds are overwhelmingly in its favor, a lion will provoke a battle, but this is not often the case.

In disposition and character the mountain lion belies its name; of all carnivorous beasts it is, perhaps, the most cowardly. Being exceedingly destructive, it not only kills for food, but it also kills out of wantonness. I have run across numbers of deer that have been destroyed by the same animal within short distances of each other, the carcasses being allowed to remain almost entire. It has also been stated on good authority that one lion will be likely to kill in the course of a year about 150 deer.

Considering its destructive disposition, I have no doubt that in a country where the deer are at all numerous this statement is not far from the truth. The ranchman has a cordial hatred for this destroyer of his stock, and the devilish cunning displayed by the lion in evading traps and turning away from poisoned meat makes him all the more unpopular. This animal will not eat of any kill unless it is his own or some other lion. Extremity of hunger may cause him to act differently, but it is exceptional. Most success in hunting this game is to be found in localities where the deer are plentiful.

It is practically useless to attempt any hunting of this kind unless you have a pack of well trained dogs handled by someone who has complete control over them. Great care and patience has to be exercised in breaking a pack of dogs for this purpose, and stop them from running other game. If, for example, a pack should take after a timber wolf, that animal is so fleet that he would distance most of his pursuers and string them out considerably. The wolf has been known to turn on the pack thus separated and kill a number of the dogs, one after the other, before the pack could be united. The disappointed huntsman, reaching the end of the run on his jaded horse, might survey the remnants of his pack—first the survivors with downcast heads and apologetic tails between their legs—and then some dog fur scattered over the blood-bespattered ground, and here and there a mangled corpse. It is no joke to have a pack run for miles after the wrong game over rough country, your whole day's sport broken up, and perhaps lose your dogs for several days.

The mountain lion has not much endurance in the chase, although very fast for a short distance, which he covers by a series of leaps. In a short time he is tired or driven to the ledge of a precipice or into some hiding place. If you are fond of hunting with a camera, you generally have ample time to take a photograph of your prize, perhaps posing in the branches of a tree and looking as pleasant as possible—for a mountain lion!

The lively serenade furnished by the dogs, which he recognizes by continual growls, displaying his whole set of ivory, completes a scene not soon forgotten. Your share of the business is very tame, although absolutely effective. A shot at close range behind the shoulder, and the lion tumbles among the savage dogs to engage in a losing fight; while in the agony of death, not infrequently, he leaves some little reminders of his long claws and strong teeth upon his assailants.

In the month of January, 1900, I engaged the services of a man with a good pack of dogs to hunt "lions" and "cats" in Colorado. The "cats" referred to are bobcats, not the wildcats known in the Eastern States. The winter was unusually free from snowfalls, and the ground being exceedingly dry, it made hunting very difficult, because the dogs could hardly follow the scent on the ground.

My first destination was a ranch on Strawberry Creek belonging to the guide, about twelve miles from Meeker. Here we engaged in a fruitless hunt for several days, until one morning a fresh fall of snow covered the ground, when our efforts were rewarded by the dogs striking a couple of cat trails; these we followed a short distance, with the whole pack tearing away ahead of us in full call. The dogs followed the trail to a great pile of massive rocks, which towered a hundred feet above our heads, and there became bewildered. What had become of the stealthy bobcats? The guide and myself climbed the rocks to search for them. Looking down from the summit I saw one of them lying in front of the cave surveying the dogs, which were silently and swiftly nosing around below it.

It was easy enough to shoot the cat where it was, but as it rested on the ledge of a rock of some breadth, it was a grave question whether it might not die there where it would be practically inaccessible, and we would have all our pains for nothing.

To drive the cat from its position into a better one was more than a doubtful possibility, as it was likely to run back into the cave. So I took a chance and fired. Like a crash of lightning above their heads, the excited dogs heard the report and knew "that there was some-

thing doing." The wounded cat gave a sudden leap into space and fell among them. If there is any question about a "cat having nine lives," it seems that the dogs were bound to be on the safe side, for they hauled the remains until I began to fear that the fur might be damaged before I could come to the rescue. Through a fatal curiosity, the other cat peeped over the precipice, and paid for its rashness with its hide, which I added to my collection. The job of skinning the cats I turned over to the guide.

The big dogs sat around in sullen dignity, particularly avoiding any familiarity with smaller dogs and with each other. Each one seemed to consider himself the hero of the occasion. I have had occasion to observe that the pack would work and fight well together, but after the fray they seemed to be intensely jealous of each other.

Several of the dogs interested me considerably. One of them was called "Old Jim," a big black-and-tan fox-hound, with a deep bass voice which would swell the chorus when the pack was in full call and sometimes almost drown it. Old Jim would sometimes provoke the not over angelic temper of the guide by occasionally leading the whole pack after a coyote. On one occasion he had distinguished himself by whipping a coyote, and whenever one of these "sassy" prairie wolves would show itself, he could not resist the temptation of giving chase, leading the whole pack after him.

Anyone acquainted with western hunting knows how useless it is for dogs to attempt to outrun a coyote. The coyotes would frequently come close to the pack, if there was no man near-by, as though to provoke a chase for our special annoyance. The dogs, however, would never run the coyotes' trail; they were broken of that.

Another interesting acquaintance was a dog called Turk, a cross-breed, but a very strong and stubborn fighter, all seamed with scars. Turk kept near the guide, and did not run with the pack except when there was something in view. He was a good-natured dog ordinarily, but an ugly customer in a scrap.

There was another dog called Boxer which had a very keen scent; long before the rest could discover a trail, you could hear Boxer's knowing yelps, which would gradually develop into a chorus, as one by one the other dogs would detect the scent as it became warmer. Boxer had more judgment than any other dog in the pack, and was very good in puzzling out a broken trail.

We spent several days longer at the ranch on Strawberry Creek. While there the guide purchased a broken down horse to feed to the dogs. It is not a particularly easy matter to keep twenty-one dogs supplied with food. When the horse was led out for execution the dogs became intensely excited and seemed to know "what was up." The moment the animal was shot, and almost before it could fall to the ground, the whole pack of dogs, big and small, was tearing some part of the carcass. No doubt the habit of attacking wild animals as soon as they have been shot developed their naturally savage dispositions.

At the suggestion of the guide, we decided to go to a ranch near the Bear River Cañon, two days' journey from our present location. When we arrived at the ranch, after a long day's ride on horseback, we found the ranchman's wife keeping house; her husband had left for several days. She seemed in no condition to entertain us on account of a bad headache, but kindly offered to do whatever she could. We volunteered to help her out with her domestic duties. First of all I prescribed for her headache; the medicine went down the wrong way, which caused her to vomit, after which she declared she felt better. As the result proved satisfactory in an unexpected way, my professional pride did not permit me to enlighten her to the contrary. I say professional pride, because I went by the nickname of the "Doctor" on account of an emergency case I carried with me. I made myself useful in doing most of the chores usual on such occasions, while the guide held the baby, which howled incessantly. The expression on his face while performing this duty was as angelic as I have seen it when Old Jim would lead the whole pack off on a chase after a coyote against his impotent protest. When the meal was served, two other children turned up, one a little girl nine years old, who was censured for not taking care of the baby; the other a boy of about eleven, who was particularly good, according to his mother's account of him. Our first day's experience with these interesting children caused us to reverse the parental opinion. When we returned from our hunt the evening of the following day, the guide missed his lasso; the good little boy had tried to lasso a cat which was selecting some delicacies from a tin can, the cat took a sudden leap to escape the lasso, and in doing so shoved its head into the can and cinched the lasso round its body; cat, can, and lasso disappeared in the sage brush and were never found.

The country around Bear River Cañon is very rough and quite picturesque. The cañon is steep and cuts a great gorge in the mountain, and is very difficult to cross. In one place we were headed off by the precipice, which must have been fully a thousand feet in depth; I rolled a stone off the edge, and its descent seemed to take a considerable time. A shower of broken fragments and dust, followed a second or two afterward by a dull crash which reverberated through the cañon, announced the termination of its fall.

The dogs finally succeeded in jumping a lion, running right upon him. From a distance I could see the chase along the side of a mountain until it turned in the direction of the cañon. The lion did not seem to be going very fast while covering the ground by long leaps, which he appeared to do without much effort, but when I looked at the pack which did not seem to be gaining on him, they were straining every nerve, and looked as if they were "going it for all they were worth." No doubt the easy gait of the lion made his speed deceptive. The lion

took refuge upon a ledge of the precipice some fifteen feet below the crest. When we arrived at the spot the dogs were raising an awful din in their impotent frenzy as they looked down upon the smiling countenance of the lion, which was displaying all his teeth. It was thought inadvisable to shoot the lion on the ledge where he was, because there was a good chance of his dying in an inaccessible spot, so we dropped stones on him, hoping to drive him on out of that place and compel him to run to the top of the precipice and take refuge in a tree.

[TO BE CONTINUED.]

E. F. R.

North Carolina Attractions.

RALEIGH, NORTH CAROLINA.—Under the direction of the writer, Governor Aycock and the other State officers enjoyed their fourth annual rabbit hunt two days before Thanksgiving. The party started from the Capitol Square here in an ambulance, not forgetting to take the components of a good dinner in the shape of a roasted turkey and plenty of baked sweet potatoes and some good bread. The hunting ground was five miles west of here, and there the party was joined by Mr. William Robbins with his pack of nine beagles, and by Mr. Charles Crawford with his pack of the same number. We stopped at a house more than a century old, and the hunt began without any preliminaries. The country is rolling, set thick here and there with noble forests, corn fields, cow-pea patches (dear to the taste of the rabbit), and with fields of broomsedge, in some places thickly grown up with young pines. It is an ideal rabbit country, and the rabbits in such cover thrive wonderfully. They are big, hardy fellows, and run, as the Governor expressed it, "just like a fox." In fact, some of the rabbits ran two or three miles and the music by the dogs was simply grand to the ear of the listening officials, who were all enthusiastic sportsmen. The Governor carried a gun, and so did State Auditor Dixon, and the rivalry was great between the two. The Governor won out, killing three, while the Auditor bagged only two. At a distance of 75 yards the Governor, with a Remington gun lent him by me, killed a rabbit by hitting it in the eye. He declared the eye was all he saw, and added that he made it a point to shoot rabbits in the eye. He acquired a great reputation at once among the entire party. In all 15 rabbits were bagged, ten of which fell to the guns, while five were taken by the dogs. I didn't carry a gun, but made it a point to keep just as near the dogs as I could, and I must have run and walked twenty miles during the hunt.

By the way, the costume I wear is a model one for men who come south to hunt, being entirely of canvas, the trousers being made to fit tight around the ankle and to button, over these the canvas leggings fitting snugly. The trousers and hunting coat are of 12-ounce duck. Light shoes with very broad soles are worn. In this clothing one can pass without trouble through the thickets of blackberries, well set with briars which abound down South.

The hunt ended a little before three o'clock, and then we went to the old country house and applied ourselves to the turkey and potatoes, adding to these a couple of gallons of fresh milk and about four pounds of good, home-made butter. Many a joke was passed around as we ate that excellent dinner. One of the sportsmen was Commissioner of Agriculture Patterson, who was dressed very much like the pictures one sees in the papers of the Southern politician—big hat, of the softest texture, long coat, the clothing being of the black so much affected by the old-style Southern gentleman. The up-to-date people call this type of coat a Prince Albert, but to the negro it is always known as a "Jim-swingler," and is to them one of the most coveted garments. Attired in this costume the tall Commissioner, a very enthusiastic rabbit hunter, said he was ready for any chase. He did not carry a gun, but was right in the running after the rabbits, and kept the hounds very close-pressed. One of the darkies with us was a great admirer of the Commissioner, and very early in the game expressed his admiration by saying to the writer: "Dat Comishner gemnum shore is a runnin' man. I never seen in my life any man whar cud outrun him. Den, too, he's main hand about cheerin' on de dogs. Dey hear him er comin', en when he whoops there is sompin' doin'." He shore is the runninest man I ever seed, an' de shoutinest. En he can carry dat Jim-swingler anywhere."

The rabbits, which were carried in a crocus sack by one of the darkies, were brought back to Raleigh and given to one of the charitable institutions. Everybody in this part of the world eats rabbit. Sometimes it is barbecued, that being a very popular mode of preparation, but it is cooked in a dozen ways. Rabbits are brought in here by the hundreds. A great many are caught in gums, which are made out of a hollow log or else a box, long and small, with one end permanently closed, and at the other a slide set with a Fig. 4 trap, baited with a bit of cabbage. Country boys take thousands in this way. Rabbits generally sell for ten cents apiece, and are always in request. In a county near here they are known as "sand horses," and when I asked a man from that county why this name was given them, he replied that it was because "they play around in the sand in the moonlight."

Dr. Jas. R. Rogers, of Raleigh, went to Chase City, Va., for a fox hunt this week, and was joined there by Mr. O. K. Holding, of Wake Forest, with his pack of 15 fox hounds. They went to the Hotel Mecklenburg, where there is a pack of 18 hounds. The sport began Tuesday morning. They found that the writer had told the truth when he said in a recent letter to *FOREST AND STREAM* that deer are so plentiful in that part of Virginia that they greatly embarrass the fox hunters, who dearly love to catch the foxes, but at such a time set no value upon the deer at all. A great chase was in progress, when sud-

denly a big buck sprang from his lair, and away the hounds went on his hot scent. So furious and fast was their rush that they caught him after a run of three miles and pulled him down, one of the hunters, who was riding a very fast horse, coming up and taking him from the dogs and cutting his throat in the approved style. He was hung up and the chase was resumed by a return to the place where the fox had last been seen. There was another failure, for another deer led the dogs astray. The pack of Mr. Holding, being new to the country and new also to the excitement of deer hunting, which is not enjoyed in this section of North Carolina, fairly went wild over the great game up before them, and this broke up the hunt, for of the Holding pack only seven returned, eight having gone a vast distance after the deer. Mecklenburg county adjoins North Carolina. The deer, with seven dogs following him, was last seen crossing the Southern Railway near the North Carolina line, and quite near the Roanoke River. Dr. Rogers and Mr. Holding offered rewards for the return of their lost hounds, and the Mecklenburg sportsmen say the dogs will probably all be recovered unless they attempted to cross the river. The plentifulness of deer in that part of Virginia, in such a well populated country, is certainly very remarkable, and impressed the writer when there in September and October.

Thousands of sportsmen went out on Thanksgiving Day in all parts of this State, it being by long custom the greatest of hunting days. It was windy and not so favorable for game, but the kill of partridges was in spite of this quite large. The demand for partridges is growing greater all the while, and prices are advancing. While a few years ago only 5 cents had to be paid for a bird, now the standard price seems to be from 12 to 15 cents. The Audubon Society is very close in its search for persons who trap or net partridges; in fact, is after all violators of the now strict game law, and arrests are made every day somewhere in the State.

News comes from Carteret county that Game Warden Willis caught a native in the very act of killing ducks at night by firelight. The natives who have defied the law about this matter for years have made threats that they would shoot anybody who attempted to arrest them or interfere with them, and they have always carried ready for use cartridges containing the lead balls used as sinkers on fish-nets. But Willis caught his man, and carried him before a magistrate, who imposed a heavy fine upon him, and also taxed him with the costs. The arrests have had a good effect, as it has been said that the Audubon law could not be enforced in that particular community. The arrest was made on Core Sound. It is a good season for ducks and also for geese, sportsmen report to me.

The item about bears in the western part of this State in a recent number of FOREST AND STREAM, has attracted the attention of some sportsmen north. They had been told in the article that many bear were killed around Mt. Mitchell, but say they could not find that mountain in their geographies. It certainly ought to be in every geography, as it is considerably the highest peak in the United States east of the Rocky Mountains. The bears in that western country are much larger and much fiercer than those in the coast countries, because they eat chestnuts and other things which give them a wonderfully fine flavor.

Really there are so many kinds of sport in North Carolina that the wonder is that more people from the North—true sportsmen, that is—do not come here. The way for them to do is to find out where to go for the particular game they are after, pay the Audubon license tax, make themselves good friends with the farmers, be willing to pay reasonably for their sport, and they will find it smooth sailing. Of course sometimes there are gruff farmers, but a pleasant introduction and that sort of thing will go a long way. They must remember that no birds can be shipped out of the State, and so be content to enjoy good sport and to live on the fat of the land.

FRED. A. OLDS.

Game in New England.

BOSTON, Nov. 26.—*Editor Forest and Stream:* The bill to abolish the open season on deer for a term of three years has been defeated in the Vermont Legislature. I have not yet learned what is the fate of the bill which makes the season for deer hunting five days instead of ten.

Mr. Silsby, of Newbury, for the Fish and Game Committee, has introduced a bill as a substitute for seventeen others that have been presented, entitled, "An Act Relating to Fish and Game Protection." This prohibits the taking of fish by grappling; makes the open season for brook trout and kindred fish from May 1 to August 1 in brooks and streams, to September 1 in ponds and lakes, but owners of private ponds may take fish from February 1 to September 1. It changes the open season on wall-eyed pike, pike-perch and pickerel, making it from May 1 to November 1, except in Lake Champlain. It prohibits all fishing except by angling; limits the catch of brook trout to 10 pounds in one day, of lake trout and masquinongé to 25 pounds in one day. It prohibits catching trout and black bass for purpose of sale, and defines stocking of waters by owners as "placing therein annually not less than 1,000 fry or 300 fingerlings for each half mile or less of stream and one acre or less of ponds," affidavits of such stocking to be filed with the town clerk. It also repeals sections permitting seining under license. It was ordered that the bill be printed. It is understood that this has the approval of the commissioners.

A black bear which had been doing much damage to crops and live stock in the town of Hardwick, Vt., was recently shot and tipped the scales at a little more than 300 pounds. Just before Thanksgiving Mr. Aaron Crosby, of Hanover, N. H., took advantage of the snowfall for a hunt on Moose Mountain, and brought back a handsome buck.

Three Boston hunters, members of the Roslindale Club, returned from Maine in time to furnish friends with venison as an accompaniment of the Thanksgiving turkey. They are Wm. H. Jenness, superintendent Roslindale post-office, and Messrs. L. Dimock and H. E. Greenlaw. They visited their camp on Uncolcus Stream, Penobscot county, Maine. They report an abundance of large and small game in that region. They brought out two bucks

each. The largest was shot by Mr. Jenness, weighing 300 pounds. Its color was unique, being a yellowish red, which the guide said was a novelty in that locality.

Reports from the Rangeley country are that snow is now nearly a foot and a half deep, and conditions for tracking are excellent. Mr. J. R. Mann, of Arlington Heights, and two friends, all members of the Middlesex Sportsmen's Club, have just returned with all the deer the law allows to be brought out. Many Massachusetts towns are represented by devoted nimrods in this section.

The records for a single day's shipment from Bangor were broken on Monday, and this week has eclipsed the previous ones of this season. There were 656 deer and 40 moose shipped this week from Bangor Station. One of the finest collections of game ever seen in that city was brought by Messrs. E. H. Corliss and E. E. House, of Boston. Each had a moose and two deer, and all the animals were large. Messrs. C. and J. Swan, of Boston, had one moose and two deer. T. Lathrop, of Boston, had a moose. There were between 90 and 100 Massachusetts sportsmen represented among the owners of the big game that passed through Bangor during the week, and it is more than likely an equal or larger number of Maine hunters secured game during that time. It would not be a greater hardship for a citizen of the Pine Tree State to pay a license of \$5 for hunting large game than it is for some of the non-residents to pay the required \$15. Such an arrangement would add from 33 1/3 to 50 per cent., no doubt, to the fund for protection of game.

CENTRAL.

Quail in Costa Rican Rice Fields.

A BRIGHT morning in the month of August found us ready for an early start after quail in the rice fields, three miles out from San José, Central America. Ben, an ex-cowboy, down here for railroad work, and myself on coffee business and hunting. This to be my first experience for quail in this new country, and not soon to be forgotten.

We breakfasted, and placing shells and lunch in our pockets, we left for the railroad, a short distance across the parade ground. Ben pulled out from the engine house a four-wheeled arrangement called a bicycle car. It had two bicycle seats side by side, handle bars and sprocket, chain and cranks, mounted on four wheels to fit the narrow gauge track. Strapping guns on the front handle bars, we matched to see who should do the pedaling, as the right side only contained the necessary crank and chain. Ben lost, and we climbed in. If we had met a train it would have been all up with us, for there was no brake, and the only way to dismount was to disentangle our legs and crawl out behind. Usually there was but one train a day and that at three in the afternoon. After the first mile it was down grade, and one could see the track stretching out far ahead. I forgot to mention, before starting Ben had filled his pockets with small stones and instructed me to do likewise; why, he would not say; but soon I discovered their use, for out of the first hut we passed all the dogs of the family rushed, and they were not a few, for in that country they harbor dogs of all sizes, shapes and colors. Ben was busy keeping the machine going, so it fell to me to repulse the enemy. Waiting till they were quite close, I fired the missiles, and oh, what a ki-yi-ing and yelping, with every dog running back. This continued as long as we were among the coffee plantations, where these huts lined the road. Soon we were out amid stretches of cleared land, and there we beheld in front of us, though distant, the shining hazy blue of the Pacific Ocean. Around us were the volcanoes and mountains standing out so sharply in the wonderful atmosphere found in that high altitude, while in the air above hovered numberless vultures, some with wings outspread and many sailing up and still higher till almost lost to sight. Such mornings as these are found in that land of tropical verdure and ever smiling skies. Shortly we were down lower and among the rice fields, entering the town of Rio Grande.

Ben proposed we should make a grand entry, and come in dignified fashion to the station, which was also the store of the town. Alas for our well formulated plan, the fulfillment was not as we expected! In all single track railroads there are sidings at the station, and this was no exception, the switch being close to the store. When the front wheels of the machine struck the frog of the switch and stopped, the rear wheels formed an arc in rising, and from their seats shot the two hunters. We surprised the natives as well as ourselves by entering town in such an ungraceful manner; but they concealed their merriment with politeness quite worth imitating. After collecting myself and belongings, I looked for Ben, and found him sitting between the tracks with one side of his face well marred and for a moment dumb. Have you ever cowboied or been in a corral when the broncho goes to the bad and tries to burn up the supreme earth? Well, Ben found speech, and thankful was I that the gazing crowd could not understand English, especially English used on the Western plains. With the assistance of some of the spectators the car was righted, which by great luck had only badly twisted seats to repair. It was a mystery how the guns ever escaped injury in such a tumble. We righted these and delayed long enough to buy some kola for lunch.

Soon we were in the quail country. We go slowly, looking each side for Bob White. What is that, a head on the track? Carefully we bear down upon it, when up the bird rises, going to the right, giving a great shot to Ben, who takes advantage of it and brings him down. This was the first Costa Rican quail I had seen—a bird much smaller than our quail of the north, and darker in color, and scientifically known as *Colinus leylandi*. Once again we advance cautiously, hardly going a dozen yards before from Ben's side rise four of the birds and sail over into the lot beyond.

We lift our car and place it near-by and climb the fence, when from all sides the quail appear, and the sport is fast and furious. What a chance for a good dog, and what a picture he would make! We work across the lot and back on the far side, not trying to pick them out, but flushing straight ahead. The tally on our return was eight to Ben and five to me, and more to be picked up by following the scattered ones, as they lay close and were easy to wake up, but we were satisfied, being out for

sport rather than to make large returns. However, we twice repeated the walk through the field, and brought in twenty-five fat, fine looking quail. Just think what feeding they had enjoyed in those rice fields!

We decided to go on to an old tie camp at the big bridge over the Rio Grande River, there to lunch and shoot in the fields near-by till time for return train. However, before we reached the bridge we encountered so many good opportunities for a shot we dismounted and entered an open lot. It was a peculiar one, for at the far end it was screened off by some bushes and coffee trees. Ben took the left side and I followed the right, for I saw some birds and was securing them, when, looking over in Ben's direction, I noticed a bird rise close to the fence; his gun was up in an instant, and on its report the quail crimped. But the strange attitude and expression on Ben's face! What does it mean? Quite motionless, and then, as it were, flying toward the fallen bird, and yet not stopping to pick it up, dashing through the fence made of the bushes before mentioned like one possessed. Now, in that southern country there is a tiny wasp having a sting fit for an insect a hundred times his size; the poison is not dangerous, but very painful, and produces a swelling which mars one's beauty for many a day, and poor Ben had met such a wasp, hence his hasty exit from the shooting ground.

When I reached him, judge of my surprise to see him with his penknife picking shot out of the back and neck of a peon, whom he had hit with the same shot he was using for the quail. Ben's flow of Spanish was great, and from what little knowledge I had could gather he was informing his victim that it was an "honor to be shot by an American," and so successful was he, that when offered money the poor fellow would not accept, but shook hands and smiled. Yet it was a sad smile, for Ben had shot almost too well.

On the way back my companion indulged in remarks which did not indicate he had found very much pleasure in quail shooting, and as he had maimed a peon in his sport, he declined to look for more birds on this trip. We then walked to the river bank and finding a cool spot under the bridge, ate our lunch and finally concluded that our hunting trip, while varied in its adventures, was worth the making, and we were gratified in having made the acquaintance of several Costa Rican quail, and fortunate in not carrying empty bags to San José.

Views of a Blunt Old Man.

Editor Forest and Stream:

I have been a duck shooter going on forty years. I hunted ducks before the majority of your readers knew how to shoot a gun; and when I was young we did not make so much pother about whether it was sportsmanlike to shoot them in any one particular way rather than another. We wanted ducks, and we got them. Like little Sally Waters sitting in the sun, weeping and sighing for a young man, we looked to the east and we looked to the west, and we banged away at the duck we loved the best. (In parentheses, we generally got him, too.)

I don't quite know what to make of the implied criticisms and the insinuations of unfair treatment of duck made in recent issues by writers concerning hunters who shoot ducks sitting on the ice. I don't know what to make of it because we all do it, and I never yet met a duck hunter—I mean while he was hunting—who did not do the same thing, and call it all right. Of course a man sitting in a snug, warm room and theorizing about ducks on the ice and how to do them, might figure it out that the truly æsthetic way was to shoot them up before he unlimbered on them; but the man who is there has no such notion, and we who have been there know that he hasn't. He just blesses his stars if he can get the drop on the birds before they fly; and even then, what with his bundlings and numbness and stiffness, the ice on his eyelashes making him see double, he thinks himself "some punkins" of a shot if he has a duck to take home to the pot.

This is just what happens. It is the practice, and theory be hanged. I will leave it to your practical duck shooters to say if I have stated the facts or not.

And I will leave it to them, too, if it is not the practice of duck shooters, shooting ducks on the water, to "give 'em one settin' and another flying" whenever they can get a chance to do so.

As for the shooting at two sitting black ducks by your contributor, Mr. Hardy, I assume that Mr. Hardy wanted duck for dinner, and took what fortune sent him—or as much of it as he could—as fortune intended he should take it, sleeping or not sleeping, at all events sitting, just as we all like to pot a duck when we are after meat.

And there you have the convictions, sentiments, creed and rule of conduct, and the actual practice of

A BLUNT OLD MAN.

Newfoundland Moose.

St. JOHN'S, N. F., Nov. 20.—The game warden at Howley writes the Fisheries Department that during the past week hundreds of caribou have crossed the railway line at that place going south. They evidently remained longer north this season than for some years past, very little snow having fallen. There was no sign of the moose.

The moose referred to are some half dozen imported early this season. They have been seen several times during the summer in the vicinity of Howley railway station. They were apparently getting on all right. If these increase and multiply, as it is expected they will, the addition to our stock of deer will be great for sportsmen. At present it is against the law to molest them.

There are several American sportsmen at present on West Coast. These will have no trouble getting good heads, as the deer are reported very numerous and in good condition. The deer are on their annual migration south, and are passing Howley station daily in great numbers.

All communications for FOREST AND STREAM must be directed to Forest and Stream Pub. Co., New York, to receive attention. We have no other office.

Capture of Animals.

From "The Trapper's Guide."

The Muskrat or Musquash.

THIS is an animal of amphibious habits. Its head and body are from thirteen to fifteen inches in length. The tail is nine or ten inches long, two-edged, and for two-thirds its length rudder-shaped, and covered with scales and thin, short hair, the edges being heavily fringed. The hind feet are slightly webbed; so that it can "feather the oar," as the boatmen say, when they are brought forward in swimming. The color is brown above and ashy beneath. Muskrats are nocturnal in their habits; but are frequently seen swimming and feeding in the day time. They are excellent swimmers, and can go from ten to fifteen rods under water without breathing. Their natural food is grass and roots; but they will eat clams, mussels, flesh, corn, oats, wheat, apples, and many other vegetables. In open waters they sometimes find their way into farmers' cellars through drains, and make free with whatever they find in store. They thrive best in the sluggish streams or ponds bordered with grass and flags. The roots of these plants are their chief support, and from the tops they construct their abodes. These structures are dome-shaped, and rise sometimes to the height of five or six feet. The entrances are at the bottom, under water; so that the inside of the houses are not exposed to the open air. The muskrats live in them in winter, gathering into families of from six to ten members. Hundreds of these dwellings can be counted from a single point in many large marshes.

Muskrats have a curious method of traveling long distances under the ice. In their winter excursions to their feeding grounds, which are frequently at great distances from their abodes, they take in breath at starting and remain under the water as long as they can. Then they rise up to the ice, and breathe out the air in their lungs, which remains in bubbles against the lower surface of the ice. They wait till this air recovers oxygen from the water and the ice, and then take it in again and go on until the operation has to be repeated. In this way they can travel almost any distance, and live any length of time under the ice.

The hunter sometimes takes advantage of this habit of the muskrat, in the following manner: When the marshes and ponds where muskrats abound are first frozen over and the ice is thin and clear, on striking into their houses with his hatchet for the purpose of setting his traps, he frequently sees a whole family plunge into the water and swim away under the ice. Following one of them for some distance, he sees him come up to renew his breath in the manner above described. After the animal has breathed against the ice, and before he has had time to take his bubble in again, the hunter strikes with his hatchet directly over him and drives him away from his breath. In this case he drowns in swimming a few rods, and the hunter, cutting a hole in the ice, takes him out. Mink, otter, and beaver travel under the ice in the same way; and hunters have frequently told me of taking otter in the manner I have described, when these animals visit the houses of the muskrat for prey.

In summer, muskrats live mostly in banks and in hollow trees that stand near a stream; and sometimes, for want of suitable marshes and ponds, they remain in the banks and trees through the winter. They are very prolific, bringing forth from six to nine at a birth, and three times a year. The first kittens also have one litter, which attain to about the size of house rats in September. They have many enemies, such as the fox, wolf, lynx, otter, mink, and owl. They are found from the Atlantic to the Pacific, and from the Rio Grande to the Arctic regions. But they do not inhabit the alluvial lands of Carolina, Georgia, Alabama, and Florida, though in other regions they live much further south.

The modes of capturing the muskrat are various. One of them we have already seen. Another is by spearing. These methods are good at certain seasons and in certain conditions of the ice, etc.; but for general service there is no means of capture so reliable as the steel-trap. Traps should be set in the principal feeding places, play-grounds, and holes of the muskrat, and generally about two inches under water. Bait is not necessary except when game is scarce and its signs not fresh. In that case you may bait with apples, parsnips, carrots, artichokes, white flag-roots, or even the flesh of the muskrat. The musk of this animal will sometimes draw effectually at long distances. The bait should be fastened to the end of a stick, and stuck over the trap about eight inches high, and in such a position that the animal will have to pass over the trap to take the bait. Care should be taken to fasten the trap to a stake in such a position that the chain will lead the captive into deep water and drown him. If he is allowed to entangle himself or by any means to get ashore, he will be very likely to gnaw or twist off a leg and get away.

Curing Skins.

However successful a trapper may be in taking animals, he will not secure a full reward for his labor unless he knows how to take care of skins, and prepare them for market in such a manner that they will command the highest prices. As skins that have been riddled with shot find little favor with fur-dealers, so skins that have been cut in stripping off, or that are encumbered with remnants of flesh, or that have passed into a state of incipient putrefaction before drying, or that have not been properly stretched, or that have been dried too fast, or that have been neglected and exposed after being cured, are very sure to be thrown out by the fur inspector as second or third rate skins, deserving only poor prices. Great quantities of valuable furs, taken by boys and inexperienced trappers, are rendered worthless by bad treatment in some of the processes of preservation. I shall give such information on this part of the trapper's business as I have obtained, both from my own experience and from conversation with fur-dealers.

General Rules.

1. Be careful to visit your traps often enough, so that the skins will not have time to get tainted.

2. As soon as possible after an animal is dead and dry, attend to the skinning and curing.

3. Scrape off all superfluous flesh and fat, but be careful not to go so deep as to cut the fibre of the skin.

4. Never dry a skin by the fire or in the sun, but in a cool, shady place, sheltered from rain. If you use a barn door for a stretcher (as boys sometimes do), nail the skin on the inside of the door.

5. Never use "preparations" of any kind in curing skins, nor even wash them in water, but simply stretch and dry them as they are taken from the animal.

Stretching Skins.

In drying skins, it is important that they should be stretched tight, like a strained drum-head. This can be done after a fashion by simply nailing them flat on a wide board or a barn door. But this method, besides being impracticable on the large scale in the woods (where most skins have to be cured), is objectionable because it exposes only one side of the pelt to the air. The stretchers that are generally approved and used by good trappers are of three kinds, adapted to the skins of different classes of animals. I shall call them the board-stretcher, the bow-stretcher, and the hoop-stretcher, and will describe them, indicating the different animals to which each is adapted.

The Board-Stretcher.

This contrivance is made in the following manner: Prepare a board of bass-wood or other light material, two feet three inches long, three inches and a half wide at one end, and two inches and an eighth at the other, and three-eighths of an inch thick. Chamfer it from the center to the sides almost to an edge. Round and chamfer the small end about an inch up on the sides. Split this board through the center with a knife or saw. Finally, prepare a wedge of the same length and thickness, one inch wide at the large end, and tapering to three-eighths of an inch at the small end, to be driven between the halves of the board. This is a stretcher suitable for a mink or a marten. Two larger sizes, with similar proportions, are required for the larger animals. The largest size, suitable for the full-grown otter or wolf, should be five feet and a half long, seven inches wide at the large end when fully spread by the wedge, and six inches at the small end. An intermediate size is required for the fisher, raccoon, fox, and some other animals, the proportions of which can be easily figured out.

Board-Stretcher.

These stretchers require that the skin of the animal should not be ripped through the belly, but should be stripped off whole. This is done in the following manner: Commence with the knife at the hind feet, and slit down to the vent. Cut around the vent, and strip the skin from the bone of the tail with the help of the thumb-nail or a split stick. Make no other slits in the skin, except in the case of the otter, whose tail requires to be split, spread and tacked on to the board. Peel the skin from the body by drawing it over itself, leaving the fur-side inward. In this condition the skin should be drawn on to the split board (with the back on one side and the belly on the other) to its utmost length, and fastened with tacks or by notches cut in the edge of the board, and then the wedge should be driven between the two halves. Finally make all fast by a tack at the root of the tail, and another on the opposite side. The skin is then stretched to its utmost capacity, as a boot-leg is stretched by a shoemaker's "tree," and it may be hung away in the proper place, by a hole in one end of the stretcher, and left to dry.

A modification of this kind of stretcher, often used in curing the skins of the muskrat and other small animals, is a simple board, without split or wedge, three-sixteenths of an inch thick, twenty inches long, six inches wide at the large end, and tapering to five and a half inches at six inches from the small end, chamfered and rounded as in the other cases. The animal should

Muskrat-Stretcher.

be skinned as before directed, and the skin drawn tightly on to the board, and fastened with about four tacks. Sets of these boards, sufficient for a muskrat campaign, can easily be made and transported. They are very light and take up but little room in packing, thirty-two of them making but six inches in thickness.

The Bow-Stretcher.

The most common way of treating the muskrat is to cut off his feet with a hatchet; and rip with a knife from between the two teeth in the lower-jaw, down the belly, about two inches below where the forelegs come out. Then the skin is started by cutting around the lips, eyes, and ears, and is stripped over the body, with the fur-side inward. Finally a stick of birch, water-beech, iron-wood, hickory, or elm, an inch in diameter at the butt, and three feet and a half long, is bent into the shape of an ox-bow and shoved into the skin, which is drawn tight, and fastened by splitting down a sliver in the bow, and drawing the skin of the lip into it.

This method is too common to be easily abolished, and is tolerable when circumstances make it necessary; but the former method of stretching by a tapering board, in the case of muskrats as well as other small animals, is much the best. The skins treated in that

way keep their proper shape, and pack better than those stretched on bows, and in the long run boards are more economical than bows, as a set of them can be used many times, and will last several years; whereas bows are seldom used more than once, being generally broken in taking out.

Sleeping Black Ducks.

GREEN BAY, Wis., Nov. 14.—*Editor Forest and Stream:* I have been interested in the articles whether or not black ducks sleep. I have been very undecided on the point myself, but yesterday I can say I saw a black duck asleep, and he must have been very sound asleep at that, for I walked through the water with my dog to within 60 feet of the bird, making noise enough to scare a wide-awake bird at 60 yards. Ducks were not flying any too thick on the bay side, so I decided to walk around the pond, which covers a few acres and is bushy near the shores, with the rice growing up close to the edge of the brush. The water was about ten inches deep in the brush which I splashed through after the dog, and from his actions I thought he evidently scented some sort of a bird. When I had got past the brush, I stopped and surveyed the pond ahead, and could see everything, as the wild rice for the most part was down and the rest very thin. I saw a black duck within forty yards of me all huddled up, evidently asleep, and I felt that I had a chance to see if it was asleep or not.

I let the dog go ahead, which he did very slowly, coming to a half-hearted point, and we splashed into the deeper water now nearly to my knees until within not over 60 feet of the bird. I then stopped and stood still with the dog for at least a couple of minutes, and I firmly believe that this duck was asleep. I yelled and the bird looked up, and then, upon seeing me, jumped and I killed it. The bird was in good condition, and was shot when on the wing, so was no sick or crippled duck.

A. G. HOLMES.
[The question is not whether black ducks sleep—all ducks sleep; but whether a company of them all sleep together.]

Cuvier Club's Annual.

THE thirty-first annual banquet of the club was held on November 22, and was enjoyed by over three hundred members and guests. Eugene L. Lewis, chairman of the Reception Committee, with some of his big staff of assistants, met the guests as they entered the building, and as they reached the top of the steps leading to the main floor, President P. F. Swing and Vice-Presidents Henry Hanna and P. E. Roach received them with a cordial welcome which carried with it the freedom of the house. There was one thing which cast a shadow over the pleasure of the evening for very many of those present, and that was the absence of ex-President Alex. Starbuck, who was reported to be ill. To say that he was greatly missed, is but stating a fact, and is not in any way reflecting upon the administrative resources of the new president, Judge P. F. Swing, who was called to the office by Mr. Starbuck's recent resignation. Among the noted anglers present were the following: Abe Furst, T. B. Paxton, J. S. Peebles, P. E. Roach, and F. G. Tullidge. W. B. Smith, R. J. Morgan and George Gerke composed the Banquet Committee, and that their work was well done was the general verdict, the dinner being pronounced one of the best ever given by the club. Two additions to the menu—black-tailed deer and diamond-backed terrapin—were obtained by Mr. Smith. Luther Parker, chairman of the House Committee, assisted in welcoming the guests, as did the secretary, W. J. Lawler. Chef Max Basse supervised the preparation of the various dishes and added to the reputation he has made in the past as the club's chef. The next public event of the club will be the New Year's reception.

The Watch as a Compass.

TORONTO, NOV. 10.—*Editor Forest and Stream:* Under the above heading I have recently seen a new formula published by you for determining the points of the compass from a watch. It is as follows: "Get the number of hours from midnight, divide by two, and point the hour at the sun, so that the shadow of a match or lead pencil falls directly across the center of the watch. Twelve o'clock will be north, six south, nine west, and three east."

I have for many years used another formula, which is as follows: "Point the small hand of the watch to the sun, and half way between that and twelve o'clock will be due south."

I have submitted both methods to the Director of the Meteorological Service here for his opinion, and he says: "I prefer your method, as it is expressed in fewer words and is about as accurate as the other. Neither method gives direction with exactness except at the equinoxes, and the error will be greatest at the solstices (midwinter and midsummer)." I may say that the second method I have found convenient and sufficiently accurate for ordinary purposes.

Carrying Game from New York to New York.

RELATIVE to the practice of the Forest, Fish and Game Department respecting the bringing of game from Orange and Sullivan counties through New Jersey via Erie Railroad to New York city, the question has never been raised, as a hunter or sportsman returning home with the number of birds the law provides one may transport, purchases a ticket direct to New York, which is a guarantee that he is not trying to evade the law by stopping in New Jersey with his game, which the law prohibits being transported without the State.

Montgomery Association.

THE annual meeting of the Montgomery County Fish and Game Protective Association was held on November 25 at Dayton, O. About 250 members were present. The election resulted as follows: President, Edwin Best; Vice-President, O. B. Brown; Secretary, John F. Campbell; Treasurer, W. N. Kuhns. Executive Committee—B. F. Seitzer, B. F. Hershey, E. T. Hardy, H. G. Protzman, Dr. D. W. Greene, H. M. Altick, Charles E. Pease.

Federal Game Protection.

From the Report of the Secretary of Agriculture, relative to the work of the Biological Survey.

Entry of Foreign Birds and Animals.

CONSTANT vigilance is necessary to prevent the introduction into the United States of birds or animals that are likely to become pests. No species, therefore, except a few that are well known and harmless, are allowed to enter this country without a special permit from the Department. The permits issued during the year numbered 318, and allowed the entry of 1,470 mammals, 205,400 canaries and 41,630 miscellaneous birds. Several importations were made of birds intended for liberation, among them 65 capercaillie from Sweden, brought in at New York and destined for the stocking of Algonquin Park, Ontario; 40 Mexican quail, liberated at various points in California by the Board of Fish Commissioners of that State, and 366 European song birds—goldfinches, bullfinches, larks and robins—turned loose in British Columbia. Permits were also issued for the entry of about 3,000 eggs of partridges and pheasants.

Interstate Commerce in Game.

Since the passage of the Lacey Act in 1900, 42 convictions for illegal traffic in game have been secured in cases passing through this Department. Of these, 26 were tried in Federal courts, 16 in State courts. During the past year 10 cases, involving the shipment of 700 birds and 36 rabbits, were reported to the Department. Six convictions were secured, one of which involved the longest distance shipment thus far taken up—from St. Paul, Minn., to Portland, Ore. In order to expedite cases arising under the Lacey Act, State wardens have been advised to present their evidence direct to the Federal courts instead of referring it through this Department and the Department of Justice. This advice has been followed in two or three instances within the past few months, and the indictments have been much more promptly secured in consequence.

Limited available resources have, as heretofore, made it necessary to concentrate efforts in two or three areas, and in all cases prevention of local shipment has been given precedence over prosecution after shipment has occurred. The passage of the laws by Texas in 1903, prohibiting sale and capture of water fowl, made it possible for the first time to restrict the enormous destruction of ducks in that State for Northern markets. Through local authorities and express companies, general attention was called to the provisions of the State and Federal laws, and a close watch maintained on usual shipping routes. No violation of the law was noted, and it is probable few consignments of ducks reached Northern markets from this State during the year.

An attempt was made to ascertain the effectiveness of recent legislation prohibiting shipment and sale of game by means of a special investigation in co-operation with State wardens and others. The kinds and prices of game in the markets of a dozen or more important cities during Thanksgiving week were ascertained. That considerable progress has been made in enforcing shipping laws was conclusively shown; few prairie chickens were on sale in any Eastern markets, and in some instances prices three or four times as high as those of a few years ago were charged; pheasants

were absent from the markets of several cities where they were formerly abundant; and at the opening of the season quail were unusually scarce, though later, when the routes of shipment still open were discovered by the trade, they became more abundant.

Protection of Game in Alaska.

The Alaska game law has accomplished the two main objects for which it was enacted: the shipment of deer hides has been stopped, and the export of heads of big game as trophies has been curtailed. The protection of game has been as satisfactory as could be expected in so large a region and without wardens. A mistaken belief, however, that the law does not permit natives to kill game for food, coupled with objections to the presence of visiting sportsmen, particularly on the Kenai Peninsula, gave rise to considerable criticism of the law. This adverse feeling led to the introduction of a bill in the Senate to replace the present law with one doing away with all restrictions except a provision to limit the export of trophies and charge license fees of \$25 to residents and \$250 to non-residents for such export. As the adjournment of Congress without definite action left this measure still pending, the Department deemed it advisable to suspend the issue of permits for the present except in very special cases. Early in June new regulations were issued extending some seasons, permitting unrestricted shipment of bear skins, and making other desirable changes.

The Bend of the Hemlock Tip.

CHARLOTTESVILLE, Va., Nov. 26.—*Editor Forest and Stream:* Please note how positive the Canadian Pacific people are that "the topmost twig of every uninjured hemlock tree tips to the east." Dr. Hedges, who is a very close observer, writes me from the Adirondacks that that is not the case. See his letter attached. What can you tell me about it? W. O. WATSON.

"WOODLAND, N. Y.—*Dear Mr. Watson:* All summer I have been trying to settle the question as to the direction of the top of the hemlock. So far as I can see, it is governed entirely by local conditions, for here in this part of the Catskills it is entirely different from what it was in Saranac.

"In Saranac the tip tended pretty generally northeast (winds largely southwest); often in the deep woods you would find one due north.

"Here I have found them turning more to the west, though the direction is not so constant as at Saranac. Trees side by side will go entirely different ways.

"Anyway I would not advise you to use hemlock tips as a compass till you know the country so well that you do not need a compass. H. S. HEDGES."

O' Pinions Vibrant.

Editor Forest and Stream:

I would like to ask those sophisters who are discussing the drumming grouse, whether hummingbirds, bumble bees, locusts, bluetail flies, and other buzzing insects, produce their rhythmic sounds by thumping their sides with their wings, hitting them together overhead, or beating a tattoo on sonorous substances? No one seems to have raised this question in structural analogy, but it might prove interesting to investigate. PERDRIX.

Long Island Shooting.

BAYPORT, L. I., Nov. 27.—*Editor Forest and Stream:* The past week has been the most successful for duck shooting we have had so far this season, the weather being fine and the birds flying good. Quail and rabbit shooting has been pretty slow, but in my rambles through the woods, this week, I kicked up several partridges, and when the leaves get off the brush a little more, there ought to be some good shooting. The most successful duck hunters this week were: Mr. G. Still and party, 36; Capt. Green, 22 and 2 brant; Mr. D. F. Thompson, 24 and 4 redheads; Mr. J. C. Hutzler, 28; Mr. A. J. Lewis and H. C. Smith, 22; Mr. F. B. Lord, 12; Mr. Daly and party, 26; Mr. Stansburg, 12; Mr. E. S. Hawkins, 12. Others shooting here from Manhattan were Mr. J. K. Hackett, Mr. Goebel, W. R. Wheelen, E. Runge, Sr., E. Runge, Jr., C. Rump, J. Boyd, U. J. Brower and G. E. Blakeslie and Dr. G. Wilkinson, Jersey City.

The ducks are in the bay in millions, one flock at least a mile in length can be seen off here at any time.

HENRY STOKES.

A Short Lesson in Natural History.

PORT RICHMOND, S. I., Nov. 28.—*Editor Forest and Stream:* If all the type used in printing stories about the wild things were set end to end, I have no doubt they would form a four-ply belt twice around the globe. The reading public, for the past three or four years, have gone daft on the subject of animal study, and yet the New York Tribune, one of the biggest newspapers of the second city of the world, publishes a full-page photograph on the cover of its supplement, showing a colored man up a tree after what the Tribune calls a 'possum, but which is very evidently a stuffed 'coon.

The Tribune should know better. Even without a course of Bon Jourraughts or Kan Jellyan or Ernest Theton Sompson, the Tribune should have identified the animal by a mental reference to that poem of our childhood, beginning,

"Squirrel has a bushy tail,
'Possum's tail is bare;
Raccoon's tail has rings around
And stumpy grows the hair."

SIDNEY EDWARDS.

Dakota's Varying Seasons.

GALESBURG, N. D., Nov. 21.—In this country it is customary for the ground to freeze and farm work to be over at this time, but this year so far, though the ground froze at the usual time, yet the weather since has been so fair and mild that considerable outside work such as plowing has been going on up to now. It only goes to show the vagaries of this climate, and if there is any place where more capers can be cut in this respect than by our fickle Dakota Lady of the North, I would like to be told about it. But with all her vagaries she is a bountiful mistress, and gave us this year, as usual, many large portions of prairie chickens and mushrooms until we surely had "our satisfy." Therefore we grumble not at any game of freeze-out she may make us play. In fact, we would hardly trade winters or summers, either, with any Eastern man. J. P. W.

SEA AND RIVER FISHING

An Outing Among the Rainbows

A Letter to an Angling Friend.

TACOMA, Wash., Nov. 6.—*Dear Friend:* The fishing season has closed, the rods and tackle have been put away, and nothing is left but pleasant memories of delightful trips and big fish. I have not wet a line since the trip to the Skokomish, September 5, 6 and 7, though I was greatly tempted to try it up there again. In writing you about that trip I did not do justice to it, and have always thought I would take it up at a later day and give you a more detailed description of the catch.

Mr. Howe and I left Shelton at 5 A. M. on the morning of September and loafed on the way over to hunt grouse. We reached the river about 9 o'clock; we sent the wagon on to the ranch and then put our tackle together. The stream was low, and the water on Latham's Bar was hardly half way to our knees. Clear up that stretch of water to Kelly's Pool was black with salmon, and the water was kept in a turmoil by the fish fighting and dashing here and there, while many were busy standing on their heads digging their spawning beds. They were the dog salmon, and beastly looking things they were as I kicked them out of my way when I crossed to the other side. Howe went up to the pool on this side, while I began at the little willow patch on the opposite bank. My second cast brought a fine fellow to the surface, and the next hooked him. It was twenty minutes before I netted him, and he pulled down the scales to 3½ pounds. Howe was having a struggle above, but after a vigorous fight lost his fish. We then went down to the pool—you will remember the place where I "discovered" the fish on our first trip this year. There Howe, who was fishing below me, hooked a big one and in a second I was fast to a daisy. They leaped and fought here and there, up and down, till we felt that we had contracts on our hands that we could not fill. There were plenty of thrills running up our spinal columns; and with teeth set and jaws locked we fought the good fight. Howe's leader broke, and his fish (he declared it was an 8-pounder) went to nurse his sore jaw among

the roots under the bank. Mine was "fought to a finish" at last, and in the net showed 4¾ pounds.

Two more 4-pounders fell to us there, and then we passed down to where the river turns to the left. At the lower end where you cross over, and where the water rolls over a half sunken log, I shortened my line to about 12 feet, and standing above cast over and hooked a big one as it rose. It broke away. Another cast and another big one was fast; but, it, too, broke away, taking the lower half of my leader. I went ashore and bent on a new one, and stepped back and cast again. As long as I live I think I shall never forget the whale that came out at me from the depths of that little pool. Three times he rose lazily, smelled the fly and disappeared. It was the first time in my life that a fish scared me. I have hunted and killed all sorts of big game of the West, and have had some nerve-trying experiences, but I do not think that even my biggest grizzly ever gave me a greater "creep" than the fish that rose to me there. I said to myself: "Jack, get out of this and get your nerves in shape. Cool off. Go take a smoke, and don't tackle that fish to-day." Howe, in the meantime, was busy, and had landed two good ones, making four to each of us.

We went through the woods to the Donkey Engine Bar; salmon, salmon everywhere. You will remember how swiftly the water runs under this shore at the head of the bar. I went in there and crossed and was nearly knocked off my feet by salmon dashing between my legs and throwing water all over me in their hurry to get out of the way. In this swift water I hooked five big fish and landed three. My basket was now full to the lid—seven fish: Howe's ditto. The tip of my big rod was showing signs of weakness, and I was afraid to trust it any longer; so we crossed on the logs to the Donkey Engine and went through the timber to the jam below (only a few hundred feet), and then walked the jam to the head of Foster's Bar. I took both baskets—no small load—and went up to the house, where I put the fish on ice and changed my rod for the one Mr. Canfield gave me.

It was then 11:30; we had been fishing 2½ hours. Howe took this side of the bar and I crossed over. What

a time we had! Big fish came at us from everywhere. I hooked one, and after fighting him half an hour made up my mind that I could never land him. I could not get him within sixty feet of me. I finally worked him over into still water and held on. When I would try to pull him in he would go the other way. Finally he stood on his head, with his tail, which was fully eight inches broad, out of the water. I knew what he was after, but in spite of all the strain I could bring to bear, I could not raise his head out of the gravel, where he finally succeeded in rooting the barb from his jaws. From his weight on the rod and the vitality and strength he showed, he was a good 8 or 10-pound fish. Need I tell you I went ashore and lay down on the bar, filled my pipe, and thought things?

When rested, both in mind and body, I went at it again, and was soon fast to another big one. After a long, hard fight, in which I was in fear of again losing, I felt the fish was mine. Howe was busy, but called to ask if I needed any help. I said "No," for I had my quarry well in hand, and when I got him into my net at last and staggered ashore, I felt that I had well earned the old fellow that tipped the scales at 5½ pounds.

It was now 2 o'clock, and our baskets were so full that a sardine could not have been packed into them. Again seven fish each, and nothing under 3½ pounds. We had enough, and were very tired after so many royal battles. So we went to the house and rested the remainder of the day. It would have done no good to have fished in the afternoon, for as soon as the sun got directly overhead it was so bright that it showed the river bottom along the whole bar, and the fish simply lay on the bottom and would not rise. Had the weather been cloudy, I actually believe we could have caught a wagon load had we been so minded. It was keen sport, such as a man does not often get.

We fished over the same water every day, namely, Latham's, Donkey Engine, and Foster bars, and it was a repetition of big fish lost and big fish caught. On the Donkey Engine Bar I hooked and landed a double, one a 3½-pound rainbow and the other a Dolly Varden of about 1¾ or 2 pounds. Again I hooked a good fish and

lost him through my leader breaking. I was fishing at the time with a heavy yellow leader. It broke at the second fly. Fifteen minutes after Howe hooked a fish which I netted, and it was the one I had just lost, with my yellow leader and fly in his jaw. He was 3½ pounds.

The last day on Foster's Bar I had played a big one for quite a while, and had him over in smooth, though shallow, water, when a big dog salmon jumped on him and tore him off, only to get caught himself on the lower fly. As soon as he felt the sting of the hook, he started down stream and I braced myself and held till the leader parted.

About eighteen or twenty of our fish weighed 4 pounds each, and the rest ran from 2 to 3½ pounds. When we loaded our box into the wagon, it was all we could do to carry it.

The river could be forded anywhere on the bars. Our fish were all caught in the shallow water, not one out of the deep pools. We could not get a rise below where you caught your 4½-pounder. There were no salmon down there, and where there were no salmon there were no trout. Most all the fish were caught on a No. 6 grizzly-king.

Don't you think you could change your time of visiting and get out here the latter part of July or August 1, so you could get the late fishing? It is much the best, and you could fish all the time.

Had I not been afraid of breaking my small rod, I think I could have saved many of my big fish. I shall get some new tips for my 11-foot rod before I tackle the Skokonish again.

I am afraid I have wearied you with this long letter, but I hope not. Mr. Canfield was just in and asked to be remembered to you. With kind regards, I am very truly yours,

JOHN LEASURE.

Fish and Fishing.

The Former Abundance of Canadian Fish.

MAGNIFICENT as are still the opportunities of anglers in many parts of the Dominion of Canada, it is melancholy to note the effects of over-fishing and other destructive agencies upon what were once amazing supplies of fish. I can mention trout streams within a few miles of the city of Quebec, which contained many fish of from half a pound to a pound in weight not more than a quarter of a century ago, and in which there can only now be found fingerlings and very few even of them. There are other streams quite near to the same city which, in the early part of the last century, were famous salmon rivers. Now it would be impossible to find a single fish in them. Judging from the reports of those who ought to be able to distinguish a salmon when they see one, a few specimens of the Atlantic salmon are caught every season in Lake Ontario. Though exceedingly scarce there now, these fish are reported to have been incredibly abundant in waters tributary to the lake but a little over half a century ago. The late Mr. Samuel Wilmot was accustomed to tell of the wholesale destruction of salmon ascending the creeks emptying into Lake Ontario, between 1840 and 1850. He himself often assisted with a pitchfork, when the farmers were using that rude implement to transfix and secure large numbers of the spawning salmon; but more remarkable still is the statement contained in the report for 1859 of the Superintendent of Fisheries for Upper Canada, showing the capture of an extraordinary number of salmon at certain points along the lake. He stated that of 470,000 fish taken at Port Credit in 1856, two-thirds were salmon. And the mention, in the same report, of salmon trout—the great lake trout—shows that the two were not confused in it, as they frequently are in some parts of Ontario. Even at that time the supply of salmon had seriously declined, for the Superintendent further says: "Many of the streams running into Lake Ontario were once the resort of myriads of salmon. I have seen them from 1812 to 1815, swarming the rivers so thickly that they were thrown out with a shovel, and even with the hand."

Fifty years ago, the nets at the mouth of some of the Canadian salmon rivers yielded ten fish for every one now taken by them.

An equally astonishing decrease is noticeable in the whitefish supply of Lake Ontario. The catch of 620,000 pounds in 1870 had fallen to about 400,000 in 1890, and to 126,000 pounds a few years later. Yet forty years ago, on Wellington Beach, at the extreme east end of the lake, where the fish are now exceedingly scarce, single hauls of over 500,000 large whitefish occurred. Last year only about 77,000 pounds of whitefish were taken out of the entire lake, and but for the fact that millions of fry have been planted in its waters for several years past, it is easy to imagine that the fishery might before now have been entirely exhausted.

How the Fish Have Been Destroyed.

I picked up the other day a copy of the very valuable reports upon the fisheries of New Brunswick, prepared more than half a century ago by the late Mr. Perley, to the Legislature of the Province. After reading Mr. Perley's representations of the wholesale destruction of fish in those days, one ceases to be surprised at the diminution of our fish supply, and to wonder only that so far as the rivers of New Brunswick are concerned, there are still any fish left in them. Spearing of salmon upon the spawning beds was quite an ordinary practice in those days. Describing the fish seen by him in one of the pools of the Nepisiguit as late as the month of September, Mr. Perley states that they were like sheep in a fold, that many of them had been wounded by the spear and were swimming about in a crippled condition; some with parts of their tails cut off, while others were seen with portions of their entrails protruding from wounds in their sides. And yet the fish at this season of the year were of course what is generally known as black or spent fish and altogether unfit for human food. All the grilse that could be killed appear to have been sent to market, one fisherman being reported to have sold £80 worth of them in a single season. It is not much wonder that Mr. Perley should have remarked that "if all the calves in New Brunswick were killed at an

early age, it is not likely that afterward there would be many cattle," and that "if all the grilse are taken, it is quite certain that salmon will soon cease to exist."

The same short-sighted and wasteful policy in regard to the sea fisheries of New Brunswick, as that already described in the case of the salmon, is on record. Mr. Perley attributed the enormous falling off, in his day, in the cod fishery of the Baie des Chaleurs, to the wanton destruction of the proper and natural food of the cod—herring and capelin—which were then taken in immense quantities; not for eating, or for curing, or for bait—but for manuring the land. In a representation made to the Legislature at that time by a fisherman of Gaspé, he stated that he had seen 500 barrels of capelin taken, in one tide, expressly for manure, and that he had also seen a thousand barrels of herrings caught at one time and left to rot upon the beach.

Bouehette, in the early part of the last century, and Nettle and Dr. Adamson later on, described the infamous practices by which the salmon rivers of Quebec were being destroyed in their days. Mr. Nettle stating in 1857 that even then there was not one-twentieth of the fish taken in them that were to be had in former years.

Human Flesh as Bait for Fish.

It appears that the Hawaiian chiefs of some years ago were much addicted to the use of human flesh as bait for sharks. It came cheaper than pig, was equally acceptable to the shark, and gave the chief an opportunity to kill any one whom he disliked. The victim was cut up and left to decompose for two or three days in a receptacle. Kamehameha I. was a great shark hunter, and kept those of his victims who were intended for bait, penned up near the great temple of Mookini. Mrs. Beckley gives a particularly interesting account of another method of capturing the huge niuhi or man-eating shark, followed by the natives. They first of all captured a large number of the small common shark, saved their livers with a portion of the flesh, wrapped them in ki leaves and baked them underground. From fifty to a hundred canoes were loaded with the baked meat and large quantities of the pounded roots of awa, mixed with a little water and contained in large gourds. The fleet would sail many miles out to sea in the direction in which the niuhi is known to appear. Arrived at a comparatively shallow place, the canoe containing the head fisherman and the priest and the sorcerer, who was supposed to be indispensable, would cast anchor; meat and the baked liver would be thrown overboard, a few bundles at a time, to attract sharks. After a few days the grease and scent of cooked meats would spread through the water many miles in radius. The niuhi would almost always make its appearance after the third or fourth day, when bundles of the baked meat were thrown to it as fast as it could swallow them. After a while it would become comparatively tame, and would come up to one or other of the canoes to be fed. Bundles of the liver with the pounded awa would then be given it, and it would become not only satiated, but also stupefied with awa. A noose was then slipped over its head, and the fleet raised anchor and set sail for home, the shark following, a willing prisoner, and the occupants of the nearest canoes being careful to feed it upon the same mixture from time to time. It was led right into shallow water until it was stranded and then killed. Every part of the bones and skin was supposed to confer unflinching bravery upon the possessor, and the actual captor, that is, the one who slipped the noose over the niuhi's head, would also, ever after, be always victorious.

E. T. D. CHAMBERS.

Another Sea-Serpent Myth.

OPPORTUNITY has rarely been afforded biologists to determine the real basis for any of the numerous sea-serpent stories which for centuries have contributed to the gaiety of nations. The present year has not been deficient in its crop of marine monsters, as reported in the newspapers, and a recent event was signalized by the very unusual capture of the creature, which by this time has been seen at close range by thousands of people.

Simultaneously with the assembling of the American Fisheries Society at Atlantic City, N. J., in July, there was exhibited on one of the piers an animal which was advertised as "a genuine sea-serpent," and was said to have just been caught off Atlantic City. Those who availed themselves of the unwonted privilege of inspecting such a creature, found it to consist of an imperfect skeleton, about 10½ feet long, stretched at full length on a plank. The parts present were the cranium, numerous elements representing the bases of the fins, and the vertebral column, which, with an apparently short section missing from its posterior end, contained 274 vertebrae. The skeleton was evidently that of some selachian, but the deficiencies made it difficult to determine its position.

The New York, Philadelphia and seashore papers printed notices of the creature, most of them referring to it as a sea-serpent, but a few hinting that it was not a real animal, but a manufactured product. Some of the accounts of the capture of the sea-serpent and its behavior before falling a victim to the brave fishermen were of a highly imaginative character.

The facts in regard to this animal are as follows: The badly decomposed carcass was snagged by a line fisherman a few miles off Atlantic City about July 25; the jaws, fins, and most of the soft structures were missing, but the skin of the trunk was partly intact, and the idea gained therefrom was that the body was about 12 or 15 inches deep. As the specimen was a paying attraction, it could not be obtained for study; but the writer had made and brought to Washington a series of drawings and photographs, and also secured several of the vertebrae. The material was submitted to Dr. Theodore Gill, the distinguished ichthyologist, who was soon able to determine the identity of the fish. It proved to be a thresher shark (*Alopias vulpes*), and good osteological plates of the species were found in Molin's paper in the Memoirs of the Venetian Institute, 1859.

H. M. SMITH.

BUREAU OF FISHERIES Washington, D. C.

Henry P. Wells.

NEW YORK, Nov. 25.—*Editor Forest and Stream:* It was with the keenest regret that I saw the announcement of the death of Mr. Henry P. Wells in your issue of this week. Appreciative as your note was, it does not do him adequate justice.

I knew Mr. Wells well for the last twenty years, and I believe no one will have a greater or better influence than he on the angling fraternity—old boys and young boys, we are all alike—for the next twenty years. What influence he has had is history.

Mr. Wells' predominant traits were modesty, thoroughness, geniality, and generosity; and combined with these were a good knowledge of mechanics, of natural science, of literary art, and a willingness to impart his knowledge to others. Above all, he was an angler.

Whether it was at the side of a salmon river, wading a trout brook, on a lake in Maine, or sitting in front of the blazing logs in his beloved camp of the Parmachenee Club on the island in Parmachenee Lake, he was always the same—genial, modest, of a kindly but keen wit, ever ready to suggest when asked, but never intruding.

His books are a fair picture of the man, for unlike many writers, he did not try to keep his knowledge for publication only.

Two instances occur to me. A young amateur once said to him that he thought that he had made an improvement on the Parmachenee-belle, a fly which, as we all know, was born of Mr. Wells' fancy, which is famous throughout the world, and which was, therefore, naturally a source of modest pride to its inventor. I expected at least a demur, but the answer was a very quiet "very likely." Another time he was shown a cheap bamboo rod which the owner had reinforced by extra windings of silk, and by adding extra line rings. We all know what cheap tackle is, but Wells tried the rod and then handed it back with a hearty "I like the action better than that of my \$70 rod of —," naming a maker other than himself.

His books are a storehouse of practical information such as the angler wants, and they have the added charm of a literary style peculiarly their own; natural, unaffected and straight to the point.

Attractive to both men and women, listened to with great respect by all, I feel sure that there are many who will feel his loss as I do, and among them notably John S. Danforth.

J. E. HINDON HYDE.

The Massachusetts Commission.

BOSTON, Nov. 26.—*Editor Forest and Stream:* The term for which Commissioner Brackett was appointed (in 1899) as Fish and Game Commissioner by Governor Woleott, ended several weeks ago, and no appointment has yet been made. In some sections of western Massachusetts there has been for several years some dissatisfaction from not having representation in the Board of Commissioners, and in view of the fact that all members of the present board reside in the eastern part of the Commonwealth, it was thought that, if the sportsmen outside of the metropolitan district could unite on a candidate, he would be likely to secure the appointment from Governor Bates. It was the opinion of some of our prominent Boston sportsmen that such a selection would tend to promote a continuance of the harmonious relations which have been brought about in the last few years by the various conferences, and what may be designated as the "pooling of issues" by the several clubs scattered over the State. Your readers have been kept posted in reference to the various movements under the leadership of the State Association and the Central Committee which have resulted in securing more stringent protective legislation. The fact of so much delay on the part of the Governor is interpreted as an indication that he is greatly perplexed by the multiplicity of candidates. His prompt re-appointment of Chairman Collins indicates that he would like to give him a man as a colleague who can furnish him relief in certain lines of work, more especially such as is to be done in the office, and which Captain Collins has said repeatedly in the hearing of your correspondent is greatly needed. We can all well remember the time (not six years ago) when our Commission had no office. When first appointed the Captain said he was not a believer in "vest pocket commissions," and in a very short time he was able to convince the Superintendent of the State House that it was his duty to find a place for him under the "Gilded Dome." This was the first step toward a regenerated Commission. In a future letter I will speak of others, and shall endeavor to present a summary of work accomplished each year which will tell its own story. I believe I express the general sentiment of Massachusetts sportsmen in saying that they are entitled to all the work that can be done by the three best men that can be selected as members of the board, devoting to its duties all their time—not a few weeks in the year, and not one or two days only in a week. Under our statutes three men are provided, and there is nothing that implies that either of the three is to be a nonentity. It is desirable that there be three able men, and sportsmen desire that the appointment shall go to the candidate who can do most for the department. Governor Bates will make no mistake if he discards all other considerations and makes his selection on the ground of capacity and fitness for the position.

In the recent field trials for beagles at Grafton, some of the Massachusetts winners were Chetwood Smith, of Worcester; John Caswell, Pride's Crossing; A. J. Purinton, Palmer; Samuel Frothingham, of Boston and Lenox, and Jacob Worth, of Boston.

There was a large gathering of fox hunters at Westfield this week, and the weather conditions were favorable for a fine outing. This was the fall meet of the Western Massachusetts Fox Club, of which Mr. John T. Way is president. There were thirty hounds, which were put out two successive mornings, and the net result was two pelts. All lovers of birds, knowing how destructive Reynard is to bird life, would be glad to read of greater slaughter of this species of robbers of birds' nests and devourers of quail and partridges. There is a strong sentiment prevailing in favor of a bounty on foxes. Several sportsmen who would have been glad to buy quail last spring for stocking purposes told your correspondent that they

did not wish to purchase quail for foxes to kill; but if a bounty could be put upon them so as to give the birds a chance, they would contribute. The bird hunters wish their brothers who love the baying of the hounds good luck, but think they are not killing the foxes off fast enough. Reports from every direction indicate that foxes are multiplying very rapidly, and are not only thinning out the birds, but are causing great annoyance to the farmers. One sportsman told me this week that, in his opinion, they are destroying more birds than are shot by the hunters.

The gunners on our south shore have been getting excellent bags of sea fowl the past two weeks. Some of our North Attleboro friends have lately secured a good number of partridges, but theirs is an exception to the general experience of the men who have been in the brush this fall. C.

Mr. Stone is not a Skeptic.

CAPE VINCENT, N. Y., Nov. 21.—*Editor Forest and Stream:* Looking over some old files of FOREST AND STREAM, the other day, I came across an article in the issue of May 9, 1903, headed "Salmon Culture in America," and signed C. H. Barkdull, in which Mr. Barkdull classes me with the "unfortunate skeptics" who do not believe in salmon culture. I think Mr. Barkdull must have had me mixed up in his mind with someone else, for I do not know of anyone who has worked harder than I have to increase the salmon of this country, or who did more for the cause during the quarter of a century between the years 1872 and 1897.

It is a small matter, I know, and only a personal one, but I must say that I do not like to be called an unfortunate skeptic who disbelieves in salmon culture, when I

spent nearly the whole of this quarter of a century trying to prove that I *did* believe in it by diligently hatching and distributing salmon during that period, to say nothing of the fact that I inaugurated salmon culture in this part of the world by building and operating in 1868, at my own expense, the first salmon hatching station in America.

I agree with Mr. Barkdull about the pretty girls and the gold mines and the big trees of the Pacific Coast; but I think he must give me credit for not being much of a skeptic on the subject of salmon culture.

A. LIVINGSTON STONE.

All communications for FOREST AND STREAM must be directed to Forest and Stream Pub. Co., New York, to receive attention. We have no other office.

YACHTING

British Letter.

G. L. Watson.

By the untimely death of Mr. G. L. Watson, which took place at his residence in Glasgow on Nov. 12, after a short illness, Great Britain has lost her greatest yacht architect. His loss is indeed irreparable, and will be felt not only in this country, but all over the world.

Mr. Watson first came into prominent notice a quarter of a century ago, when, after having experienced some success in the 5-ton class, he produced the 10-ton cutter Madge, destined three years later to be the pioneer in American waters of a type of boat which was to cause a complete revolution in yacht designing in the States and to kill forever the dangerous crabshell stamp of boat which had been in vogue there for many years. Madge's performances produced as startling an effect in America in 1882 as the famous schooner America had done in Great Britain thirty-one years before, and the result of her racing, crowned as it was by the subsequent brilliant performances of the Fife boats Clara and Minerva and the Herreshoff cutter Gloriana, was that the ultra deep and narrow British model and the flat-sectioned, shallow-bodied type, so common in America, became gradually merged into the boat of moderate proportions to the distinct benefit of both countries. In 1880 Mr. Watson turned out in Vanduara, 98 tons, the first of a long list of big racing cutters and yawls, nearly every one of which has been a successful prize winner. Vanduara was built of steel, was easily head of her class, besides being by far the best looking boat in the fleet, and is racing to this day in the handicap class under the name of Nicandra.

Mr. Watson has never succeeded in producing an America Cup winner; but in 1883 he designed for Mr. James Coats, owner of the 10-tonner Madge, the 72-ton cutter Marjorie, the most beautiful specimen of a straight-stemmed cutter ever seen, and one of those extraordinary samples of perfection of type which Watson alone knew how to create, and which never seem to grow old. There was some talk of Marjorie going across the Atlantic in 1884 to try for the America's Cup. Had she done so, there can be little doubt but that she would have brought it back. The idea fell through, however, and a golden opportunity was lost.

Of all the British designers who have been employed in the attempts to recapture the cup, none have gone so near success as Watson. His first attempt in 1887 was a failure, and there can be no doubt that Thistle was outclassed by Volunteer. Valkyrie II. was the second boat from his board which crossed the Atlantic to try and regain the coveted trophy. She was one of four new big cutters built in 1893, the others being Britannia, also a design of Watson; Calluna, W. Fife's first big racing cutter, which turned out a failure, and Soper's Satanita.

Valkyrie II. before her trip across the Atlantic was raced consistently with these boats, and was far and away the best of the bunch. She beat Britannia twice out of every three races, and had she been left in her original trim, there is no reason to suppose that she would not have disposed of Vigilant. Unfortunately, with the supineness which has characterized the management of most of the later cup challengers, she was tinkered up on the very eve of her departure by having some lead removed from her keel, and her sail area increased. These alterations were an absolute experiment, for the boat was no longer floating at her designed line and there was no possible chance of a trial with a known opponent before starting on her voyage across the Atlantic. The experiment resulted in disaster, as indeed it deserved to do, and another glorious chance of winning the cup was gone.

It was not until Valkyrie II. was back in British waters the following season that the full extent of the damage done to her speed was made manifest. It was at once apparent that she was no match for Britannia, whose master she had been the year before, and it is probable that she was 15m. or 20m. slower over a 40-mile course than when she first came out. Unfortunately, before she could be put back to her original trim she was run into and sunk by Satanita at the regatta of the Mudhook Y. C. Britannia proved herself a better boat than Vigilant, and it may be taken for granted that the America's Cup was never in greater danger of capture than it was in 1893.

Watson designed two more cup challengers, Valkyrie III. and Shamrock II. The former was not a boat of great promise, but the latter, under better management, might have been successful. She was the first cup challenger that ever sailed home ahead of her

rival in a race devoid of accidents. She lost the race on time allowance, but it was really thrown away by bad judgement on the part of her skipper. Had she been as well managed and sailed as Columbia, she would in all probability have beaten her. It is only fair, however, to remember that Columbia was in her third season.

Watson has designed racing yachts of all sizes from the very smallest to the largest, and they have been distinguished alike for their speed and great beauty. There was a refinement of finish about the racers which no other designer, British or foreign, has been able to equal, and his wonderful talent for symmetry has also left its mark in his cruising yachts and steamers.

Of late years he had given less attention to sailing yachts and was chiefly engaged upon steam yachts. He was engaged upon the design of a steam yacht of 2,000 tons for Mr. Kenneth M. Clark, owner of the cutter Kariad, at the time of his death, and he was responsible for the lines of a dozen of these palatial vessels exceeding 1,000 tons, many of which found their way to America and are too well known to require description. Mr. Watson had been out of health for some time, but only became seriously ill a few days before his death. The funeral, which took place at Glasgow, on Nov. 16, was by his own request quite a private affair, but the German Emperor sent a magnificent wreath and was personally represented.

The news that Mrs. Turner Farley has given Herreshoff an order for a 52-footer has been received in England with general satisfaction. It is ten years since Niagara came over here and sailed with such marked success, and it will be interesting to see whether the Bristol designer can do better with our rating rule than our own designers. Our 52-footers have not been improved upon to any great extent since the present rule came into use; in fact, it is an open question whether Fife's Magdalen, which came out in 1900—the first year of the new rule—is not a better boat than anything we now have, except perhaps, in very light winds. At any rate she could stand up to her canvas, and the newer boats seem unable to do so. The tax on girth has had the undesirable effect of cutting down draft of water too much for stability, and the class is now unmistakably tender. If Herreshoff can see a way out of the difficulty he will earn the gratitude of British yacht owners, if not of the designers. E. H. KELLY.

Usona II.

THIS photograph shows the Lozier launch Usona II. on her arrival at Trouville, France, after the "Paris-to-

USONA II.

Sea" contest last August. She was entered in the cruiser class, and finished first out of sixteen competitors by a margin of over two hours.

S. & M. MOTOR BOATS FOR MR. FRANK CROKER'S LAUNCH.—The Smith & Mabley Company have received at their boat shop, the 45ft. speed launch designed a year or so ago by Mr. C. F. Herreshoff, Jr., of this city, and built by the Chase Pulley Co., of Providence, R. I., for Mr. Frank Croker. This boat was to have been furnished two high-power Rochet-Schneider automobile motors, by the late Alex. Fischer. It has not yet been decided whether installation will be a 75 or 150 h. p. Smith & Mabley Sixplex. If the larger motor is chosen, the boat will surely be heard from in 1905.

Propellers.

BY A. E. POTTER.

THERE is more than one auto boat designer just at present "up against it" in propellers. His boat shows up-to-date construction, he has seen the engine tested, and is reasonably sure of its power; but the speed of the boat is not up to his expectations. He is well satisfied that his propeller is at fault, but in what essential respect he does not know. He consults all the written authorities he can find, and his mind is soon added with blade surface, pitch, slip, frictional resistance, etc.

The party from whom he purchased the wheel showed him recommendations galore, and told him his wheel would fill the requirements. He buys and tries his luck, fails; buys another, fails; gets desperate, and soon he has a collection that appals him, and a bill for wheels that frightens him.

In selecting a propeller for a high speed auto boat, one should go at it intelligently. He cannot expect to get the right wheel the first time, but the second time he ought surely to make an improvement, until finally he begins to realize his hopes.

Now, for instance, his first wheel comes from the manufacturer ordered a certain diameter and pitch, either two, three, or four-bladed. It is well understood, I think, that an absolutely true pitch wheel offers the least resistance on high speed. A true pitch wheel would have the same pitch at each and every diameter. At 20 inches diameter it may be, and usually is, more or less pitch than measured at 16 inches. Each blade should have the same pitch. Obviously it is true that it is possible to get two blades true to each other; something next to impossible to find three or four blades all alike. If he will make a careful record of his measurements, note his engine speed, and carefully time his boat at full speed between two fixed channel or other marks, with and against the tide, this data will be invaluable in the selection of his next wheel. If his engine does not turn up to what the builders suggested, the wheel, if true pitch and blades are all alike, has probably too much pitch, which should be reduced. If the boat goes faster or nearly as fast at slower engine speed, especially in lumpy water, the wheel has insufficient blade surface. Very rarely does a propeller have too much blade surface, but many times has excessive pitch. Too much blade surface will make comparatively little difference so long as the blades are true themselves and true with each other. The only drag they will make is the additional frictional resistance through the water.

I should strongly advise auto boat owners and designers against trying any but guaranteed and tested true pitch wheels, except they are put on and tried out by the manufacturers themselves, and sold subject to approval. One should remember that an engine rated at 1,200 revolutions per minute is not developing so much power at 800 and still less at 600. If the wheel slows the engine down beyond its rated revolutions per minute, it is not correct.

In cruising boats and launches the propeller question is not quite so important, although there is hardly a case where the performance of the boat and engine cannot be improved by an intelligent study of the wheel. The field is probably not so fruitful, but I have seen cases where 15 to 20 per cent. improvement in speed has been made by substituting a wheel more suitable for the work. I understand that at least one manufacturer is contemplating putting an interchangeable wheel on the market which will be true pitch and can be exchanged for one of the same diameter with more or less pitch at small additional cost. The motor boat has surely set the propeller designer and manufacturer to thinking.

WORK AT MORRIS HEIGHTS.—The New York Yacht, Launch and Engine Co., of Morris Heights, are equipping the launch Canvas Back for the Spesutia Island Rod and Gun Club, of Havre de Grace, Md., with two 12-15 horsepower Twentieth Century gasoline engines. They are also building a 90ft. cruiser to be equipped with a 6-cylinder 100 horsepower Twentieth Century engine for Mr. J. E. Fletcher, of Providence, R. I., to take the place of his 55ft. Coronet II., recently sold to Mr. R. L. Hull, of Philadelphia.

OUR English cousins describe our two-cycle and four-cycle types of gasoline explosive engines as the "two-stroke" and "four-stroke." Undoubtedly the long appellation of the "one in two strokes cycle" and "one in four strokes cycle" would be much more easily understood, but these names are too long. Why would not "two-stroke cycle" and "four-stroke cycle" be less confusing and more explanatory?

Four Philadelphians Cruising Down East.

BY THE LADY COOK.

IN the first place, we did not start from Philadelphia, but having summered several seasons in a native cottage on one of the islands of Casco Bay, with our yacht Eleanor lying off the back door, early in August of 1903 we stocked the small cabin from the island store and headed further down East; that is, the cook's husband, and his father and brother.

Eleanor is a sloop-rigged yacht, often known as the dead rise bateau, 26ft. 6in. over all, 16ft. 6in. waterline, 8ft. 2in. breadth, 20in. draft, with centerboard down 4ft. 6in., sail area 418 sq. ft., carrying 600 pounds ballast. She is of entirely single-handed, home-made construction; I hesitate to call her even amateur build, as the before-mentioned brother, who is responsible for her existence, does not intend to build another, his life-work being entirely apart from any work of the hands. For two seasons our family had knocked about in the waters of Casco Bay and often outside in an open Hampton boat, which is undoubtedly the best type of open boat for these waters, often chilled in calm sunsets, and wet with heavy seas, with no cabin even to stow warm and dry clothing. Then Eleanor was conceived. That is, we must have a cabin, with enough about it to make a boat answering our needs. The fact that she is flat-bottomed might relegate her among the unseaworthy, but with skillful handling and proper precautions as to attempting long open stretches of open water in threatening weather, we have ridden out many a blow and enjoyed a 250-mile cruise. A centerboard and cabin without head room but with ample width and length to accommodate four sleeping occupants by night, and the same space used for cooking purposes and shelter by day, lockers forward, ice-chest aft, and plenty of room under the overhang for stowing clothing, fishing tackle, charts, etc., comprises the interior. After a ten days' cruise we once calculated that it was equal to living for the same time under the family dining table at home, going about on all fours when a needed article happened to be beyond arm's length—but oh, the simplicity of it, the absolute rest, and the reluctant return to civilized ways!

With a fair S.W. wind on this August day, we started to beat out 10 miles to Sequin Light; three long legs and Small Point was rounded, with the light just ahead, then close-hauled for The Sisters. After passing these rocks the wind suddenly dropped, and we slowly drifted to the Cuckolds, passed inside the light, and a few gentle zephyrs enabled us to make Card's Cove on Linekin's Neck, at 7:40 P. M., too late to go ashore that night for provisions; but before even lighting the Khotal for a hot meal, let me ask how all the other cruising yachtsmen we see get along without a mosquito-proof cabin? Our scheme is copper bands covered with two thicknesses of cotton netting slipped over the port-holes, and perfectly fitting frames with bronze wire for the fore and aft hatches. If one midget should find his way in before we come to anchor, he is easily found and disposed of on the perfectly white top and sides of the cabin. With an acetylene lamp, a good bicycle lamp, and an old trusty lantern, there are cards, books, magazines, nautical and otherwise, yarns and songs, until the blankets are unrolled and the race is on as to who will get to sleep first.

Next morning fog and rain, wind S.E.; no hurry to get off under these conditions, so the cook goes ashore for fresh bread, beefsteak, New England doughnuts, and whatever else she can find. Low water and unfamiliar landing places necessitate partial disrobing; but the fog was thick and thereby convenient. By 11 o'clock scenery was appearing, and a light wind enabled us to pass out inside Green Island, where the current set in toward the island, and at one place the centerboard touched slightly; no damage, however, and as the fog again looked threatening, we made for the Thrum Cap, intending to anchor somewhere in the Thread-of-Life passage, as it was that much to the East, rather than Christmas Cove. After passing Turnip Island and dodging several hundred lobster buoys, anchored behind Hay Island at 2 o'clock. Having friends at the other end of Rutherford's, two of us unfolded ourselves and walked the distance through mud and rain, appearing in fine trim before hotel guests and rocking-chair sojourners.

More fog the following morning, but after a violent rainstorm, the fog lifted a little and we started for Pemaquid Point, intending to take advantage of any further clearing, but we had no sooner threaded our way out of the passage than the fog settled down so thickly that we returned to our former anchorage. At nine o'clock the weather was sufficiently encouraging for us to start again, and with a light wind were able to make Pemaquid, sail close-hauled. After rounding the point, the wind freshened and we had a delightful two hours' sail across Muscongus Bay. From this point is the first view going up the coast of Camden Mountains, and from here up to Mt. Desert there is no lack of shift and change in the mountain outlines. But this seemed to be a period of storm for us; in the northwest the blue-black clouds rolled up, and we made for Herring Gut; just before entering it the squall came whistling, preceded by a gust of rain. We met it head on, breaking our wire bobstay with the strain, and dropping the mainsail sailed to an anchorage under the jib. The storm soon passed off to the East, and with wind light from the S.W. started for Lennant's Harbor, chiefly to procure alcohol with which to start the stove. But the fluid was not so easily obtained, the druggists at two of the small coasting towns where we put in having the conscience to refuse us a drop even of wood alcohol. In vain did we plead cold meals and perhaps a stress of bad weather before Rockland could be reached; nothing would move them out of a literal translation of the laws of the State. Then the cook hunted up a doctor's sign, and after choosing between the only two that she could find in the town, walked in and presented her case, with the awful consequences which would ensue if he should refuse a little of the spirits. All the doctor had was at her service, which all was but half a pint, but was enough. Hereafter, alcohol in generous quarts will be first on the list of cruising necessities. A magnificent rainbow and the evening marked by the new moon and the splashing of innumerable fish in the harbor ended the third day of our watery world.

At six in the morning weighed anchor and with a fair

wind reached through Mussel Ridge Channel, making Rockland at 10 o'clock. Two hours sufficed to get a new washer on the pump of the Khotal and plenty of Columbia spirits at one of the marlin-smelling shops skirting the harbor. At twelve off for North Haven, across West Penobscot Bay, but the wind was not true enough for us to fetch the Thoroughfare, and we were compelled to hold off. The wind kept increasing in strength, and two reefs were put in; even then it was impossible to hold the course. Fierce gusts came off the land and heavy clouds banked up rapidly; we then decided to ease off the sheet and make for a little harbor toward the north of the island of North Haven. Here we put out two anchors and passed the night. It was a case of toss that night in a little cove not too well protected, but all hands slept, and next morning the weather was gloriously clear, with a S.W. wind. We emerged from shelter not with trepidation, oh, no, but curious to see if things outside were as they had been the day before; but the wind had gone down considerably, and with two reefs in the mainsail beat to the Fox Islands Thoroughfare entrance. Here we shook out the reefs, and with a good wind aft had a thoroughly enjoyable day. Across the Isle au Haut Bay, where we lifted the tender on the stern to increase speed, through Deer Islands Thoroughfare, across Jerico Bay, and at buoy No. 2 took the time, when we found that the last 5 miles were covered in just 55 minutes. Through Casco Passage and Blue Hill Bay, and just as we reached the bell buoy off the entrance to the channel West of Cranberry Island, the wind suddenly changed to the S.E. and burst upon us with all the force of a squall. The sky was perfectly clear and a moderate N.W. wind had been

ELEANOR.

blowing when this happened. Whether this is peculiar to the Maine coast or not I cannot say, but during several years' experience there, sailing practically every day during the summer months, we have met with these conditions probably four times. This time there was a heavy swell, and the long line of wave-swept ledges under our lee allowed no room to reef. Hastily shoving the tender over and lowering the peak, we fell off and made for the passage. The wind increased as we got to the bar in the channel, and with an ebb tide against it, there was a heavy choppy sea which took all our attention. We had had times of dogged hard work, but this was an affair of alertness, of taking advantage of every wave, of breathless suspense during long seconds while the question of supremacy between the elements and our little craft was being debated. It was with great relief that we finally got through and anchored at Mause, an old town near the more fashionable Southwest Harbor. Upon going ashore, an old salt eyed us curiously, and then drawled out, "What you call that boat? I saw you coming in with your peak lowered. She can go, but I never saw a boat of that type."

Last winter I read of a cruise where the skipper got as far as Bass Harbor in a small boat, but had been forewarned not to try to get any further. Curious to know why, I wrote to the editor of the paper, but he could give no information. After traversing the course, under the conditions we found there, we thought perhaps we had discovered for ourselves the reason why.

That day we made 45 miles, an average of five miles an hour for the day. A row across the harbor and a walk through the village for supplies to last over Sunday, resulted in a most elaborate menu for Sunday morning breakfast. During my trick at the tiller next day, when the mate was trying to get a few lines ready to send home to assure them of our safety so far, I was interrogated as to what that "breakfast food was this morning." Then I knew that the fame of that breakfast was going abroad. We always had another hot meal at night of fresh vegetables and meat, but there were days when the work, or rather pleasure, of chart, compass, log, and coast pilot was too strenuous for even a sandwich to come between.

We had intended to go around to Bar Harbor, but when we found that wind and tide were favorable to getting out of that channel, decided to return, and were off by 6:20 the next morning. Just outside the wind died out, and we slowly drifted to Bass Harbor Light. Here we passed midway between the light and the opposite island, but it is much better to keep near the light. There is a bar which extends almost across; where we passed there was apparently not more than eight feet of water, and under improper conditions some very nasty seas would undoubtedly be met there. A breeze from the S.E. then came up, and back we flew over the course of the day before, to North Haven, from 6:20 in the morning to 6:15 P. M., a full day of charm.

A habit which the cook has of falling overboard at least once a season has lost its novelty. Through no fault of her own, I declare it, this was her night, and down she went into the icy depths, but there was only a head poked out of the cabin, a voice calmly asking, "Is R. over-

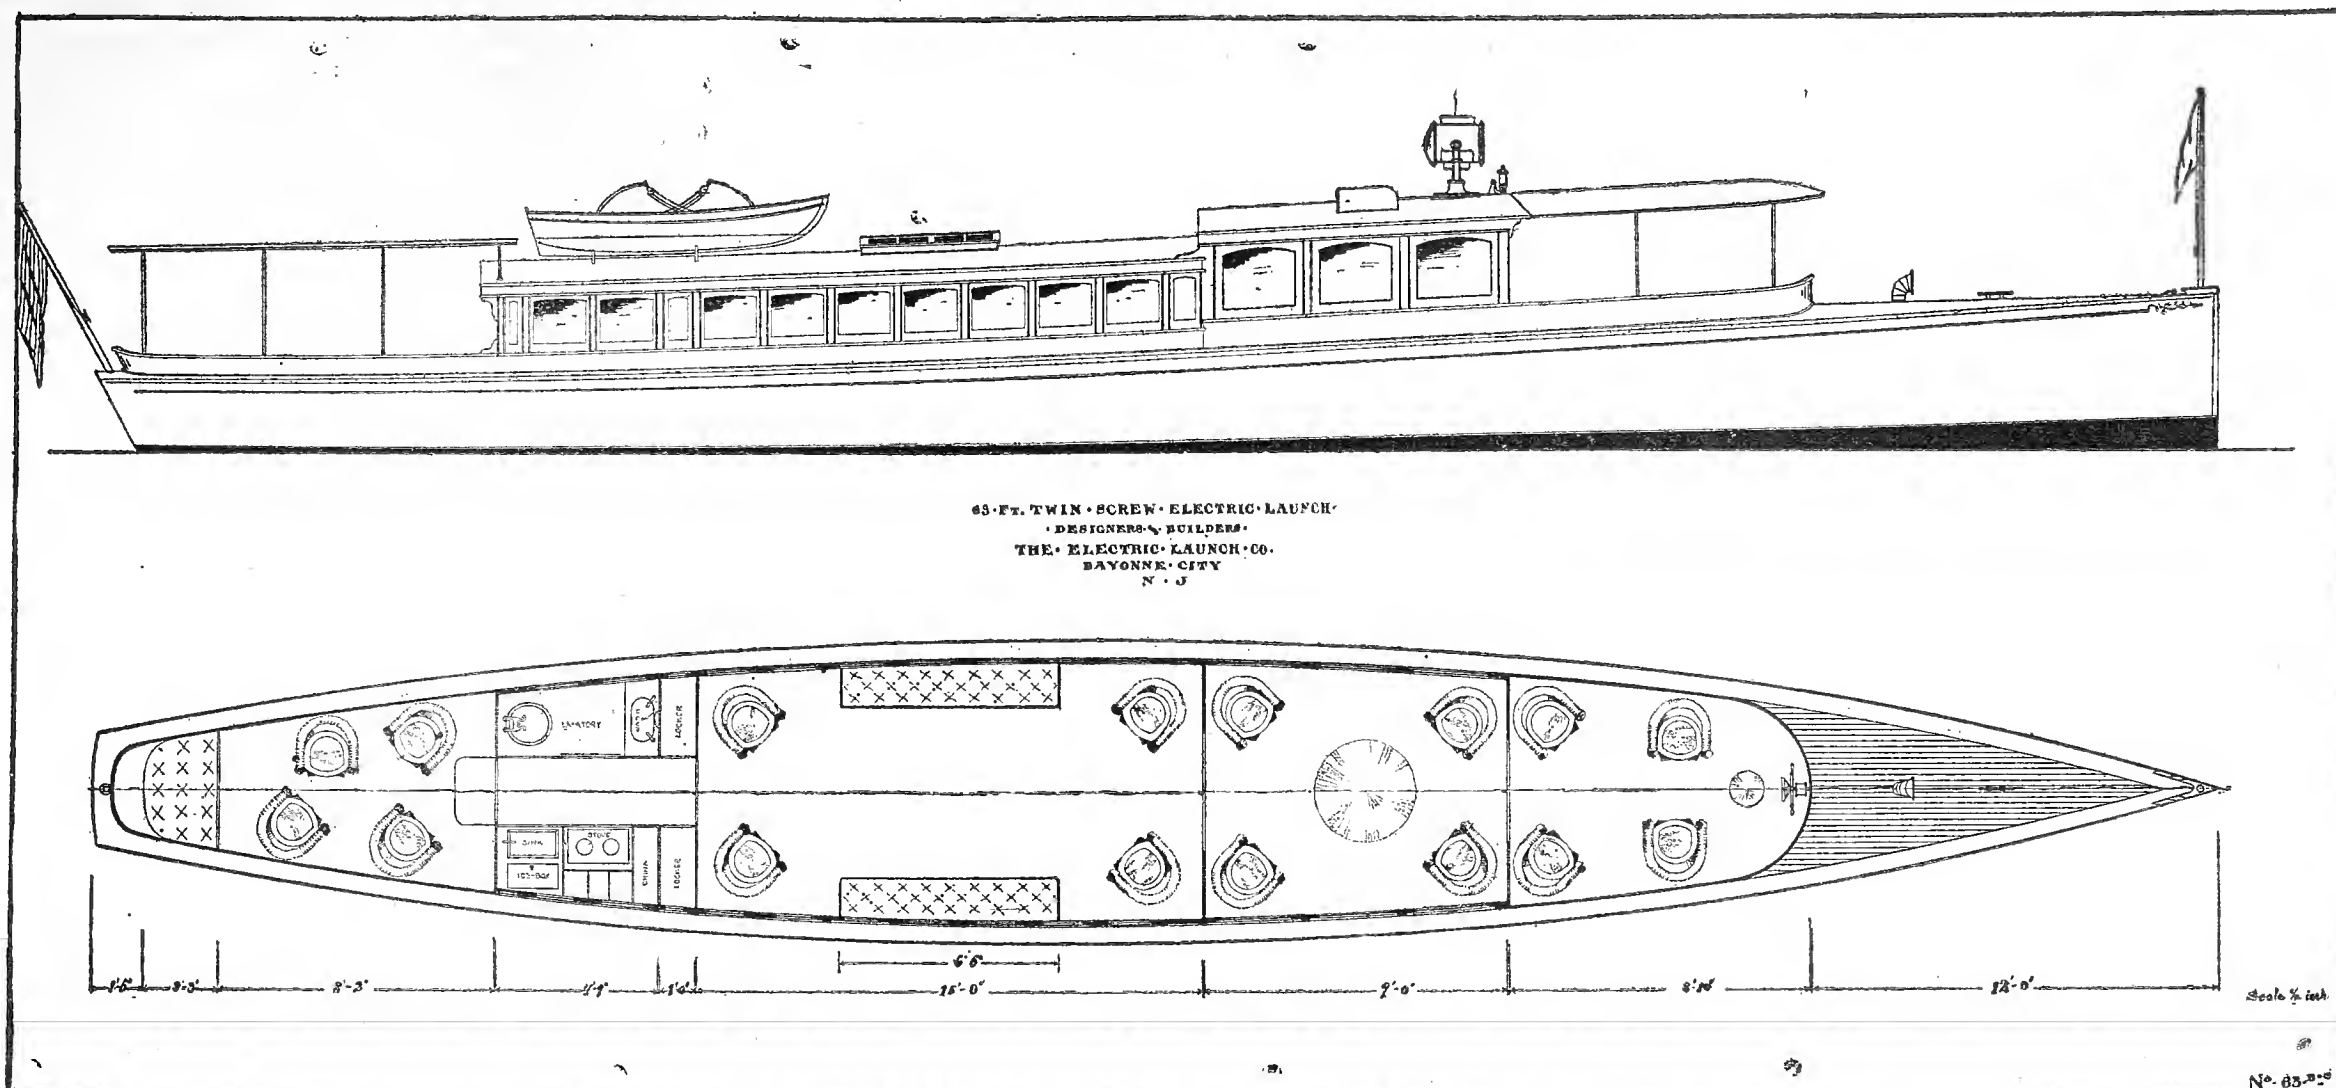

board?" and a patient waiting until she appeared some few feet away, viewing the fleet in the harbor, and trying to decide in the darkness which boat she shall swim for; then a shout of "Over here!" and the next day a fluttering of garments in the breeze. But I greatly prefer that trick to the boom or gaff hitting me; and worse than that, one night when we had anchored too close to a wharf and all had turned in early but the mate, who had gone ashore for a few hours, he came down to the sloop and found the end of the boom wedged in between the stones of the wharf, the tide having risen, and the boom on a tremendous strain. He tugged and pulled and shoved, and finally, without thinking of the position of his chin, directly over the boom, it was released, and his head almost went with it.

Again West Penobscot Bay to cross, but as the wind seemed determined to carry us north every time we approached this body of water, we went up to Camden, passed back of the island at the mouth of the harbor, and anchored in the company of such boats as the yawl Katharine II. and auxiliary schooner Idler. We found this harbor much preferable to Rockland, where the smoke from the lime quarries soils the deck and the tender in a little while.

Fog and rain, wind S.E. The weather did not look promising, but the wind was fair. There were salad days in our sailing when we would beat in a fog, and by making accurate calculations we never missed but one buoy in that sort of work; but after a few years' experience have decided to fog it only with a fair wind. This day we saw the most curious cloud forms—light, detached, fantastic, and flying low; evidently advance guard to the heavy fog blown in later. We steered for Frenchman's Island, and just before reaching it the fog came down thick. We had been able to make out the buoys, and with compass made Ash Island beacon at the entrance to Mussel Ridge Channel without difficulty. It commenced to rain and it rained hard, so decided to make Seal Cove and spend the night there; anchored off the granite works' wharf at 11:20 in the morning. According to custom, the cook went ashore, with no excuse this time but to buy chocolate at the store, but desolation upon tombstones, the wind shrieked through the fog, the store was locked, an old woman at least a thousand years old hung out the second story window and said she was desperately ill and could not come down; the faces of the dogs and of a few children peeping out the panes of an adjacent house were harder than the granite. A few minutes sufficed for this place, and then back to the snug and warmth of the cabin, books, and companionship. We put out two anchors that night and slept to the accompaniment of the fog whistle at White Head Light, about a mile to the west of us.

Clear and calm when we awoke next morning; got up anchor at 7:20, and with light wind and ebb tide passed White Head. Later in the morning the wind sprang up so strong from the S.W. that we anchored and put two reefs in the mainsail and one in the jib, had lunch, and started off again. In beating up to Marshall Point we had some difficulty in locating the old fish weir; the tide was high, and all but one or two stakes were covered, and these barely visible. Across Muscongus again, and instead of stopping at Squirrel Island, we decided to go up into Boothbay Harbor and try Townsend's Gut for the first time, a narrow, crooked passage opening out into the Sheepscot River. This passage could only be made in a S.W. or S. wind, except in a small boat which could go about quickly. We were through in twenty minutes. There is a drawbridge, but three toots on the horn is a signal which promptly opens the draw. As we were now in entirely new waters, it was necessary to look up an anchorage for the night on the chart, and decided to cross the Sheepscot and get back of Fire Islands on the west side of the river. This is an unusually pretty harbor, where we had the very coldest bath of the season next morning. This was to be a day of extremes and superlatives, for after the coldest bath, we had the strongest N.W. wind that we had ever encountered; put two reefs in but found it necessary to hold the sheet most of the time. To complicate matters, just off Sequin the chart blew overboard, and the boat was put about in the gale to recover it; then a moss-grown hat appeared from the cabin to inquire what was the matter, and the hat, rich in associations, also went overboard. This time the mate jumped into the tender and went for the hat. The jib had blown around the forestay, and the skipper, in fixing it, had tied the jib sheet to the knight-head. When he tried to bring the boat up to the wind it would fall off again, the head being pulled around by the wind. After considerable rowing by the mate and almost running him down, things were straightened out, and we bowled on. After rounding Small Point, we got the full strength of the waves and wind; put in a small cove and reefed again, putting three reefs in the mainsail and two in the jib, the first time it had been necessary to do this in the four years' handling of the boat. Beating out, we found it practically impossible to manage her. Even with the three reefs we had to hold the sheet, and the waves washed over the deck. If the wind had been fair, it would not have been so bad for us, but in such a wind and sea we could make very little headway. We therefore put about and ran into the first protected spot we saw. It was a good enough place, apparently, as a last resort refuge, but after being told that the place we had anchored in was bare at low tide, we decided to move on. I do not remember ever to have been out in such wind. Sighting a likely looking place back of little Gooseberry Island, we ran in there late in the afternoon. It was the place we wanted; the water was deep and beautifully protected. We put down the big anchor and the little anchor astern and to the east to keep the boat off the rocks. Things were rather wet inside, caused by the straining of the boat; there was a hasty meal, and for the first time we were all too tired to wash dishes; they were put out in the cockpit for the dew to wash.

Being ten miles from home, it was a temptation next morning to try hugging the shore and making a circuitous route, as the wind was about as strong out in the open as it had been the day before. Twelve hours' sleep and a hearty breakfast put the mettle in us again, and we started out, beat up to the northern end of Wood Island to get advantage of the lee, and then headed over to the mouth of the New Meadow River; beat out again and were able to let off sail for Jaquish Channel. The wind was very strong and coming in fierce puffs, but

OUTBOARD PROFILE AND CABIN PLAN OF 63FT. TWIN-SCREW ELECTRIC LAUNCH.
Designed and Built by The Electric Launch Co., of Bayonne City, N. J.

under the lee of the land we made good weather of it. Off Jaquish, the main sheet horse gave way, and instead of one man handling the sheet it now required two to manage it, but in a few minutes we were able to ease her off, and home was in sight.

About 250 miles was the distance covered in a leisurely way, and so thoroughly enjoyed that we expect to repeat the trip again.

To women who contemplate roughing it in this way, I should advise, above all things, to go light with the baggage. A set of slickers for wet weather (slicker skirts are now obtainable), a white drilling jacky shirt such as the jackies wear on men-o'-war slipped over the shirt-waist for protection from the soil of cooking and a little extra warmth, and a sweater, are all the extra outside clothing I have ever needed in four years' cruising. The jacky shirt can be thrown aside easily every time an anchorage is made and one wants to go ashore.

Queries on Marine Motors.

R. M. H., Phila., Pa.—My two-cycle motor seems to "stick" when piston is ascending and insulated electrode is removed. Disconnecting the shaft does not help matters. Can you tell me the cause?

Ans.—If the engine showed this trouble when new, it would indicate that the upper part of the cylinder was either smaller than the lower part or was out of round. It frequently occurs when the cylinder is strapped for boring on a lathe that it is held at each end by three adjusting screws. The tendency is to slightly distort the cylinder and on removing from the lathe the bore will sometimes be a trifle irregular. In your case, supposing the trouble to be of recent appearance, we should say that the lower piston ring catches in the exhaust or inlet port. It may be broken or the parting may have shifted until the ends catch in the port openings. This could be readily determined by removing the piston and examining the condition of the inside of the cylinder, the piston and the rings. The piston rod may be bent, but in that case it would stick only in one direction, as when going ahead, and be perfectly free on the reverse.

J. J. B., Dubuque, Ia.—We are much interested in your motor boat articles. Nearly every one here who loves the water has a launch. We all have the usual troubles which help make the sport so fascinating. Would it be practical to have two explosions for each charge, one at the last of the compression, and the other at the end of the stroke to explode the balance of the gas (if there be any) before it passes out of the exhaust? 2.—Which do you think the better for marine work, the jump spark or make and brake?

Ans.—In order to get the maximum power from an explosive mixture, it is necessary to ignite it considerably before the end of the compression stroke. If the mixture is poor in gasoline vapor the flame remains the whole length of the power stroke, combustion being slow. If the mixture is in the proper proportion, there is no explosive gas left at the end of the stroke. Many attempts have been made to compound the explosive type of engine, but not particularly successfully. In no case could "compounding" be assisted by a subsequent spark. It is imperative that the back pressure on the exhaust be as low as possible, to rid the combustion chamber of the products of perfect combustion which are carbon dioxide, nitrogen, and watery vapor, as any volume of these remaining in the cylinder under pressure after the exhaust closes reduces the volume of the incoming charge. The principal loss of gas in two-cycle engines is from poorly designed and proportioned exhaust and inlet ports and incorrect "baffle" plates, which are used to deflect the incoming charge to free the cylinder of burned gases.

2. Both systems of ignition have their good and bad points. We have used both with excellent results. The jump spark is almost universally used in automobile work, and in the past year or two has been used extensively in marine. If the coil can be kept dry, the secondary wiring is sufficiently well insulated, and the installation is intelligently made, just at present the jump spark system seems to have first call. The cost of operation is probably less, and jump spark troubles can usually be located easier than make-and-break. It will be a long time, however, before either system is abandoned entirely.

E. B. B., Syracuse, N. Y.—Can you tell me what advantage a double form of ignition could be in a marine gasoline engine, in which the jump spark is used only to start the engine, and the make and break is used after engine is started?

Ans.—There is one make of French engine that uses jump spark ignition for starting and then runs on a closed circuit, with break of contact caused by a pin on the head of the piston, similar to that formerly used when the "Empire" first adopted electric ignition. The only advantages to this double ignition would appear to be, by its use, being able to start the engine without danger of back kicks, and igniting the charge much earlier. In this particular case noted, the current for the jump spark was from a storage battery, while the make-and-break was from a magneto.

R. J. H., Providence, R. I.—What will it probably cost to change my make and break two-cycle single-cylinder engine to jump spark?

Ans.—A good jump spark coil will cost about \$8. A timer can be bought for \$3 to \$5, or can be made for considerably less. Secondary wiring will cost about 5 cents per foot. Plugs from 35 cents to \$1.50 each. Four cells of dry battery will usually be found sufficient to operate jump spark ignition. (We expect to give full directions for making a timer and installing jump spark either in connection with, or in place of, the make-and-break.)

W. J. B., Bensonhurst, N. Y.—Why does my double-cylinder four-cycle engine start harder, now that I have equipped it with positive acting inlet valves?

Ans.—When your inlet valves had light springs on them, they would readily lift from their seats. Now it sometimes takes quite a little vacuum to lift on the "off" down stroke. For instance, in attempting to start with the forward piston on the upper center and after one on the lower, the forward piston descends and draws in a charge of gas through the mechanically operated inlet valve, while the exhaust valve on the after cylinder is open. The next stroke upward in the forward cylinder compresses that charge partly and draws the charge into the after cylinder also through a mechanically operated inlet valve. The next down stroke forward is a power stroke, but if for any reason the charge does not ignite, additional gas is taken into the cylinder to replace that which has passed through the compression relief, and this has to come through the inlet valve held to its seat by a much heavier spring. You will probably notice that it is harder turning the flywheel to ignite on the after than the forward cylinder, and this is the reason.

E. J. M., Chicago, Ill.—Do you know of any two-cycle engine in which the inlet of gas is controlled by the piston closing and opening a port in the cylinder wall that can be started readily without recourse to "priming" with gasoline?

Ans.—The bother of "priming" a "ported" two-cycle engine with gasoline is the chief disadvantage of this modern construction. Some manufacturers claim "priming" in their particular engines is unnecessary, but we do not see how it can be avoided without turning the engine over very rapidly when starting. When the bearings become worn and leaks develop, you will usually not attempt to start without "priming."

Cruising Electric Launch.

We are reproducing this week the lines of an electric cabin launch designed by the Electric Launch Co., Bayonne, N. J., for a prominent New York yachtsman, who already owns a 42-footer of the same type. Dimensions as follows: 63ft. long, 9ft. 2in. beam, 2ft. 2in. freeboard and 3ft. 3in. draft. Planking is of cedar, copper fastened. Interior finish is of mahogany throughout. In the cabin are four folding Pullman car-type berths. The motive power consists of two 15 h. p. motors and 176 porcelain insulated marine type accumulators. The motors will be direct connected with two controllers, effecting five speeds ahead and reverse. Storage capacity is estimated to be sufficient for 140 miles at a speed of 10 miles, with a maximum of 12 miles. By a special arrangement, it is not necessary to use the direct current for recharging, as any electric light circuit can be utilized, economically, or even a trolley circuit. This boat is particularly designed for Long Island Sound use.

Log of the Launch Clara.

(Concluded from page 455.)

ST. LOUIS, MAY 31.

After breakfast we visited the World's Fair, and were much disappointed at the condition of things. The grounds and buildings are far from completed.

ST. LOUIS, MO., JUNE 1-7.

During this period Clara remained at her moorings, and we made frequent visits to the Exposition. The whole affair is laid out on such a magnificent scale that it was rather too large to appreciate it fully even after a protracted stay. We were glad to see FOREST AND STREAM exhibit in the Forestry Building. On the whole, the weather was pleasant, and our stay proved an agreeable one.

ST. LOUIS, MO., JUNE 8.

Warm and sultry. Ashore early to do our marketing, then bade farewell to St. Louis. We cast off about 10:30, heading for the Illinois River. We ran on about 20 miles, where we anchored for night. Could not find the floating light off Piasa Island in the Mississippi River, which bothered us a little, as we were afraid of getting on the dike. However, we got through safely. The scenery on the river at this point is very beautiful, the cliffs below Grafton being particularly magnificent. We found the Illinois River well lighted and a beautiful river, although it seems to be full of fish nets. About midnight a steamer passed going north.

ILLINOIS RIVER, JUNE 9.

Cold and foggy. After breakfast we proceeded up the river, reaching Kampsville Lock about 9 A. M. We learned that the superintendent was away, and as we were not registered, we could not lock through after 8 A. M. and before 5 P. M. Being unwilling to wait until 5 P. M., we went over the dam and touched lightly, although the lock keeper or his assistant had assured us we would find 5 feet over the dam, and that the steamer Bald Eagle had gone over the dam at midnight. The Kampsville Lock is a State lock, and toll is charged. La Grange, the next lock, is a Government property and free. The latter we made about 3:30, and the superintendent proved to be very nice and obliging. A dredge was working in the lock, but he offered to take it out and lock us through. Rather than put them to that inconvenience, we waited two hours for the dredge to finish. The superintendent gave us considerable information about our course, and presented us with two big frogs, which were very palatable. Finally we locked through and went on up to Beardstown, where we tied up for the night. This is a nice town, with good, clean stores.

BEARDSTOWN, ILL., JUNE 10.

Left about 8:30 A. M., and reached Havana about 1:30 P. M. Went ashore to get acquainted, and found the place clean and thrifty. Then we cast off and took in tow for seven miles a skiff with an old man and his two boys. Arriving at Copperas Creek Lock, we stopped a few minutes. The superintendent told us we could go over the dam all right, which we did. This is a State lock and toll is charged if you lock through. Found no difficulty in navigating to Pekin, where we tied up for the night; 86 miles made to-day. Found very few lights.

PEKIN, ILL., JUNE 11.

A wideawake, hustling town is Pekin. Left about 9 A. M., and made Peoria without trouble, where we stopped for information, as we had been told the river from Peoria up was dangerous and impossible to navigate without a pilot. As we had sailed from Florida to Peoria without a pilot, we thought we could navigate the Illinois River, although we could not get charts, and had to rely upon the little information that was picked up along the river and our own judgment. The captain of the launch Islander very kindly gave us instructions how to leave the lights, etc., but notwithstanding this we were very much puzzled. We passed the first light, Waterworks, giving it a good berth, and made little Detroit all right. This place is in the bend and hard to pick up until you are

almost abreast of it. The next light we missed, but the one on Blue Creek Point we picked up, although it is so hard to find, and after sailing through what looked to be a lake of snags, Sand Point Light showed up pretty well, owing to the bar running out from it. After passing Henry it is easy sailing. The iron mines show up a long way off, looking like twin mountains. We passed under a bridge further on, and later encountered another, where we stopped and hailed a passing carriage for information. We could not make out what they said, but in answer to our question as to where the Illinois and Michigan Canal was, they waved their hand further on; had not gone far when we ran into the canal entrance. One could easily pass it, as there is nothing to indicate a canal; only a creek or ditch until one reaches the first lock. After blowing our whistle repeatedly, and waiting some time, the lock tender arrived upon the scene. He informed us we would have to pay ten dollars to register, besides the mileage fee. This is an imposition, as we found the canal in a dilapidated condition; some of the locks are on the verge of collapse. It is well named the "Ditch." From the entrance to Utica it is shoal and the canal is in disreputable condition. However, it is the only way to get into Lake Michigan, unless one goes back to the Mississippi River and up to the Wisconsin River. We had been told the latter was impossible to navigate on account of the shoal water. This information we afterward found to be incorrect, as we were assured by a reliable captain we could have carried four feet through easily owing to the high stage of water. After locking through two locks we went on to the next, locked through and tied up for the night.

ILLINOIS AND MICHIGAN CANAL, JUNE 12.

Near Utica found the dredge at work. They pulled out to let us pass. As yet have met no craft of any kind. Beyond Utica the canal is better. We went on as far as Ottawa, where we tied up at the collector's office; found it to be a very nice town, and the country all around is beautiful.

OTTAWA, ILL., JUNE 13.

Left at 9 A. M., and we reached Joliet about 6 o'clock, where we stopped for the night. Here we saw the new drainage canal, which can be navigated from Chicago to Joliet only. They also have a bear dam below Joliet, as the canal runs at a terrific rate.

JOLIET, ILL., JUNE 14.

Took aboard 50 gallons of gasoline at 13 cents a gallon; then we left for Chicago. Tied up to Wells street bridge at 2:30 P. M., thankful to get out of the dirtiest and most filthy water we have ever navigated; from Joliet it is a sewer, and quite impossible.

CHICAGO, ILL., JUNE 25.

We leave to-day after a very pleasant stay. The Columbia Y. C. members, and Mr. Hickey particularly, being very kind and helped to make our stay most enjoyable. We found they were such good sportsmen we joined the club. While in Chicago saw some good racing between the yachts competing for the Lipton Cup. Our only objection to Chicago is the soft coal nuisance. We took aboard 125 gallons gasoline at 11 cents. About 2 P. M. the wind blew up fresh and we ran into Waukegan, a most delightful town. We passed Palmetto bound S.

WAUKEGAN, ILL., JUNE 26.

Light W. wind; off by 5:10 A. M. Made Racine at 8:50. Went ashore to see if we could find marine ways to haul out, as the stern bearing is still leaking, but could find no ways of any kind, so left at 11 o'clock. We arrived at Milwaukee about 1:30, and went up the river, thence back around to the Kinnikinnick River, and tied up to a wharf. In five minutes we were surrounded with the toughest lot of young boys I have ever seen. When ordered off the boat they commenced to gather rocks. Not knowing what they might do, George, the man, went for a policeman. We got out the gun, not with the intention of using it, but to see if they would scatter. This they finally did. A policeman could not be found, and not caring to stay over night, we moved over to the Milwaukee Y. C. house, where we found a nice clean slip to lie in.

MILWAUKEE, WIS., JUNE 27-JULY 1.

We lay in our snug berth for several days, making trips about the city and the surrounding country. Oconomowoc was visited one day, and the place was most attractive.

MILWAUKEE, WIS., JULY 2.

Left at 11 A. M.; made Sheboygan 4:30. Fine run, smooth sea and light N.E. wind, shifting to S.W. as we entered the harbor; weather cool.

SHEBOYGAN, WIS., JULY 3.

Left at 5 A. M., but had to run back, owing to the fog. We had breakfast, then made another start; made Manitowoc at 9:15; found a good sized town with up-to-date department stores and immaculate streets. Commodore and Mrs. Vilas paid us a short visit; they had just run up from Milwaukee in their yacht Thistle.

MANITOWOC, WIS., JULY 4.

The Fourth turned out to be rainy and cold, with plenty of noise. Toward noon it cleared off, and we rode by trolley to Two Rivers; the scenery was most disappointing.

MANITOWOC, WIS., JULY 5.

Delightful weather, with N. wind. Pulled stern out to fix shaft, and found the shaft and stuffing-box terribly worn. Had a new bronze shaft put in very reasonably, and work was well done.

MANITOWOC, WIS., JULY 8.

Rainy and disagreeable. We are waiting for good weather to run to Sturgeon Bay.

MANITOWOC, WIS., JULY 9.

Thick fog; about 9 o'clock it was partially dispelled, so we cast off lines and bade good-by to Manitowoc. We were due off Kewaunee at 12 o'clock, but in the meantime the fog closed in thick; could not see a rod ahead of us; did not hear the fog horn, so changed the course to W., and finally heard the welcome sound. We were almost on top of the pier, when the fog lifted, and we entered the harbor easily. We found the river entirely free from fog. Just as the fog lifted the old lighthouse on the pier head loomed up so big and sudden our man

George ran forward and shouted, "A steamer is upon us!" The old fog horn did sound ominous. This is a beautiful country, hilly and rugged; a quaint, crude town. At 4 P. M. we cast off lines and at 5:30 made Ahnapee, a nice town, much larger than Kewaunee. While at Manitowoc we were looking for the Standard Oil agent, and having been directed to the house, we knocked at the door, and a German woman responded. Thinking she was his wife, we asked to see her husband. She replied, in very broken English: "He gone to cemetaire." We in turn asked when he would be back. She again said: "No, no; he gone to cemetaire." Finally a neighbor volunteered to act as interpreter, and said her husband had been dead two years, and that the Standard Oil agent lived across the street.

AHNAPEE, WIS., JULY 10.

Under way at 4:30 A. M. Entered Sturgeon Bay Canal at 7:15, and stopped at Sturgeon Bay City to inquire for Roamer, but was told she had not called there, which we afterward found to be a mistake. Met the yacht Thistle going E. through the canal. Green Bay is beautiful, and in places majestic cliffs rise up sheer from the water. We tied up to a small dock in a beautiful bay off Detroit Island, the snugest harbor for small craft imaginable. The water is very clear, and we astonished the natives by showing them fish swimming under our glass bottom. Weather cool, N.E. wind.

DETROIT HARBOR, GREEN BAY, WIS., JULY 11.

After an early breakfast, cast off and ran out through the Port de Mortes passage. Laid our course from Pilot Island to Beaver Light; made South Fox Island at 11:30, and Beaver Island Light at 2 P. M. Then decided, instead of making Beaver Harbor, we would run on to Mackinac, and arrived off the fort at 7:15 P. M., 120 miles day's run, which is one of the finest runs we have made on the cruise. When we left the harbor in the morning it was blowing fresh from the S., but after sighting the Fox Islands had clear weather. Off South Fox Island we passed a steam trawler. Weather cool.

OLD FORT MACKINAW, MICH., JULY 12.

Wind N. W., blowing half a gale and very cold. We took the ferry across to Mackinac Island, a beautiful spot, and wonderfully pure and invigorating air.

MACKINAW, MICH., JULY 13.

Warmer weather, W. wind. Left 7:30 A. M., and made Cheboygan at 8:15. About 9:30 left for Presque Island Harbor, but off Ten Mile Point the wind shifted to N.E., blowing fresh, and we ran back. Cheboygan is not much of a town, dirty and unattractive—not a shade tree anywhere. Lumbering seems to be the main industry.

CHEBOYGAN, MICH., JULY 14.

Made a very early start, casting off lines at 3:10 A. M., and had smooth water until we got off Roger's City, when the wind shifted from light W. to fresh S. As we passed Presque Island Harbor the storm signals were up for a S.E. gale, so we headed into Middle Island Harbor, finding a snug anchorage and a well equipped life saving station. The weather looked nasty and the wind was blowing hard from the S. Toward night the wind shifted to S.W., accompanied by lightning in the W. and N.W., followed by light rain.

MIDDLE ISLAND HARBOR, LAKE HURON, JULY 15.

W. wind blowing fresh and storm signals for S.E. gale still up. Off at 7 A. M., and said good-by to Middle Island with regret. Off Thunder Bay we found a big sea running and the wind increasing. Just before reaching Sturgeon Point it looked so dirty and fearing the S.E. gale predicted, we turned back and ran into Black River. There found only 3 ft. on the bar, and rocky bottom. We made it all right, however, and went on up the river to the village, a desolate place. After an hour's stay, we decided to go outside again. We headed down the coast, making Au Sable at 4 P. M. The wind held to the W., with occasional vicious puffs. Found only 3½ ft. on the bar at Au Sable River. The town is in a dilapidated condition. We suffered from the many mosquitoes considerably. Only 30 gallons of gasoline in the town, which we purchased for 18 cents per gallon.

AU SABLE, MICH., JULY 16.

Over the bar at 4 A. M. Off Saginaw Bay we found the sea smooth, but a big swell on. Off Port Sanilac the wind came out of the E., but very light. Passed Port Huron about 5:30 A. M., and ran down the St. Clair River; tied up at St. Clair at 7 P. M.

ST. CLAIR, MICH., JULY 17.

Left this port at 6 A. M., and made Detroit at 10 A. M. It is a beautiful run down the St. Clair River, which is very properly named the Venice of America. Detroit is finely situated, and has one of the best club houses in the country. Had to wait until 2 P. M. Monday before we could get gasoline. Thermometer 96 degrees in the shade.

DETROIT, MICH., JULY 18.

As soon as we filled our tanks with gasoline we left for Put-in-Bay, which place we reached at 9 P. M. We had trouble with the compass light; it refused to burn. However, we made the harbor all right, and anchored near Roamer. We found the harbor ablaze with the lights from the many yachts lying there.

PUT-IN-BAY, O., JULY 19.

Left in company with Roamer at daylight, and made Cleveland at 10:30 A. M. Fresh W. wind, but the city fearfully hot.

CLEVELAND, O., JULY 20.

Got away at daylight, but found a rough sea and a head wind, so turned back. At 7 we started a second time and found the sea had gone down. We made Fairport about 11 A. M., and after lunch took the trolley to Painesville, a very nice town, where we found a carnival of fakes in possession of the place. Fairport does not amount to much as a town, but considerable ore is shipped from here.

FAIRPORT, O., JULY 21.

Weather cooler; N.E. wind blowing fresh all night, resulting in quite a lumpy sea. However, we started, but after getting out six miles decided to run back and wait for better weather. At 10 the sea had gone down considerably, so made another start, arriving at Ashtabula

at 2:30 P. M. This is quite a town, having big shipping interests and a population of many foreigners.

ASHTABULA, O., JULY 22.

Left 4:30, and reached Erie 10 A. M. Smooth sea and no wind when we left; before reaching Erie, however, it commenced to blow from N.E. fresh, and in the afternoon it blew very hard, followed by thunder and rain. Erie has a fine harbor.

ERIE, PA., JULY 23.

For a short while the wind was about S.W., and we made a start for Buffalo, but the weather looked bad, and we ran back. Just off the bar we saw a waterspout about half a mile away.

ERIE, PA., JULY 25.

N.E. wind still blowing hard, as it had done for past 24 hours. After breakfast made a start, and found a big sea running, but kept on. When off Dunkirk it began to get smoother, and we had a fine run, reaching Buffalo at 6 P. M., where we found Roamer and tied alongside of her.

BUFFALO, N. Y., JULY 26.

Went out to Tonawanda by trolley and back to the Iroquois for lunch. Afterward we enjoyed a drive through this beautiful city.

BUFFALO, N. Y., JULY 27.

Did Niagara Falls and enjoyed the day very much.

BUFFALO, N. Y., JULY 28.

Weather hot; with several guests aboard, we cast off at 9:45, and sailed down the Niagara River to Tonawanda, where we entered the canal. After clearing and putting George ashore to go to Niagara Falls, we continued on to Lockport, where we tied up for lunch, then went through five locks, one after another. After locking through, Mrs. M. and Mrs. N. left us and returned to Buffalo.

LOCKPORT, N. Y., JULY 29.

Rain all day. At 5 A. M. we started and passed through a beautiful country. The scenery around Genesee Falls is a great treat. After going through five locks we made Newark at 7 P. M., where we tied up to the bank of canal for the night.

NEWARK, N. Y., JULY 30.

A clear, fine day; cold N. W. wind blowing fresh. We left at 4:45 A. M., and stopped at Syracuse an hour or so. We made New London about 7 P. M.

NEW LONDON, N. Y., JULY 31.

Weather cool and heavy fog on canal, so did not start until after breakfast; made Amsterdam and tied up for night. After dinner, went ashore to buy stores, and were astonished to find such a lively place.

AMSTERDAM, N. Y., AUGUST 1.

Warm S. wind blowing. Made Catskill after a most beautiful run. The scenery from Little Falls to Cohoes is most impressive. At Cohoes we passed through sixteen locks. At Troy one can leave the canal and go down the Hudson or continue on through canal to Albany. If one has an ebb tide it is better to leave the canal at Troy. At the latter place the locks are in a disreputable condition and a disgrace to the State.

CATSKILL, N. Y., AUGUST 2.

Left at 5 A. M. The same heavy, warm S. wind still blowing. When off Tarrytown ran into a vicious squall and saw another to the south of us. Went through Spuyten Duyvil and tied up at Morris Heights.

We found that gasoline could be procured at most of the towns we touched at. The following shows where we purchased fuel and what we paid for it:

	Gallons.	Cents.
Miami, Fla.	140	18
Tampa, Fla.	110	16
St. Andrews, Fla.	15	20
Pensacola, Fla.	110	15
New Orleans, La.	50	13
Natchez, Miss.	25	25
Vicksburg, Miss.	150	15
Helena, Ark.	30	17
Memphis, Tenn.	120	12½
St. Louis, Mo.	160	12½
Joliet, Ill.	50	13
Chicago, Ill.	125	11
Manitowoc, Wis.	50	12½
Detroit, Mich.	100	12½
Buffalo, N. Y.	100	12½

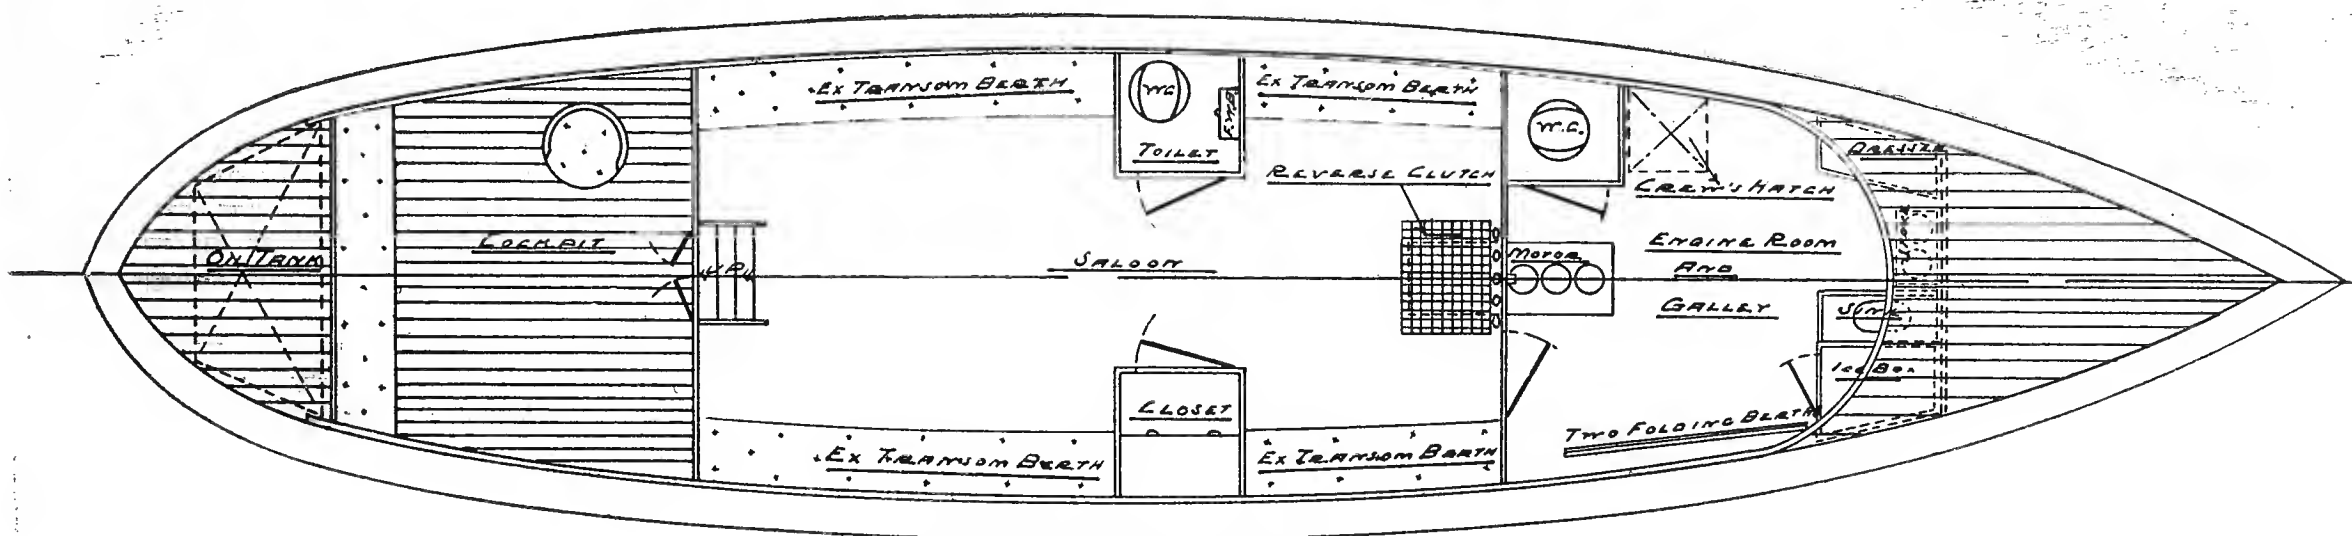

We used gasoline for fuel, lighting and cooking, and the 1,335 gallons consumed on the trip for all these purposes cost \$190.90.

55-Foot Cruising Launch.

We publish herewith the outboard profile and cabin plans of a 55 ft. cruising launch, now building in the shops of the Standard Boat Co., Long Island City.

The boat was designed for a New York yachtsman as a medium-speed launch, intended to be thoroughly seaworthy in all summer weather. The low trunk cabin forward is used instead of the ordinary round glass, in order that there may be no danger of a broken sash admitting green seas. She is arranged with the engine room, crew's quarters and galley fittings forward, followed by the owner's quarters, which consist of a forward saloon, an aft saloon, a toilet and a closet. In the forward part of the forward saloon is arranged the steering wheel and the reversing lever for the engine.

As shown on the sketch, the trunk cabin and house are laid out so that the steersman can see. Aft of the house is a self-bailing cockpit with a wide seat at the end. It is intended to use chairs also. The gasoline tank is placed aft, of sufficient capacity to give a cruising radius of 500 miles. The boat is fitted with owner's w. c. and wash basin; also a crew's w. c. with galvanized sink, in the galley. It is the intention to build this boat of oak keel, stem, sternpost and deadwood. Steam bent oak frames; yellow pine plank, with mahogany joiner work inside and out. The design in general is intended to meet the requirements for an all-around cruising boat, and it is especially laid out with the idea of removing the crew from the middle of the owner's quarters.

OUTBOARD PROFILE AND CABIN PLAN OF 55FT. CRUISING LAUNCH.
Designed and Built by the Standard Boat Co., Long Island City.

Gas Engines and Launches.

(Continued from page 458.)

BY F. K. GRAIN.

Gaskets, Packing, Graphite, Oils.

GASKETS, or the packing used in the cylinder head and different parts of the engine, can be made of good quality of drafting paper, giving the paper and the surfaces to be brought together a thorough coat of shellac, bringing the surface together while wet. Do not put graphite in your oil cups, as it will produce a short circuit should it work up on to the electrode.

Oilers.

Oilers are to be had in copper, brass and zinc; but the best oil-can for cylinder lubrication is an ordinary ten-cent teapot. Do not cover your motor over closely or wrap it in a canvas, as the canvas will hold the moisture and cause it to sweat and rust.

Tightening Bolts.

To tighten up the bolts of a cylinder head or any similar surface, start by putting down one bolt moderately tight, then follow with the opposite one, then the one at right angles, working from side to side. After all are in place and tight, follow in a like manner and screw down hard. Always tighten nuts holding the head after engine has run and become warmed up. Be careful not to use a wrench which is proportionately too large for the bolt without using great care, as it is very easy to twist off the ordinary stud bolt.

Defacing Surfaces.

Do not pound on any of the bright surfaces of your engine with a hammer or wrench, without putting a piece of hard wood between, as it will be sure to mar the surface.

Nuts, Pipe Fittings.

Nuts and pipe fittings that will not readily unscrew can be started by pounding a little with the hammer. In case of a pipe, hold a weight against the opposite side, then apply the wrench.

Electric Switch.

Electric switch should be placed where it will not get wet, otherwise the moisture over the surface will short circuit, producing the same results as the closing of the switch.

Pumps.

If your pump refuses to work on first starting, hit the inlet check valve a sharp blow, and nine times out of ten your difficulty is at an end. Be careful in packing your pump not to screw down too hard on the packing, it being far better to have the pump leak a little.

Lubrication before Starting.

Before starting your motor, fill all oil and grease cups, and oil all parts not provided with cups. Then adjust cylinder lubricator and start same, feeding before engine is started. If the engine has been standing idle for any considerable length of time, it is well to flush or force a considerable quantity of oil to the cylinder before starting. Should the cylinder oil thicken by becoming chilled so that it will not feed, the cups can be warmed by burning a small piece of waste, say about the size of a walnut, saturated with gasoline and held under the cup.

Handling with Reverse Lever.

In handling your engine when desiring to make a stop, no matter whether equipped with reverse gear or reverse wheel, never stop the engine until the actual stopping point is reached. Many smash-ups are caused by operators getting rattled and stopping their motors when they should have allowed the motor to run and depended on the reversing mechanism. When the engine has no reversing device and dependent upon reversing the engine, always make the approach for a landing from the side, avoiding coming head-on.

Generator Commutators

Become scored and rough from use, and should be kept smooth by holding a piece of fine sandpaper stretched over a flat stick on the commutator while it is running, afterward applying a thin film of vaseline with the finger. Never use emery cloth on the commutator, as the small particles of emery will imbed themselves in the soft copper of the commutator and destroy it and the brushes.

Short Circuits

On generators are often caused by the dust from the brushes, and copper covering the insulated inside terminal causing a short circuit. A good plan is to keep a small paint brush convenient for dusting these parts.

Wiring Batteries.

Batteries are wired in single sets of any given number of cells in series, as follows: Begin with either pole of the first battery, say the zinc, and wire to the carbon of the next; then from the zinc of this one to the carbon of the next, and so on until the desired number are wired. This will leave at the end of the set a carbon and a zinc pole vacant, to be attached to the line wiring. In the wiring of a double set the same plan is followed; but at the one end the zincs of each set—that is, the terminals from both sets are brought together, the other ends being kept separate. These separate ends being run to the two poles of the double throw switch. Another way, sometimes employed in wiring a double set of batteries, is to wire both sets in series, then connect both carbons together on one end and both zincs at the other end. By this wiring we use both sets at the same time, the effect being, however, to double the amperage or, in other words, the results are the same as if we had but one set of batteries, but of double size.

Gas and Pet Cocks

That have become leaky may be made tight by being ground in with powered emery and oil, putting a little brown soap on the valve before putting it together.

Caution.

Never attempt to look in at any opening to the cylinder while the switch is turned on, and also beware of all open air and pet cocks—the reason is obvious.

Paint for Exhaust Pipes.

The best paint or covering for exhaust pipes or other parts subject to extreme heat is ordinary stove blacking applied in the usual manner. If asbestos covering is used over the exhaust pipes, it must be protected by metal covering if exposed to the elements, otherwise, moisture will dissolve it.

ROBERTA NOT LOST.—The yacht Roberta, before reported lost on the North Carolina coast, was at Charleston, S. C., on the 20th ult. Captain Golden reports all well on board.

Maritime Superstitions.

From English Country Life.

"Seamen love to hear and tell,
Of portent, prodigy, and spell;
What gales are sold on Lapland's shore,
How whistle rash bids tempests roar;
Of witch, of mermaid, and of sprite,
Of Erick's Cap and Elmo's Light."—Scott.

Foam-crested waves are usually termed "sea-horses," but on the Welsh coast they are supposed to be the sheep of Gwenthiddy, a mermaid, and the fisher-folk say: "Beware when you see Gwenthiddy driving her flock ashore." Every ninth wave which breaks upon the beach is said to be larger than the rest, a belief which Tennyson mentions in "The Holy Grail":

"Wave after wave, each mightier than the last,
Till last a ninth one, gathering the deep,
And full of voices, slowly rose and plunged
Roaring . . ."

This is called Gwenthiddy's Ram, or the Death-wave, and according to a Cornish saying,

"When the ninth wave breaks
The earth shakes."

Another superstition speaks of a foam-crested wave as "the sheep of Norway," which are under the charge of a shepherdess named Aslauga,

"Who tends
Her flock along the white Norwegian beach,"

and it is considered a very ominous sign when Aslauga's sheep make their appearance.

"Who knows what tale of wreck or death to-morrow may be told,
For the wild white sheep of Norway are coming to the fold."

When the waves send up a high spray, it is said that mermen are drinking toasts to the welfare of sailors. Sometimes the mermen appear in the shape of a mist which stretches right across a harbor bar, in order to warn sailors not to put out to sea on account of a gathering storm.

The Scotch have a curious legend concerning "the ribbed sea-band," that is, the vermicular ridges which the waves make along the beach. Michael Scott, the famous wizard of olden times, had charge of a demon, for whose tireless energy it was necessary to find constant employment. No matter how difficult the task might be, the demon always contrived to accomplish it in a single night, and it seemed to be quite hopeless endeavor to keep him at work. At length Michael be-thought himself of the task of making ropes out of sand. The demon was vanquished at last. He is still vainly striving to accomplish his task, and the untwisted strands may be seen upon the shore whenever the tide recedes.

The ebb and flow of the tides are under the control of a giant, who lives far down in the depth of the sea. The waves bear witness as to the state of the giant's temper. When he is angry they are lashed to fury, and they sink to rest as his temper cools. Children give the title of "soapsuds" to the lumps of froth that are churned by the action of the waves, and they say that "the giant has been washing his hands" when they see

"Crisp foam-flakes scud along the level sands
Torn from the fringe of spray."

The electric light which often plays about the mast-head of ships is known by various names, such as St. Elmo's Stars, or the Feu d'Hélène. One flame only is a sign of foul weather. Two flames, which were known

to the ancient Romans as Castor and Pollux, are a favorable sign:

"Safe comes the ship to haven
Through billows and through gales,
If once the Great Twin Brethren
Sit shining on the sails."

In Horace's Odes too, we read

"Where'er the sons of Leda shed
Their star-lamps on our vessel's head,
The storm-winds cease, the troubled spray.
Falls from the rocks, clouds pass away,
And on the bosom of the deep
In peace the angry billows sleep."

According to a Scandinavian myth, storms are caused by the flapping of the wings of Hrasvelg, the gigantic eagle who is stationed at the root of the tree which supports the world. Many charms used to be employed in order to secure immunity from storms. At Mont St. Michael, in Normandy, nine druidesses used to sell arrows to sailors for this purpose. The arrows had to be discharged by a young man on his twenty-fifth birthday. In Lapland, favorable winds were often sold to sailors. Whistling on board ship is said to bring "both bad winds and bad luck." Eric, King of Sweden, was often called "Erie Windy-cap," from a popular belief that the wind would blow from the direction in which he turned his cap.

Southey mentions St. Cyric as the patron saint of sailors in "Madoc," where he says:

"The weary mariners
Called on St. Cyric's aid."

But it was St. Clement who was generally regarded as the sailor's saint, while St. Nicholas was the special patron of the fishing community. Many cliffs along the coast used to have caves which were used as oratories, and dedicated either to one of these saints or to the Virgin, the "star of the sea," who was supposed to possess great influence over the weather. Passing vessels always lowered their topmasts to these cave-chapels in token of respect.

Sailors have a decided preference for a vessel that has been christened by a woman. If the bottle of rose-water does not break when thrown over the bows, the vessel is not properly christened, and it is sure to be one day lost with all hands. A similar fate awaits the vessel whose name has been changed. In some European countries the name of a boat must not be divulged before it is launched.

To sail after a Saturday's moon is quite as ill-fated as the well-known superstition concerning a Friday's voyage, but a horsehoe "that has been found" insures a boat's safety if nailed to the mast with its ends upward. A boot-jack or red garments of any kind are strictly tabooed by sailors, and it is considered to be a very evil omen if a stray bird rests upon the yardarm of a vessel. It is unlucky to pick up a drowning man, as he is sure to do some injury:

"Save a drowning man at sea,
And he'll prove your enemy."

If a fisherman runs a fish-hook into his finger, the hook must be carefully kept from getting rusty until the wound has healed, otherwise he would get blood-poisoning. Swedish fishermen believed that a fish-hook made from a nail used in building a church will bring successful fishing.

It used to be considered lucky to commence mackerel-fishing upon May Day, as a good haul could be obtained by decorating the masts of the fishing-boats with garlands. When the floats to the mackerel-nets were thrown overboard, the fishermen used to shout in chorus:

"Watch, barrel, watch! mackerel for to catch;
White may they be, like a blossom on a tree.
God send thousands, one, two, and three,
Some by their heads, some by their tails,
God sends thousands, and never fails."

As the last net went overboard, the captain was careful to use the formula, "Seas all!" which was supposed to insure the perfect safety of the nets.

Tradition declares the haddock to be the fish in whose mouth St. Peter discovered the tribute-money. In proof of this assertion, the dark spots upon its body just beyond the gills are pointed out as the impression left by St. Peter's first finger and thumb:

"Haddock, which appear
With marks of Rome, St. Peter's finger here."

The dory disputes with the haddock for the honor of being St. Peter's fish; but another tradition attributes the marks upon the dory to St. Christopher, who is said to have caught one while wading through an arm of the sea, bearing our Saviour upon his shoulders.

The Finns declare that the reason why the flounder is so much whiter upon one side than on the other is that the Virgin Mary once laid her hand upon one. The spot which she touched immediately turned white, and has remained so ever since.

The pike is said to bear marks of the Crucifixion upon its head. The cross, nails and sword may all be seen there. Upon the continent there is a superstition that these marks appeared because the pike alone remained above water at the time of the Crucifixion. All other fishes sank in terror to the bottom of the sea, but the inquisitive pike put out its head in order to behold the scene.

The Jews have a superstition that a child which is backward in learning to talk can easily be cured by putting a live fish into its mouth. But it must not be a shell-fish of any kind. The barnacle is supposed to turn into a brent-geese when broken off the keel of a ship. So general was this belief in days of yore that the Roman Catholics permitted the brent-geese to be eaten upon all fast days on account of its supposititious marine origin.

Phantom ships find a place in the folklore of many nations, from the spectral bark which glides in and out of the icebergs near the North Pole to the Flying Dutchman, which may only be seen off the Cape of Good Hope. The French cherish a tradition of a vessel which enters Dieppe Harbor upon the eve of All Saints' Day, having on board the wraiths of those who have

been drowned at sea during the past year. Their faces are turned toward the shore as the vessel glides slowly and silently past the pier, but not a word is spoken, and as the hour of midnight strikes the death ship vanishes into the gloom of night. In Brittany the fisher-folk tell of another phantom ship, which roams for ever up and down the coast bearing the souls of the lost.

The Germans have a legend of a vessel manned by a skeleton crew, which sails about the North Sea, carrying skulls at her portholes instead of cannon. Upon the bridge stands the captain, with an hour-glass in his hand. When this mystic glass shall have been turned a certain number of times, the end of the world will come. Tradition also speaks of a gray-colored ship, which has sailed the North Sea for many centuries without helm or crew. She is only visible at night-time, when flames play about the masthead.

The Kobold of the Baltic is a sea-goblin, who rides upon the bowsprit of a phantom ship, called the Carmilhan, during a storm. She

"Haunts the Atlantic north and south,
But mostly the mid-sea,
Where three great rocks rise bleak and bare,
Like furnace-chimneys, in the air,
And are called The Chimneys Three."

These rocks will not be found marked upon any chart, for they are of the same nature as the Carmilhan.

Norse traditions speak of a colossal ship called the Mannifual, whose masts would shame the dimensions of our largest oaks. She was so huge that when she once ventured into the English Channel, her mizzen-boom swept a flock of sheep off the Dover cliffs while her bowsprit was touching Calais.

CADILLAC REACHES NEW ORLEANS.—The ex-Canada's Cup defender Cadillac reached New Orleans a few days ago, after having been transported from Detroit, Mich., by rail. She is 49ft. long, 11ft. 6in. beam, and draws 3ft. She was carried on a 60ft. car, and the journey was made in about two weeks. Mr. S. F. Heaslip, president of the South Gulf Coast Yachting Association, is the new owner of Cadillac. She was sold through the agency of Mr. L. D. Sampsell, secretary of the Southern Y. C.

NEW POWER TENDERS COMPLETED.—The Gas Engine & Power Co. have ready for shipment two particularly interesting power boats. They are both yacht tenders, but in size and general appearance are about as unlike as two similar boats could be. One is for Mr. James Gordon Bennett's Lysistrata, 30ft. long, 7½ft. beam, 2ft. 4in. draft, with liberal freeboard, square stern, a nice looking boat which will easily seat twenty-five persons. Power is furnished by one four-cylinder model A Speedway motor 4½ by 5in. On speed trial she did better than nine miles. The other is 32ft. 6in. long, 4ft. 4in. beam, double cedar planked, two cockpits, finished inside with Spanish cedar, has a six-cylinder 4½ by 5in. model A Speedway motor, and weighs, complete, approximately 2000lbs. Commodore F. G. Bourne, New York Y. C., is the owner of this high-speed and remarkably light-weight tender. She will be carried on board Delaware on davits. Eyebolts are connected to two four-legged yokes, fastened through two sister keelsons, instead of the usual plates outside the keel. New departures noted were aluminum engine beds and tank amidships, between the two cockpits. Her appearance in the water will be marked, as she will be white above and green below the waterline.

NEW YORK Y. C. ONE-DESIGN CLASS.—At a meeting of the committee appointed by Commodore Bourne to select a design for a one-design class, the plans submitted by the Herreshoff Mfg. Co. were accepted. The design shows a boat of 30ft. waterline, 43ft. over all, 8ft. 6in. breadth and 7ft. draft. The sail area will be slightly over 1000 sq. ft. Eleven members of the club have already agreed to build from the design, and it is more than likely that twenty boats will be built in time for next season's racing.

"Forest and Stream" Designing Competition No. IV.

Sixty-foot Waterline Cruising Power Boat.

\$225 in Prizes.

THE three designing competitions previously given by FOREST AND STREAM have been for sailing yachts. In this competition, the fourth, we are to change our subject and give the power boat men an opportunity. The competition is open to amateurs and professionals, except that the designers who received prizes in any of the three previous contests may not compete in this one.

The following prizes will be given:

First prize, \$100.

Second prize, \$60.

Third prize, \$40.

Fourth prize, \$25, offered by Mr. Charles W. Lee for the best cabin arrangement.

Mr. Henry J. Gielow, N.A., has very kindly agreed to act as judge. In addition to making the awards, Mr. Gielow will criticize each of the designs submitted; and the criticisms will be published in these columns.

The designs will be for a cruising launch propelled by either gasoline or kerosene motors, conforming to the following conditions:

I. Not over 60ft. waterline.

II. Not over 4ft. draft.

III. A signalling mast only to be shown.

IV. Cabin houses, if used at all, to be kept as low and narrow as possible.

V. Construction to be of wood, and to be strong, simple, and inexpensive. The cost of the boat complete in every detail must not exceed \$9,000.

VI. The location of tanks and engine or engines to be carefully shown. Either single or twin-screws may be adopted. The power and type of the motor must be specified.

VII. The boat must have a fuel capacity sufficient to give a cruising radius of 700 miles at a rate of 8 miles an hour. The maximum speed shall not be more than 14 miles nor less than 10 miles. The estimated maximum speed must be specified.

VIII. All weights must be carefully figured, and the results of the calculations recorded. A thousand-word description of the boat and a skeleton specification must accompany each design.

The design must be modern in every particular, without containing any extreme or abnormal features. We wish to produce an able, safe, and comfortable cruising boat, one that will have ample accommodations, so that the owner and his wife and two guests, or three or four men, can live aboard, and one that can easily be managed at all times by two or three paid hands in addition to the steward. The draft is restricted to 4ft. in order that the boat may have access to nearly all harbors, canals and rivers North and South, and may thereby widely increase the cruising field. We have in mind a boat that can be used North in the summer and South in the winter, and a craft well able to withstand outside passage along the coast in all seasons of the year.

Special attention must be given to the cabin arrangement. The interiors should be original, but devoid of any impractical features. Arrangements should be made for a direct passage forward and aft without going on deck.

Drawings Required.

I. Sheer plan. Scale, ½in.=1ft.

II. Half breadth plan. Scale, ½in.=1ft.

III. Body plan. Scale, ½in.=1ft.

IV. Cabin plan and inboard profile and at least one cross-section. Scale, ½in.=1ft.

V. Outboard profile. Scale, ½in.=1ft.

The drawings should be carefully made and lettered; all drawings should be preferably on tracing cloth or white paper, in black ink. No colored inks or pigments should be used.

The drawings must bear a *nom de plume* only, and no indication must be given of the identity of the designer. In a sealed envelope, however, the designer must inclose his name and address, together with his *nom de plume*.

All designs must be received at the office of the Forest and Stream Publishing Company, 346 Broadway, New York, not later than February 3, 1905. All drawings will be returned. Return postage should accompany each.

The FOREST AND STREAM reserves the right to publish any or all the designs.

Canoëing.

Officers of A. C. A., 1905.

Commodore—C. F. Wolters, 14 Main St., East Rochester, N. Y.
Secretary—H. M. Stewart, 85 Main St., East Rochester, N. Y.
Treasurer—F. G. Mather, 30 Elk St., Albany, N. Y.

ATLANTIC DIVISION.

Vice-Commodore—W. A. Furman, 846 Berkeley Ave., Trenton, N. J.
Rear-Commodore—F. C. Hoyt, 57 Broadway, New York.
Purser—C. W. Stark, 118 N. Montgomery St., Trenton, N. J.
Executive Committee—J. C. MacLister, U. G. I. Building, Philadelphia, Pa.; L. C. Kretzmer, L. C. Schepp Building, New York; E. M. Underhill, Box 262, Yonkers, N. Y.
Board of Governors—R. J. Wilkin, 26 Court St., Brooklyn, N. Y.
Racing Board—H. L. Quick, Yonkers, N. Y.

CENTRAL DIVISION.

Vice-Commodore—Lyman T. Coppins, 691 Main St., Buffalo, N. Y.
Rear-Commodore—Frank C. Demmler, 526 Smithfield St., Pittsburg.
Purser—J. C. Milsom, 736 Mooney Brisbane Bldg., Buffalo, N. Y.
Executive Committee—F. G. Mather, 30 Elk St., Albany, N. Y.; H. W. Breitenstein, 511 Market St., Pittsburg, Pa.; Jesse J. Armstrong, Rome, N. Y.
Board of Governors—C. P. Forbush, Buffalo, N. Y.
Racing Board—Harry M. Stewart, 85 Main St., East Rochester, N. Y.

EASTERN DIVISION.

Vice-Commodore—D. S. Pratt, Jr., 178 Devonshire St., Boston, Mass.
Rear-Commodore—Wm. W. Crosby, 8 Court St., Woburn, Mass.
Purser—W. S. Stanwood, Wellesley, Mass.
Executive Committee—Wm. J. Ladd, 18 Glen Road, Winchester, Mass.; F. W. Notman, Box 2344, Boston, Mass.; O. C. Cunningham, care E. Teel & Co., Medford, Mass.; Edw. B. Stearns, Box 63, Manchester, N. H.
Racing Board—Paul Butler, U. S. Cartridge Co., Lowell, Mass.; H. D. Murphy, alternate.

NORTHERN DIVISION.

Vice-Commodore—Chas. W. McLean, 303 James St., Montreal, Can.
Rear-Commodore—J. W. Sparrow, Toronto, Canada.
Purser—J. V. Nutter, Montreal, Canada.
Executive Committee—C. E. Britton, Gananoque, Ont.; Harry Page, Toronto, Ont.
Board of Governors—J. N. MacKendrick, Galt, Ont.
Racing Board—E. J. Minett, Montreal, Canada.

WESTERN DIVISION.

Vice-Commodore—Burton D. Munhall, care of Brooks Household Art Co., Cleveland, Ohio.
Rear-Commodore—Charles J. Stedman, National Lafayette Bank, Cincinnati, Ohio.
Purser—George A. Hall, care of Bank of Commerce, Cleveland, O.
Executive Committee—Thomas P. Eckert, 31 West Court St., Cincinnati, O.; Dr. H. L. Frost, 10 Howard St., Cleveland, O.
Board of Governors—Henry C. Morse, Peoria, Ill.

How to Join the A. C. A.

From Chapter I., Section I., of the By-Laws of the A. C. A.: "Application for membership shall be made to the Treasurer, F. G. Mather, 30 Elk St., Albany, N. Y., and shall be accompanied by the recommendation of an active member and by the sum of two dollars, one dollar as entrance fee and one dollar as dues for the current year, to be refunded in case of non-election of the applicant."

Rifle Range and Gallery.

Fixtures.

Jan. 16-20.—Pittsburg, Pa.—First annual tournament of the Iroquois Rifle Club.

The Rifle in Italy.

THE National Board for the Promotion of Rifle Practice is collecting information from various governments as to what is being done in the same direction in other countries. An interesting description of what the Italian Government is doing for the promotion of rifle practice has been received:

"In 1882 the Italian Government organized an association for the purpose of teaching all citizens how to properly handle the military rifle. This organization is under the supervision of the Secretary of War, who has his headquarters at Rome. As soon as there are 100 members affiliated in any community, a branch is formed. Every citizen above sixteen years of age making an application with bona fide certificate, on the payment of 60 cents a year, becomes a member.

"Total or partial exemption from military duty is given to members who have profitably taken shooting lessons for two years before the call to arms. A student cannot get his diploma or attend any university unless he presents the shooting booklet, proving that he has attended the shooting exercises of his society.

"As soon as a branch society is formed, it takes the name of the National Rifle Association—society of the city or town where it is located. The members meet and elect an executive board, which holds office for two years. This board is composed of three men for every 100 members, five for 200, seven for 500 and nine for 1,000 or more members. The Italian Government also appoints a commissioned officer over each society, who has the same authority as the other members of the executive board.

"In the vicinity of each branch society, by the order of the executive board and under the supervision of a military engineer, there is built a shooting ground. If the society cannot pay the expense of making and maintaining it, such expense will be paid, one-third by the city, one-third by the county, and one-third by the Government. This is a law of the country.

"The Government gives each branch, according to the number of members, sufficient rifles, and sells the ammunition at cost price. Many complaints were made that the cartridges for the small caliber rifles were too powerful for safety at the ranges, and three years ago the Government experts made a cartridge for practice only which shoots accurately up to 300 yards and costs something less than a cent each. The difference between the regular and the reduced cartridges is as follows: Regular cartridges, weight of bullet 10.50 grains, filled with solenite 2.28 grains; reduced cartridges, weight of bullet 7 grains, filled with ballistite 1.1 grains. The reduced cartridge looks the same as the regular, except that the metallic outside part of the bullet has an opening the size of a square millimeter, which is filled with sand.

"The day for practice is always Sunday, so the workingman can always attend the meetings without losing a day's work. A military instructor attends each meeting to teach the rules of shooting, cleaning of the rifle, and the individual and company drill. The instructor is an officer of the army, and all shooting is carefully watched by him. There are separate targets for the picked marksmen.

Every year there are community matches; every two years, inter-county matches; and every five years a national match. This latter match, with few exceptions, is held at Rome, and the occasion is made a legal and popular holiday. Representatives of each branch of the society and of the army and navy attend. The Government gives free railroad tickets to representatives; other marksmen who attend are allowed 75 per cent. discount on cost of tickets. In the last match, which lasted fifteen days, about 20,000 men took part. There were 300 targets, and all the officers in charge of the shooting were from the regular army. The points were marked ticket by ticket in the pit and by the range officer, each controlling the other. There were about 2,000,000 cartridges shot. The list of prizes had among its donors the King and Queen of Italy, members of Parliament, the cities, the counties, the Government, ladies of nobility, etc. The King always opens the match. At the last meeting he made a 3, which is the possible; then a 2, and 0. He said, laughingly, 'I am not sure that I made the first two shots, but the last one I am sure I made.' The giving of the prizes is attended by the civil and military authorities, regiments drawn up in full dress, and a large crowd from the city. The King gives the prizes to the first three men in each class."

Miniature Versus Service Rifles.

THE chief complaint against our service rifle when used in combination with the Morris tube for work at miniature ranges is that it sets up a false standard of shooting. The very fact that the service rifle is constructed to fire powerful military cartridges means that the sights are primarily set so as to comply with the behavior of the full-power cartridge at long distances. The Morris tube gallery ammunition does not, therefore, leave the barrel so as to strike the bull at 25yds. when the sights are properly aligned. It, therefore, happens that the average performance of a marksman using the service rifle as a miniature weapon is far below the true merits of the shooter and the ammunition. It is for this reason that in the case of a substantial proportion of the miniature marksmen of the country the relations with the National Rifle Association are strained. The latter body aims at insisting on the use of the service weapon, whether or not it is suitable for the work to be done, whereas the practical exponent of miniature rifle club shooting persistently urges his right to select for miniature shooting the combination of weapon and ammunition which is best capable of recording on the target the degree of skill exercised by the individual.

If the service rifle and Morris tube combination was as effective proportionately at short ranges as the same weapon shooting full-power ammunition is at the longer distances, we should side with the National Rifle Association. On the other hand, if a weapon costing anything from one-fifth to one-half the price of the service rifle and Morris tube combined, and firing ammunition 50 per cent. cheaper, can produce superior shooting, our sympathy must, of course, be accredited to those who desire that the selection of weapon shall to a great extent rest with the individual competitor. At tournaments and other gatherings which are intended to promote rifle shooting as a national pursuit, and not merely to uphold mistaken fads, the policy adopted in regard to rifles and ammunition should be the one that represents the greatest good for the greatest number.

To make our argument clear, we may suppose that a dozen rifles are fitted with Morris tubes, and that a series of ten shots are fired from each of them at 25yds., using a table rest to insure perfect steadiness of aim. So far as possible, the shooter

should take a perfect sight, touching the lower edge of the bull with the tip of the foresight. The position of the group of shots which results should then be noted. The figure of merit of each rifle would then be represented by the smallness of the area containing the shot holes, and the distance of its center from the middle of the bull. It is not unfairly condemning the service rifle to suggest that the shots would neither occupy a small area, nor would they center around the bull. The weapon ceases to be a service weapon if the foresight is thrown right or left to produce central shooting at 20yds.; in the same way it is inadmissible to lower the sight below the adjustment for so-called point blank shooting. With a rifle shooting high and to one side it is impossible to cultivate satisfactory shooting, and if any proof of this contention were needed it would only be necessary to quote the bad scores which are the rule rather than the exception at ordinary drill-hall practice. A separation of 3in. between the two widest shots in a series of seven rounds fired at 25yds. does not, on account of its frequency, stir the instructor to wrath. Such results are not to be wondered at if the idiosyncrasies of the rifle demand that the shooter should aim off the bull in order to hit it. This no doubt is necessary in the absence of a wind-gauge when shooting at military distances, but here at least the shooter has some kind of confidence that if disturbing conditions are absent, and provided he has found the correct elevation for his back-sight, all properly aimed shots should strike the bull. It is then and only then that the shooter feels assured that every serious divergence from the bull is due to some fault of his own.

When a sportsman purchases a deer-stalking rifle from one of our leading gun makers, it is, as a matter of course, taken down to the range, where it is fired, usually at 100yds., from a table rest. An extraordinary amount of specialized skill has been developed by the class of shooting expert who carries out this test. Our own reports of these weapons give frequent evidence that ten shots from a well-made rifle will fall nicely within a 3in. square when firing at 100yds. A gun maker would be about as likely to send out a weapon throwing its group of shots a foot high and 3in. to the left at 100yds. as to commit any other folly likely to take away 80 per cent. of the efficiency of the weapon. It is, therefore, the work of the gun maker's shooting expert to adjust the two sights so that the accuracy of the weapon shall be of real use to the sportsman by making the average line of travel of the shots coincide with the line of aim. This is the essence of rifle shooting as we understand the term. No one can cultivate perfection in the manipulation of the rifle unless the line of the sights is correctly related to the line of the barrel. On the other hand, while we believe that fixed sights have many advantages for sporting rifles, which are likely to be used by many shooters who are not scientific riflemen, there is a good deal to be said in favor of leaving the rifle club enthusiast to adjust his own sights.

The miniature target is fired at under conditions which are totally dissimilar to those which obtain in the pursuit of wild game. The bull of the target represents a mark as small as the human eye can well appreciate, and its area allows for very little deviation on the part of the shooter, let alone inaccuracy in the sighting of the rifle and the dispersion of the shot. In this way it happens that a minute error in the sighting may produce a serious divergence from the point of view of the score made. In so far that no two shooters will obtain exactly the same results from the same rifle, it is not remarkable that the fixed sight adjustment of a weapon sold for a few pounds will leave much to be desired from the point of view of the conscientious shooter. Ignorance on the most elementary matters must of necessity exist among every body of learners, and it is not, therefore, remarkable that of the many thousands of shooters we have in this country there are very few who really understand what a rifle should do and how to make it do it. An American arms catalogue puts the question in a nutshell in the following words: "The test of accuracy in shooting is the close grouping of the shots. If the shooter can make a close group, this group can be brought to any desired locality by adjustment of the sights." In these two short sentences we have the alpha and omega of miniature rifle shooting.—Field (London).

New York Schuetzen Corps.

THE second gallery shoot of this club took place Friday evening, Nov. 25. Scores follow: G. Ludwig 484, Gus Zimmerman 478, F. Facompre 471, B. Zettler 469, D. Peper 469, C. Meyer 464, O. Schwaneman 462, H. D. Meyer 459, H. Nordbruch 459, P. Heideberger 458, M. Lackman 455, A. W. Lemke 454, J. H. Meyer 453, H. B. Michaelson 452, J. Wellenbrock 452, Capt. J. H. Hainhorst 450, G. Thomas 449, C. Roffman 447, H. W. Mesloh 447, S. C. Seigers 446, J. H. Kroeger 446, W. Dahl 444, H. Gobber 444, N. C. L. Beverstein 444, F. Ronn 439, C. Koenig 437, J. Bradley 435, G. W. Offerman 435, J. Paridies 435, F. W. Diercks 434, Dr. C. Grosch 433, H. Beckman 432, W. Schults 432, S. H. Martins 428, C. J. Brinckman 429, H. C. Hainhorst 427, H. Hesse 427, Geo. Zimmerman 427, G. J. Voss 427, H. Meyer 423, C. Schmitz 423, L. C. Hagenah 422, J. C. Brinckman 422, J. N. Herrman 421, R. Ohms 417, W. J. Behrens 417, C. Wahlman 417, C. Maren 414, M. J. Then 413, C. H. Ficken 411, N. W. Haaren 410, H. Quaal 409, Capt. J. G. Tholke 407, Von der Leith 406, M. V. Divingelo 406, A. Lederhaus 405, J. Jantzen 404, H. Decker 403, H. R. Caplan 402, H. Hoenisch 402, D. Ficken 395, H. Offerman 392, F. Schultz 390, W. Schaefer 387, G. Junge 382, D. Dede 379, Nic Jantzen 371, G. N. Bolken 370, J. F. R. Ernest 366, C. Boesch 364, J. N. Tonjes 360, F. Gobber 353, Geo. Wehrenberg 322, P. Prange 299.

Bullseye target: J. C. Bonn, 30 degrees, G. J. Voss 36, H. Offerman 50, G. Ludwig 55, O. Schwaneman 59½, Geo. Zimmerman 67½, N. W. Haaren 67½, H. Nordbruch 69½, C. Koenig 79, H. Beckman 79½.

Williamsburgh Shooting Society.

This organization held a very successful open-to-all gallery tournament on the Hamburg Avenue range Nov. 26 and 27. Shooters from New Jersey and Staten Island appeared on the scene the second day, giving the local experts some pretty stiff work in order to remain in the front ranks. Scores follow, all shooting off-hand on the ½in. ring target:

R. Gute	75 73 73—221	Wm. Rosenbaum ..	72 72—144
P. Muth	74 74 73—221	Martens	73 71—144
L. C. Buss	74 73 73—220	Owen Smith	73 71—144
A. Huberlick	73 73 73—219	Sparling	72 72—144
Zeigler	73 73—146	J. Kaufman	72 71—143
M. Dorrier	74 72—146	G. Worn	72 70—142
W. A. Tewes	73 73—146	F. Kost	71 71—142
P. J. Donovan	73 72—145		

Premiums for the most rings: P. Muth, \$5; F. Kost, \$3; L. C. Buss, \$2.

Greenville, Ohio, Rifle Club.

THE Greenville (O.) Rifle Club held a shoot on Nov. 24, only a few men taking part. The conditions were: 12 shots, 200yds., off-hand, possible 120: Katzenberger 87, Smith 73, Hetzler 68, Wilson 67.

Cincinnati Rifle Association.

THE following scores were made in regular competition by members of the Cincinnati O., Rifle Association at Four-Mile House, Reading road, Nov. 20. Conditions, 200yds., offhand, at the 25-ring target. Hasenzahl was declared champion for the day, with the good score of 326. Payne was high on the honor target with 70 points. Mr. John W. Coleman a former member of the Miles Standish Rifle Club, of Portland Me., was a visitor at the range, and before the day was over, made formal application for membership. We are pleased to extend him a cordial welcome into our midst, and we trust he will spend many a pleasant hour with us. Mr. Strickmier visited the range and shot a score with Mr. Odell's rifle. It was quite a treat to have his genial form in our midst, and we trust he will not stay away so long again. The scores:

Hasenzahl	226	221	217	216	212
Payne	222	221	219	215	208
Odell	221	218	216	201	200
Nestler	220	219	217	215	212
Bruns	220	214	213	209	209
Strickmier	217
Trounstine	212	197	196	188	184
Freitag	196	194	192	189	189

Harlem Independent Corps.

WEDNESDAY evening, Nov. 23, the Harlem corps held full sway on the Zettler ranges. A baker's dozen participated in the race for high scores on the ring target.

Ring target: Hy. Koch 451, A. Feigert 450, G. Thomas 444, A. Miller 443, J. W. Blumenberg 425, H. Behrman 421, C. Wolf 410, H. Hollworth 406, W. Mensch 382, C. Hopf 349, L. Lewenson 306, J. Hollroeth 246, F. Lauzer 171.

Bullseye target: A. Feigert 23 degrees, C. Hopf 72, A. Miller 86, J. W. Blumenberg 99, G. Thomas 160, H. Hollroeth 160, C. Wolf 180, Hy. Koch 206, J. Hollroeth 244.

Massachusetts Rifle Club.

Long range match, 1,000yds.: W. Charles 46, F. Daniels 45, F. Carter 43, I. James 40, T. E. Russell 36.

German ring target: A. Neider 219, F. C. Fitz 203, F. H. West 197, M. T. Day 195, R. Berry 194.

Pistol match: E. E. Partridge 94, W. A. Smith 90.

Military revolver match: R. L. Dale 29, S. C. Sampson 27, J. W. Bickwell 46, J. B. Hobbs 44, S. D. Martin 41.

Standard American target: R. L. Dale 95, S. C. Sampson 87, M. T. Day 80.

Williamstburgh Rifle Club.

The following scores were shot on the Hamburg avenue range at the regular semi-monthly practice shoot. All shooting at 75ft. offhand, on the 25-ring target: G. Worn 248, 247; P. Andrassey 244, 245; M. Baal 243, 245; C. Zeigler 244, 244; H. Hubaek 243, 243; J. Kaufman 243, 246; F. Kost 242, 242; M. Mertens 243, 239; J. Kuhl 235, 237; G. Grimm 236, 235; J. Kiefer 220, 229; W. Kantz 220, 220.

Independent New York Schuetzen Corps.

THE regular practice shoot of this society was held Thanksgiving evening, Nov. 24, on the Zettler ranges, Capt. Zimmerman securing a total of 490 out of the possible 500. Scores follow: Gus Zimmerman 490, L. Schmidt 484, A. Begerow 483, F. Liegibel 480, L. C. Hamerstein, Jr., 474, H. D. Muller 465, Jacob Schmid 465, F. A. Young 457, E. Kiefer 456, B. Euser 454, H. J. Rohrens 444, J. Geo. Bauer 411, E. Gartner 402, F. C. Halbe 390.

Zettler Rifle Club.

This group of expert target shooters again met at headquarters, 159 W. 23d Street, Tuesday evening, Nov. 21. Scores follow: L. C. Buss 1219, L. P. Hansen 1212, R. Gute 1208, C. Zettler, Jr., 1204, C. G. Zettler 1203, H. Zettler 1197, L. Maurer 1189, H. Fenworth 1186, B. Zettler 1188, F. J. Herpers 1154, Geo. J. Bernius 1142.

Rifle Notes.

At the regular weekly shoot of the Miller Rifle Club, Hoboken, Capt. W. A. Tewes succeeded in securing the possible 250 on the German ring target, onhand, at 75ft. But twice has this feat been accomplished on this range.

After but a brief illness Mr. Joseph Moore, for many years chief scorer of the Creedmoor range, died of pneumonia Nov. 16. His congenial ways won for him a host of life long friends, who deeply mourn his loss.

Mr. Alfred I. DuPont, of the well-known powder concern, was accidentally shot while on a hunting trip in Virginia the past week. While his condition is not considered dangerous, there is a possibility that he may lose one of his eyes. Mr. DuPont was at once taken to Philadelphia, where he is under treatment at the University Hospital.

The official figures showing the results of rifle practice for the year 1904 of the National Guardsmen on the various State ranges gives the 7th Regiment the lead by a wide margin, 987 men qualifying as follows: 615 marksmen, 206 sharpshooters, 130 experts and 46 distinguished experts. A showing of this kind speaks for itself, no comment being necessary.

Trapshooting.

If you want your shoot to be announced here send a notice like the following:

Fixtures.

Dec. 6-8.—Salina, Kans.—Anderson's tournament.
Dec. 17.—Lakewood, N. J.—All-day shoot of Mullerite Gun Club.
A. A. Schoverling, Sec'y.

1905.

Jan. 1.—Poughkeepsie, N. Y., Gun Club annual shoot.
Jan. 17-20.—Hamilton, Can., Gun Club live-bird tournament. J. Hunter, Sec'y.
Jan. 23-28.—Brenham, Tex.—Sunny South Handicap.
Jan. 31-Feb. 2.—Taylor, Tex.—Central Texas Handicap.
Jan. 31-Feb. 2.—Taylor, Tex.—Central Texas Handicap tournament. C. F. Gilstrap, Mgr.
Feb. 6-9.—Houston, Tex.—Len's Grand Southern Handicap. Alf. Gardiner, Mgr.
June 8-9.—Dalton, O., Gun Club annual tournament. Ernest F. Scott, Capt.

DRIVERS AND TWISTERS.

Club secretaries are invited to send their scores for publication in these columns, also any news notes they may care to have published. Mail all such matter to Forest and Stream Publishing Company, 346 Broadway, New York. FOREST AND STREAM goes to press on TUESDAY OF EACH WEEK.

The Montclair, N. J., Gun Club will hold its annual election and dinner on Dec. 3.

Mr. Lewis C. Hopkins won the November cup at the shoot of the Crescent Athletic Club on Saturday of last week.

The Poughkeepsie, N. Y., Gun Club announces Jan. 1 as the date of its annual shoot for 1905. Competition will begin at 10 o'clock. All are welcome to participate.

Dec. 10 has been fixed upon by the Ossining and Poughkeepsie gun clubs for a team race. The match will be shot at Poughkeepsie. The next practice shoot of the Ossining Gun Club is fixed to be held on Dec. 3.

In the tournament of the Gallatin, Tenn., Gun Club, Nov. 24, the Sumner County Handicap, at 15 live birds, was an event of chief interest. Seven tied on 13 as high score. In the shoot-off, miss-and-out, J. C. Baker, of Jacksboro, Tenn., shot all his competitors out on the thirteenth round, and won the handsome loving cup, which was the prize.

Messrs. J. Edwards and A. A. Felix made clean scores of 10 in the weekly shoot held at the Point Breeze track, Saturday last. This was the seventh and last shoot of the prize series. The five best scores of each contestant were the basis of the decisions. The winners were: J. Edwards, first, 48 out of 50; A. A. Felix, second, 47 out of 50; F. Murphy, third, 46 out of 50.

Mr. Hood Waters, famous as an expert of the Lafin & Rand Powder Co., was a visitor in New York last week. He is recovering from a severe trouble with his eyes, which impairs his success at the traps as compared with his admirable skill when in his usual good form. He journeyed to Ossining and participated in the recent holiday shoot of the active and popular club which is domiciled there.

Under date of Nov. 26, Mr. Elmer E. Shaner, secretary-manager, writes us as follows: "The annual meeting of the Interstate Association will be held Thursday, Dec. 8, at 10 A. M., at Oakland, Bergen county, N. J. The meeting will be held in proper form and adjourned to the afternoon of the same day, when the adjourned annual meeting will be held in the offices of the Lafin & Rand Powder Company, 99 Cedar street, New York City, at 1:30 P. M."

The Aqueduct, L. I., Gun Club had a large gathering of shooters on Nov. 24. Fourteen shooters participated, and there were fourteen prizes, awarded as follows: W. Hopkins, H. Van Siclen, Dr. Ireland, E. Smith, W. Ryder, S. Northridge, H. J. Selover, J. W. Dayton, H. Camden, W. Glazebrook, H. Bramwell, D. Mohrman, A. Van Siclen and S. Hitchcock. In a 10-bird sweepstake the scores were: Hopkins 10, H. Van Siclen 9, Mills 8, Dr. Ireland 7, Smith 6, Hitchcock and Northridge 5 each, Dayton, Camden and Bramwell 4 each.

BERNARD WATERS.

Woodmont Rod and Gun Club.

THE Washington, D. C., Post, of Nov. 27, contains the following account of the grievous loss sustained by the Woodmont Rod and Gun Club:

"The club house of the Woodmont Rod and Gun Club, situated on the Maryland side of the Potomac River, opposite Great Cacapon, W. Va., and about ten miles west of Hancock, Md., was completely destroyed by fire yesterday afternoon. The building, which was reduced to a pile of ashes, was erected about fifteen years ago at a cost of \$6,000, and was insured for \$4,000. The contents, which were insured for \$2,000, were nearly all removed before the fire had gained much headway, and the loss is practically confined to the structure.

"A defective flue in the room over the bedroom of the superintendent of the club preserves caused the fire. The flames were discovered about 12:30 o'clock in the afternoon, and, immediately, Messrs. W. Scott Towers and N. O. Messenger, two members of the club, and Gen. George B. Williams and Mr. Charles C. Randolph, who were present as their guests, began to fight the flames with buckets of water.

"The attendants of the club were called into service and battled hard to check the progress of the fire, but it quickly became evident that they could not cope with it. Italian laborers employed on the railroad near by were sent for by Messrs. Towers and Messenger. They responded to the call for assistance, and joined the impromptu fire brigade. Modern fire apparatus was not to be had, and the crude appliances were ineffective to stop the flames. It soon became evident that there was no hope of saving the lodge, and all hands then turned their attention to the removal of the furnishings and other equipment of the club house.

"In a short time the place was a mass of burning ruins, and it continued to burn until about 3 o'clock. No one was hurt in the fire. Messrs. Messenger and Towers and Gen. Williams and Mr. Randolph, who had gone to the club house last Friday for a few days' outing, returned to Washington last night.

"Located as it was, at a high point on the picturesque banks of the Potomac, the lodge was a mecca for well-known sportsmen of this city and Pittsburgh. Its guests in the past have included many men of national renown, who sought recreation here. Among them were the late President Arthur and former President Cleveland, the latter of whom was entertained at the club house on two occasions while on fishing trips. Many entertainments were given there during the winter months, and the young people of the surrounding country frequently held dances in the spacious rooms of the house.

"Mounted trophies of hunts adorned the walls of the building, the furnishings of which were elaborate, but, through the efforts

of those who fought the flames, these, as well as the records of the club, were saved.

"Besides the regular club quarters on the ground floor and the rooms of the superintendent, the lodge had accommodations for twenty guests. The club preserves contain approximately 3,000 acres in the vicinity of dam No. 6, about 108 miles from Washington.

"Several prominent Washington men incorporated the club in 1881, and at present it numbers among its members many of the most distinguished men of the nation. Mr. Henry Clay Stewart is the president and James M. Green its secretary and treasurer. The superintendent of the place is Alexander Reid, who resides there with his wife.

"Reports were received here last night that the woods in the neighborhood of the club house were on fire, but it was stated that the fire at the lodge had no connection with the forest fire."

IN NEW JERSEY.

Montclair Gun Club.

MONTCLAIR, N. J., Nov. 24.—The Thanksgiving Day shoot of the Montclair Gun Club was greatly enjoyed to-day. Some fifteen men participated. Events 1 and 2 were for practice. Event 3, 25 birds, was won by Mr. Howard with a score of 23; prize a box of shells. Event No. 4, a handicap match, 25 birds, was tied for by Messrs. Bush and Doremus on a score of 24. On the shoot-off the prize, an opera glass, was won by Mr. Bush. Event No. 5, a handicap match, 25 birds, each member being allowed to shoot at missed birds of event No. 4 for his handicap in event No. 5, was tied for by Messrs. Soverel, Bush, Wallace and Cockefair, but was finally won by Mr. Bush, who received a very handsome silver loving cup, which had been donated by Mr. Wallace for this event:

Events:	1	2	3	4	5	Events:	1	2	3	4	5
Targets:	10	15	25	25	25	Targets:	10	15	25	25	25
Cockefair, 0	8	14	19	16	17	Scheffey, 10	8	14	19	16	17
Doremus, 8	8	7	14	24	13	Badgley	8	7	14	24	13
Wallace, 4	6	12	18	17	17	Bush, 6	6	12	18	17	17
Winslow, 8	6	6	14	17	13	Crane, 4	6	6	14	17	13
Hartshorne, 8	4	5	17	22	15	Swartwout	4	5	17	22	15
Bettinson, 10	5	11	19	14	14	Babcock	5	11	19	14	14
S R Soverel, 2	8	18	22	22	22	Pray, 6	8	18	22	22	22
Howard, 0	12	23	22	20	20						

Handicaps as indicated apply only on event No. 4.

Scores of Nov. 26:

Events:	1	2	3	4	5	6	7	8
Targets:	25	10	25	15	10	25	25	25
C W Kendall	15	8	19	9	5	23	19	15
Cockefair	8	21	11	10	18	20	17	17
S H Soverel	17	10	10	3	10	18	15	15
Wallace	17	10	10	3	10	18	15	15
Hartshorne	17	10	10	3	10	18	15	15
W I Soverel	17	10	10	3	10	18	15	15
Baldwin	17	10	10	3	10	18	15	15
Pray	17	10	10	3	10	18	15	15
Bush	17	10	10	3	10	18	15	15
Scheffey	17	10	10	3	10	18	15	15

The shoot this afternoon was quite well attended, considering its nearness to the Thanksgiving Day shoot. Aside from event No. 6, Mr. Kendall's shooting was not up to the average. Mr. Bush shows the greatest improvement over past performances.

The club holds its annual meeting and dinner on the evening of Dec. 3, at which time a new set of officers will be elected.

EDWARD WINSLOW, Sec'y.

Pattensburg Gun Club.

Pattensburg, N. J., Nov. 26.—The most exciting and interesting events of all the year took place to-day at the shoot of the Pattensburg Gun Club. Though cold and the wind blowing toward the traps and carrying targets 60yds. at a high speed, only seven shooters attended. They all showed a will, and they wondered what was the trouble. This was our regular monthly medal shoot, and the final for the Hunter medal, which was up to to-day in Mr. A. E. Holbrook's hands. At the last moment he weakened, and Mr. R. Stamets took it from him, with second badge of the monthly contest. Mr. C. W. Bonnell took first prize, this being the second time in succession.

C. W. BONNELL, Sec'y.

Bound Brook Gun Club.

Bound Brook, N. J., Nov. 28.—The wind and snow on last Saturday kept a number of the members home from the regular shoot of the Bound Brook Gun Club.

Among the visitors at the shoot was Dr. Bache's wife and mother, and the Rev. E. E. Roberson, of the Methodist church. Mr. Roberson is an old hand at target breaking, considering that he has not shot at targets for a few years, yet his score was equal to the majority of the members.

Dr. Pardee showed how he could break targets, even if it did snow. After he left the score, he looked like a walking snow bank, and said he could find them all right, too.

Dr. Bache and F. K. Stelle tied for the first cup, and, after shooting at twenty-five more, they were still tied. It was decided to let it go until the next club shoot, when they will try it again.

Mr. Du Four came over in his automobile, so he would have some way of getting cup No. 2 home. S. W. Dunning was the winner of No. 3 cup and the medal.

	Hdp.	Bk.	Tot'l
Du Four	000000000110000011010110	8	14

Stelle	1101010011111100111001	17	10

Extra events: Du Four shot at 10, broke 6; Dunning, 20, 11; Stelle, 25, 15; Dr. Bache, 10, 4; Dr. Pardoe, 75, 60; Roberson, 25, 17.

F. K. STELLE, Sec'y.

Highland Gun Club.

GORGAS STATION, Pa., Nov. 26.—A stiff wind made unfavorable conditions for big scores at the monthly shoot of the Highland Gun Club, to-day. The scores in the club event, 25 targets, 16yds., all at scratch, were as follows: Denham 19, Ringold 17, Pinkerton 15, Dalton 11, McMichael 11, Meehan 11, Burns 7.

Crescent Athletic Club.

BAY RIDGE, L. I., Nov. 26.—Compared with an average shoot of the Crescent Athletic Club, the attendance was light. The November cup was won by Mr. Lewis C. Hopkins. The scores:

Trophy shoot, 15 targets, handicap:						
Hdp. Brk. Tot'l.			Hdp. Brk. Tot'l.

Hopkins	1	11	12		

Match, 25 targets, 20yds., all scratch: F. B. Stephenson 23, H. L. Kenyon 17, A. G. Southworth 15, H. M. Brigham 14.

Nov. 24.—There was a good attendance of members and guests. The gobbler handicap, 15 targets, prize a bronze turkey, resulted in a tie on straight scores between Messrs. H. L. Kenyon and O. C. Grinnell, Jr. Kenyon won in the third shoot-off, 15 to 13.

The holiday cup, 25 targets, resulted in a tie, Messrs. Frank B. Stephenson and H. L. Kenyon, breaking 24 each. In the shoot-off the scores were: Kenyon 24, Stephenson 23. Mr. A. G. Southworth won an event at 25 targets, and one at 15. Mr. O. C. Grinnell won two 15-target events. Mr. Lowell M. Palmer won one 15 target event. In a six-man team contest Frank B. Stephenson and Harry B. Vanderveer, captains, the team of the latter won; scores 67 to 58. Mr. W. W. Marshall and D. C. Bennett each won one event at 15 targets.

Trap at Point Breeze.

THE final shoot of the series of seven contests, held at the Point Breeze, Philadelphia, Race Track, Nov. 26, was decided, and the winners were, first, J. Edwards, 48 out of 50; A. A. Felix, 47 out of 50; F. Murphy, third, 46 out of 50. The five best scores of each of the contestants were counted in the decision. The weather conditions were excellent for live-bird shooting. A strong wind was a material assistance to the birds.

An open sweepstake resulted as follows: Alman, Felix, Maloney, 5 each; Murphy, 4; Ford, 1.

Club shoot, 10 live birds, handicap rise:

J Edwards	2122222222—10	H Stein	2222022202—8
A Felix	2222222222—10	J Bruce	2020222222—8
F Muller	2222222222—9	C French	2022022202—7
F Murphy	2112222020—8	J McAnany	2222022202—7
S Alman	2112221232—8	C Jones	2020222202—6
H Delaney	1121110*21—8	H Thomas	2002220220—6
J Maloney	2012222120—8	H Brawley	2000200222—5

Fred Muller lost his first bird dead out, and won second money alone.

Meadow Springs Gun Club.

PHILADELPHIA, Nov. 26.—The club handicap shoot at 25 targets to-day had scores as follows:

	Hdp.	Bk.	Tot'l		Hdp.	Bk.	Tot'l
Garrett	5	23	28	Murdock	6	11	17
Bush	2	19	21	Henry	0	16	16
E Zeiler	5	16	21	Chadburne	0	16	16
Roberts	0	20	20	Dill	0	15	15
Martin	0	20	20	Heite	0	14	14

Where to Hunt Game in the South

WHERE to hunt game in the South is becoming more and more of a problem each succeeding year. Not by any means on account of the scarcity of game, but owing largely to the increasing tendency of sportsmen to form clubs, and reserve the shooting privilege of large sections of country. In this way places where sportsmen have formerly found good shooting are no longer open to them, consequently they must cast about for new territory, new guides, and new accommodations while in pursuit of their pleasures afield. And it is well to add here that the shooting preserves, while in a way numerous, cover but a very small fraction of the vast bird country throughout the Southern States, and for many years to come can the individual or parties of hunters find good shooting and good accommodations in the South. The most serious and really only perplexing problem is just where and with whom to shoot. For the accommodation of its patrons the Seaboard Air Line has at considerable expense and time taken up this matter in behalf of the sportsman, and publish the following list of places where they know birds can be found and good accommodations had, and in many cases, for those not owning their own kennel, dogs may be secured as well.

NORTH CAROLINA.

North Carolina presents a great variety of country. There are many miles of open pine woods in which the shooting is very fine. Quail, of course, is found most generally, but in many places wild turkeys are still numerous. In the following summary only the best points have been selected. It will be observed that these places are located with reference to their distance from some central point. At Seaboard, sixty-nine miles from Portsmouth, Va.—Shooting good. Country rolling. Quail numerous, turkeys and deer in the swamp lands. Guides, from \$1 to \$1.50 a day. Horses, \$2 a day; there are no dogs for hire. Board, \$1 a day. At Gary's, seventy-six miles from Portsmouth—Quail, rabbits, squirrels, and turkeys abundant. Guides—J. F. Lifsey, E. G. Garlick, at \$3.50 to \$5 a day, furnishing dogs and team and board where desired. Horses, \$2 a day. Board, \$1.50 a day. At Weldon, seventy-nine miles from Portsmouth—Shooting good. Quail, turkeys, ducks, squirrels and deer. Guides—Henry Grant, "Billy" Clanton, William Roberts, Ben Pope, and J. T. Evans will act as guides at reasonable rates. They will also furnish dogs. Horses, \$2.50 to \$3 a day. Board, \$1 per day up. At Gaston, ninety-one miles from Portsmouth—Quail, squirrels, rabbits, and frequently wild geese are abundant. Guides—J. J. King and Sam Shaw, at \$1 a day. Horses, but not dogs, \$1 to \$1.50 a day. Board, \$1 a day; \$5 a week. At Littleton, ninety-nine miles from Portsmouth—Quail very numerous this season; also turkeys, geese, and ducks. Guides—George Kirkland, J. J. Myrick, J. H. House, or John Reed, at \$1 a day or \$5 a week. Guides will also furnish teams and dogs. Board, \$1 a day; \$5 a week. Judge Gummerie, of the New Jersey Supreme Court, is a regular hunter here every fall. At Roxabel, eighty-one miles from Portsmouth—Quail are abundant, and in the Roanoke River bottoms turkey and deer are plentiful. Guides at reasonable rates. At Norlina, ninety-eight miles from Richmond, Va.—Quail, turkeys, squirrels, and rabbits. Guides—F. B. and F. P. Wiggins will act as guides at reasonable rates. Mr. F. B. Wiggins can furnish two or more dogs. Horses, \$1.50 a day. Board, \$2 a day. At Henderson, one hundred and fourteen miles from Richmond. On the ridge between the Tar and Neuse rivers—Shooting excellent. Quail, turkeys, squirrels, rabbits, foxes, and a few deer. The quail shooting is especially fine, and will be better than usual this season. The country is level and open, with enough cover to protect the birds. Board, \$5 to \$10 a week. Guides—R. J. Southerland and Mr. June Clements will take charge of parties at reasonable rates, furnishing horses and dogs. Henderson has an established reputation among sportsmen, and is visited every season by Northern hunters. At Manson, one hundred and three miles south of Richmond—Quail shooting unusually fine; also turkeys and squirrels. Guides—J. H. Bullock and C. M. White. They also furnish dogs. Horses, \$1 a day. Board, \$2 a day. At Middleburg, one hundred and six miles south of Richmond—Quail, turkeys, deer, and partridges. Guides—Alfred Plummer can furnish board, guides, and dogs at reasonable rates. At Franklinton, one hundred and thirty miles from Richmond, Va.—Quail, turkeys, and squirrels abundant. Guides, \$1.50 a day; they supply dogs. Horses, \$1.50 and \$2 a day. There is a good hotel at which board can be had at \$2 a day or \$10 a week. At Raleigh, the capital of the State, one hundred and fifty-seven miles from Richmond—This is a good point from which to go to less populous sections. At Osgood, thirty-seven miles south of Raleigh—Here the country becomes less rolling, but the shooting is as fine as it is in the northern part of the State. Quail, turkeys, and squirrels plentiful. Guides, \$1 a day. Board, \$1 a day. Teams at reasonable terms. At Lakeview, sixty-two miles south of Raleigh—All the land in this section is posted and under the management of the Lakeview Townsite Company, which readily grants permission to sportsmen from a distance. Quail and turkeys are very plentiful. Last spring the Lakeview Company planted a large number of small patches of peas, inclosing them so they would benefit the partridges and other wild game. Competent guides may be obtained at from \$1 to \$2 per day. Board, \$2 per day at hotel; \$5 to \$10 per week in boarding houses. At Southern Pines and Pinehurst, two hundred and twenty-five miles from Richmond—At Pinehurst there are 35,000 acres of land over which the shooting privileges are owned by the management of Pinehurst. Probably the finest quail shooting in the country is found here, as the birds are cared for scientifically and are protected for the benefit of guests of the place. There is maintained a kennel of hunting dogs for the use of guests of Pinehurst. Twenty of the best trained dogs in North Carolina were purchased for this purpose, and are kept in good condition under charge of Mr. Gray. Competent guides always to be had by day or week. At Aberdeen—Mr. H. H. Powell, one of the best known hunters in North Carolina has the

shooting privilege over 5,000 acres of ground. Mr. Powell acts as guide, and being familiar with the country, knows where the game can be had, and makes it easy for those desiring sport to have plenty of it. Mr. Powell has a comfortable home for those who desire to hunt over his grounds. At Hamlet, two hundred and fifty-four miles south of Richmond—This is one of the best points in North Carolina from which to arrange hunting expeditions. There is an excellent hotel here, and within a radius of twenty miles there is some of the best shooting in the State. Guides and dogs can be had here to hunt the adjacent country. At Rockingham, near Hamlet—Quail very abundant this season; also turkeys. Guides not needed. Teams can be hired reasonably, but hunters must bring their own dogs. There is a good hotel here; rates \$1 to \$2 a day. At Polkton, thirty-three miles from Hamlet—Here is a famous shooting country. In addition to the quail and turkeys, there are plenty of foxes and of fox hunters. Guides can be had cheaply, and teams also at low prices. Good board, \$1.50 a day, or \$5 a week. Guides—Sam Hubbard, William Bryant, Prince Henry, and James Willoughby. At Peachland, thirty-seven miles from Hamlet—Quail very abundant. Guides can be had at nominal prices, and so can dogs and horses. Board, \$1.50 a day; \$10 a week. At the Rutherfordton Branch, between Shelby and Rutherfordton, is some of the best quail shooting in the country. The line here runs into the foothills of the North Carolina mountains. It is a rich grain country, and the birds are numerous and in fine condition. Board can be had at almost any of the stations of the Seaboard Air Line Railway, and agents of the road at Lincolnton, Shelby, Ellenboro, and Rutherfordton will gladly furnish information to prospective visitors. At Lumberton, forty-three miles from Hamlet—Quail, turkeys, and squirrels abundant. In the swamps deer are found. Horses, from \$1 to \$2 a day. Board, \$1 to \$2 a day; less by the week. At East Arcadia, also near Wilmington, and in one of the best sections for game—Quail, wild turkeys, woodcock, ducks, and squirrels plentiful; and in the swamps bears, deer, mink, otter, and other wild animals rarely found to-day, within reach of sportsmen. Board can be had at reasonable rates, and guides and horses can be hired. Guides—T. J. Johnson and R. H. Grant, of Wilmington. Board at the Wilmington hotels from \$2 to \$3 a day.

SOUTH CAROLINA.

Much the same conditions exist in South Carolina as in her northern neighbor, though the State does not afford an equal number of excellent hunting and fishing points. Between Hamlet and Atlanta, however, there is both good shooting and fishing, and in some other regions of the State the conditions for both are fine. At Greenwood, between Hamlet and Atlanta—Quail are abundant, and so are squirrels and rabbits. Guides can be had if needed, and teams may be hired at reasonable prices. There is a good hotel here, where hunters will be well taken care of. At Abbeville, about fifteen miles beyond Greenwood—The quail shooting is especially fine; it is a common thing to bag seventy-five in a day. The local sportsmen will act as guides at nominal cost, and will furnish horses and dogs. Board may be had very cheaply. At Calhoun Falls, a little beyond Abbeville, is another good point for either fisherman or hunter. Camden, three hundred and twenty-seven miles from Richmond—Good shooting and hunting on the Wateree River. Quail shooting is especially fine, and guests at the three large tourist hotels here have full benefit of the sport. Guides, dogs, and horses may be had at reasonable prices, and local sportsmen always may be counted on to accompany visitors. In season doves are also abundant. Fox hunting is a favorite sport, and there are several good packs of hounds in the town and immediate neighborhood. This sport is enjoyed here under favorable conditions rarely found in this country. Mr. A. J. Boykin, of Camden, has excellent hunting grounds within five miles of station. He acts as guide, and supplies dogs, board, etc.

GEORGIA.

At Stillwell, twenty-four miles north of Savannah, low, flat country, near the coast—Quail, doves, turkeys, snipe, woodcock, ducks, wildcats, deer. Board can be had here, but it is well to go to Savannah, and there make arrangements for guides and equipment. At Dorchester, twenty-five miles south of Savannah, near the coast—Quail, turkeys, and squirrels. Guides—Patrick James, Sumner Lambert, C. A. Tate, \$1 a day. Horses, \$1.50 a day; no dogs. Board, \$4 a week. At Clyo, thirty-two miles north of Savannah—Quail, turkeys, and deer abundant. Guides and dogs at reasonable rates. Board \$1 a day; \$5 a week. At Riceboro, about thirty miles south of Savannah—Quail, doves, turkeys, plenty of deer. No guides. No boarding-houses; but an ideal spot for operations from Savannah. At Darien, ten miles further south—Quail, turkeys, and deer plentiful. Guides, \$1 a day. Horses, \$1.50 a day; no dogs. Board, \$1 to \$2 a day. At Everett City, fifty-six miles south of Savannah—Splendid hunting—quail, doves, turkeys, ducks, squirrels, deer. Guides can be had if desired, but they are unnecessary. Board, at Brunswick, \$1.50 a day up. At Townsend—The same conditions prevail here and at White Oak, Woodbine, Colesburg. At Collins, sixty miles from Savannah—The quail shooting here will be unusually good this season. Guides not needed. Board, 75 cents a day. At Ohoopce, sixty-eight miles from Savannah—One of the best points in the State. Quail, doves, turkeys, ducks. Guides—N. B. Jarriel, E. J. Giles, R. A. Giles, \$1.50 a day. Horses and dogs at reasonable prices.

FLORIDA.

East of the Rocky Mountains there is no such hunting as in Florida, and the fishing is equally fine both in the fresh-water streams and lakes and in the fishing on the coast. The tarpon, the king of all game fish, has his true habitat in the waters just south of Tampa Bay, on the west coast of Florida. Fishermen have come here in such numbers from this country and from England, that it has

paid to maintain a good hotel at Sarasota. For shooting, it may be said, in brief, that at any point a very few miles distant from centers of population, quail are to be found. In Florida one can find quail as easily as he can find English sparrows in northern parts; but the presumption is that the sportsman who goes to Florida has larger game in view. Probably, however, the finest sport with the gun obtainable in civilized lands is quail shooting, and this is found in absolute perfection in Florida. At Live Oak, eighty-two miles from Jacksonville, is a splendid point for both fishing and shooting. All kinds of fresh-water fish native to these parts are here in abundance. The quail shooting is unsurpassed. Guide—W. R. McGregor, \$1 a day. Horses, teams and guides are usually furnished by livery stables, \$3 a day. Board, \$1 to \$2 a day. At Hampton Springs—With this as the central point, he can get whatever kind of game he wants. Below Hampton Springs, Fenholloway River affords fine fishing, bass, perch, and bream being plentiful. Quail, turkeys, and squirrels abound in the hammocks (heavily wooded tracts) and deer are also plentiful. Frank King and George Lee, of Perry, Fla., are competent guides, whose services can be had for \$2 per day. Cook's Hammock, through which the Steenhatchie River runs, and the adjacent territory, abound in game; quail in the open woods, turkey, deer, bear, panther, and wolves in the hammocks and swamps. Along the coast ducks and geese are plentiful. Rookeries of sea and plume birds are found which are of interest to ornithologists. At McClenny, twenty-seven miles from Jacksonville—Fine fishing. Quail, doves, and squirrels plentiful. Guides can be had at reasonable rates. Board, \$2 a day. At Madison, one hundred and ten miles from Jacksonville—Good fishing and splendid hunting. Quail, turkeys, ducks, deer, and bear plentiful. Guides will be furnished by D. H. Mays & Co. and Thomas McLeary, from 50 cents to \$1.50 per day. Teams and dogs can be hired cheaply. Board, \$1.50 to \$3 a day. At Monticello, one hundred and forty miles from Jacksonville—Fine quail, dove, duck, and snipe shooting. Guides can be had at all times at reasonable rates. Board, \$2 a day; \$12.50 a week. At Ward City, sixty miles from Jacksonville—Fishing and hunting fine. Quail very abundant, squirrels plentiful. Fine hunting country. Guides, \$1 a day. Neither horses nor dogs for hire. Board, \$2 a day. At Chaires, twelve miles from Tallahassee—Fishing fine when river is at right stage. Fine quail, turkey, and squirrel shooting. Deer also plentiful. Guides—No trouble to secure guides. Board very reasonable. At Gainesville, seventy miles from Jacksonville—Fishing and hunting good. Quail and ducks the principal game. No regular guides, but good livery service at \$2.50 and \$3.50 for team. Board, \$7 to \$10 a week. At Tallahassee, one hundred and sixty-five miles from Jacksonville—Trout, bream, mackerel, bass, bluefish, etc. Deer, turkeys, ducks, snipe, woodcock, quail, and doves all abundant. Guides furnished by livery stables at \$3 to \$4 a day with team. Horses, \$1.50 a day; dogs, \$1. Board, \$2.50 and \$3 a day at hotels; \$7 to \$12 a week in boarding-houses. At St. Marks, twenty miles from Tallahassee, on the Gulf—Splendid sea fishing, as well as fresh water. Fine duck and goose shooting as well as quail. Guides—Ernest Oliver and Carey Turner, \$1.50 a day. Board, \$1 to \$2 a day. At Fernandina, thirty-four miles northeast of Jacksonville, on the coast. Excellent sea and fresh-water fishing. Quail, ducks, and some deer. Guide—Crockel Holzendorf, \$1.50 a day. Teams at reasonable prices. Board, \$1 a day and up. At Yulee, twenty-four miles north of Jacksonville. Fine fresh and salt-water fishing. Quail, turkeys, deer, and squirrels. Guides—John White, J. J. Edmondson. Horses, \$2 a day. Deerhounds can be rented. Board, \$1 a day. At Waldo, on main line, fifty-six miles south of Jacksonville. Good fishing and excellent quail shooting. Board, \$2 a day; \$6 to \$10 a week. At Ocala, in the heart of the best hunting section in the State—Quail, duck, turkeys, deer, etc., can be found in abundance. Guides—Henry Livingston, Ocala; W. H. Hopkins, Orange Lake, \$1 to \$1.50 a day. Can furnish team at \$2.50 to \$4 a day. Board, \$1 to \$3.50 per day. At Wildwood, one hundred and twenty-eight miles south of Jacksonville. Trout, speckled perch, bream, etc., abundant. Quail, turkeys, and deer abundant in the neighborhood. Guides—L. W. Cook, Jeff Walker, 75 cents a day; \$3 a week. Board, \$1 to \$2 a day. At Leesburg, eleven miles from Wildwood—Splendid bass fishing, quail and duck shooting. Guide—G. E. Winter. Horses and dogs can be hired. Board, \$1 to \$2.50 a day. At Tavares, twenty-two miles from Wildwood. Fine fishing and shooting—Quail, ducks, squirrels, deer, and bear. Guides can be had at \$1.50 per day. Horses, \$1 a day. Board, \$1 and \$2 a day. At Oviedo—Splendid fishing; perch, bream, trout. Quail, turkeys, and deer abundant. Board, \$1 a day. At Mohawk, short distance from Tavares—One of the best points in Florida, where, at the Jolly Palms Hotel, there is a sportsman's resort with everything necessary to make an expedition enjoyable. Fine fishing in lakes and streams, and all kinds of large and small game close at hand. Lake Weir, a fine fishing point, is three miles distant.

At Lacoochee, fifty miles north of Tampa. Fine fishing, trout, pickerel, etc. Quail, turkeys, and deer abundant. No professional guides. Horses and dogs can be hired. Board, \$1 a day. At Abbott, thirty-eight miles north of Tampa—Trout, bream, perch, etc. Quail, turkeys, and deer in abundance. Quail more plentiful than ever before. Guides—J. A. Turner and John Smith. Board, \$4 to \$6 per week. At Braidenton, on the Manatee River, about sixty miles below Tampa—Fishing fine in the river and bays along the coast. Bird shooting fine, also good duck and snipe shooting. The fishing in Sarasota Bay, a few miles below here, is the finest on the Florida coast. This is the home of the tarpon, which is caught here in greater numbers than anywhere else. There is a good hotel at Sarasota, and boats may be hired.

Hunting and Fishing in the South.

WINTER VACATIONS have become more popular with many than summer outings, from the fact that the folks who take their vacations in winter can take with them every device for out-door pleasures, and find places to indulge every fancy. There is no other section of country in the world that furnishes so many diversified pleasures as the Southern States, in the Fall and Winter months.

To tell *just where* to find the various kinds of game and fish, *just where* to find the best golf courses—*just where* one can find and satisfy his pet hobby, The Southern Railway has published a book that deals fully and plainly with Hunting and Fishing. Aside from the interesting and instructive details in the book, its artistic value makes it worth your while to secure a copy. The front cover contains a picture of Ex-President Grover Cleveland bagging ducks. The back cover shows the genial Joseph Jefferson fishing.

The Southern Railway has published this book for the general information of the patrons of its lines, and will be glad to send it to persons interested.

For further information call on or address any of the following agents of the Southern Railway:

WESTERN TRAP.

JACKSONVILLE, Ill., Nov. 24.—The second shoot of the season for the Jacksonville club was held Tuesday and Wednesday, with good weather conditions, especially the first day.

About thirty shooters were present, all being much delighted with their entertainment. This club has the use of the Nichols Park grounds, and they are fine, although "a bit" far from the street car line. The club's officers are made of the correct stuff, and they are workers.

There are attractions for shooters elsewhere at this time of the year. Besides game shooting, many of the trapshooters are too busy for recreation at the traps with harvesting their fall crops.

Everything in connection with the shoot was run to the best that possibly could have been thought of in any way connected with a tournament. No disputing the referee; no correcting the score cards. Leslie Standish was in the office, and that kept going smoothly. Targets were sent a distance of 45 yds.

The handicap was not severe. There were Hall, Harris, Groves, Ed. Scott and Z. Scott at the 17 peg; all the others, including the professionals, at 16 yds. On the second day Harris and Hall were sent a yard back, and there the wind caused a lot of trouble.

Ike Harris beat out all the amateurs the first day, with the very good score of 189. Tom Hall, J. C. Ramsey and T. C. Stoner all finished second. J. L. Scott came next with 184. Then one "Dad" Gilbert came on with 90 per cent. Now this was extremely pleasing to all present, even to Viemeyer.

Frank Riehl was at the top with 196. Cadwallader came on with 188, then Lord 183, and Keck, the one-armed man, 178. The latter made 91 out of first 100. Tom Hall's score the second day was very good, when with the strong wind and at 18 yds., he made 184. This won him high average over all for the two days, with Groves and Stoner second. The high men for the first day fell away, and yet Riehl won high expert average with 368. Cadwallader 367 and Fred Lord 366. The three were as near even as could be and not to tie. Each shot a different shell. It was unfortunate that the wind sprung up the second day.

Those present were: Hugh Snell, Litchfield, Ill.; Tom Hall, Loami, Ill.; J. C. Harris, Fairbury, Ill.; J. C. Ramsey, Manito, Ill.; T. C. Stoner, Mt. Zion; W. M. Gilbert, Philadelphia, Ill.; J. L. Alderson, Chapin, Ill.; J. P. Bunch, Chapin, Ill.; H. Englebrecht, Chapin; W. Morris, Merritt, Ill.; then J. A. Groves, J. Z. Scott, C. S. Magill, H. C. Goebel, Simon Fernande, H. M. Seymour, Ed. Scott, O. C. Henry, John Vienna, J. O. Vassellar, Geo. A. Wisner, G. T. Perry, W. L. Leach, Wm. Craig, S. B. Stewart, J. W. Horney, of Jacksonville, Ill.; H. W. Cadwallader, Decatur; C. T. Keck, Chicago; H. V. Viemeyer, Chicago; Fred Lord, La Grange, Ill.; Frank Riehl, Alton, Ill., and Leslie Standish, Chicago. Scores:

At Chattanooga.

Chattanooga, Tenn., Nov. 20.—The weather was bad on the day set for the October shoot for the Smith trophy, hence the November meeting was the occasion for two shoots.

There was a change in the conditions from 30 singles, use of both barrels to 15 singles and 10 pairs. The weather was of the very best, and that assisted in the making of two record scores. In the October shoot, Plummer made 23 out of 25, and all thought that it would stand for many moons; but when the November shoot had closed it was no good as "Tony" O'Connell got very busy, and with "nary a goose egg," set a pattern of a perfect score. Though this was Tony's first win, it makes all the members worry to think of their slim chances to take the trophy at the future shoots.

The scores for October: Plummer 23, Webb 21, Thomasson 19, O'Connell 18, Roy 16, Burk 16, Chicester 16, Moore 14, Hutchins and Morrison did not finish.

November contest: O'Connell 25, Plummer 22, Webb 20, Burks 19, Roy 19, Moore 17, Morrison 16, Hutchins 13.

At Milford.

Milford, Ill., Nov. 19.—The gun club here held a tournament Friday which was fairly well attended. This club has good, live officers, viz.: Tom Blessing, President and Bert Smith Secretary. The grounds used are situated conveniently to the business center of the town. The trap works well, hence it is a pleasure to meet with the club and participate in a tournament.

Leslie Standish was present and took charge of the office. The expert shooters were Fred Lord and C. T. Keck, the one-armed man. Fred Lord made the high score, 118 out of 140, followed by Miller and McKinnis with 117 each. The scores:

Events:	1	2	3	4	5	6	7	8	9	10	11	12	Shot at.	Broke.

A One Arm Challenge.

Lincoln, Neb.—It will be news to some shooters to learn that George W. Maxwell, of Hollstein, Neb., the good target shot, has but one arm. He met with an accident while shooting quail and lost one arm. He did not give up shooting, and by reference to scores made at the late shoot at his home town it will be noticed that he tied "Bill" Heer the first day, and came near doing the trick the second.

One-arm shooters are not common, hence the novelty of the thing has set some of the Nebraska trapshooters to thinking, and they have decided to issue a challenge for Mr. Maxwell, and will back him against any one-armed man the world over. The conditions, 100 targets, the money purse, anything reasonable. While no names are given, a letter to George Carter, of Lincoln, or Wm. Townsend, of Omaha, will meet with a response.

Cincinnati Gun Club.

Cincinnati, O.—The attendance on Nov. 26 was much better than on the previous Saturday, thirteen taking part in the practice events. The principal event to-day was a 100-target sweepstake with five entries. Ahlers made the fine score of 92. The day was cloudy and cold, with a strong wind, which affected the flight of the targets and made the shooting difficult.

The boys were sorry to learn that the genial Del Gross has been sick for over a week, and confined to his bed. All wish him a speedy recovery. Scores:

Sweep, 100 targets, \$1 entrance, two moneys, 60 and 40 per cent.: Ahlers 92, Squier 84, Faran 79, Peters 79, Gambell 71

In spite of the weather, a good deal of practice shooting was indulged in, and some good work was done. Gambell shot at 90, broke 70; Squier 140, 102; Ahlers 105, 90; Block 150, 100; Williams 120, 86; Maynard 140, 114; Peters 115, 84; Faran 70, 59; Tuttle 180, 103; Hesser 220, 152; Pfeiffer 95, 72; Barker 20, 15; Don Minto 20, 13.

It has been some time since as large a crowd as attended the shoot on Nov. 24 has been present at the grounds. The day was cloudy and cold, and a strong wind, which blew most of the afternoon, made the shooting difficult.

Maynard, who has just returned from his Illinois trip, reported having had a good time, and very fair sport on quail. Colonel, who has been away for many months, took part in the sport.

Barker was high man for the day with 136. Squier second, 135, and Ahlers third, 132.

The programme consisted of ten 15-target events, \$1 entrance, purse divided 50, 30 and 20; fourth man, a turkey; fifth, a Burmister Hotel ticket, and sixth a dressed duck. All ties for the money divided; ties for the prizes were shot off in next event. In the first event, Tuttle won a turkey. Second event: Dick, turkey; Tuttle, ticket; Gambell, duck. Third event: Medico a turkey. Fourth event: Faran, turkey; Dick, ticket. Fifth event: Peters, turkey; Grau, ticket; Hesser duck. Sixth event: Faran turkey; Tuttle, ticket. Seventh event: Faran, turkey; Williams, ticket; Harig, duck. Eighth event: Ahlers, turkey; Tuttle, ticket; Grau, duck. Ninth event: Hesser, turkey; Tuttle, ticket; Peters, duck. Tenth event: Williams, turkey; Hesser, ticket; Dick, duck. Scores:

	Shot at.	Broke.		Shot at.	Broke.
Barker	150	136	Block	135	98

Ohio Notes.

The shoot held by the Welfare Gun Club, of Dayton, on Nov. 19, was a record-breaker in point of attendance, a large number of spectators being present, and thirty men taking part in the various events. The Rohrer's Island and Dayton gun clubs were well represented.

Harry Oswald has issued the following challenge to Dayton shooters: "I hereby challenge any club member in this city, Mr. Spangler preferred, manufacturers' agents barred, to shoot a match at 100 targets each, \$100 a side, or any part of it; 50 targets each to be shot on the Rohrer's Island Gun Club grounds and 50 targets each to be shot on the N. C. R. Gun Club grounds. Each party to select a judge and the two judges to select one referee. Interstate Association rules to govern.

While L. G. and J. W. Sherlock, of Dayton, were quail hunting, they flushed a bevy of twelve albino quail. They succeeded in killing four of the white birds, which they will have mounted.

Charles Urban and party spent three days in Brown county and brought back sixty-seven rabbits and fifty-six quail.

Jesse Pursell, of Piqua, with four friends from Pittsburg, spent a few days at Lewistown reservoir and bagged seventy quail, forty rabbits and one wild goose.

Mad River territory has proved barren this season. Dr. Wm. M. Duckwall, of Dayton, hunted there for two days and never saw a bird.

F. W. Brown and John R. Brown, Dayton, who are hunting near Dunbar, Wis., write that the former killed his first deer on the run at a distance of 200 yds.

Ed. A. Deem, one of the best-known sportsmen of Dayton, is at Richmondale, Ross county, with a party of Washington C. H. friends.

Annie Oakley will spend a week hunting quail around her mother's home at North Star, Darke county.

Carl Hambreck, of Dayton, and T. C. Angel and Joseph Machir, of Butler township, are at Gallon, La., for a month's hunting.

Joseph Cheney, Fred Ernst and Howard Saxby, of Mechanicsburg, will spend two weeks in the mountains of West Virginia, in a section where big game as well as pheasants, quail and wild turkeys are plentiful.

Messrs. H. E. Talbot, E. F. Platt and Geo. Mead have just returned from a hunting trip in the Ontario forests. The party brought home three fine bucks, the largest one being killed by Mead.

Mr. D. Norrod, of Doicstown, New Brunswick, has been the guest of Col. Frank T. Huffman, Dr. D. W. Greene and Mr. John S. McIntire. Mr. Norrod has been their guide for many years on their hunting trips in the Canadian forests. He is sixty years old, but still hale and hearty, and as active as many a man who is years younger. He is a thorough woodsman and perfectly familiar with the localities in which deer and moose abound. He comes from the Minamiky country, which is the section almost invariably visited by hunters from Dayton and vicinity, and has a large acquaintance among the sportsmen.

Chas. W. Sander and John J. Stoecklin have gone to Wheeler, Miss., for quail hunting. Their headquarters will be about fifty miles from a railroad, in a section where wild turkeys and other game are abundant. They took with them Frank Platt's Irish setter Pat, S. A. Thomas' pointer Pride, and Dr. Scherbenzuber's pointer Joe, three good ones.

The Gazabo Hunting Club, of Hamilton, drove over to Laurel, Ind., in their six-horse wagon for a couple of weeks' hunting. The party was composed of C. A. Strobel, P. E. Schwab, Max Her-

main, John Getz, Gus Deemer, Sam P. Durbin, Geo. Rohman, John Braun, Tony Waradorf and Jacob Brown.

For the first time in ten years Ed. Rike was obliged to open the season without his field companion, Rolla O. Heikes, who is in St. Louis, on business, and was unable to get away. Mr. Rike took a day's shooting along Beaver Creek, and then went to Huntsville with Harry Harman for a couple of weeks.

BONASA.

Springfield, Mass., Shooting Club Banquet.

The annual banquet of the Springfield, Mass., Shooting Club was held at the Highland Hotel, Friday evening, Nov. 18. A large number of sportsmen were present, many from out of town being on hand. The tables were prettily arranged in the palm garden of the hotel, and covers were laid for seventy. During the supper music was furnished by Nonpareil Mandolin Orchestra of Westfield. The menu card was in the form of a target, and among the good things served that tickle the palate of sportsmen were the following:

MENU.	
Manhattan	
Blue Points	
Celery	Stuffed Olives
Venison Soup—Hunter Style	
Quail en Casserole—Mushroom Sauce	
Julienne Potatoes	Sweet Pickles
Fried Smelts—Tartar Sauce	
Claret Punch	
Roast Mallard Duck	
Potatoes a la Duchesse	
Cauliflower in Cream	Cider Jelly
Tutti Frutti Ice Cream	
French Coffee	Roquefort Cheese
Toasted Crackers	Claret Punch
Cigars	

After the dishes were cleared away and cigars lighted, C. L. Kites, secretary of the club, made a brief speech, and acting as toastmaster, called upon the following for informal after-dinner speeches. T. Ed. Doremus, of Schaghticoke, N. Y., and H. L. Tilton, of Boston, Mass., who were the guests of honor, also Dr. S. B. Keith, of Palmer; A. M. Arnold, of Somerville, Conn.; Wm. Henry, of Thompsonville, Conn., and D. N. Coats, J. Douglass Law, Abraham Snow, Chas. Vining, Wm. E. Parsons and F. D. Kemp, of the local club. During Mr. Tilton's speech, he presented to the club a beautiful silver loving cup, which the club won for having the largest number of entries of any club in the country in the series of national sportsmen's contests for season of 1904.

The main tenor of the speeches was the needed protection of game birds, and a few of the speakers went so far as to advocate a close season for birds for two or three years in order to replenish the supply and restock the covers. Every one had a good time, and all agreed that it was the best supper held yet. Among those present were H. L. Tilton, Boston, Mass.; T. Ed. Doremus, Schaghticoke, N. Y.; E. H. Pinney, Stafford, Conn.; Dr. S. B. Keith, Palmer, Mass.; Wm. N. Henry, Thompsonville, Conn.; Edward Craven, Thompsonville, Conn.; R. L. Soper, Westfield, Mass.; A. M. Arnold, Somerville, Conn.; Chas. Axtell, Geo. M. Blair, D. N. Coats, W. A. Cone, Ernest Cady, W. L. Clough, Chas. Fitch, E. Gesner, Amenzio Griffith, W. J. Hyland, Burton Hickox, E. K. Janser, D. C. Keeney, C. L. Kites, H. L. Kites, Albert Keyes, J. Douglass Law, Wm. M. Lester, A. C. Merritt, W. A. Newton, Elmer E. Neal, W. C. Pease, Wm. E. Parsons, Dr. Benj. Pierce, Geo. Rice, Jr., G. H. Reynolds, H. W. Shannon, Abraham Snow, W. H. Snow, Chas. Vining, A. A. Vining, A. H. Whitmore, F. H. Williams, F. D. Kemp, Wm. T. Keyes, Geo. K. Turner, Alonzo Pixley, R. A. Fosket, Ralph Blodgett, L. A. Herry and Harry Cady.

MISFIRE.

Ossining Gun Club.

OSSINING, N. Y., Nov. 24.—The Thanksgiving Day merchandise shoot of the Ossining Gun Club was a big success, thirty-one shooters participating, many of whom shot through the entire programme of 190 clay birds. While the merchandise prizes were not, for the most part, very valuable, still they were attractive enough to hold the boys, and the handicaps were sufficient to hold down some of the crackjacks like Floyd and Piercy, who, from 20yds., had to step some to keep in the game. Piercy was breaking in a new gun, so was not in his usual good form. Hood Waters and W. G. Hearn, trade representatives, were most welcome visitors. Considerable interest was manifested in extra event No. 10, which was a handicap at 25 targets. The prize was a silver berry dish, given by Col. Franklin Brandreth. This resulted in a tie between C. W. Floyd and Ray Hendricks, of Rye, N. Y., with a score of 22. The latter won on a shoot-off at 10 targets with a straight score, which was shot in semi-darkness—a remarkable performance.

The Ossining Gun Club team will go to Poughkeepsie on Dec. 10 for a team race. The next practice shoot will be held Dec. 3.

Mr. Waters has just recovered from a serious illness, so was naturally out of form. Figures after names denote yards handicap in merchandise events:

Prize Winners.—First event: A. Traver, Poughkeepsie, \$5 gold piece, donated by Ossining Gun Club; G. Piercy, Jersey City, silver plate, donated by F. Brandreth; E. A. Staples, New York, stein pitcher, donated by E. Macdonald; H. W. Bissing, Poughkeepsie, ham, donated by J. Brown; C. W. Floyd, New York, hunting coat, donated by Barlow & Co.; R. Hendricks, Rye, 50 shells, donated by I. T. Washburne; I. T. Washburne, box of cigars, donated by Thomas Lyons; G. B. Hubbell, Gun Bug pin, donated by C. G. Blandford; A. L. Burns, Maraschino cherries, donated by Smith Bros.

Second event: E. A. Staples, \$5 gold piece, donated by F. Brandreth; R. Hendricks, stein, donated by D. Brandreth; I. T. Washburne, 100 shells, donated by Schoverling & Welles; Geo. Piercy, hunting knife, donated by Ossining Gun Club; C. W. Floyd, gun case, donated by M. Hartley & Co.; D. Brandreth, hunting vest, donated by Ossining Gun Club; F. W. Perkins, Poughkeepsie, sack of flour, donated by Crown & Williams; C. G. Blandford, stein, donated by H. L. Stratton; H. W. Bissing, fountain pen, donated by Ossining Gun Club.

Third event: E. A. Staples, pair binoculars, donated by C. G. Blandford; F. W. Perkins, water color, donated by C. G. Blandford; Geo. Piercy, stein, donated by H. L. Stratton; C. W. Floyd, vase, donated by Ossining Gun Club; R. Hendricks, 50 shells, donated by I. T. Washburne; A. Traver, Maraschino cherries, donated by Smith Bros.; H. L. Stratton, New York, stein, donated by D. Brandreth; I. T. Washburne, hunting coat, donated by W. S. Smith Co.; K. R. McAlpin, Monarch shirt, donated by Barnes & Barnes; D. Brandreth, cleaning rod, donated by Barlow & Co.

Gallatin Gun Club.

GALLATIN, Tenn., Nov. 24.—The Gallatin Gun Club to-day gave its fourth annual fall shoot, which was a decided success in all respects, except the attendance. Only eleven shooters participated, but they had the pleasure of shooting at as hard a lot of birds as ever flew from anybody's traps. The birds were a selected lot of old birds, which only needed a little wind to make them very hard. They had the little wind in the shape of cold blast from the north, which picked the birds up off their feet as soon as the trap opened. Considering the quality of the birds and the lack of practice of most of the shooters, the scores are good.

The third event at live birds was the Summer county handicap, 15 birds, a handsome loving cup to the winner. The cup was won by J. C. Baker, of Jacksboro, Tenn., who tied with seven others in the event, and then shot all the others out in a hot shoot-off, miss-and-out. Baber stayed in the miss-and-out until the 13th round, when an old, tough bird carried two loads of shot over the line, to drop dead out of bounds. Five 15-target events followed the live-birds shooting.

Bright Harris, of Gallatin, was high gun for the day, as he was also last year at our shoot. He shot about 95 per cent. at targets, and was the principal money winner in the live-bird events. The scores follow:

Live Birds:	5	7	15	Live Birds:	5	7	15
Lyles, 28.....	4	6	13	W. G. Harris, 31.....	4	5	13
Porter, 28.....	4	..	13	B. Harris, 29.....	3	7	13
Martin, 29.....	4	4	13	Baker, 29.....	2	4	13
Armstead, 30.....	5	5	12	Seay, 28.....	4	4	12
Legler, 31.....	2	5	12	Baber, 28.....	4	4	13
Hobson, 28.....	2	6	13				

Extra event, 15 birds: Seay (33), 13; B. Harris (33), 14; W. G. Harris (33), 15.

The Gallatin Club feels grateful toward Messrs. Porter and Campbell, trade representatives, and Mr. Geo. Hobson, of Bowling Green, for their kind services in scoring and refereeing.

Sec'y.

New York Athletic Club.

TRAVERS ISLAND, N. Y., Nov. 26.—To-day was full of active competition at the traps of the New York Athletic Club. The November cup was won by Dr. J. K. Knowlton, who, with Gus Greiff, had two wins previously scored for it. In the shoot-off, Dr. Knowlton won.

All events were handicaps, allowances added. The November cup had 50 targets, with scores as follows:

To "The Indians."

New York, Nov. 25.—Whereas the Great Spirit has summoned to the Happy Hunting Grounds our friend, Mr. E. D. Fulford, of Utica, N. Y., and it has been suggested that his sportsmen friends erect to his memory a monument as a fitting tribute to their substantial friendship, I will ask that each and every member of the Tribe forward to Mr. J. T. Skelley, Wilmington, Del., care of DuPont Powder Co. (who has been selected as custodian of wampum) any amount which you may deem proper.

Frank C. Riehl,
Chief Scribe.

TOM A. MARSHALL,
High Chief.

PUBLISHERS' DEPARTMENT.

The E. J. Willis Company, 8 Park Place, New York city, are busy compiling their annual catalogue for issue during January. Realizing the demand for motor boat supplies and accessories, they offer their catalogue as a medium for the sale of meritorious goods. Manufacturers of such might do well to give them a call. The Witherbee Igniter Company, of 27 Thames street, this city, have passed their experimental stage with their gasoline engine igniter outfits. They are clean, compact, and easily handled, and for all engines where the storage battery is adapted, are giving universal satisfaction. Frank Croker's XPDNC in her recent Hudson River race with the Challenge, was equipped with a Witherbee. Several large automobile manufacturers have adopted it as standard equipment.

Pennsylvania Railroad Company Will Issue Clerical Orders for 1905.

PURSUANT to its usual custom, the Pennsylvania Railroad Company will issue clerical orders for the year 1905 to ordained clergymen having regular charge as settled pastors of churches located on or near its lines. Clergymen desiring such orders, should make individual application for same on blanks furnished by the company, and which can now be obtained from the Ticket Agents. Applications should be sent to the General Office of the company as soon as possible, in no case later than Dec. 15, so that orders may be mailed by Dec. 30, to all clergymen entitled to receive them.—Adv.

FEDERAL PROTECTION OF WILDFOWL.

A BILL was introduced in the House, on Monday of this week, by Hon. George Shiras 3d, of Pennsylvania, entitled "An Act to Protect Migratory Game Birds of the United States." It is printed on another page.

This means a Federal law on wildfowl, something for which earnest students of the problem of protecting the wild ducks, and sportsmen everywhere solicitous to devise some efficient scheme of conserving the birds, have been earnestly wishing for many years.

While the suggestion has often been made that a law of Congress would accomplish the end which the diverse and conflicting laws of the separate States have not secured and never could secure, a prevailing objection raised in discouragement of Federal action has been found in the proposition that the game belongs to the State, its protection is an exercise of the police power of the State, and Congress has no jurisdiction.

The course of reasoning by which Mr. Shiras has found what he believes to be a sufficient answer to this objection is outlined in the text of the measure. Briefly it is this: Game birds are of two classes. One class is of species which are native to a State, breeding and remaining within its limits, and so throughout the entire term of their existence properly within its jurisdiction; and may efficiently be protected by its laws. The other class is of migratory species, which breed in districts beyond the State boundaries in the north, and pass, after a temporary stay, into other districts out of the State boundaries to the south, and being thus only temporarily and transiently in the limits of the State they are not properly under its jurisdiction, nor may they efficiently be protected by it.

On the other hand, while the control of the individual State is temporary only, the control which might be exercised by the United States would be so extended as to secure the desired end.

In practice the protection of wildfowl by the States has proved ineffectual. If the migratory species are to be preserved, they must have the protection which only the Federal Government can give.

The experience of the last quarter-century of game protection has convinced us all of the futility of striving to secure uniformity of protection for ducks. If it shall be attained at all, it must come through the intervention of Congress. All technical considerations dismissed, and fine-spun theories of State and Federal jurisdiction aside, the true consideration of public advantage supports this measure of Mr. Shiras.

The people of this country want the wildfowl protected. There is not the slightest question of that.

If a law of Congress enforced by Federal agencies will secure that protection, the people want the law and the Federal execution of it.

Leaving for subsequent consideration certain details of the plan as outlined in the measure, we believe that we represent the thoughtful sportsmen of the entire country when we declare that in House Bill 15601 Mr. Shiras has pointed the way to the satisfactory solution of a problem which has vexed us for a generation. If we are correct in the estimate of the reception the measure will have, we trust that sportsmen everywhere, as individuals and in association as clubs and game protective societies, will declare for the Shiras Bill in an expression of support. We share the confidence expressed by Mr. Shiras the other day when he remarked, "If the sportsmen of the country want this law they can have it if they will say so and work for it."

We have now such an opportunity as has never before been presented to provide for a wise system of conserving a great natural resource.

AMERICAN FOREST CONGRESS.

DURING the first five working days of January next there is to be held in Washington an American Forest Congress, under the auspices of the American Forestry Association. To this congress are invited representatives of foreign nations, as well as Americans of many sorts; Congressmen, Governors of States and Territories; foresters and generally all people interested in forest work. This does not include merely foresters, lumbermen and wood-working associations, but irrigation people, miners, stockmen, makers of turpentine, railroad men, engineers and members of various Chambers of Commerce and Boards of Trade.

The various subjects to be considered by the congress are: (1) Relation of the public forest lands to irrigation; (2) relation of the public forest lands to grazing; (3) the lumber industry and the forests; (4) importance of the public forest lands to mining; (5) forestry in relation to railroad supplies; (6) national forest policy; (7) State forest policy.

The gathering, which is being brought together at the call of some of the most eminent men of the country, promises to result in an interchange of views on a subject of the very highest importance, and is likely to result in great benefit to the whole Northern American Continent.

THE CAMEL CAN SWIM.

ONE of the most amusing features of the introduction of camels into the United States, the story of which has been told in our natural history columns, was the prolonged discussion of the question whether the camel could swim or would drown. It had been stated on the authority of Father Huc that the camel could not swim, and when the United States authorities proposed to import the beasts for traversing the deserts of the Southwest, the objection was promptly made that the enterprise would be futile because the camels would be unable to cross the rivers. As the point was demonstrable by a simple experiment with the beast in its Asiatic home, one might assume that before purchasing camels the authorities would have settled the swimming question by a preliminary experiment; but no one appears at the time to have thought of this. The curious discussion was carried on all the while the importation was in progress. The camels were landed at Indianola, and thence proceeded to Albuquerque, a journey of a thousand miles, consuming forty-five days; from Albuquerque the expedition marched to Zuni, thence to the Little Colorado, a stream too shallow for the swimming test; and then on to the Colorado, where at last the conditions were found to settle the long-involved question. The river here was from 200 to 300 yards wide, with nineteen feet of water in mid-channel flowing at the rate of three or four miles an hour. The result of the trial was recorded in the New York Tribune of Jan. 22, 1858: "Now it was to be proved whether the camel could swim; a test to which Lieutenant Beale had looked forward with not a little anxiety. Having reached the Colorado, he was determined to settle the question for himself. The first camel brought to the bank refused to enter the river; but another being brought down, to the great delight of the whole company it took the water freely and swam boldly across. The others, tied one behind the other in strings of five, were taken across in the same way. They not only swam with ease, but in this particular, as in others, they seemed to outdo the horses and mules. This seemed to be the only remaining test needed to establish the character of the camel as a beast of burden specially suited for those regions."

Thus at the end of a journey of thousands of miles over land and sea, and after months of anxious speculation, it was determined in the distant Colorado that the camel could swim, and the bright minds of the officers, for many months burdened with anxious speculation, were finally set at rest.

Had these white men possessed the scone of a Carib they would have decided the question by throwing a cheap priced camel into the Red Sea and watching to see it swim or drown. Hugh Linchot relates that when the first Spaniards arrived at Porto Rico, and the islanders saw the great ships and heard the thunder of the cannon, and saw the white faces, they thought that they had come down from heaven. But the Casique Yaguara made a test of their immortality by promptly

throwing a Spaniard into the water, to try whether he would drown or not, and seeing him wholly deprived of life, he concluded in consequence that the rest of them were mortal, and thereupon set upon them, when they were seeking for gold, and killed above a hundred and fifty of them.

FIRE IN THE WILDERNESS.

THE terrors of fire on the prairie or in the forest have often been pictured. Volumes of early travel over the plains of the Southwest describe the fury and speed of a conflagration on the prairie, the mingling of beasts ferocious and gentle in a common flight, and, after the fire had passed by, the blackened, smoking land strewn with carcasses. Not a few among our readers have witnessed such scenes, and in early days it was not uncommon to find on the prairie old buffalo bulls whose sight had been destroyed by the flames through which they had run. Even within a few months we have seen in Dakota a prairie fire which, traveling over level land, ate up within our view the stacks and buildings of a prosperous farmer.

There recently occurred a deplorable conflagration in the St. Mary's country in northern Montana, a region well known to many of our readers. The fire started within the forest reserve on the head of Swift Current River, among dead tops left years ago by persons cutting timber for houses or for mining use. The wind was blowing a gale, and, once beyond control, the fire destroyed the local saw-mill near the town of Altyn, one house in that town, and thence swept down through a fine body of timber south of Swift Current River and over on to Boulder Creek, and perhaps all around Flat Top Mountain. The few houses occupied by miners and squatters within the area covered by the fire were all destroyed, together with all their domestic animals. For fury and swiftness no fire like this was ever seen, even in that country of forest fires. The heat was so intense that fish were cooked in Boulder Creek, and within a mile of Swift Current Valley a bull elk was found roasted in the timber.

A large area of mountain and valley once covered with beautiful green timber is thus now a blackened waste, and many years must elapse before the country shall become reafforested.

The danger to the forest from the heaps of dry tops left here through the inefficiency of an employe of the Land Office was long ago recognized, and the attention of the Land Office called to the peril. To its failure to act in the premises is due this disastrous fire.

WIDGEONS.

WE are not disposed to intervene in the discussion of the ethics which should control in the writing of books of bear stories; but we cannot refrain from alluding to the contribution which Dr. Morris makes, in his letter printed to-day, to the figures of speech drawn from field sports and the ways of animals. We say of a detective that he is "on the wrong scent;" of a man who is used to induce others to do something that he is a "decoy duck;" of one who is making a mistaken attack that he is "barking up the wrong tree;" of a fugitive who is caught that he has been "run to earth;" of one who is indiscreet in certain methods that he is trying to "hunt ducks with a brass band;" of a lawyer quizzing a witness in a certain way that he is on a "fishing excursion" for information; and so on, as any of us may note in the speech of the next person who talks to us. In his exposition of the principle that we must grin and bear it when we believe ourselves to have been stolen from and must find our recompense in the joy of the struggle and the consciousness of having contributed something to the sum total of human good, Dr. Morris draws a new figure of speech from the wild ducks whose habits he has noted as a sportsman. Having observed the ways of the widgeon which gets its fine flavor by snatching the dainty roots of the wild celery brought to the surface by other ducks, he applies the figurative appellation "widgeon" to those members of the human family who appropriate to themselves the good things brought to light by their fellow workers in the various fields of literature and science, not forgetting the medical profession, as to which we may assume that the opinion of Dr. Morris should be accepted. Such appropriators he calls "widgeons." The term is felicitous; it describes the thing perfectly. We are all familiar with the phenomenon; the widgeons, like the poor, are always with us.

THE SPORTSMAN TOURIST

In Missouri.

WHEN *Jemima*, M.D. (Meat Dog), discovered, from my attire, that I was going shooting, she approved of the measure with delicious enthusiasm. Momentarily forgetful that it is against the law to paw me, much less embrace me, she did the latter, after which she fetched me the morning paper and bothered me all the while I was reading it at breakfast, by beseeching me to hurry up, although it was barely daylight and there was an abundance of time. A lady of quality and a member of a learned profession, as above indicated, she nevertheless, when not afield with her master, works by the day as a gopher-digger, whereby she has acquired the strength of a mule; and when she nudges a fellow at his breakfast it means something. On the whole, I prefer that kind of dog—or man. Several men had assured me that it was too dry to go quail shooting; that the scent was bad, and I would not find any birds unless I stumbled across them, and that a dog could not even find dead birds. And, I confess, the outlook was not encouraging, when later it happened that the train was late and the day turned warm and dry; but we were in for it now, hopeful on my part, sanguine on *Jemima's*, and must make the best we could of it.

It was after 12 o'clock when we got off the train, and so, when we were fairly out of the small town, I sat down in the sun at the top of a hill and ate my lunch. Below stretched a valley leading off to a farmhouse, presided over by a lady who, being a Pennsylvania German, is the best cook in that part of Missouri, and where I intended to stop that night.

Teams were hauling gravel from the bed of the stream, and when we got down there and were close to them, *Jemima* pointed a covey of quail in a patch of underbrush, which I flushed, but did not shoot at, because of the horses. I marked them down and went to where the teams were, and found the man there who owned the land on one side of the stream, who said I might shoot on his side, and on the other side also, since the farmhouse on the other side was vacant, and that the horses would not be frightened.

And then *Jemima* and I began to have fun, and to put to shame the prophets of evil, for she found those birds again in a jiffy. I never touched a feather! I apologize to the readers of *FOREST AND STREAM* for not being able to say I made a nice double; but the fact is, I have not written any shooting stories for some time, and the truth slipped out before I knew it.

The birds flew toward a side thicket across an old field. One of them lit in this field and *Jemima* pointed it, and I made a very pretty single miss—that is, it was a single bird, but there were two barrels! I began to commune with myself then and, after I had struggled with my feelings for a moment or two and apologized to the dog, I laid it all to the circumstance that the Judge had asked me to bring him two birds for two members of his family who were ill. I was too anxious to get those first two birds. It was the same way week before last. We had visitors at our house, and I went a few miles out of the city on a suburban train to just get enough quail to go around. I knew birds were scarce there, but thought I could make it. I made a good many misses, in spite of which, by dint of naming each bird for some member of the household, politely beginning with the visitors, I got everybody checked off, except the hired girl. I missed her bird five times in succession, and began to think it was not meant that hired girls should eat quail. So, when the dog was not looking, I shot her a rabbit; and right away, after *Jemima* hurried in to see what I was shooting at (which she didn't), she found me that girl's quail again, and I killed it as nice as anybody's quail. I examined the bird critically, but so far as I could discover the markings were the same. It was, apparently, of the same variety as our own and our visitors' quail. Joking aside, I missed more birds that day than I often do, and those I killed often flew some distance before falling; and so I cut open one of my shells. They had been on hand upward of a year, and as they were some of the "factory loaded" shells you brag so much about in your advertising pages, I wanted to see what was the matter—and I think I saw. The powder (nitro) was caked in one compact mass, so tight that I could only pick it apart with my knife. Another shell proved to be in the same condition, and I concluded that some of the powder detonated and some of it only burnt up. Anyway, they were deficient in power, for they did not kick, some of them, and when there is no recoil to speak of there is very little penetration.

It was not the fault of the ammunition on the present occasion, however, for I had brought only twenty of the old shells with me, and had fifty newly purchased ones, and was missing with both kinds. Directly a bird got up in the thicket, and by dint of a certain expedient of mine, I killed it. It is a difficult thing to do, and especially difficult with a man of a nervous temperament; but after many years' experience in field shooting I have concluded that it is the secret of good shooting. It consists in an almost imperceptible pause before pressing the trigger. It is the hardest easy thing to do I know of, but it counts. When I can manage to strike a streak of doing that, I kill like

clockwork, whether at ducks, snipe or quail; and, as for prairie chickens, one can shoot thus all day without a single miss. It results in three things: First, it enables you to get your eye down on the rib of your gun; second, to get your gun on the bird if it is going away, and third, to get it ahead of the bird if it is crossing rapidly.

After this digression upon the art of shooting, I proceed to state that I missed two more birds. Each time the bird popped up, my vaunted expedient popped out of my head. And then a thing happened, which I shall never forget. *Jemima* went in the field beyond the thicket and got on a point, and when she failed to respond to my whistle I knew what was up and began to hunt for her. The weeds were as high as my head and, when I approached her at length, the noise started two birds, one of which came skimming over the tops of the weeds straight at me, and as I threw my gun up in the air, expecting to turn as the bird passed me and shoot it if I could, the poor thing darted squarely into the gun barrels and dropped lifeless at my feet. To shoot a game bird and put it in one's pocket is one thing; but to have a tragedy like that at one's door is a vastly different one. I stood there, shocked more than I can tell, feeling like a murderer, until *Jemima* came and picked it up and gave it to me.

I left that place and went across the creek to a cornfield, where the dog began to walk; and when that dog walks in a cornfield, I know it is time for me to climb over the fence and follow her. She has a way of conjuring up a bevy of quail at the end of such a saunter, and if she gets out of sight you have to hunt her. It was not two minutes on this occasion before she stopped with a high head, indicating that the birds were some distance down the rows. When I got to her they arose and I had time to shoot at one bird, which dropped with a broken wing. After I had my way for a few moments and had her to hunt where I thought it was, I let her have hers, whereupon she proceeded some sixty yards further and pointed and then picked up the bird in a ditch. I got through a hedge over which the birds had flown, suspecting that some of them had stopped there, which was the case, *Jemima* finding two, both of which I killed as they flew toward a thicket. Following up this clue, we found the remainder of the covey therein, and when they rose, I got more. Then I missed one, and then killed one; then three other hunters appeared on the scene. I had heard them shooting for an hour past, and as they were coming from up the valley, where I expected to shoot on the morrow, it augured ill for the morrow. They turned out to be a pseudo dog trainer, who lived near the village and who had three young and poorly-trained dogs, one of them gunshy; and two men from the city, neither of whom could shoot very well. They had killed but ten quail, and this pleased me so much, that I let them have my scattered covey to chase around and shoot at, and started back across the creek to the cornfield below the vacant house, killing one more bird as I left.

I now had ten birds, and in half an hour it would be time to think of my farmhouse and supper. I sat on the fence surrounding the cornfield, and *Jemima* started to work it out at a clipping gait, and then all at once dropped to that eloquent tip-toe trot of hers, and, as I hustled down off the fence, I said to myself, "Here is where I have a little cornfield practice," for the corn was of the typical Missouri variety—eight or ten feet high. "One bird at a time now, son," I said to myself as the dog stiffened out, and I kicked up the covey and stuck to my rule, the bird dropping at the first barrel. Retrieving it, we went to the upper side where the dog pointed, and the same process was gone through with with the like result. Following them around the upper edge she pointed again, and as she did so, a single bird darted up in the open where I stood, which I killed and marked against the fence, and slipped in a shell just as *Jemima's* bird got up, which I killed. She then reluctantly retrieved the two birds, after which she went on a few rods and pointed two more, one of which I missed, and, while my gun was empty, several more birds followed the missed one into the stubble field. When she was making this last point, where I missed one and killed the other, I remarked to her as I walked up to flush, "Well, Miss *Jemima*, you certainly are doing yourself proud in this cornfield, not to mention any other member of the family." We then followed in to the stubble field, where she made four more points on single birds, two more of which I missed. But we had seven birds out of the covey, and seventeen in all for the afternoon, and the sun was setting, so we went on to the farm.

When I had made my salutations, I took a big, generous package of raw meat from my back game pocket and fed my good dog good, after which supper was in order, followed by an early retirement to the best room—the one with the bed in one corner and the melodeon in the other, and the tidies on the chairs, and fancy lamp, that is never lighted, on the center table. *Jemima*, M.D., slept on my coat by my bed, but woke me up with her cold nose about 2 A. M., to say, "Let's go out after 'em again." I gave her a piece of my mind and turned over and finished my nap.

In the morning we went down toward the saw-mill, and just as we came in sight of it, I heard quail whistling

in the woods, just over the fence. I climbed over and the birds got up and I missed them. I soon discovered that I had another missing spell, but managed, nevertheless, to get five more birds, making twenty-two in all. I had determined to stop shooting when I got two dozen, as that would be enough for this trip; but the covey, what remained of it, had gotten scattered and I could not find them. I had to put in the time until noon some way, so I went up to the saw-mill and watched the men working there a while, and then a man told me he had flushed a "large gang" of quail the evening before, which had lit in an old field, even pointing out the exact spot where he assured me the birds were to be found.

I went over there after a while, accordingly, and discovered that this corner of the field was where that covey made it a habit to roost. They must, therefore, be in one of the adjacent cornfields. The first field was a blank, and while I was taking it easy at the edge of the other field, *Jemima* thrashed it out pretty well before I missed sight of her. I knew she must be behind some corn shocks at a certain corner, and I stood watching them, expecting, if she did not soon emerge, to go down and see if she had found them. After a minute or two a large covey came from behind the shocks, followed apologetically by the dog. She had been pointing them as they had been feeding, and they had taken alarm at something. To make a long story short, I followed this covey up a few minutes, struck another hitting streak, and before I could get to the house and eat my dinner and walk to the train back along the valley which I had traversed the afternoon before, my total had been swelled to thirty-two birds. I felt satisfied, and *Jemima* evidently felt proud, for every dog that came near me and my bulging pockets had to take a licking, her dog fight score for the trip home being one village setter, one greyhound in the baggage car and a hound she met on the way home from the train. As an example of inherited traits, this is the third dog of this strain which I have owned, and every one of them would fight any dog that came near their quail, although perfectly peaceful at other times. They seem to have a sense of personal interest in birds shot over them. GEORGE KENNEDY.

P. S.—The last covey but one, on the way home, I shot but one bird out of; and the last covey I did not molest at all. I just flushed them in order to get *Jemima* off her point. Enough is plenty; and I know where there will be plenty more next year. Not that I am to shoot no more until then, heaven forbid, but that I try to go to a different locality each time. The next place, for instance, is to be in "Happy Valley," where I expect to make the best bag of the year.

Floating Down the Mississippi.

A Journey Through the Swamps.

ON the afternoon of Dec. 10, Mr. Mitchell took me up the river into the St. Francis Lake. Our boat was a little steel one, rather wabbly; but Mitchell drove it along as only a man of the swamps can do. I have always found the sensation of sitting in the bow of a paddle-driven boat one of the pleasantest there is. One sees himself sent headlong at stumps, or the bank, or swift water, wondering if the turn will be made or not. Of course it is, and just in time. Here, I was going into one of the most interesting places in America. It is like Reelfoot Lake, but more diversified, and presenting a score of problems to all sorts of nature investigators. Flocks of wild ducks sprang out of the flag grass at intervals along the way. They rose above dead tree trunks like those of Reelfoot, surrounded by yellow grass, or growing trees instead of deep water. On either side was a swamp wilderness, while underneath flowed a stream of the clearest water imaginable. At the bottom were masses of giant or cattail moss, growing on half-buried victims of the New Madrid earthquakes. With these logs were occasional white flakes of pearl shells. The water in places came through numerous channels, and the canoe-man would find new difficulties trying to make his way down the main channel in low water. In high water, some chutes lead far back into a wilderness so dense that "the geese get lost in it." In low water, the problem is to find any channel at all.

Mitchell pointed out pools from which he had taken messes of black bass. The local paddlers sometimes explained to one another the difference between lake trout and brook trout, using bass as the specimens. On the Mississippi the perch is called "speckled trout." Three years ago the first bass flies were introduced to local knowledge by Johnson of the Cossitt Library at Memphis. His light rod, and leaders and flies are the wonder of the region. One may guess the fishing to be had there from this late introduction of modern bass lures.

A feature of the swamps that sportsmen must consider, is the law which prohibits hunting by non-residents. The cause of the law is explained in a thousand stories which the native tells. Game was exceedingly numerous only a few years ago, and there was no difficulty in getting an ample supply at any time. Hordes of shooters were attracted, and "head hunts"

were of common occurrence. Men killed ducks, twisted off their heads and threw away the carcasses. The man who brought in the most heads was the best man. Deer were killed for their hides—one party recently arrested had nineteen green hides in their possession. Wild turkeys were shot and sent to market to "cover expenses." The Swamp Angel found himself hunted out of his own meat.

Then when game began to get scarce, some St. Louis men formed a club and bought up a lot of land, from which hunters were to be excluded. I couldn't learn just what happened when the attempt to keep the swamp angels from the wild lands was made, for I did not know that such an attempt had been made until after I was out of the St. Francis. But the situation was handled effectually. After fuming a while, the swamp angel burned buildings, took a few shots at obnoxious persons, and then raised his voice, till it was heard in the Legislature of his State. Then the Arkansas non-resident law was passed. It is not enforced against men who do not hog the game, nor the hunting lands, nor interfere with the swamp angels; but the club that tried to overwhelm the swamp angels, found itself thrown out of the State bodily. The club sportsmen of the Arkansas swamps are, without question, the meekest sportsmen on the continent as regards the natives of their favorite hunting grounds.

Throughout the St. Francis Lake region, the dead trees have furnished two classes of men with interesting occupations. It is only a few years since the dead trees ceased to be cut for the purpose of rafting the logs to the saw-mills. Hunters, during the overflow, used to cut down enough of the dry standing timber to make rafts, on which they lived while they hunted. The nearest dry land might be several miles from this raft, and the hunters came and went, of course, in canoes or boats. If one became lost, he had to tie his boat to a tree and wait for daylight. A stranger sort of hunting cannot be imagined. Of course there were places back in the woods which were not overflowed, and here the game congregated in vast quantities—deer, turkeys and the rest. One would find deer standing around in water up to their knees, on ridges that were not quite high enough. The poor things became emaciated with hunger, and no one of the natives killed them, unless for meat. It was the visitor who came in and knocked them over with shot-guns at a range of ten feet. The swamp rabbits—hares—are seen sitting in rows on logs half submerged. But these rabbits take to water like deer when the dogs pursue them, so the water is a hardship, merely as it keeps them from their food. They become so weak and careless, that clubs are used to kill them. And wild turkeys are shot from trees with equal ease. It is in such features as these that the tourist gains some idea of what the Arkansas swamps are. In a mountain country game goes to "high ground" in wet weather. But here, for a breadth of eighty or ninety miles, and a length of 300, an elevation of ten feet means more, relatively, than 500 in the Adirondacks—much more, for when a deer is up to its knees in water near the freezing point, a further rise of ten inches soon spells death to it.

Here and there along the way were sticks jutting up from the water, on the ends of which were bits of duck or fish, and inshore from them the reddish line of rust marking the presence of No. 1 or 2 steel traps. The traps were only six or eight rods apart, and in none that we saw was there any catch. It was a glimpse of past industry worth noting emphatically. Years ago these bottoms furnished furs in vast quantities, and the regular trappers were men who made western history; but in these later days, the trappers make a scant living, at best. The man who set these traps told me that he began in early September, and trapped as long as he could catch any. He said he began so early, in order to get ahead of other trappers—with the usual result of "blue" hides, scantily furred and worth only a few cents. If the trappers would wait till late October, even the present catch would treble in value. But it is not done; and trapping is merely a piecing-out process, utilized by men who, for the most part, eke their livings from as many and as easy sources as possible.

Years ago Mitchell trapped in the bottoms for fun, and made money at it. The channel up which we went to look at St. Francis Lake was the scene of many incidents memorable in swamp trapping, one of which was Mitchell and Charlie Gunlock coming down in the dead of a black, cloudy night, with a load of furs, in a dugout sunk almost to the gunwales, and only the feel of the bottom at the end of a paddle to go by. Gunlock mentioned that incident almost the first thing when I met him a hundred miles or so further down the St. Francis as one of the best feats of swamp craft he had known in twenty-five years' experience; Mitchell was the pilot.

We returned to the club house in the late dusk. It was the time when the swamps—as all wild lands—accentuated their individuality. The loneliness, the chilled humidity, the dense forest brakes and the flatness were most plain. When the poet of the swamp lands begins to sing, he will unquestionably dwell on the blunt twilight of his favorite land. No one who goes into the swamp and feels the wonderful compression there which is the antithesis of mountain exhilaration, can help but understand the men who go hunting in noisy crowds because they cannot bear the natural spiritual depression incident to the lowlands. The quack of a duck, the cheep of a muskrat and the wash of the wind through the flag belong more to the moist, forest-clad lowlands than do human voices raised to shatter the stillness.

Of the river, down which I was to go, I could hear little definite information. Mitchell had not been down it in twenty years, and none of the others were acquainted with the region. But wilderness, frontier cabins and clearings might all be found there, and if I was to get through at all, it was time to start on. A freeze might come any time, which would hold me fast for days. It was Dec. 11, and time to start on.

It was morning when I loaded my boat and made ready to start on. A trapper was at the boat house getting ready to go down stream a half-mile to camp in a tent for the winter. All his duffle, tent, stove, a

hundred traps, bedding, and the like were piled in a dugout ten feet long and twenty inches wide. The sides were only half an inch clear of the water when the mass of stuff was in it, and he had only room for his feet as he stood in the stern balancing. He landed against a foot high bank, sawed by a three-mile current, without mishap—but I don't know how he did it. The canoe was unloaded when I came past him a few minutes later, guided by a paddler who was to show me the way through an intricate maze of quake-river stumps and logs.

Through the maze, I came to a youth in a board canoe, on his way from his line of traps to the cabin boat at the foot of St. Francis Lake. His guidance was welcome, for without it I would surely have hung up on numerous shallows on the way.

The foot of the lake was indicated by a scarcely perceptible rise in the ground, and the appearance of river banks. The cabin boat was on skids, and beside it was a gasoline stern-wheeler for tender. I drove past in the quickening current and a hundred yards beyond I was alone, and very much so. The most ardent seeker of solitude will go far and wide before he finds a lonelier place than the Arkansas Bottoms when a winter's day is coming to a close, even though the sky be clear and the weather warm. Indeed mere warmth of weather in winter is a matter of suspicion as that night impressed upon me.

I pushed, instead of pulled the oars, and the current was considerable, but I did not make fast time, and when dusk came I was still far from Marked Tree. I tied to a stump, unrolled my hammock, spread the canvas over the gunwales, without hoops, and crawled down in, and by dark I was asleep. For hours I slept blissfully, soundly and restfully, but suddenly the wind veered with a swish, and in a moment I was awakened by the rain-bearing chilling wind that comes from the north. There was nothing to do but turn out, brace up the canvas on tripod and sticks to shed the water and then try and sleep again—a try that was successful. In the morning the oil-stove warmed the tent, and some hot cocoa and some of the lunch Mitchell put up for me served for breakfast.

The rain was not yet come, but held off in the clammy fashion that characterizes weather in the bottoms. I soon started on, because my boat contained no grub, and, rain or shine, I must reach Marked Tree. The wind brought a faintly perceptible mist, which increased in density, until the water gathered in globules on everything. When these broke and ran down the sides of the boat, one knew that it was raining. After a time the mist drops increased in size to such an extent that their pelting on the face was perceptible. In a couple of hours, when I reached Marked Tree (upper landing), the rain was pouring down. I stopped in a trapper's tent for a time waiting for it to cease. The trapper and a visitor were knitting hoop nets, and one listened with manifest pleasure when I told them that a steel trap half a mile above town contained a 'possum busily engaged in chewing a log close by.

After a time I went up town in a hard rain to buy supplies. Marked Tree is said to be on the route of an old Indian trail that crossed the bottoms, and that here the Murrell gang had a hiding place for stolen slaves, and other plunder. It is a town on stilts, these days, very noisy with the whine of bandsaws and exhaust of steam. The buildings are all on stilts, or dirt embankments, thrown up because the region is liable to be flooded under any spring. At night, electric lights illuminate the clearing, and beams dart far among the trunks of a wilderness in the taming.

I bought supplies, of which quinine and lemons were an important part, for a weeping cold and malarial aches had seized me. A soap box full of stuff was brought to the landing for me, and I went down stream. The saw-mills had two booms across the river just below the railroad bridge, and I had a time passing them both. After seven miles' rowing, I came to Marked Tree again, and by land about a mile from the upper landing. When I was down stream out of sight of town it was forest on both sides of me again. I grew hungry, and on examining my stuff, I discovered that the chubby-faced clerk had left out my chocolate, potatoes, tomatoes, etc., to the value of forty cents at the store, but whose absence I felt for the next 250 miles. I hoped the clerk's dinner, for which he was in such haste, didn't taste good to him. I should have examined my stuff when it was delivered. But there was no help for it, so I cooked dinner without potatoes and the other things.

I tied in some miles below town for the night. I had cane hoops to hold up the boat cover and a piece of oil cloth purchased at Marked Tree, covered the bow, so that neither the rain nor wind was unbearable. Still at frequent intervals all that long night the warm zephyrs of rain, followed by freezing gusts, kept rousing me from sleep in most wearisome fashion. The swamp traveler during winter weather ought to have a perfectly wind-proof covering for his boat. Toward morning the cold wind held steady, the sky cleared and ice formed around the boat an inch thick. Dressed for the cold, especially the feet, it was not uncomfortable.

Shortly after daybreak I awakened to a cold and raw morning. But the oil-stove warmed the interior of the tent, and thawed the frozen canvas. Breakfast was as poor a meal as I ever ate; for my baking powder was damp and the pancakes were clammy and bitter in consequence. But a cup of thick chocolate made the mess digestible and I started on. It was a clear day and I heard occasional gunshots, and saw a pair of hunters at Horseshoe Lake—one of the couple of hundred horseshoe lakes of the Mississippi Valley which were formed by the streams taking short cuts across peninsula necks. The hunters told of Turkey Jimmy killing twenty-seven coons in one night by means of a headlight of his own invention. This sounded pretty steep, but it is true, probably, for there seem to be more raccoons on the Mississippi bottoms than in any other part of the land.

It was a long, hard day because the water was so low that at the shoals there was usually but one channel down which I could make my way. Sometimes the keel hung in the sand, and I had to back out and try again. The sand bars were moving down stream in

waves, the faces of which were steep, reaching far down into deep green pools of water, while the crests were just under water. I was aground a dozen times before I thought to put the weight in the boat well toward the bow. When I struck then, by shifting the stuff back a couple of feet I could pole myself out of the false channels that lured me on and seek the true one a yard or so to right or left.

The river was utterly sinuous. Ahead of me was a bend, and behind was a bend only a few rods distant, if I was not already in the curve. The straight reaches were fifty or seventy-five yards long usually. The stream would bear to the right until one felt as if he was coming back to the upper stream again, and then the bend would be to the left for as long a time. On one side was the steep bank into which the current was cutting slowly, and on the other the sloping bar, with willows and stream-side shrubs which hid the gum forests in that direction. Though I watched the sun, I lost the sense of direction, and my compass seemed to point anywhere, except to the north. Had I been on foot, I could not have been more completely turned around. The current of the stream at the ripples alone assured me that I was down-bound.

At intervals I flushed flocks of mallard ducks, and sometimes I had glimpses of squirrels among the trees. And at intervals along the stream were the evidences of men being in that neighborhood. Every dozen rods or so were fish heads, tails and chunks on the ends of short sticks jutting from the water. Inside, at the edge of the bank was the rusty form of a steel trap. Beyond the trap, out in the way was often another stake, "the tangle stick," around which a victim would wind the chain and so accomplish its own drowning. In one of the traps was a sparrow hawk, his body half submerged in the icy water. He was a most disgusted looking bird, and seemed ashamed of himself. I did not attempt to kill him, nor any of the other victims that I saw on the way. One time a man was found dead, shot through the heart, on a fish box in the Arkansas River that was not his. An action in the neighborhood of a trap might be misconstrued, so I kept my distance from the traps.

Late in the afternoon I came to a new house built of rough boards, but vacant. A couple of hundred yards below I came to an old log house, in front of which was a gallows-like frame from which were suspended a lean wild turkey hen and a big swamp hare. I ran in below a log at the ford and after tying went up to the house.

A tall, lean man before the fire-place shrunk before my voice when I addressed him from the door, and he invited me in to "warm" in a voice that was not welcoming; nevertheless I "warmed." I spoke of the game, but he was not communicative. On asking about the region he said it was thickly settled. "There are twenty-five people and three houses within five hundred yards of this place," he said. "Did you see that new house when you come down the river? Theh's a fam'ly going to move in theh d'rectly. And theh's a house about a mile below here that was built only las' spring. This country's settling up fast; hit sure is." He volunteered the information that he was a carpenter, and was profiting by the boom that had struck the locality. In the morning he was gone hunting when I went up to say good-by to him. A suspicious man I was to some of the swamp people that I met. The time when detectives hunt the "wanted" in the Arkansas swamps is not yet over with. And when a little while after starting down stream I met three men in a flat boat towing a dug-out, the thought that perhaps these men were less than they should be was confirmed that night by an old man who was seeking information about a sassafras dug-out which pearl fishers were supposed to have stolen.

The three men were the advance of the army of pearl fishers which was making its way up the St. Francis. At Big Eddy was a gasoline boat—a home-made affair with canvas top, with which a man was making his fortune carrying the shells he was digging to market. When I climbed to the top of the twelve-foot high bank, half a dozen fox squirrels darted among the leaves seeking tree trunks from behind which they peeked at me impudently; and a swamp hare, startled from its form, ran within ten feet of me, headed for the swamp depths. "The woods were full of game," as wild turkeys scratching in the leaves and deer hoof prints in the moist soil showed.

I wished a thousand times that I had a proper companion with me. Those miles of forest would then have offered vast pleasure instead of loneliness worse than that of a crowd. To leave the boat was to invite theft by some one of the many whose dug-outs scratched the sand at the shoals, but who seldom came in sight. To stop was to make a delay that would, perhaps, result in my being frozen in by the ice. And yet a month could have been passed there in seeing the swamp forests, which are wildest America, perhaps.

Moss-grown, vine-hung gum cypress and willow trees with occasional patches of cane on higher and richer ground marked the wilderness brims that were at the edge of the river. The moss covered whole tree trunks, and began to show the ragged edges and flying ends which in the Louisiana swamps becomes the loose purple-gray tresses of Spanish moss. The trees looked awkward, for their trunks were big and clumsy, while their top branches were heavily jointed and gnarled. So many of the trees were diseased and fungus-grown that the mind was filled with a cold horror. Many of the trees were of vast size, splendid columns with beautifully marked bark, on which the sun marked the ridges and crevices with lattice-work distinctness. But frequently the searing coils of ivy were sunk deep into the bark, and the breaking branches and the discolored wood that was disclosed showed the slow strangled agony of the parasitic victims. So many of the trees were in trouble that one fancied himself in a land stricken by pestilence. It was a shuddering horror this of silent trees of wonderful size and strength giving way slowly to the damp rot in their hearts. The healthy tree, thrown to the ground by a shattering thunderbolt, was a pleasanter spectacle.

Stopping at a house of sawed boards to ask where I was, I found only women there, and they were frightened to see a foreigner come up from the river. One old one, whose thin clothes and fleshless bones suggested one of A. B. Frost's most pathetic pictures, answered the questions as she stood before the door arms akimbo. The next house was a "right smart distance." "Parkins' is that-

away, and right smart—perhaps twelve miles." "Right smart of people lives round here," and there were houses along the river at intervals.

Toward night I spied a rived board house, and on going to it the door proved to be guarded by a fence that ran from one corner of the house in front of the door in a semi-circle to the next corner beyond. To get over the fence one must climb by way of two stepping blocks. Within the yard were corn ears in husks, and without were many pig tracks. The yard was to give the chickens a chance to eat and to keep the pigs away from the door. No one was at home, and I set about making my boat comfortable for the night. While I was at this a young fellow came along the trail from down stream. I greeted him, and he jerked his hand toward the house, inviting me to go with him to it, trying to say "Come in and warm!" but failing to get more than the letter "c" pronounced, for he stuttered emphatically. He built a fire in the fireplace, an opening made of split boards and daubed with mud. He was dressed in a light gray suit, celluloid collar, bright red necktie, and heavy shoes. His trousers were rolled up and his hands brawny. In a box which he soon opened was a pair of patent leather shoes, and a more striking contrast could hardly be found. To see patent leathers in the depths of Arkansas swamps, in a split clapboard sassafras house, the proud property of a swamp woodsman, was surprising.

After a time a man and woman came—W. H. Casen and his wife, who were attending the lumber camp which this building was. The spring previous a negro was killed out in the woods a piece, in a difficulty, the nature of which had been forgotten. The man who stuttered was a neighbor, and a scraggling bearded old man who dropped in later inquired about the sassafras dug-out which the pearl diggers stole. The snuff bottle was passed around. The stutterer dipped with his finger, the woman used a chewed-stick brush, but Casen poured the powder from the bottle into the required place in the left cheek, a fact that puzzled me until I learned that he came from the Ozark Mountains of Missouri.

Casen voiced the indignation of the bottom lands against the game hogs who formerly swept the region of its wild turkeys, deer, bear, ducks, and other marketable creatures. One party of hunters in the fall of 1902 shot forty wild turkeys and sold them in the Memphis markets to "pay expenses." Another gang killed seven dozen ducks in a day for "sport," and sold them for expenses. 'Coons were hunted and trapped by the scores, and still there was a good deal of game left, though deer and bear were driven back five miles or more.

Life in the bottoms was different from Casen's mountain experience; but the opportunity to get rich was not to be neglected. Land that could be purchased for \$1.25 an acre would pay for itself in the clearing many times over, now that saw-mills were reaching back that far for timber; and once this land was cleared, cotton land, valued at \$30 an acre, was ready for the planting. Casen had a quarter section—180 acres—to clear, and he pictured himself a plantation owner in a very few years. Of course there are drawbacks; one of which is the overflow that covers all the land to depths from a few inches to thirty feet. Men build cabin boats in the swamps to live in during the high water, if the land on which they live is subject to flooding in ordinary high water; but those whose land has a "high ridge" on it are overflowed in unusual years only, and then they must build flats or rafts, and while saving their own lives, see their cattle and horses and hogs topple over and drown when the icy water has chilled them so that they can no longer stand.

We ate biscuit, rabbit, duck, and corn bread for supper, and then amused ourselves with French harp and stories. One remark by Mrs. Casen indicated the swamp life better than most descriptions. She was one of the women who were scared when I asked questions at the new house up the river. Hearing me repeat the questions, and remembering that the old woman had told me 12 miles to Parkins, and Casen said the distance was really 18 miles from his house, she said:

"We didn't know how far it was. The men folks has been there, but we never has."

Here were women—one of them at least fifty years old—who had never seen two dwelling houses standing side by side; they had never seen a town of other description than a lone cabin, with the sign "Post-Office" printed in rude capitals on a rough sawed plank over the door. The newspapers with which the flimsy cloth they purchased at the "store house" or of the wandering peddler, was wrapped, were meaningless sheets to them. Election day means the time when the men folks "go to town" and come back with tales of fighting. Fancy how much these women hear about the horse show, wireless telegraph, automobiles, and other spasms and symptoms indicating the wonders of the human mind and progress as seen in New York.

However, they have their own affairs. A saw-mill was being built not five miles distant; pearl diggers had appeared—"even niggers!"—clearings were being made, and a load of cotton already taken to market foreshadowed the whirr of cotton-gin and wide fields devoted to the "staple product of the valley." For people who had never been able to see two hundred yards "without squinting through the bresh," a mile wide cotton field was something to be hoped for, even if the scene was not first in their minds.

When the youth who stuttered displayed his patent leathers, the woman whose waist and bust lines were perfectly natural, asked him:

"Gwin to spo't 'round a little?" The answer was a wink and an embarrassed grin. There was that in the woman's tone which indicated that the inborn wisdom of the sex in the swamps is not less than in regions where the figure is more restricted and the mind less so. The subtle compliment was not lost on any of the men present.

RAYMOND S. SPEARS.

*Christmas will be all the pleasanter to look back upon through 1905 if among the gifts of the day shall have been a paid-up subscription to FOREST AND STREAM. It is a gift which renews itself every week, it loses nothing by age, never becomes an old story, keeps its interest, and is as acceptable on its fifty-second coming as on the first. For a sportsman old or young the FOREST AND STREAM is a most appropriate Christmas gift.

Trails of the Pathfinders.—XXII.

(Concluded from page 466.)

Commerce of the Prairies.

In 1839, after having been only a few months in the "States," Gregg was unable to resist his longing for the free life of the prairies and began to make preparations for another trip to the Mexican settlements. At that time the ports of Mexico were blockaded by French men-of-war, and the demand for goods was great, with a prospect of correspondingly high prices. Late in April the wagon train, loaded with twenty-five thousand dollars' worth of goods, crossed the Arkansas, not far from the mouth of the Canadian fork. They had not proceeded far before they lost a teamster; "a Cherokee shop-keeper came up to us with an attachment for debt against a free mulatto, whom we had engaged as teamster. The poor fellow had no alternative but to return with the importunate creditor, who committed him at once to the care of 'Judge Lynch' for trial. We ascertained afterward that he had been sentenced to 'take the benefit of the bankrupt law' after the manner of the Cherokees of that neighborhood. This is done by stripping and tying the victim to a tree; when each creditor, with a good cowhide or hickory switch in his hand, scores the amount of the bill due upon his bare back. One stripe for every dollar due is the usual process of 'whitewashing'; and as the application of the lash is accompanied by all sorts of quaint remarks, the exhibition affords no small merriment to those present, with the exception, no doubt, of the delinquent himself. After the ordeal is over, the creditors declare themselves perfectly satisfied: nor could they, as is said, ever be persuaded thereafter to receive one red cent of the amount due, even if it were offered to them. As the poor mulatto was also in our debt, and was perhaps apprehensive that we might exact payment in the same currency, he never showed himself again."

The party just setting out were well armed with Colt's repeating rifles and revolvers, and carried besides, two small cannon. Among the men were a number of young fellows from the east, most of them quite without prairie experience. They had not been many days out when one of the party, out hunting, became lost, and not returning at night, muskets were fired to guide him to camp; but he imagined that the firing was done by hostile Indians, and fled from the sound. Finally, according to his statement, he was attacked during the night by a panther, which he succeeded in beating off with the butt of his gun. It was imagined, however, from the peculiar odor with which the shattered gun was still redolent when he reached camp, that the "painter" that he had driven off was not many degrees removed in affinity from a skunk.

When the train reached the north fork of the Canadian, they met with a considerable camp of Comanches, with whom they had some friendly intercourse. With them was a body of United States Dragoons, under Lieut. Bowman, to whom had been entrusted the task of trying to make peace with the Comanches, and so protecting the settlements of the border. Among these Comanches were a number of Mexican captives—women, boys and small children—of whom Gregg notes that a number of them were still well able to speak Spanish. In other words, their captivity had been so short that they had a clear memory of the events of earlier life. An effort was made to purchase several of these captives, in order to return them to their homes. Most of them, however, were unwilling to go, and for a variety of reasons; one of the lads, only ten or twelve years old, explaining that by his life among the Indians he had become "now too much of a brute to live among Christians." One lad Gregg did purchase, and was repaid by much gratitude.

It was near the Canadian River, which they had now reached, that a small party of Americans experienced terrible suffering in the winter of 1832 and '33. "The party," Gregg says, "consisted of twelve men, chiefly citizens of Missouri. Their baggage and about ten thousand dollars in specie were packed upon mules. They took the route of the Canadian River, fearing to venture on the northern prairies at that season of the year. Having left Santa Fé in December, they had proceeded without accident thus far, when a large body of Comanches and Kiawas were seen advancing toward them. Being well acquainted with the treacherous and pusillanimous disposition of those races, the traders prepared at once for defense; but the savages having made a halt at some distance, began to approach one by one, or in small parties, making a great show of friendship all the while, until most of them had collected on the spot. Finding themselves surrounded in every direction, the travelers now began to move on, in hopes of getting rid of the intruders; but the latter were equally ready for the start, and, mounting their horses, kept jogging on in the same direction. The first act of hostility perpetrated by the Indians proved fatal to one of the American traders named Pratt, who was shot dead while attempting to secure two mules which had become separated from the rest. Upon this, the companions of the slain man immediately dismounted and commenced a fire upon the Indians, which was warmly returned, whereby another man of the name of Mitchell was killed.

"By this time the traders had taken off their packs and piled them around for protection; and now falling to work with their hands, they very soon scratched out a trench deep enough to protect them from the shot of the enemy. The latter made several desperate charges, but they seemed too careful of their own personal safety, notwithstanding the enormous superiority of their numbers, to venture too near the rifles of the Americans. In a few hours all the animals of the traders were either killed or wounded, but no personal damage was done to the remaining ten men, with the exception of a wound in the thigh received by one, which was not at the time considered dangerous.

"During the siege, the Americans were in great danger of perishing from thirst, as the Indians had complete command of all the water within reach. Starvation was not so much to be dreaded, because, in cases of necessity, they could live on the flesh of their

slain animals, some of which lay stretched close around them. After being pent up for thirty-six hours in this horrible hole, during which time they had seldom ventured to raise their heads above the surface without being shot at, they resolved to make a bold sortie in the night, as any death was preferable to the death that awaited them there. As there was not an animal left that was at all in a condition to travel, the owners of the money gave permission to all to take and appropriate to themselves whatever amount each man could safely undertake to carry. In this way they started with a few hundred dollars, of which but little ever reached the United States. The remainder was buried deep in the sand, in hope that it might escape the cupidity of the savages, but to very little purpose, for they were afterward seen by some Mexican traders making a great display of specie, which was without doubt taken from this unfortunate cache.

"With every prospect of being discovered, overtaken and butchered, but resolved to sell their lives as dearly as possible, they at last emerged from their hiding-place, and moved on silently and slowly until they found themselves beyond the purlieu of the Indian camps. Often did they look back in the direction where three to five hundred savages were supposed to watch their movements, but, much to their astonishment, no one appeared to be in pursuit. The Indians, believing, no doubt, that the property of the traders would come into their hands, and having no amateur predilection for taking scalps at the risk of losing their own, appeared willing enough to let the spoliated adventurers depart without further molestation.

"The destitute travelers, having run themselves short of provisions, and being no longer able to kill game for want of materials to load their rifles, they were very soon reduced to the necessity of sustaining life upon roots and the tender bark of trees. After traveling for several days in this desperate condition, with lacerated feet, and utter prostration of mind and body, they began to disagree among themselves about the route to be pursued, and eventually separated into two distinct parties. Five of these unhappy men steered a westward course, and after a succession of sufferings and privations which almost surpassed belief, they reached the settlements of the Creek Indians, near the Arkansas River, where they were treated with great kindness and hospitality. The other five wandered about in the greatest state of distress and bewilderment, and only two finally succeeded in getting out of the mazes of the wilderness."*

After many difficulties, Gregg reached Santa Fé again, and prepared to start south for Chihuahua, where a better market for his goods was expected. They crossed the famous Jornada del Muerto, and reached El Paso del Norte, and at last Chihuahua. Here was a country devoted to cattle raising; the herds, according to Gregg, being almost as numerous as those of the buffalo to the northern plains. Some time was devoted to journeying through northern Mexico.

One of the largest cities visited was Durango, one of the handsomest cities of northern Mexico, having at that time a population of about 20,000. Situated in a level plain, surrounded on all sides by low mountains, it presented two or three handsome squares, with fine buildings, and some splendid churches. "Durango is the first northern city in which there is to be found any evidence of that variety of tropical fruits, for which southern Mexico is so justly famed. Although it was rather out of season, yet the market actually teemed with all that is most rich and exquisite in this kind of produce. The *maguery*, from which is extracted the popular beverage, called *pulque*, is not only cultivated extensively in the fields, but grows wild everywhere upon the plains. This being the height of the pulque season, a hundred shanties might be seen loaded with jugs and goblets filled with this favorite liquor, from its sweetest unfermented state to the grade of 'hard cider'; while the incessant cries of 'Pulque, pulque dulce! pulque bueno!' added to the shrill and discordant notes of the fruit venders, created a confusion of sounds, amid which it was impossible to hear oneself talk.

"Durango is also celebrated as being the headquarters, as it were, of the whole scorpion family. During the spring, especially, so much are the houses infested by these poisonous insects, that many people are obliged to have resort to a kind of mosquito-bar, in order to keep them out of their beds at night. As an expedient to deliver the city from this terrible pest, a society has actually been formed, which pays a reward of a *cuartilla* (three cents) for every *alacran* (or scorpion) that is brought to them. Stimulated by the desire of gain, the idle boys of the city are always on the lookout, so that, in the course of a year, immense numbers of this public enemy are captured and slaughtered. The body of this insect is of the bulk and cast of a medium spider, with a jointed tail one or two inches long, at the end of which is a sting whose wounds are so poisonous as often to prove fatal to children, and are very painful to adults.

"The most extraordinary peculiarity of these scorpions is, that they are far less dangerous in the north than in the south, which in some manner accounts for the story told Capt. Pike, that even those of Durango lose most of their venom as soon as they are removed a few miles from the city."

On his return to Santa Fé, Gregg, having ordered his men to "rope a beef" for food, from the herds which covered the plains, got into trouble with the Mexican authorities, and was greatly delayed, being taken back to Chihuahua, tried for his offense, but acquitted on the ground of ignorance of the laws and the customs of the country.

Shortly before they reached the Staked Plains, on their return, they were attacked by a war party of Pawnees, on foot, who succeeded in running off a few of the horses, and in wounding two or three men. Their Comanche guide took them safely across the plains, until at last they reached the Canadian River. Gregg relates of the winds of the prairie: "It will often blow a gale for days, and even weeks together, without slackening for a moment, except occasionally at

*Mooney—Kiowa Calendar, p. 255—gives the account of this occurrence from Kiowa sources. They say that one Indian, Black Wolf, was killed in the fight.

night. It is for this reason, as well as on account of the rains, that percussion guns are preferable upon the prairies, particularly for those who understand their use. The winds are frequently so severe as to sweep away both sparks and priming from a flintlock, and thus render it wholly ineffective.

While following down the Canadian they found buffalo very abundant, and the gentleness and lack of suspicion of the animal is noted. "On one occasion, two or three hunters, who were a little in advance of the caravan, perceiving a herd quietly grazing in an open glade, they 'crawled upon' them after the manner of the 'stillhunters.' Their first shot having brought down a fine fat cow, they slipped up behind her, and resting their guns over her body, shot two or three others, without occasioning any serious disturbance or surprise to their companions; for, extraordinary as it may appear, if the buffalo neither see nor smell the hunter, they will pay but little attention to the crack of guns, or to the mortality which is being dealt among them."

Gregg's praiseworthy reflections on the wanton killing of the buffalo are made in entire good faith, yet only a day or two later he frankly confesses to some unnecessary killing that he did himself. He says of the excessive destruction: "The slaughter of these animals is frequently carried to an excess, which shows the depravity of the human heart in very bold relief. Such is the excitement that generally prevails at the sight of these fat denizens of the prairies, that very few hunters appear able to refrain from shooting as long as the game remains within reach of their rifles; nor can they ever permit a fair shot to escape them. Whether the mere pleasure of taking life is the incentive of these brutal excesses, I will not pretend to decide; but one thing is very certain, that the buffalo killed on these prairies far exceeds the wants of the travelers; or what might be looked upon as the exigencies of rational sport." In a footnote he adds: "The same barbarous propensity is observable in regard to wild horses. Most persons appear unable to restrain this wanton inclination to take life, when a mustang approaches within rifle shot. Many a stately steed thus falls a victim to the cruelty of man."

In April, 1840, Gregg reached the end of his journey—his last trip upon the plains. He was as susceptible as other men have shown themselves to the attractions of the free life of the prairie, its "sovereign independence;" but acknowledges the disadvantages which follow an almost entire separation from one's fellow men. Nevertheless, "Since that time," he says, "I have striven in vain to reconcile myself to the even tenor of civilized life in the United States; and have sought in its amusements and its society a substitute for those high excitements which have attached me so strongly to prairie life. Yet I am almost ashamed to confess that scarcely a day passes without my experiencing a pang of regret that I am not now roving at large upon those western plains. Nor do I find my taste peculiar; for I have hardly known a man who has ever become familiar with the kind of life which I have led for so many years, that has not relinquished it with regret."

In his account of animals of the prairies, Gregg names first the mustang; and here we find one of the earliest mentions of a traditional wild horse, which has come down in many a story.

"The beauty of the mustang is proverbial," he writes. "One in particular has been celebrated by hunters, of which marvelous stories are told. He has been represented as a medium-sized stallion of perfect symmetry, milk-white, save a pair of black ears—a natural 'pacer,' and so fleet, it is said, as to leave far behind every horse that had been tried in pursuit of him, without breaking his 'pace.' But I infer that this story is somewhat mythical, from the difficulty which one finds in fixing the abiding place of its equine hero. He is familiarly known, by common report, all over the great prairies. The trapper celebrates him in the vicinity of the northern Rocky Mountains; the hunter on

the Arkansas or in the midst of the plains, while others have him pacing at the rate of half a mile a minute on the borders of Texas. It is hardly a matter of surprise, then, that a creature of such an ubiquitary existence should never have been caught.

"The wild horses are generally well-formed, with trim and clean limbs; still their elegance has been much exaggerated by travelers, because they have seen them at large, abandoned to their wild and natural gaiety. Then, it is true, they appear superb indeed; but when caught and tamed, they generally dwindle down to ordinary ponies. Large droves are very frequently seen upon the prairies, sometimes of hundreds together, gambolling and curvetting within a short distance of the caravans. It is sometimes difficult to keep them from dashing among the loose stock of the traveler, which would be exceedingly dangerous, for, once together, they are hard to separate again, particularly if the number of mustangs is much the greatest. It is a singular fact, that the gentlest wagon-horse (even though quite fagged with travel), once among a drove of mustangs, will often acquire in a few hours all the intractable wildness of his untamed companions."

It is many years since the real mustang has been seen on the prairie. To-day his place is taken by the range horse, an animal of very different character, though of similar habits. Yet, we well recall a time, long before the day of the range, and its cattle or horses, when journeying through the southern country, little bands of mustangs could sometimes be seen. One such, which passed once close to our command, was noticeable for the presence among its numbers of a gigantic mule, which it had picked up from some traveling party, and which was now as wild as the horses themselves.

Naturally, Gregg has much to say about the buffalo, and he voices an impression which long had currency, and may still be believed by people, that the bulls were sentinels and guards for the cows and calves. Speaking in general terms, he says, "A buffalo cow is about as heavy as a common ox, while a large fat bull will weigh perhaps double as much."

"These are very gregarious animals. At some seasons, however, the cows rather incline to keep to themselves; at other times they are mostly seen in the center of the gang, while the bulls are scattered around, frequently to a considerable distance, evidently guarding the cows and calves. And on the outskirts of the buffalo range, we are apt to meet with small gangs of bulls alone, a day or two's travel distant, as though performing the office of 'pique guards' for the main herds."

He inveighs against the slaughter of the buffalo, which was even then so great, and says: "It is believed that the annual 'export' of buffalo rugs—often, but it would seem improperly, called 'buffalo robes'—from the prairies and bordering 'buffalo range,' is about a hundred thousand; and the number killed wantonly, or exclusively for meat, is no doubt still greater, as the skins are fit to dress scarcely half the year." A good description of the mass of the buffalo, and of their alarming appearance, is given in a sentence, where he tells of having turned a frightened gang, which was rushing toward him. They had parted and run by; "still their advance is somewhat frightful—their thundering rumble over the dry plains, their lion-like fronts and dangling beards, their open mouths and hanging tongues—as they come on, puffing like a locomotive engine at every bound, does at first make the blood settle a little heavy about the heart."

In his remarks about the gray wolf, and its habits, he touches on a subject which has more than once come up in *FOREST AND STREAM*, and elsewhere—that is to say, the question as to whether the big wolf of America ever voluntarily attacks man. He says: "I have never known these animals, rapacious as they are, extend their attacks to man, though they probably would, if very hungry, and a favorable opportunity presented itself. I shall not soon forget an adventure with one of them, many years ago, on the frontier of Missouri. Riding near the prairie border, I perceived one

of the largest and fiercest of the gray species, which had just descended from the west, and seemed famished to desperation. I at once prepared for a chase and, being without arms, I caught up a cudgel, when I betook me valiantly to the charge, much stronger, as I soon discovered, in my cause than in my equipment. The wolf was in no humor to flee, however, but boldly met me the full half-way. I was soon disarmed, for my club broke upon the animal's head. He then 'laid to' my horse's legs, which, not relishing the conflict, gave a plunge and sent me whirling over his head, and made his escape, leaving me and the wolf at close quarters. I was no sooner upon my feet than my antagonist renewed the charge; but, being without weapon, or any means of awakening an emotion of terror, save through his imagination, I took off my large black hat, and using it for a shield, began to thrust it toward his gaping jaws. My ruse had the desired effect, for, after springing at me a few times, he wheeled about and trotted off several paces, and stopped to gaze at me. Being apprehensive that he might change his mind and return to the attack, and conscious that, under the compromise, I had the best of the bargain, I very resolutely took to my heels, glad of the opportunity of making a draw game, though I had myself given the challenge."

Gregg devotes considerable space to a discussion of the aborigines of America, and among these he mentions most of the prairie tribes. He speaks at some length of what we now call the civilized tribes—that is to say, the Cherokees, Creeks, Choctaws, Chickasaws and Seminoles. He notes the dreadful evil that liquor has created among the Indians, and gives, at the same time, a somewhat amusing account of the Legislative Council among the Choctaws, where whiskey was banished from the nation: "Many and long were the speeches which were made, and much enthusiasm was created against the monster 'whiskey,' and all his brood of compound enormities. Still every one seemed loth to move his arrest and execution. Finally, a captain of more than ordinary temerity arose, and offered a resolution that each and every individual who should thenceforth dare to introduce any of the liquid curse into their country, should be punished with a hundred lashes on his bare back, and the liquor be poured out. This was passed, after some slight changes, by acclamation; but, with a due sense of the injustice of ex-post-facto restrictions, all those who had liquors on hand were permitted to sell them. The council adjourned; but the members soon began to canvass among each other the pernicious consequences which might result from the protracted use of the whiskey already in the shops, and therefore concluded the quicker it was drank up, the more promptly would the evil be over: so, falling to, in less than two hours Bacchus never mustered a drunker troop than were these same temperance legislators. The consequence of their determination were of lasting importance to them. The law, with some slight improvements, has ever since been rigorously enforced."

It is interesting to note that the Comanches, while bitterly at war with the Mexicans and the Texans, for very many years, nevertheless, cultivated peace with the New Mexicans, "not only because the poverty of the country offers fewer inducements for their inroads, but because it is desirable, as with the interior Mexican tribes, to retain some friendly point with which to keep an amicable intercourse and traffic. Parties of them have therefore sometimes entered the settlements of New Mexico for trading purposes; while every season numerous bands of New Mexicans, known as Comancheros, supplied with arms, ammunition, trinkets, provisions, and other necessities, launch upon the prairies to barter for mules, and the different fruits of their ravages upon the south."

Gregg's history of these first beginnings of the westward commerce of the United States is a most valuable and interesting repository of the facts of the period. It purports to be only a diary of a trader, but actually it is history.

GEORGE BIRD GRINNELL.

NATURAL HISTORY

American Ornithologists' Union.

THE Twenty-second Congress of the American Ornithologists' Union convened in Cambridge, Mass., Monday evening, November 28. The business meeting was held in Mr. William Brewster's museum, and the public sessions, commencing Tuesday, November 29, and lasting three days, were held in the Nash lecture room of the University Museum.

The fellows present were: Chas. B. Cory, Outram Bangs, and H. A. Purdie, of Boston; William Brewster and Chas. F. Batchelder, of Cambridge; Drs. J. A. Allen, Jonathan Dwight, Jr., and Messrs. Frank M. Chapman and William Dutcher, of New York city; Ruthven Deane, of Chicago; Henry W. Henshaw, of Hilo, Hawaii; Drs. A. K. Fisher, T. S. Palmer, and Merrs. E. W. Nelson and H. C. Oberholser, of Washington, D. C.; Dr. Louis B. Bishop, of New Haven, and John H. Sage, of Portland, Conn.

Among the other members present during the sessions were: Glover M. Allen, Geo. H. Mackay, Walter Deane, Ralph Hoffmann, Francis H. Allen, J. D. Sornborger, E. H. Forbush, A. C. Bent, Miss Harriet E. Freeman, Rev. Wm. R. Lord, Geo. C. Deane, Chas. E. Ingalls, W. R. Davis, H. G. Higbee, Owen Durfee, R. H. Howe, Jr.; Max Boewe, Mrs. Lidian E. Bridge, T. Otis Fuller, A. C. Comey, J. Stanley Howard, C. E. Bailey, Miss Helen A. Ball, Miss Emma G. Cummings, Prof. C. F. Hodge, F. H. Kennard, Harold Bowditch, F. B. McKechnie, John B. Wheeler, Rev. H. W. Gleason, H. Porter Hall, Miss Harriet E. Richards, Bradford Torrey, Miss Helen Granger, A. H. Clark, Dr. C. W. Townsend, Chas. H.

French, C. W. Chamberlain, Mantin Copeland, Howard M. Turner, Wm. L. Underwood, Richard S. Eustis, Miss Fannie A. Stebbins, Mrs. Wm. Howell Reed and Elizabeth S. Hill, of Massachusetts; Prof. T. Gilbert Pearson, of North Carolina; Louis Agassiz Fuertes, Geo. O. Shields; John Lewis Childs, Miss Eliza S. Blunt, and John T. Nichols, of New York; Mrs. Elizabeth B. Davenport, Mrs. Carrie W. Ormsbee, and Miss Isabel M. Padlock, of Vermont; Fred. B. Spaulding, of New Hampshire; Rev. H. K. Job and Mrs. Eustace L. Allen, of Connecticut; James H. Fleming, of Toronto, Canada; Arthur H. Norton and J. M. Swain, of Maine; W. E. Clyde Todd, of Pittsburg; Mrs. Irene G. Wheelock, of Chicago; Henry Oldys, of Washington, D. C., and Wm. L. Finley, of Portland, Oregon.

Chas. B. Cory was re-elected President; C. F. Batchelder and E. W. Nelson, Vice-Presidents; John H. Sage, Secretary; Jonathan Dwight, Jr., Treasurer; Frank M. Chapman, Ruthven Deane, A. K. Fisher, Thos. S. Roberts, Witmer Stone, William Dutcher, and C. W. Richmond, members of the Council.

Three associates were elected to the class known as Members, and 125 new associates were elected, the largest number in any one year since the society was founded.

Papers of universal interest on the subject of bird migration were presented by Prof. W. W. Cooke and Dr. Louis B. Bishop, and the conclusions reached seemed reasonable.

Mr. E. H. Forbush referred to certain disappearing birds, and asked that information concerning them be sent to the Massachusetts State Board of Agriculture.

Mrs. Irene G. Wheelock gave a detailed account of her

studies, extending over many years, on the regurgitative feeding of nestlings. Her paper created much discussion.

Mr. Wm. L. Finley's papers on the land birds of Oregon and California and the sea birds of the Oregon coast, illustrated as they were by beautiful lantern slides, showed what exceptional opportunities he had had for studying the avifauna of the Pacific region.

In his paper on the nesting habits of the flamingo, Mr. Chapman exhibited most excellent views from photographs which he had taken of the birds in the Bahamas. He observed much there that was new concerning the domestic life of the species.

Mr. Henry Oldys spoke of some interesting bird songs, and Mr. Fuertes gave imitations of bird notes and explained the habits of the birds.

A valuable paper on the birds of the sandhill region of Nebraska was presented by Dr. Robert H. Wolcott. His observations covered a section of the country very little known.

Rev. H. K. Job showed a large series of lantern slides from photographs of shore birds, herons, and water fowl, and explained the ingenious expedients to which he resorted in order to secure good results.

From the report of the Committee on Protection of North American Birds, read by its chairman, Mr. William Dutcher, it was evident that satisfactory results had been obtained during the past year, and that interest in the preservation of wild bird life was not lacking at the present time.

In the absence of Prof. C. F. Hodge, of Worcester, so well known for his successful experiments in rearing ruffed grouse in confinement, Miss Helen A. Ball ex-

plained a series of lantern slides showing the different stages of growth of the grouse from the chick to adult plumage. She stated that the young became very tame—eating from the hand—and that two adult wild birds placed in the inclosure with the others soon showed no fear. In a short time it was impossible to distinguish them, either in plumage or habits, from those raised in confinement.

On Friday after adjournment of the Union, Mr. Harold Bowditch, with other local ornithologists, conducted a party to Ipswich, an historic locality for bird students.

The social features of the congress just closed will long be remembered, for nothing could exceed the cordial welcome shown by the local committee and by the members of the Nuttall Ornithological Club.

The next annual meeting will be in New York city, in November, 1905.

Following is a list of the papers read at the sessions:

"A Review of the Gulls Which Have Light-Colored Primaries." Jonathan Dwight, Jr., New York city.

"An Untenable Theory of Bird Migration." Wells W. Cooke, Washington, D.C.

"Regurgitative Feeding of Nestlings." Irene G. Wheelock, Evanston, Ill.

"The Direction of Flight in the Fall Migration at New Haven." Louis B. Bishop, New Haven, Conn.

"Some Interesting 1904 Bird Songs." Henry Oldys, Washington, D.C.

"The Status of *Helminthophila leucobronchialis* and *Helminthophila lawrencei*." Louis B. Bishop, New Haven, Conn.

"Wear in Its Relation to Subspecies." Jonathan Dwight, Jr., New York city.

"The Psychological Conditions of Bird Study." Wm. R. Lord, Rockland, Mass.

"Some Disappearing Birds and Suggestions for Their Protection." E. H. Forbush, Wareham, Mass.

"Florida Notes." Illustrated by lantern slides. Frank M. Chapman, New York city.

"The Land Birds of Oregon and California." Illustrated by lantern slides. Wm. L. Finley, Portland, Oregon.

"Experiments in Rearing Ruffed Grouse in Confinement." Illustrated by lantern slides. C. F. Hodge, Worcester, Mass.

"Some Strange Bird Notes—A Mystery." E. H. Forbush, Wareham, Mass.

"*Cyanocitta cristata* and Other Eastern Birds at Wray, Yuma County, Colorado." Horace G. Smith, Denver, Colo.

"The Birds of the Southern West Indies." A. H. Clark, Boston, Mass.

"Ornithology of a Churchyard." B. S. Bowditch, New York city.

"The Nesting Habits of the Flamingo." Illustrated by lantern slides. Frank M. Chapman, New York city.

"The Sea Birds of the Oregon Coast." Illustrated by lantern slides. Wm. L. Finley, Portland, Oregon.

"Exhibition of Lantern Slides." Wm. L. Bailly, Ardmore, Pa.

"Illustrated Readings from Thoreau's Journals." H. W. Gleason, Boston, Mass.

"Experiments With Nesting Boxes." Illustrated by lantern slides. E. H. Forbush, Wareham, Mass.

"Report of the Chairman of the Committee on the Protection of North American Birds." Wm. Dutcher, New York city.

"Observations on the Birds of the Sandhill Region of Nebraska." Illustrated by lantern slides. Robert H. Wolcott, Lincoln, Nebraska.

"The Season's Experiences with Shore Birds, Herons, and Water Fowl." Illustrated by lantern slides. Herbert K. Job, Kent, Conn.

From the Sportsman's Viewpoint.

None of the papers and illustrated lectures of the meeting appealed quite so strongly to sportsmen as that elucidating the experiment by Prof. C. F. Hodge, of Clark University, Worcester, in the rearing of partridges. A young lady told the story of the Professor's success in raising grouse from the egg, and teaching wild birds to eat from his hand. Some of the pictures showed the development of the captured chicks, picked from the shell which recently inclosed them. At least a score of views were required to bring the birds to maturity. They were shown "dusting" themselves in the earth, stretching their necks for grapes, of which they are very fond; standing on the Professor's knee and eating from his hand; making music on a log (drumming); strutting about with widespread tail, and neck feathers puffed out. Many men have tried the experiment of domesticating the partridge, but hitherto without success, and so the belief has become general that the bird is untamable. Prof. Hodge has been able in a single day to induce wild birds by the example set them by the home-reared ones to jump to his knee and eat grain, beechnuts, grapes and other things. The bird shows wonderful quickness in discerning an enemy, but when it is sure of kind treatment is not averse to human society. Your readers who have visited the island in Rangeley Lake owned by Mr. Dickson, of Philadelphia, where gunning is prohibited, can testify that the grouse there are almost as tame as barnyard fowl. Many have flown over from the mainland to this place of refuge, and now in summer they often show themselves on the piazza looking for crumbs or grain. Not long ago one took a look into the upstairs part of the boat house and was picked up by one of the men, and when he set the bird on the ground outside he shook his feathers unconcernedly and walked away in the most deliberate manner possible. All sportsmen will rejoice if Prof. Hodge will continue his experiments until he is able to "blaze the way" for the rearing of grouse in captivity—"a consummation devoutly to be wished."

On Thursday afternoon was held a joint meeting of the Audubon Society and Ornithologists' Union, at which Prof. C. B. Cory presided. The chief feature was the report of Dr. Wm. Dutcher, of New York, who spoke for the National Committee on the Protection of North American birds. He explained the objects for which the Audubon societies are working. Its methods are by lectures, holding meetings, distributing educational literature in reference to the aesthetic and economic value of birds and animals, promoting comprehensive and uniform legis-

lation, and the employment of wardens to protect colonies of birds during the breeding season. He said: "I am glad to be able to present the best report of work done since the organization of the society." Some of its main features are the following: The adoption of the model law in Louisiana and Mississippi, thus helping to close the gap in the coast States; the organization of an active, aggressive Audubon Society, now doing splendid work in California; a largely increased membership in the societies of many States; a large bird reservation, including seven islands, in the Gulf of Mexico made by President Roosevelt at the request of the national association. Thirty-five wardens were employed during the year, and the colonies of birds guarded by them show a remarkable increase, not having been disturbed by hunters or eggers. These wardens were located, ten in Maine, one in Massachusetts, two in New York, eight in Virginia, four in North Carolina, four in Florida, two in Oregon, one each in Texas, Michigan, and Louisiana. A special warden has been placed in charge of the reservation above mentioned. Literature has been sent out to agriculturists and the public schools. Illustrated lectures have been loaned to schools and societies. Several lecturers have been in the field advocating the objects of the Audubon societies. Most valuable aid has been rendered by the United States Department of Agriculture, Post-Office Department, Lighthouse Department, and Department of the Interior. Plans set forth for the coming year are to secure additional legislation, to defend our laws from objectionable amendments, to organize additional societies, prosecute the educational work in every direction, and to increase the number of bird guards as fast as our means will permit. It is also proposed to incorporate the National Association of Audubon Societies, that it may legally receive bequests and gifts for carrying on its work. Mr. Dutcher informed the audience that a New York philanthropist had already made a bequest of \$100,000, and it is proposed to appeal to the bird lovers of the country to increase the amount to \$1,000,000, the interest of this fund to be used for wild bird and animal protection in North America.

At the morning session, Dr. T. S. Palmer, of Washington, gave a talk on the "Prairie Chicken." Cumulative records were presented by colored maps showing the range of the bird and the methods of obtaining data. He expressed the opinion that the outlook for continuance of the species is most encouraging. In Nebraska shipments have practically ceased, and in many States a close season has been adopted, and all violations are followed up. In some States their killing has been prohibited temporarily in order to insure future abundance. In many markets where they used to be sold by thousands there are now none on sale. More are sold in Boston than anywhere else.

CENTRAL.

New Light Among Unnaturalists.

IN spite of all the pow-wow among the scientists over the new school of natural history writers, they seem to thrive, and one of them has just written a book, which even Mr. John Burroughs cannot fail to commend. More than any of its predecessors, it brings to light the principles, or the lack of them, underlying the school of the "Unnaturalists" and adds to old acquaintances a new and notable "Book of Clever Beasts." The book is published by G. P. Putnam's Sons and purports to be by Miss Myrtle Reed. We conjecture, from internal evidence, that it has been edited by Miss Reed. It would have taken a very clever man to write it. All the higher critics of Birdville Center are at loggerheads over the authorship. One, a woman-hater, declares that it is much too clever to have been written by any mere woman. Another thinks that some of the incidents smack too much of those of other famous animals already recorded; but everybody who has read Mr. Thompson-Seton's delightful works knows that animals repeat themselves, else how could his "Wully" have been so much like Red Wully in "Bob, Son of Battle"? The artist at the Center, who has carefully studied Mr. Peter Newell's illustrations, and who knows how Mr. Newell can topsy-turvy anything into anything else he pleases, reports that there is no cryptogram concealed in the illustrations. The general impression is that this is the last work of Mr. Sitdown, who very likely died of mental exhaustion, leaving nothing behind him but this manuscript, which has been put in order for the press by Miss Reed, whose name the publishers inadvertently left on the title-page, after the manner of a book, which has recently received much attention in FOREST AND STREAM.

The little book, which seems to be as veracious as any of the recent books on natural history, tells of Mr. Johnson-Sitdown's experience as a "Little Brother of the Woods." He lives in the forest, a quiet and retired life, making notes upon the creatures for whose lives he has obtained contracts from the publishers. The others have little interest for him. "I knew Hoot-Mon (the owl) of course—every Little Brother of the Woods knows Hoot-Mon—but an article on him had not yet been ordered, and so I made no special study of him." It is only later that he makes the acquaintance which ripened into such a beautiful friendship. "I had written about everything I knew for the magazines, and my work was still in demand, but, seemingly, there were no new animals." Then only does he begin to cultivate Hoot-Mon. He discovers the nest, "long and narrow, with a great bundle of feathers at one end for a pillow. Hoot-Mon was asleep, lying flat on his back, with a blanket made of rabbit skins over him, snoring audibly. In the bottom of the nest was a hare mattress. I did not disturb him, for he works at night and needs his sleep in the daytime."

This thoughtfulness pervades and beautifies the book. Mr. Sitdown seldom fails to call attention to his kindheartedness—and his jeweled repeater. "I never shot any more ducks," he says again, "and refused, ever afterward, to wear duck trousers in summertime. These garments are really a luxury, being made of canvas-back duck."

"I do not claim that my owl was more brilliant than the owls of my fellow unnaturalists, but only that I had superior opportunities to study. When a Little

Brother of the Woods sees anything that I have missed, I do not call him a liar, and I expect others to pay the same courtesy to me."

While waiting for these compliments to be returned, Mr. O. Sitdown-Johnson Johnson-Sitdown—to give him his full name—lived a whole winter with Hoot-Mon. "Often he got hungry for his own kind of food, and at such times I would put on some red flannel stockings I had made for him, without feet; a red flannel shawl, pinned closely at the throat, and a face-mask, also of red flannel, with openings for the eyes and beak and those wonderful ears, of which I have spoken before. He got so that whenever he wished to go hunting, he would search out these articles from the corner in the cabin, where they were kept—never forgetting the safety-pin that fastened the shawl—bring them to me and stand very still while I put them on."

Later on we read of the pathetic end of Hoot-Mon. He twisted his head entirely off—an event not without precedent in the literature of the "Little Brothers." "I was stunned, and it was more than an hour before I saw how it had happened. It was my own fault; no one but myself was to blame. An owl will turn his head but never his body, and Hoot-Mon had followed me around the stump with fond eyes until he had wrung his own neck." But, as the author admits when speaking of Jim Crow: "Even if Jim had not been so very dead, I could not have saved him, for in the words of a rival unnaturalist, 'there are no hospitals for sick crows.'"

Through such simple and unaffected accounts of actual friendship with the animals, we learn the life-histories of little Upsidaisi, the mouse; Jagg, the scoot-away goat; Snoof, the bear; Kitchi-Kitchi, the squirrel; Jim Crow; Hoop-la, the wonderful fox; Jenny Rag-tail, the rabbit; and Hoot-Mon, the owl. All are intelligent and affectionate beasts, ready at any time to instruct and amuse their human inferiors. There is less of sadness in this book than in most of its sort; the author skillfully avoids the tearful conclusion more than once. "It was not pleasant," he says on one occasion, "even though the end of a wild animal is always a tragedy. The only way to make a story of this kind untragic, is to quit before you get through."

When we consider the needless tears we have all shed over the true animals existing only in the imagination of the unnaturalists, we first begin to realize how much sweetness and light are added to existence by this discovery of Mr. Sitdown's. We can all do just what he did—"quit before we get through." No more shall we need to pursue these harrowing tales to the end—we are free to leave off anywhere, even before we begin. No other group of fiction writers ever so terrorized their audience, compelling their readers to weep over the funerals of those whose wedding bells they had just rung! What would novel-reading result in, if that were insisted on. A strike, gentle readers, But why should we submit in the case of the loves and the lives of the lower animals? Are their lives any more inevitably tragic than ours? What is tragedy anyway?

The book under review makes an appeal to reason not noted in any of its predecessors; it offers some proof of the statements contained. Lovers of truth are urged not to omit the appendix. (Probably all books, like all men, would have appendices if the publishers did not cut 'em out.)

"Realizing that much of this work must of necessity seem almost incredible to all save genuine Little Brothers of the Woods, I have, at great expense and difficulty, secured for exhibition purposes, a collection of relics which will fully substantiate every statement I have made."

"This exhibition will be an annual affair, and will be held in the main office of my publishers, on Nov. 31 only."

"Admission is free to all who hold a copy of this book under the left arm. Copies are not transferable."

"The complete catalogue will be found on the following pages."

Among the exhibits we note the following:

"A 4—Mainspring of my jeweled repeater."

"A 10—Returned manuscript. A 11, A 12, A 13, the same."

"E 16—Picture of me, showing crow's feet around eyes."

"G 8—Pen sketch of Jenny drawing map."

"G 9—Better picture of same thing—'Wild Animals I Have Known,' p. 122."

"G 20—Drawing of rabbit entertainment."

"G 21—Superior picture of same thing—'Ways of Wood Folk,' p. 250."

"H 28—Rabbit's tail in alcohol. (This exhibit has the words, 'A tragedy,' lettered on the bottle, being the end of a wild animal.)"

At last we have a succinct and satisfactory definition of what an animal tragedy is—it is a rabbit's tail! Mr. Johnson-Sitdown deserves the thanks of all seekers after truth for having discovered what was the will-o'-the-wisp which, for seven years or more, we have been chasing when we worked so anxiously, so tearfully to get the last glimpse of the tragic end of some wild animal!

FANNY HARDY ECKSTROM.

P. S.—The illustrations, by Peter Newell, are not tragic at all, even though they are killingly funny; but readers take their risks.

P. S. S.—It is hoped in order to accommodate FOREST AND STREAM readers, to whom this comes too late, that the publishers will re-open this exhibit on the second Saturday after Christmas, this present year. If some one else will head a petition to that effect, the present critic is willing to take the tragedy part of it.

The Linnaean Society of New York.

REGULAR meetings of the Society will be held at the American Museum of Natural History, 77th street and Eighth avenue, on Tuesday evening, December 13 and 27, at 8:15 o'clock.

December 13—B. S. Bowditch, "Photography in Nature Study." Illustrated by lantern slides.

December 27—C. G. Abbott, "A week with the Ospreys on Gardiner's Island." Illustrated by lantern slides.

C. G. ABBOTT, Secretary.

"Monarch, the Big Bear."

Editor Forest and Stream:

Western does not agree with my defense of Ernest Thompson Seton in FOREST AND STREAM for November 19. He says: "Dr. Morris' letter on the subject of Mr. Seton, Mr. Kelly and Monarch, does more credit to his genial cheerfulness of nature and his tolerance of human frailty than it does to his ethical sense."

Now, what are these books of Seton and of Kelly? They are nothing but literature, anyway. Some of us have been brought up in the hard school of science, where the slightest deviation from truth is a fly in the milk; but we love to step down into the garden of literature, where the fly is a butterfly, spreading its gorgeous wings over a single drop of milk just long enough to get potential for a new flight. It is a short step from biology down to metaphysics, from that to history, and then to pure literature. People who are fooled by literature would not get things straight anyway, so what is the difference so long as literature is enjoyable? Let it go at that.

Concerning my Redruff ideas that pleased Mr. Seton, Western says: "It happened that the proceeding did not touch Dr. Morris in a sensitive spot, so he doesn't mind." A man on earth has little time for bothering with sensitive spots. In fact, some of us hold that a sensitive man is a most dangerous element in society. His feelers come out like the claws of a basketful of crabs whenever a finger is pointed at him admiringly or in caution. Sensitive men are apt to reach out and pinch at anything that attracts their attention. Put your sensitive men in a basket and cover them up with sea weed where they can nab at each other, but out of sight of useful folks.

Western says further: "Suppose Mr. Seton had heard Dr. Morris give a detailed account of his treatment of a case of surgery, and had set himself up as a surgeon * * * and if he should happen to achieve brilliant success, would that make any difference concerning the doctor's convictions about the moral status of the affair?" Why, bless your soul, my good Western, do you not know that that is just what happens every day in our professional life? Whenever I spend time, money, and labor in developing a new procedure, the first thing that comes out of it is a ferocious attack from colleagues who have not as yet given the matter attention. That is not only right, but desirable, because so many fanciful things are foisted upon the public by well-meaning doctors that the only safeguard lies in battling every head that bobs up with a new idea. The idea when let loose will care for itself if it is sound. The next result is that after the fighting is over my product is appropriated by men who have not had to bear the onus of the contest, and they make all of the profit. It may cost a surgeon thousands of dollars and loss of prestige and of friendships to bring out an idea, the eventual profits of which go to others. What are we all working for, anyway, for ourselves or for the crowd? There is no doubt a certain sort of satisfaction in working for one's self; but it is twice as much fun to work for the crowd. Give me the fun, and let the losses go. But does appropriation of ideas in literature mean loss? I bought both of the books in question on account of the plagiarism charge, and that meant at least thirty cents added to the incomes of the authors.

L. F. Brown also says that it is naughty for one writer to take material that has been painfully gathered by another. Oh, it is not such a painful process! Life is a struggle and a fight, like a game of football or any other healthful amusement, and it is good sport to play both games.

Where does a widgeon get his fine flavor? By snatching dainty roots of valisneria that are brought up from the bottom by other ducks. Is it a painful process for other ducks to pull up the valisneria? Not a bit of it; they do it for exercise after they have had a fill. The widgeon knows just what it wants for developing an exquisite flavor, and that is why so many people are after Setgeons. Human nature craves romance. The best of real things are not good enough for us. Down on the South Bay there are two gunners living in the same village, with whom I go after ducks. At the opening of the season one will write: "Some ducks in the Bay. Flocks not yet broken up properly for decoying. Weather not good; wait until I send for you." The other gunner writes on the same day: "Never saw so many ducks here before. Thousands in sight from the window as I write. All breaking up nicely. Weather just the thing. Come right down." Both gunners are looking at the very same ducks, only they state the matter differently. Which gunner's advice would you follow?

ROBERT T. MORRIS.

P. S.—We have many more widgeons in the medical profession than in the profession of literature, and the public actually fosters them. They not only take the best that is brought up, but not content with that, seek to keep the real workers obscured for fear that they will obtain credit that is their due. If the workers are truly altruistic, they let everything go, and get their joy out of seeing the public get the benefit of their work, even though it means loss to them. If a writer in general literature is truly altruistic, I think he can maintain a similar attitude when others make use of his facts.

NEW YORK, DEC. 2.

Did He Mean It—or Didn't He?

Editor Forest and Stream:

I read Dr. Morris' remarks re Seton Thompson's appropriation of Allen Kelly's "Monarch Bear" stories. And then I read them again. They reminded me of the Hibernian barber who shaved me a few days ago at the Southern Hotel in St. Louis. My mind was a thousand miles away, and, influenced by strenuous thought, I budged a little. "Am I hurtin' of yez, sohr?" said Pat. "Gwan," said I, "I didn't know you were shaving me!" And with uplifted razor in one hand and meditatively rubbing his chin with the other, said he: "Well, sohr, I don't know but that's a compliment, begorra!"

And that's the way I feel about Dr. Morris' article on Mr. Seton Thompson—"begorra" it's complimentary. At first I imagined Dr. Morris was a rubbing of it in to the hide of Mr. Thompson with a velvety hand, just as one is

wont to rub in croton oil with a soft rag; but I am afraid "I have it not," like the Irishman who, when asked by his friend had he a light, Pat replied, as he pulled on his stogie, "I have"—a draw, a puff of wind—"I have not," and out went the match! Now, when I imagined Dr. Morris was just laying open Mr. Thompson with a keen-edged scalpel, "I had not" his intention at all.

It's all right for Dr. Morris to complacently watch the water in his brook meander to beautify the grounds of Mr. Thompson, but that water cost Dr. Morris effort of no kind; for do not the springs gush unaided from somewhere on Dr. Morris' estate to run their watery course free and untrammelled to the sea!

In the commercial world the confusion of *meum et tuum* is looked upon with a less lenient eye. Witness an electrical sharp, who, finding that his water pipes were undergoing an attack of electrolosis, just simply wires up his house and warms and lights his rooms from current drawn from his water pipe by means of properly arranged wires. The lighting company learned of it, and at least threatened all sorts of things. They called it robbery because they had produced the current at the expense of coal and labor. But there was no labor involved in the flowage of the springs; but there was labor—brain work—involved in the production of Allen Kelly's stories so deftly utilized by Mr. Thompson.

As I stated above, I was completely fooled when reading Dr. Morris' supposed strictures on the literary strabismus perpetrated by Mr. Thompson. I for one would like to hear more from Dr. Morris upon this subject. It is a most interesting one, to say the least.

CHARLES CRISTADORO.

ST. PAUL, MINN., DEC. 2.

MONTREAL, DEC. 2.—Editor Forest and Stream: The correspondence anent Mr. E. Thompson Seton is, I think, one which will warrant an expression of opinion from one who knows him pretty thoroughly, inasmuch as two of the letters published might lead the public to think that Mr. Seton is not a close and appreciative student of nature. I know very well, indeed, much of the country, its fauna, and its Indians, about which Mr. Seton writes, and I must say that he has enlarged my horizon although interested in these things myself. Mr. Seton is a thorough investigator, he is a scientific authority upon the habits of many wild animals, he is a student of human nature, and an artist and naturalist. I have never wasted any of the hours that have been spent in his company, but have always come away with the feeling that I had learnt something, and that the good-natured part of me was working more actively.

I do not wish to pronounce upon the subject of "Monarch the Big Bear" and Mr. Kelly; but there are tens of thousands of Mr. Seton's friends who may be misled by the controversy into exaggerating Mr. Seton's fault—if fault there be—in connection with the story. I am inclined to think him guilty of a trivial plagiarism only (if guilty at all), and one which the thousands to whom he has given pleasure and profit will readily forgive.

Let us, at all events, keep an unbiased mind until we hear from Mr. Seton, who is now in Europe.

L. O. ARMSTRONG.

How Do They Do It?

Editor Forest and Stream:

Three things are puzzling to me—yea, four:

1. The partridge drum. I used to think I knew all about it, and whether the bird smote the log or not. If so, many of your communicators could not tell what they know—half of them knowing quite the opposite of what the other half knows—I would still retain and maintain and defend against all comers my conviction that the bird does strike the log; or does not—I am not prepared at this moment to satisfy myself as to which one of the two theories I am just now holding.

2. How does the hummingbird maintain itself perfectly still in the air when it is sipping sweets or extracting insects from the flowers? I can understand how the rapid movement of the wings which produce the hum can drive the bird forward in its darting movements, but how that same hum can be kept up and the bird go neither forward nor backward nor up nor down, is too much for me to comprehend.

3. How does a flying fish fly? Does it by moving its "wings" propel itself through the air by fin movement, or does it get its entire momentum before it emerges from the water, and simply use its fins to steer by, or to support itself by their planes while in the air. I have spent hours in trying to determine this point by watching the actual fish as seen from the deck of a sailing vessel or steamer. I do not know any more about it now than I did before. Your Santa Catalina Island readers perhaps can give me some light on the problem.

4. Another question as to fin work. How does the porpoise propel itself through the water? From the bow of a swiftly moving steamer I have looked down into water so clear that it was practically as transparent as the atmosphere, and have watched a school of porpoises playing along the bow, swimming at equal speed with the steamer, and now falling behind, and then darting ahead, and ever and anon emerging from the water to blow. Every part of the body of the porpoise was visible, but look as closely as I would, I could not detect a movement of the flippers. All I could see was the upward movement of the tail which drove the porpoise head down, and the downward movement of the tail which drove the creature up out of the water. The specific question I wish to ask is, does a porpoise propel itself by its flippers? Presumably the movement of the porpoise is analogous to that of fishes, and some of your students of the fish in the water may solve this puzzle.

GEO. A. BENT.

In Jordan and Evermann's "Fishes of North and Middle America," the flight of the flying fish is described as follows: "Observations on the flight of these fishes, and especially of *Exocoetus californicus*, have been several times made under most favorable conditions by Dr. Charles H. Gilbert and the writer. The flying fishes live in the open sea, swimming in large schools. They

will 'fly' a distance of from a few rods to more than an eighth of a mile, rarely rising more than three or four feet. Their movements in the water are extremely rapid; the sole source of motive power is the action of the strong tail while in the water. No force is acquired while the fish is in the air. On rising from the water, the movements of the tail are continued until the whole body is out of the water. While the tail is in motion, the pectorals seem to be in a state of rapid vibration, but this is apparent only, due to the resistance of the air to the motions of the animal. While the tail is in the water, the ventrals are folded. When the action of the tail ceases, the pectorals and ventrals are spread and held at rest. They are not used as wings, but act rather as parachutes to hold the body in the air. When the fish begins to fall, the tail touches the water, when its motion again begins, and with it the apparent motion of the pectorals. It is thus enabled to resume its flight, which it finishes finally with a splash. While in the air it resembles a large dragon-fly. The motion is very swift, at first in a straight line, but later deflected into a curve. The motion has no relation to the direction of the wind. When a vessel is passing through a school of these fishes, they spring up before it, moving in all directions, as grasshoppers in a meadow."

The Sleeping, Smelling Black Duck.

Editor Forest and Stream:

Mr. L. F. Brown's invitation to take me to Pamlico Sound, a place where I have long wanted to go, is most generous and kind. Unfortunately, however, I cannot, like the black duck, "get away."

From Mr. Brown's description of the places to be visited, I feel sure that I would see no flock of black ducks all asleep at once. Unlike Mr. Brown, I cannot say that I would not see such a thing; but I would be willing to gamble my last dollar on it. After re-reading the descriptions of the places and the conditions under which Mr. Brown has observed black ducks, it is no wonder that he has never seen a pair asleep. I have made a specialty of dusky mallards all my life, and I have never "caught them napping" under such conditions. So far so good; but if I went on to say that no man ever did, then my observations become valueless. So far as my observations go, the conditions for a pair of sleeping black ducks are as follows: In the spring, say in middle March, a soft, dark day with the snow falling fast from the south, no wind, the river full of drifting ice, no shooting going on, a pair of newly mated ducks, quarter or half a mile from shore, on an ice floe. Nor is it every day or every such day that one would find a pair sleeping. I have never seen three ducks asleep at once—it is always a pair, which, newly mated, seem to be "two minds with a single thought, two hearts that beat as one."

A neighbor of mine, Mr. Hudson Covert, who has also hunted black ducks several springs gone past, says he also has seen a pair of black ducks asleep. "But," he says, "if the boat happened to hit a cake of ice as I paddled up, away went the ducks. Also, one day I had a friend with me who could neither paddle or shoot. When I got within easy range, I turned the boat sidewise to shoot, and then, too, the ducks always jumped. Another time on Black Creek, when not hunting, I found a pair of black ducks asleep on a strip of ice outside the fringe of willow-herb and dodder. They heard my paddling just as I saw them. By the very comical but startled way in which they stretched their necks and 'rubbered,' I knew they had both been asleep. As soon as they saw me they sprung into the air. More tellingly to the point, however, is an experience of mine one spring, when I was using a new-fangled boat I had just built. The boat was long, narrow, and low, and being painted white, needed no battery. I lay flat on my back in it, making it go by a device of my own, of which I will say no more than that it worked 'by hand,' and therefore was not in violation of law. I found it did not work, however, for though I could get near the ducks, I could not raise up, seize my gun and aim quick enough to catch the swift-flying black ducks before they were out of range. I got hardly any ducks with it, and returned to the use of a battery. But one day I saw a pair of blacks asleep. It was snowing and raining. I came up to within thirty yards of them, rose up, adjusted myself, raised my gun and aimed, the ducks remaining motionless. They were asleep, and when they awoke, they found themselves in the next world. The reason I remember it so distinctly, was from my trying out the new boat. It was a mile below Judge Parker's, off the end of Esopus Island."

Mr. John Burroughs, in his article in Outing, also says he has seen four black ducks asleep. If he says so, I believe him; had he gone on to say that there was no man who had not seen a pair of black ducks asleep, I would have been skeptical.

Mr. Hardy, the famous Maine woodsman, has also seen a pair of black ducks asleep under just the conditions that one would expect to find them.

Maybe black ducks can smell cheese, but those that I have seen can't smell a man. I have paddled up close to black ducks with a gale blowing from me to them. Mr. William Brewster, of Cambridge, Mass., says they can't smell at all. A fox can smell you, but if you stand or sit motionless, he cannot see you. A duck can see you ten miles away (I sometimes believe), but can't smell you.

To Mr. Otto Keim I will say, that last spring was the first time the law has been on ducks in March. I shot no ducks then.

JAMES ACKERT, JR.

The New York State League.

THE annual meeting of the New York State League was held in Syracuse on Thursday of this week. Among the subjects discussed was the proposed law forbidding the sale of grouse and woodcock. A report of the proceedings will be found in our issue of next week.

GAME BAG AND GUN

A Federal Game Law.*

An Act to Protect Migratory Game Birds of the United States.

WHEREAS, experience has shown that laws passed by the States and Territories of the United States to protect game birds within their respective limits have proved insufficient to protect those kinds and classes of said birds which are migratory in their habits, and which nest and hatch their young in States other than those in which they pass the usual hunting season, and in some cases breed beyond the boundaries of the United States;

And whereas such local laws are also inapplicable and insufficient to protect such game birds as, in their migrations, are found in the public waters of the United States, outside the limits and jurisdiction of the several States and Territories;

And whereas the absence of uniform and effective laws and regulations in such cases has resulted in the wholesale destruction and the threatened extermination of many valuable species of said game birds, which cannot be practically restored or re-stocked under State laws applicable in the case of game birds having their permanent habitat within the respective States and Territories, therefore,

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled,

Section 1. That all wild geese, wild swans, brant, wild ducks, snipe, plover, woodcock, rail, wild pigeons, and all other migratory game birds which in their northern and southern migrations pass through or do not remain permanently the entire year within the borders of any State or Territory, shall hereafter be deemed to be within the custody and protection of the Government of the United States, and shall not be destroyed or taken contrary to regulation hereinafter provided for.

Sec. 2. That the Department of Agriculture is hereby authorized to adopt suitable regulations to give effect to the previous section by prescribing and fixing closed seasons, having due regard to the zones of temperature, breeding habits and times and line of migratory flight, thereby enabling the Department to select and designate suitable districts for different portions of the country within which said closed seasons it shall not be lawful to shoot or by any device kill or seize and capture migratory birds within the protection of this law, and by declaring penalties by fine or imprisonment, or both, for violations of such regulations.

Sec. 3. That the Department of Agriculture, after the preparation of said regulations, shall cause the same to be made public, and shall allow a period of three months, in which said regulations may be examined and considered, before final adoption, permitting, when deemed proper, public hearings thereon, and after final adoption to cause same to be engrossed and submitted to the President of the United States for approval.

Provided, however, that nothing herein contained shall be deemed to affect or interfere with the local laws of the States and Territories for the protection of game localized within their borders, nor to prevent the States and Territories from enacting laws and regulations to promote and render efficient the regulations of the Department of Agriculture provided under this statute.

House Bill No. 15601, introduced Dec. 5 by Hon. George Shiras 3d, of Pennsylvania, and referred to the Committee on Agriculture, Hon. Jas. W. Wadsworth, of New York, Chairman.

Who Are the True Sportsmen?

AS DIFFERENT persons choose to shoot small game in different ways, and I never could see that it made any odds to the game whether it was shot flying or sitting, I have never interfered with other people or called them hard names because they did not do as I did. At the same time my private opinion is that very few of those who cry out about "pot-hunting" or unsportsmanlike ways of shooting, have ever given game the same chance that I have.

First as to duck shooting: I have always considered it a mean, lazy way to shoot any kind of ducks, except on sea shore, from behind a blind or with decoys or by baiting. I consider it giving the ducks a great deal fairer chance either by long rifle shots or by creeping to them and taking any chance which offered, either flying or sitting, or as the most of my shooting at ducks has been to shoot from a moving canoe at ducks which are usually on the wing. We have but few ducks here, and it is extremely rare that one can get over half a dozen in a day on our lakes or streams, and yet many of those who kill from 25 to 100 in a day from behind blinds, where not a tithe of the skill is required, will find fault with the man who may shoot one bird in three sitting, and kill the rest in fair flight instead of when dropping down to, or rising from, decoys, when the birds are often nearly as still as when sitting, and offering a great deal larger mark. Any fair wing shot knows that he is surer to kill most kinds of ducks flying than sitting. I have shot mostly at wood ducks and blue-winged teal, and have averaged better at those flying than those sitting, but often it is "Hobson's choice." After crawling for a long time, one gets a chance to poke a gun through the bushes, where there is no chance to shoot in any other way except sitting. I believe that the man who can by fair still-hunting get a chance to fire at ducks as wild as they are here, is entitled to shoot in any way he chooses, and it is no one else's business.

Most men who shoot ruffed grouse prefer to shoot over a dog. Of course in this kind of shooting they must shoot flying. But I notice that they give the bird as small a chance as possible. They usually shoot a cylinder-bored gun with $1\frac{1}{4}$ to $1\frac{1}{2}$ ounces of shot, usually No. 8.

If the object of wing-shooting is to increase the bird's chance of life, why not shoot as I do—a choke-bore with only one ounce of No. 6 or No. 4? I have shot at least 2,000 ruffed grouse, and have never shot a single one by the help of a dog. Probably at least half of them have been shot where the birds are as wild as can be found in the United States. I have depended on myself to do the hunting, and would prefer to kill one in this way to several shot over a dog—unless the dinner depended upon it. For many years I used a gun with one barrel rifled, and where grouse were tame I nearly always shot at the head and can count by the hundred those shot in that way. Often when I have missed I have not used the shot barrel unless I needed the bird to eat, and repeatedly I have shot a single bird when there were three or four others looking at me while I reloaded my rifle, and have picked up my bird and left the others without disturbing them. I have shot quite a number of ruffed grouse flying, but I had much rather gun a shy old bird and after starting him five or six times shoot him running or sitting, than to shoot one flying without any gunning. I once started one nine times before I shot him, and have him now mounted. It is not the quantity of game I get that I care for; it is the way I get it. I have no fault to find with those who prefer to hunt with dogs; in fact the most of them would not get much if they did not use them; but I am sure that if more hunted game as I do, there would not be such an outcry about the scarcity of birds.

The great mass of so-called sportsmen need to be educated up to the fact that to bring in a large bag of any kind of game does not prove that the owner is a good gunner. When a man has to depend on a dog for his game, he from necessity does not learn as much about the habits of the game he shoots as the one who does his own hunting. Many people seem to think that the end and aim of all gunning is to kill all one can. Now, I do not believe in killing anything for the mere sake of killing. For many years I have not shot a heron, bittern, fish-hawk, log-cock, kingfisher, woodchuck or porcupine, simply because I had no use for them, and if they did any harm it was so small that there was no good excuse for killing them. The gentleman who signs himself "A Blunt Old Man" expresses my views better than I can, and has my thanks. Robert Burdette once, in speaking of an article entitled "Every Man His Own Grammarian," said, "That is which I always did." So I have always gone my way and let the other man go his, but I believe that the man who does his own hunting without any aid of dogs, blinds, decoys, etc., is the truest sportsman, and although he may not decrease the game supply so much, is the best gunner.

M. HARDY.

Shooting Ducks Sitting.

Editor of Forest and Stream:

One or two duck hunters who have killed dusky mallards on the Hudson in springtime from behind white muslin blinds, have actually admitted that they then shot ducks not only sitting at rest, but ducks that were, in addition, sound asleep! Truly strange admissions to supposedly bring credit to the writers when printed in America's foremost sporting publication!

Such "sportsmen" and law-breakers have caused stringent enactments by nearly all the States, forbidding, under penalties, various pot-hunting practices—limiting the time of year, day or week, number and kinds of blinds, guns and decoys, boats, and of the ducks killed, and forbidding their sale or transportation, and the use of poisoned or medicated food, etc.

If one of these pot-hunters were a guest at the club house of almost any shooting club, and should fire at ducks when they were at rest or asleep, he would have a very uncomfortable experience furnished to him by almost any club member who saw him. Many clubs punish such shooting by a fine, or even by expulsion for a new offense after admonishment.

Yet some "Blunt Old Man" fires a flint-lock blunderbuss here in defense of such practices, and as their champion declares that reference to them in deprecation is "implied criticism" and "insinuation."

Sportsmen readers are entitled to know who it is that assumes to rebuke them and furnish instruction that such practices are universal among duck shooters. Who is Blunt Old Man? Let him get from behind his blind and shoot in the open.

L. F. B.

ST. PAUL, MINN.—Editor Forest and Stream: I admire the bluntness of the "Blunt Old Man," but in such cases as this I think he ought to follow Priscilla's advice and speak for himself, and not for others. *De gustibus non disputandum.* Now, if "Blunt Old Man" takes everything coming his way, sitting or standing or sleeping, he certainly is privileged to do so, but when he, as a general proposition, assumes that everybody else with a gun behind a blind will do the same thing, then I say it's time to call a halt. There is a wide difference between the ethics of a sportsman and a marketman. In the case of the latter, it's meat, and ergo, dollars, any way you can get them. I don't know how it may be with others, but if I were to fire into a flock of dusky mallards "all asleep together at the same time" (excuse me, Mr. Brown), and laid the whole flock low, including the sentinel, I'd feel ashamed of myself, unless I was shooting for market. In other words, game has no rights which the market-hunter is bound to respect. I can only speak for myself when I say that to shoot a sleeping duck, a sitting grouse, a partridge strutting on a log, or a running quail upon the ground, to my idea, is the height of unsportsmanlikeness. I wonder if mortal man or boy who, crawling up to a fence corner and shooting into a bevy of quail sunning themselves in the noonday sun, ever felt proud or satisfied with himself after the deed was done? We can go just

a little further, if the "Blunt Old Man" will permit it, and advocate the dynamiting of trout, the seining of bass, and the spearing of salmon. This is certainly getting meat, I would like to take a rising vote and thereby ascertain how many of the readers of FOREST AND STREAM are with the "Blunt Old Man" or with

CHARLES CRISTADORO.

In Cold Camp Under the Spruce.

HERE is a story of near-home camping in New England. It was written by Mr. C. H. Gere and printed in his own paper, the Hampshire Gazette, and Mr. Charles Hallock sends it to us as something that should be in FOREST AND STREAM:

CAMPING beneath the spruces in winter! Winter is when the leaves are off and water freezes. The sensation is great! A little more ozone, and much less flies and ants; much more sighing of the branches and a little more scurrying for firewood than in summer. We had camped in the Rockies in winter and survived it, but to go out from your house in a civilized part of the earth and voluntarily commit yourselves to the elements when water freezes in your bucket as you sleep, to stumble out of your tent in the morning and put on frozen shoes, to take your morning wash from an ice-fringed stream, these seemed to our home counsellors too rigorous for constitutions any less hardy than log drivers. Yet we two tried it, my son-in-law and I. We wanted to go a-hunting. We sighed for the hills. We could go up and live in board houses, and eat pie and cake and such things when the appointed meals were announced, or we could take along our tent and frying pans, and eat in the woods what we wanted, when we wanted. A majority vote of the household was for the pie and the board house, but we, the hunters, took to the woods.

After all the arguments were over, we backed a springless wagon up to the back door and loaded in the outfit. There was a 10 x 12 wall tent. A cotton mattress, abundant wool blankets, a big buffalo robe, two changes of shoes, an extra pair of pants, four pairs of stockings for each, an extra overcoat, in case we came in wet from a hunt, two cast-iron kettles, two frying pans, two water pails, plates, cups, etc. For the week's feeding of two men and two dogs there were twenty pounds of beef, a few onions, five pounds of pig sausage, five of dog sausage, four quarts of self-rising buckwheat flour, a quart jar of real maple syrup, taken back to the hills whence it came, apple sauce in glass jars, home-grown chow-chow in glass jars, two quarts of chestnuts to roast under the camp-fire at night, a peck of apples, a peck of potatoes, a peck of wheat coffee, four loaves of bread, five dozen doughnuts, two pounds of cheese and a half-pound of real Switzer, sugar and salt in glass jars (paper bags are apt to get wet and burst while camping) and three jars of jelly.

This, with the game we should shoot, seemed enough to feed two men a week. Then we had an ax, wire, a few nails, and a lantern; but our piece de résistance was a sheet-iron stove weighing about fifteen pounds, four lengths of pipe and two elbows.

We remembered a spot in the spruces, along Mill Brook in Plainfield. We would camp there. It was twenty-five miles away. We left home at 11 A. M. The way was steep, the wagon heavy; we fell short of the goal. Night was coming on us four miles short of the end. We turned into a pasture bar-way, rattled over mountains of boulders and brought up in a little clearing in a thick mass of spruces, beside a clear brook, into which we had put 5,000 of the State trout fry for several years past. There was little time to select the exact spot, though the locality was known years before, we having stopped there in the balmy June days when fishing down the brook. The earth was thick with the spruce needles and deep covered with the decay of fallen trees. Little moisture comes up from the soil through this covering. You sit around the tent and camp-fire in comfort in such a spot.

Hurriedly we unhitched, lest darkness come before the camp was made. One goes with the horse to a nearby barn, and the other, more used to camp life, makes the camp. Back the tent up against a tree, run a pole through the top of the tent to a limb of the tree, drive two stakes at the front corners, slip the ropes over the stakes, lift the front end of the pole and rest it on a forked stick; the tent is up. Drive in the other stakes and make taut the ropes; the tent is secure in a gale. It takes an experienced hand but a few minutes. Lay spruce twigs over the ground, a foot deep, throw on your mattress; you can sleep the sleep of youth, before nerves were made and care was born.

Next a fire, then to the brook for a kettle of water. Set two kettles a-boiling, one for coffee and one for dish washing. Fry ten sausages, cut half a loaf of bread. Set up the stove in the tent, running the pipe out of a hole cut in front. Then your supper is ready, and you, too. After supper grope around in the woods for dead branches, to keep the tent warm while you talk over the tame events of the day and the wild events of the morrow. Strange, anticipation is always wild, no matter how oft experience proves the morrow to be as tame as was to-day and yesterday.

After supper the glimmer of a lantern through the trees, and the clatter of footsteps over the rocks tell the approach of a visitor, a nearby farmer, known of old, who comes to sit out the evening and answer many questions of the haunts of game around about, with bright visions of which we retire, exultant in our power to slay it as it flees our approach.

The night was cold, the brook was lined with ice in the morning. Water froze a quarter-inch thick in

our bucket, yet we slept warm. By daylight we were up, the camp fire was snapping, the kettle steaming, and breakfast eaten by sunrise; boiled potatoes, pork sausage, barberry jelly, bread and butter, coffee.

The dishes are washed and everything stored away in the tent, for it looks like rain or snow. Then we start, the dog more anxious than we. Swamp, brush, alders, spruce, fallen logs, rocks, blackberry briars—what obstacle does not the hunter surmount in his eagerness to shed the blood of the affrighted remnant of the game birds of the woods and fields. Enough we saw, but none we shot, save a poor lone rabbit, which committed itself to the open by force of a dog on one side and one of the hunters on another. After six hours of weary trudging through the brush, we return to camp, unlimber our guns at the wagon, the while bemoaning our luck, when a partridge gives two preliminary twitters and bounds out of the yellow birch tree on which the tent pole rests. A partridge actually at rest, eating birch buds! We could have killed it had we seen it sitting there. Clearly, this is no place for us, we must move.

After dinner we load up and move through Plainfield Center, about four miles, to our originally selected spot. Deep in the spruces, where no wind blows, the ground dry with spruce needles, on a knoll, whence water would run quickly in case of rain, a little brook just far enough off to sing softly at night, and a trout in the hole where you dip your water, such the spot. At dusk we arrive. Two partridges, gone to roost in the spruces, fly as we come, and a rabbit scurries off into the denser woods.

The noise of the camp making is over, supper eaten, and stillness comes over the forest. The stove is fired by green yellow birch, a good burner, probably best of all woods green, though white and black birch and hickory burn nearly as readily green. Nearby people come to see how comfortable one can be in a tent in November. They were not cold, though the night was very frosty outside. The second night we had other visitors and a long spell at high five.

Here we try the white rabbits, going to the spruce woods around Plainfield Pond. It wants a good dog for this work, one that is very active in search and slow on the trail. Rare traits are these in combination. An active dog is apt to be too quick on the trail, and overrun the scent. Then he has to take too much time in making circles around the places where he left the scent. The best sport is had with two dogs, one a vigorous brush beater, to get up the rabbit, and the other slow on the trail. The white rabbit does not live in holes, as the small brown rabbit does, and never goes into a hole unless wounded. He sleeps in the daytime under a bush, or fallen tree-top, or in thick laurel. To get the rabbit running, your dog must first find him, and this is the longest part of the hunt. When started, the rabbit will run off perhaps a half-mile, but always comes back near where he started. The impatient hunter tries to keep up with the hound, whose baying is a delightful sound as it sifts back through the long woods. The patient waiter, though chilled in body and cold of feet, stays where the pursuit began, and then doesn't always get a shot. The talking of companions will turn the rabbit from his course, as it will a flying partridge. Keep still, get in certain runways, if you know them, and from ten to forty rods ahead of the hound will come the rabbit, and it's a quick shot you get at best. If the leaves are dry, the dog will be slow on the trail, but if the leaves are damp or there is a moist snow the rabbit is pretty certain of a long chase unless the hunter interferes. There is no other sport equal to running white rabbits with a good hound. Partridge shooting requires more skill, and a dog of finer qualities to hold the bird to a point, but the bird dog never barks. There is no music. The sympathetic reader may be inclined to pity the poor rabbit, so relentlessly pursued by the hound, but, however much or little the noise of the dog and the fact of pursuit may prey on the rabbit's nerves, the speed of the chase is no tax on the rabbit's strength, because the rabbit frequently leaps at right angles from his course and throws the dog off the scent long enough to give the rabbit plenty of rest.

White rabbits are not as plentiful as formerly, and it is probably not because they are killed by hunters. They seem to migrate. They leave a section where they have long been numerous and are unknown there for a number of years, then they come back. It is said that they will not live in the same region with the brown rabbit, just as the gray squirrels are driven away by red squirrels.

It is a wise provision of nature that the food of the browsing animals, rabbit, deer, partridge, should be richer in winter than in summer, and in summer richer than the grasses on which foraging animals, cattle and horses live. Common grasses contain about 4½ per cent. of protein, and the tender ends of brush about 7 per cent. in summer. In winter the brush is much richer in nutrition than in summer, for trees are busy all summer storing up in their buds starch and sugar and fat, that they may make a rapid growth when the first warm days of another growing season come again, and be ready to blossom, fruit and seed, that the great work of reproduction may be well done.

On our rabbit hunt our dog followed the trail of two deer, the tracks of which we ourselves could see in the frosted grass. Speaking of deer, one came close to our tent one night, then running away, with much crashing of dead branches. There is room up there on Hampshire's highest hills for deer. Miles and miles of wooded hills and pastures growing up to brush, with lessening habitations of man, is the aspect. Mixed with the baying of our hounds came the puff of a steam saw-mill, working up the spruce into barrel staves, the beech and maple into chair stock, the ash into scythe handles and wagon material.

We were back home from the rabbit hunt at 1 o'clock, and took time for an elaborate meal of boiled beef, put in the kettle the night before, and kept simmering well into the night. Nothing like beef when you are using up muscular tissue behind a dog. It fills the need of the tired hunter better than any other food, and smacks more of the aboriginal menu than anything

else procurable. When the Indian surcharges his frame with a meat dinner he lies down and sleeps. That was what we did, and when we woke and stumbled out of the tent, there sat a partridge, not twenty feet from the camp-fire, and no gun ready for her. We cut the branches from the spruces down to the dipping place in the brook, and a beautiful walk it was, over the soft dead needles and dry moss. We examined the trout in the brook, now in their brightest colors, ready for the mating, which comes Nov. 16, with hardly a day's fail. The fins of the trout were bordered with a wide stripe of white, and a lesser stripe of scarlet, and the scarlet and white spots on the sides were more pronounced than in summer. In a pond, nearby, where there are thousands of trout in summer, there were few now, and these were at the head of it in the current, lying over freshly cleaned gravel, whereon they were to drop their spawn. It's a great work, this reproduction, and from the tadpole up, only shirked by man.

Say, look at that queer looking stump over across the pond! Sticks up from a clear space beneath the spruces. Looks like a bottle, with a long neck, and the neck twisted a little sideways. Great Caesar! can it be a partridge? Quick, the gun!

Alas, too late! A couple of hops, a couple of "peeps," "pceps," a spread of wings, and off she goes; another chance missed.

The next day we would hunt partridge. We would get up early, get a quick meal, and be off by sunrise. There was a dim light in the east when we turned out. What a glorious thrill to feel the zest of life return, as you grope to the brook for a wash in the icy water, and appetite strong for a lantern-light breakfast. Buck-wheat griddle cakes? Yes, just the thing for a strenuous day and easy had. Pour in a little syrup to make them brown good, flop them in the air by a deft turn of the wrist (takes a strong nerve to risk a delicious, big, brown slap-jack on this aerial toss), and serve hot, with sausage. Who couldn't shoot partridges on such a meal!

When we came to, it was 10 o'clock. Maybe it was the griddle cakes, or maybe the sausage, or maybe getting up so early. At any rate, we had slept over three hours after breakfast. But no matter, the birds are near; we haven't far to walk. We found that the partridges were eating beechnuts, but that they feed under beech trees which were not a great ways from the spruces, to give them shelter. We noticed that they started to fly with a spruce between us and them. That is education, a full college course, with a post-graduate added. In the story books they always shoot a lot of game, on great hunting trips like this of ours, and so we fashion this story.

When we were off in the woods one day we received a call from Charles Hallock, the founder of FOREST AND STREAM, and author of many books. We found his card and several magazines on our bed. Mr. Hallock spends his summers at Mr. Gurney's, in Plainfield, and the winters in various places in the South. Strange, that the first sporting book I ever read, and one of the best ever written, was largely about this very stream we heard singing in the night, Mill Brook, Plainfield. If you would catch some of the spirit of the woods, read this book of Hallock's, "The Fishing Tourist."

Another day after the rabbits, and we must go home. We hated to go. Man started in the woods, why not continue there? But no, we must go back and build higher this mighty structure of civilization, which eats up those at work in the top stories a little bit faster than they can walk into the ground floor.

The last hunt is over, the last night under the spruces, the wagon is packed, the horse is headed for home, the cold, gray clouds promise snow; but we know that we can camp out in winter with as much delight as in leafy June.

C. H. GERE.

Growth of Moss on Trees.

From the Literary Digest.

It is often said that expert woodsmen are able to ascertain the points of the compass in a forest by noting the growth of moss on the trees, the usual statement being that it is thickest on the north side. This was hardly borne out by an investigation made about two years ago by Henry Kraemer, of Philadelphia, who found that in his vicinity moss grew on all sides of the trees except the south, the predominating direction being the east. In a later investigation by a French botanist, M. Leon Bédel, it appears that no dependence at all can be placed on the moss as a guide to the points of the compass. The determining factor seems to be ability to hold moisture for the sustenance of the parasitic growth. M. Bédel, in an article in the *Revue Scientifique*, describes his observations. Alluding first to Kraemer's data, he says: "It may be seen that the parasitic growth is not thickest on the north side, but rather on the east. Looking a little closer, we find that M. Kraemer has proved a fact of considerable importance—that the moss, which does not care for publicity, tends to cling, by preference, to the parts of the trunk that are inclined from the vertical, * * * especially on those that form an acute angle with the ground. In any case, on a given trunk, the favorite habitat of mosses and other parasites, he says, is the side that 'receives and holds' the greater proportion of moisture. Here there is some vagueness, since the side that receives the most moisture is that exposed to the wind, while that which retains the most is the sheltered side. And we should also distinguish between isolated trees and trees in a wood or forest."

To clear up these points, observations have been made during the past two or three years in the neighborhood of Dozulé, France, by the author, who believes that he has established the following facts: (1) Exposure has only a slight influence on the fixation of mosses, and it is impossible to lay down a rule in the matter. (2) Mosses usually grow on the upper, rather than the lower, side of inclined trees. (3) They are more abundant on cracked and furrowed than on smooth trunks, and also on knots and lumps. (4) Moss prefers horizontal to vertical branches, and grows thickly in bifurcations. (5) The direction of the wind seems to have no influence on the fixation of moss.

The key to this whole matter appears to the author to lie in the question of moisture. He says:

"The fixation of moss on trees is governed by the degree of moisture retained. Mosses grow preferably on the parts of the tree that hold most water. This law is true for isolated trees as well as for groups. Even when grouped trees have not one face more exposed than others to moisture, they have one that holds more of it; that is to say, there is always one face more or less inclined, or more cracked, or rougher, on which the water from the leaves or branches stays longer.

"It is especially the quantity of water retained and not that received that influences the growth of the moss. Of two trees situated side by side, one with a smooth and the other with a rough trunk, the former will have no moss and the other will be covered, because the water easily runs off the one, while on the other it is held by the irregularities of surface.

"The retention of moisture explains why the upper part of horizontal branches is mossy, while the under side is not. The water, owing to gravity, strives to reach the earth in a vertical course. It does not remain on the lower side of the branch, because it can fall thence directly to the ground without meeting any obstacle, while on the upper side the branch itself opposes a direct fall. The water has to run around the branch to reach the lower side, and the roughnesses of the bark retard and retain it. * * * It is the same in the case of an inclined trunk. * * *

"To sum up: Mosses grow preferably on the parts of the tree that retain most moisture. They are thus more abundant * * * on rough or cracked parts; on the upper side of a branch or inclined trunk; on knots or bosses; at the fork of branches; at the base of the trunk.

"We may say that 'moss draws moss.' When moss has grown on a tree it is itself a powerful factor in the retention of moisture; and new moss, either of the same or a different species, develops and thus increases the extent of the green covering."

In North Carolina.

RALEIGH, NORTH CAROLINA.—A party of Raleigh sportsmen is back from a jolly good hunt in eastern North Carolina. They left here Sunday, November 13, snow then falling, and went to Croatan in Craven county, near the junction of the Neuse and Trent rivers, prepared for a week's hunt for any and all game, principally ducks and geese. In the party were J. D. Bowen, conductor on the Seaboard Air Line; W. R. Sherman, J. J. Bowen, manager of the Southern Express office here, and his two sons. They arrived there about 6 o'clock Monday afternoon, found no one to meet them, owing to failure to get a letter giving time of arrival. They got a couple of carts to haul the luggage out to camp, seven miles distant. When they arrived at the "camp" they found an old deserted log house which had been used by fishermen as a dwelling. The whole party got busy, gathered fuel, made a fire, the weather being very cold, after which they unpacked the luggage, got out the cooking utensils and had supper at about 11 o'clock. During all this time the geese were constantly passing back and forth over and above the camp, honking so loudly that the party could hardly hear themselves talk. They went to bed full of happy anticipations of the next day's sport.

At 4 o'clock the next morning they got up and had breakfast, and just as day began to dawn they left camp, each man going in an opposite direction, of course all bent on making the largest bag for the day. They assembled again in the afternoon at 6 o'clock, when they had dinner, and then made showdown of the first day's work, which was something like twenty ducks, all mallards. They did not hunt deer the first day, though they are plentiful in that locality, but devoted some time to them later on. They spent five days at Croatan, the range of hunting extending something like ten miles in practically every direction, both on water and land. They hunted mainly in the creeks, where the mallards were feeding, these being all tidal streams, quite narrow, deep and tortuous. There is wild rice, grass seed and roots. No wild celery was seen, this being the food so dear to the canvasbacks, and which is also greatly relished by all other kinds of ducks, though all of the latter except the canvasback and redhead are too lazy to dive in deep water after it. The natives in that part of the country call these other ducks the "lazy ducks." The hard-working canvasbacks and redheads dive in water as deep as 12 feet and pull up the roots of the celery. Much of the stuff floats to the surface and then the other ducks, the lazy fellows, get in their work. What they leave floats to the shore and is in the shape of wrack.

As a result of the five days at Croatan the party got three deer, forty mallards, nine squirrels, three geese, and a bald eagle. They devoted some of the time to fishing with a seine 250 yards long, owned by one of the boatmen, and caught about 200 pounds of trout, jack, welshman (or "chub," really large-mouth black bass), and mullet, the latter fish being very fat and highly prized by all North Carolinians when fresh, and by the coast people both fresh and when cured. Along the back of the mullet lie two streaks of fat, which are often cut out and put aside in kits and used as lard. The coast people like the mullet because it is so fat that it will "cook itself."

All that part of North Carolina is a paradise for the hunter and the fisherman, the real sportsman, either on land or water. People up north know a lot about Currituck Sound, which is the head-center of canvasback shooting in the world, but they don't know what a game treasure-house a vast deal of North Carolina is. The real sportsman is welcomed here—not the pot-hunter or the shooter for market. These get the chilly hand, the icy heart, the stony stare. All land in North Carolina is posted by a general law, and in many of the counties the written consent of land-owners is necessary. The gentleman sportsman coming to North Carolina will have no trouble, but let the other classes beware. There is no room for them here.

One of the interesting natives at Croatan is Uncle John Pittman. He is 80 years old, but the spryness and vitality of the North Carolinians is shown by the fact that the old fellow put in two whole days deer hunting with the party. In his time he has killed great numbers of deer, and the love of the sport has never left him for a minute. He

keeps a fine pack of deer hounds always ready for the use of his friends, and it is certainly well worth while to be a friend of "Uncle John." His stories of his past deeds in the hunting field fill in the evenings delightfully. He has a negro assistant, "Uncle Needham," who is as old as Uncle John, and the two have hunted together ever since they were a dozen years old. Needham keeps at the hunting almost every day. He is very proud of being a bear hunter, and in that section has killed about thirty of these animals, this fall having shot two, one of which weighed over 300 pounds. He thinks there is no meat on earth quite so good as that of the bear, and nothing can be more amusing than Needham's stories, in his native dialect, about his hunting of the bear, not to speak of lesser game. Every night Needham sat in the middle of the floor, the center of attention, and told us, young and old, story after story about bears and ghosts, or "hants," as he calls them. His belief in a "hant" is as firm as that he holds in the Supreme Being. The negroes never say ghosts, but always "hants." He actually got the youngsters in the party so frightened by his stories that in broad daylight they were afraid to go to the spring after a bucket of water, and at night dared not stick their heads out of the door. Uncle John has a nephew, Noah McGowan, whom he is training to succeed him as a deer hunter. Soon the mantle of this Elijah of the hunting field will fall upon the trusty Noah, for there is a pride in the family in always having a crack deer hunter in its ranks. This has come down for generations from the old hunting days, away back before 1700.

After breaking camp, the party made their way in boats up a creek to the house of Uncle John, shooting all the way, and walking from their camp to his snug old house, where they first of all received a hearty greeting at the hands of his niece, Miss Gratsy McGowan, who, by the way, is a notable housekeeper. Such a supper as was laid! Made up, first of all, of a great blue china platter piled high with North Carolina "collards," admirably cooked; other dishes being a pile of well baked sweet potatoes (yams, not those miserable things which the New Jersey people raise and eat, and which so many unfortunately ignorant Northern folk call sweet potatoes); North Carolina ham, cornbread in great slabs, hot and fine; cold pork, biscuits as big as your fist and standing as high; truly a noble meal, which was washed down with plenty of black coffee, hot and fine. The hunters ate until they could barely move, and left the table greatly to the distress of Miss Gratsy, who deplored the utter loss of appetite, though they had eaten about six pounds apiece it really seemed. They left the kitchen and went to what the country folks call the "big house." Uncle John wasn't feeling very well just then, but sat up in bed and told a few stories and enjoyed the companionship of the crowd very much. The party had taken with them on the trip three gallons of corn whiskey, commonly known as "white liquor." That is the sort which gets next to the heart and the stomach of your native North Carolinian. No "red liquor" for him; it doesn't go at all. He will leave a bottle of it unnoticed, but will sail into the white stuff every time, declaring it to be the only pure whiskey. Uncle John can carry off a quart every day with the finest grace in the world, and declares it makes him younger.

People who go to eastern North Carolina hunting had better take tents. The winters are very mild and tents give all the comfort desired. Croatan is immediately upon a railway and is very conveniently located. Persons who may desire to go there, or anywhere in the State, for that matter, to hunt, had better write ahead and obtain permission, and arrange all affairs beforehand. These people own the land for miles and miles around Croatan,

and of course they also control the hunting. If you are all right they like you; that is the sort of people they are. This is indeed typical of all North Carolinians. Be sure you are right and then go ahead. It is a good old motto, and applies to hunting trips just as much as it does to anything else in the world.

Mention ought to be made of Wiley Pittman, of Croatan, as a capital hunter and good companion and boatman. He is an expert and knows all that country far and near; by the way, owning his own boats and seines. He went with the party on all the trips, and was invaluable, full of good advice as to the best hunting ground, and a very companionable fellow in every way. Sportsmen who come to North Carolina will have to unlearn a good many things they think they know, and if they keep their eyes and ears open, they will go home with a great many admirable new ideas. They can pick up something else in North Carolina besides game.

All this is just a mere little bit of a chat about the possibilities of the eastern section as a resort for true sportsmen. Now for a little line or two about the shooting in Raleigh's vicinity. Charles E. Johnson, who is one of the best sportsmen here, is very proud of his new self-acting shotgun, one of those terrible weapons which it is the desire of not a few to see put utterly out of action. It is a five-shot automatic. The other day he was out hunting partridges near here. His dogs found a fine covey. A bird got up, and was killed; he put in another cartridge, giving him five ready for use, and as in very rapid succession the birds got up, killed five without a break, then going forward and getting all the six. Mr. Johnson by no means is a "hunting hog," but a gentleman sportsman, and tells me that with the advent of his new automatic he has made a fixed resolve never to kill more than 15 birds in any one day. He has killed over 60 in a day. He says that with moderation such as his, the automatic is no more a slaughterer of game than the old-fashioned gun.

For the first time Raleigh will this winter enter the lists as a place of resort for Northern people, with two up-to-date hotels, the Yarrowborough and the Park, and will present not only the attractions, social and otherwise, of a charming old Southern town, but will offer to sportsmen a point of special advantage, from which they can easily reach good shooting very near-by on five lines of railway, and from whence they can quickly get to other points of advantage in this particular. A number of people from the North are already arranging to come here. Pinehurst, of which the writer has written several times, is only a little over an hour distant, and there will be much visiting between the two points. Raleigh is so close to New York (only 15 hours' run by either the Seaboard or the Southern Railway) that there is no trouble about getting in or getting out. The main line of the Seaboard passes through the city. The partridge shooting will be found to be excellent. A new railway is in course of construction which will be an air-line to one of the finest duck shooting sections of the State, to which one can go from Raleigh in three or four hours when the road is finished. Another fact is that the schedules out of Raleigh and into it for local points are perfect for sportsmen, so they can spend the day in any direction they choose. Good roads, macadam or gravel, well graded, add to the facilities for getting out into the country. The presence of Northern people here in numbers will mark a new era in the life of Raleigh—something it has heretofore not known except by hearsay. FRED. A. OLDS.

All the game laws and fish laws of the United States and Canada are given in the "Game Laws in Brief."

A Massachusetts Deer Case.

BOSTON, Mass., Nov. 29.—*Editor Forest and Stream:* Inclosed find clipping from a local paper giving a short account of a trial held in the district court, South Framingham, Mass., Nov. 19, 1904, for the illegal killing of a deer:

"Fred. L. Bowman was arraigned before Associate Justice Higley in District Court this morning charged with hunting and killing a deer on his farm in Sudbury. He pleaded not guilty and stood trial, being represented by counsel. The prosecutors were officials of the Massachusetts Fish and Game Protective Association. The testimony showed that one Young, a meat dealer of Sudbury, had deer meat from the defendant, and which, he testified, he took thinking it was veal. Officers also found a sack saturated with blood, and clinging to which were deer hairs, on defendant's farm. Bowman denied any knowledge of the presence of the sack on his place. He was discharged."

The defendant was acquitted on account of the evidence not being sufficient to justify the conviction of the guilty party. You will notice that Young, the meat dealer who sold the venison, testified under oath that he received deer meat from the defendant supposing it to be veal. On inquiring into the case I find that Young took this meat which he supposed to be veal and sold some of it as venison to one party and offered it as venison to another party. Both parties were in court and testified to this.

If such an open violation of the law, with such evidence as was given, can go unpunished, I would like to have you or some reader of *FOREST AND STREAM* tell me what kind of evidence is necessary to bring about the conviction of parties who kill these harmless animals. How long will the deer last in a community where only the fear of the law keeps them from being slaughtered, if such open violations as this can go unpunished?

CONSTANT READER OF *FOREST AND STREAM*.

In Florida.

PUNTA GORDA, FLA.—*Editor Forest and Stream:* In your number of November 26 is an article by "W." on "A Cheap Winter in Florida." The article is far from correct. To say that "the absence of pines is a striking feature of Florida's landscape" is in nowise a fact, and the writer must know very little of the State. He says that "the lowering of Lake Okechobee by the numerous drainage canals, etc." There has been no lowering of Lake Okechobee; all the work of the Hamilton Disston Drainage Company was a failure. There is no change in the conditions as to the rise or fall of water. The woods are practically the same. The only change is caused by cattle men who burn the grass for their stock, and by the new turpentine stills. Your correspondent says radishes grow in three weeks. Humbug! And those famous ibis and flamingo. I have been in Florida for sixteen winters, and have only seen one flamingo. And "Paroquets displaying richness of plumage that startles the spectator." I have never seen these birds, and never saw a man who had. Have passed from Kissimmee to the Gulf and back; have hunted in about as wild country as there is. He says "rattlesnakes are so scarce that hunters have to make a diligent search for one." I have to keep up a search to avoid them. One of my men killed a 6½-foot fellow to-day that had nine rattles and a button. He says "Alligators are few and small of size." There are lots of them from ten to twelve feet long. In one pond last winter I saw thirty young ones.

Where could this man have been to learn so much that is not so?

C. A. DEAN.

SEA AND RIVER FISHING

The Sea Trout Again.

Editor Forest and Stream:

Among all the writers on Fish and Fishing who contribute to the columns of the oldest and best known sporting paper in America, there is not one whose pleasant gossip is looked for with more eagerness or read with more interest by The Old Angler than that furnished by your usually well-informed correspondent, E. T. D. Chambers. Much to the writer's regret he reads in your issue of November 19 nearly two columns of information (?) respecting what Mr. C. calls the "sea-run trout of the Saguenay and its tributaries," those found in the lower part of the St. Lawrence, in the bays and harbors of P. E. Island, in the mouth of the Cascapedia in Bay Chaleurs, and in the tidal waters of the Moisie, the Trinity and the Saguenay rivers.

Whether intended or not, the scope of the paper implies that these "sea-run trout" are denizens of the sea, and resort to fresh water rivers only to spawn or "run into some of them after the smelt upon which they feed, and when these latter return to the sea, late in the year, the sea trout again follow after them."

There is nothing in the article to indicate that Mr. Chambers ever saw these "sea trout" except in the Saguenay and some of its tributaries. Indeed, the context leads us to conclude that the last summer was the only time he "was fortunate enough to enjoy opportunities for their study." Unfortunately for the conclusions to which his single season's study has led him, they directly contradict the conclusions of other observers who have made this fish the study of a lifetime, and have had exceptional opportunities for the study.

In your issue of April 11, 1903, the veteran artist and angler, Walter M. Brackett, of Boston (than whom, in the present writer's opinion, no more competent and careful observer can be found), wrote: "Allow me to say that I have spent thirty summers in the pursuit of

my favorite sport of salmon fishing on the Restigouche and its tributaries, the York and St. John in Gaspé, and for the past twenty seasons on the Ste. Marguerite, a tributary of the Saguenay, all of which rivers abound in sea trout (so-called). During all these years I have been a careful observer of their structure, habits, etc., and have yet to find a single point of difference between them and brook trout, excepting that these have acquired the habit of spending a part of each year in salt water, but always in the vicinity of the streams in which they are bred. They spawn in the upper regions of the streams under the same conditions and at the same time as other trout." Mr. Brackett concluded a minute and correct description of this fish in these words: "In answer to Mr. Hallock's question, 'When is a sea trout a brook trout?' I will say ever and always, whether in fresh or salt water, he is the much-loved *fontinalis* pure and simple."

In your issue of July 23 last, that veteran angler and charming writer, Edward A. Samuels, said: "So far as I have been able to discover, we have but one *S. fontinalis*, and I have handled the fish upward of fifty years, having taken them not only in the waters of many of the States, but also in all the Provinces of the Dominion, and have even crested them from the Laurentide lakes, and have never been able to discover such peculiarities of markings and coloration as would be necessary to constitute a distinct variety."

With the waters of Bay Chaleurs and most of the rivers debouching into it on both sides, the present writer is familiar, and he can say with confidence that, while all about with the so-called sea trout, these are identical with the common brook trout in structure, in habits, in markings, in colors, and that more are caught far from the estuaries of their native rivers.

Had Mr. C. looked a little more sharply into Frank Forester's "Fish and Fishing," from which he quoted all that part of his paper relating to P. E. Island, he would

have found that writer indorsing the belief of his friend, the late M. H. Perley, that there is but one distinct species of brook trout in North America, and that this is a migratory fish which, when not debarred, descends to salt water and returns to spawn in the clearest, coolest, and most limpid water it can find. In his "Report on the Sea and River Fisheries of New Brunswick," Mr. Perley says: "During the last thirty years the writer has caught many thousands of these trout in estuaries, rivers, streams and lakes in the Provinces and in Maine, and can safely say, after close and attentive examination, that he has never seen but one species of the brook trout, whatever naturalists may say to the contrary." This was the opinion of Prof. Agassiz, of Harvard, and of Profs. Baird and Goode, of the Smithsonian Institution, each of whom carefully examined specimens sent them by

THE OLD ANGLER.

The Rainbow Trout.

It is about twenty years since the rainbow trout was introduced into note by the United States Fish Commission. My friend, Prof. Baird, kindly called my attention to them, knowing my interest in such matter, and at my request the Commission sent me, to my place in North Carolina, a few live fish and some eggs. They reached me safely, and were duly planted in the streams which supplied two large ponds. They grew wonderfully, so much so that, to my astonishment, some of them were taken the next year which weighed over a pound, and very soon two and three-pound fish were commonly taken by the summer visitors here, who have free use of my stream and ponds. Since then I have not done much fishing myself, nor have taken much care to keep trace of the fishing done by the many summer visitors who come here to enjoy our beautiful mountain country; but I have quite often heard of fish of three or four pounds being taken, and on one

occasion, I myself had the good fortune to come across a big fellow which I could reasonably judge to weigh at least ten or twelve pounds, but which has invariably broken the tackle of every one who has hooked on to him. I judge the fish will weigh twelve pounds at least, and I have been told of other fish seen lying at the bottom of one of my ponds, at least quite as large. A three-pounder hooked by me in one of the ponds from a boat, near dusk, one evening, occupied all my attention for three hours, when he kindly leaped into the boat and was safely secured. This was my last fishing, having been in Chicago for some time past, and giving but little attention to the sport when at home in Highlands, N. C. I expect to spend some time in North Carolina the coming summer, and will renew my acquaintance with these grand fish and tell you more about their condition.

No other fish can take better care of itself than this. Some fish planted from my waters into the head of the Tennessee, a few miles from here, have appeared far down, and are now taken abundantly in the main river. Doubtless the waters on that side of the mountains are now well stocked, and probably the fish are all the way down the big Tennessee and probably further. There is no gamier fish than this; it takes the fly greedily. And the most favorite one is the white miller, as I should judge from seeing the water actually foaming from the hundreds of fish rising as these moth dipped into the water to drop their eggs at the season. It is easy to find schools of these fish lying apparently dozing on the bottom of the deeper parts of the ponds, and treating a bait dropped down to them with the utmost neglect. Having no time to give my waters any protection, they are poached very freely, and occasionally I hear of wonderfully large fish being speared as they lie in shoals on the bottom, where the deep holes are. Readers of the FOREST AND STREAM are cordially invited to try their luck in my streams, and they will not only get some first-rate fishing, but enjoy the pleasure of spending a few pleasant days and really cool nights here, at the elevation of 4,000 feet; and they will see the woods filled with our abundant flowers all the summer through, walk on the shady roads and enjoy the cool, bracing air, sleep soundly under the needed blankets during the cool nights, and free from mosquitos or other annoying flies, really rest in the pleasantest mountain region in the whole broad expanse of the United States. No need to ask leave to fish down the waters for six miles down the stream, and two up it from the town; and no questions are asked of any stranger who may shed his benignant countenance on our pleasant, quiet forest-shaded and flower-spangled mountain country, for I own all the stream.

It is the healthfullest locality in the whole Union. There are hundreds of cool springs; one of lithia water, and doubtless more not yet discovered; and a sort of procession of strangers, seeking rest and health here, tread the shady road from the village to this particular spring to get their morning and evening inspiration from it, cool and fresh as it flows down a shaded ravine in which the sun never shines, and thus the water is nearly ice-cold at all times.

We have abundant feathered game—wild turkeys, pheasant and quail in abundance. And as the FOREST AND STREAM folks are all my friends, they will be welcomed and well treated. We have excellent hotels and private boarding houses, where trout are cooked to perfection, and a climate free from all taint of malaria, and a specific cure for all disorders of the lungs and heart—a region in which every tree, native to the United States but one, is growing, and one which is found nowhere else. There are no swamps or wet places, and our waters are pure and soft. The woods are brilliant with flowers from the early spring to the late fall, and then they are gorgeous with all shades of yellow and red; and the Indian summer lasts until spring.

HENRY STEWART.

Fish Chat.

BY EDWARD A. SAMUELS.

The Striped Bass is Not a Weakfish.

IN FOREST AND STREAM for November 19 I had a short paper on "A Study of Fish Markets," in which, in treating of the striped bass, I was made by the types to use the expression, "the striped bass, or weakfish, as it is often called." When I wrote that paper I thought I wrote "rockfish," and wrote it very plainly, but if I did not, I stand ready to be forgiven; that a man who killed his 30-pound bass before most of the present generation of anglers was born, and therefore ought to know something of what the characteristics of the fish are, surely ought not to be supposed to write such a thing, but when he receives letters like the following, he begins to lose confidence in his penmanship or in his mental condition when the writing was done. The letter is from Newport, R. I., and reads thus:

"My Dear Sir—I find in FOREST AND STREAM of November 19, 1904, in an article written by you the statement, 'The striped bass, or weakfish, as it is often called.' Is not this a misprint for 'rockfish?' If not, could you kindly tell me where it is called 'weakfish,' and your authority for the same. Thanking you in advance for your reply, I am yours faithfully,

Now, as a reply to this, and to head off all letters of similar import, I will say right here that the expression was a misprint *pure et simple*, and that no man could by any stretch of his imagination, unless he had absorbed a dozen or two "high balls," think of classing the bass with the weakfish.

The types, first and last, and I have for upward of fifty years been keeping them moving, have made some curious messes for me. One of the drollest happened not many months ago. I had written, as I thought, a rather interesting description of the charms of salmon fishing, and in it I gave as one of the requisites the salmon angler should possess was "a great lung capacity." The types dropped out the word "lung," making as a desideratum for the angler "a great capacity."

The chaffing I had to endure for that slip was among the worst I ever experienced, and I had no idea there were so many people who read FOREST AND STREAM so

carefully. I wonder how many times I was requested to state "for what the salmon angler should have a great capacity," and I was asked if I was darkly hinting at "Rhumb," or any of the other precious liquids, to absorb which many fishermen consider it to be a necessity in their outings. I made my peace with some of the more turbulent, but at what a cost!

"Sea Trout" Again.

I had hoped that the discussion regarding the identity of the so-called sea trout would be dropped from the columns of FOREST AND STREAM until I could get my monograph on that fish, which I now have in preparation, completed; but the topic will not down, and, after all, it is perhaps best that all possible light should be thrown upon it, and from every available source. In FOREST AND STREAM for November 19, Mr. Chambers has something in relation to the silvery beauties, which, although written in a most interesting manner, is not entirely free from error, or which will not, at any rate, excite some discussion.

In treating of the sea trout fishing near Charlottetown, he states that a very large run of these beautiful fish is often met, and among other catches on record is one of 16 trout weighing over 80 pounds. Now I know something of the fishing around Prince Edward Island, and I think I can truthfully say that neither near Charlottetown nor in St. Peter's Bay, nor anywhere else on the coast of the island, may be had anything like such fishing as he describes. The largest "sea trout" I ever took in any of the waters around the island were killed near Malpeque, and none of them overrun two pounds weight.

So far as my experience goes, large runs of these beautiful fish do not now occur in many of the waters in which they were formerly abundant. The catch of sixteen trout weighing eighty pounds occurred nearly fifty years ago, and the story is told by Mr. Perley, of St. John, N. B., in Frank Forrester's book on "Fish and Fishing," page 123; but conditions have changed since then, the average size of game fishes has decreased very considerably, and I doubt if there have been many 5-pound "sea trout" taken near the island during the last twenty years. It was Mr. Perley's glowing account, as printed in Frank Forrester's book, which first led me to visit their homes and become acquainted with the merits of the fish, and I have for the last forty years kept up the acquaintance most assiduously and faithfully. During that period I have taken them in many of the rivers of Quebec, all around Prince Edward Island, and practically every river in Nova Scotia and New Brunswick in which they are found, and I do not believe I exaggerate when I say I have probably handled as many specimens as any angler now living. With this long experience I cannot refrain from putting on record here the fact that I never knew of one being taken in the sea "out of sight of land," as Mr. Chambers asserts is done; nor that they will rise to the fly if trailed behind a yacht or other sailboat in deep water "with a mackerel breeze and often with a heavy ground swell." If Mr. Perley did not draw on his imagination when he wrote that account of "sea trout" fishing, the fish must have changed very considerably in their habits during the last half century. Thad. Norris, in "The American Angler's Book," printed in 1864, reprints Perley's account and criticises it rather freely.

Mr. Chambers' account of the gaminess of the trout is not a bit overdrawn, and the story is charmingly written; but the degrees of the gaminess of the fish vary considerably with the locality, length of time they have been in the river, and with different conditions of water. In a deep, broad pool the trout does not begin to give as much play as it does in shoaler pools and in moving streams. I have often had a two or three-pound fish in live water leap above the surface and make long, sharp runs which caused my reel to sing right merrily; when others of similar size, hooked in deep, still water, rarely come to the surface until they are ready for the landing net; they insisted on "sagging down," just as a salmon often does in deep water. A 10-pound salmon in the Rangeley lakes, sometimes when the water is five or six fathoms in depth, does not begin to vie in activity with one of equal weight in quick water.

Like the salmon, the "sea trout," if long in the river, has not a moiety of the gaminess it has when just up from the salt water. I will not say just up from the sea, for, so far as I have been able to learn, and I have studied the fish very carefully, it never goes to the sea, nor even very far from the estuaries of the river in which it makes its home. I reside in the heart of one of the best "sea trout" countries on the Atlantic Coast, every river northwest and south of me teeming with them, and I am daily thrown in contact with men who depend upon deep sea fishing for a livelihood; they ply their calling all the way from "the banks" to the inshore fishing grounds; that is to say, fishing grounds which are not more than two or three miles from the mainland, and not one of all whom I have questioned has said that he has ever seen or heard of a "sea trout" being taken, either in mackerel or herring nets or in any other manner whatever, at any distance from the entrance of rivers which they descend for food in the late autumn and in the spring. Occasionally one is captured in a herring net when drawn close to the shore, but in the deep water of the ocean not one has ever been seen.

The trout is not, therefore, in any sense a sea trout; and it does not remain in the salt water very long after the spring run of smelts have ascended the streams to spawn. In my articles on this fish printed in FOREST AND STREAM January 24, 1903, and August 6, 1904, I have discussed this habit of the fish at considerable length, and will not further enlarge upon it here.

Now a few words on the breeding habits of this fish. It has been stated in FOREST AND STREAM that "it is brought up in the sea, better fed, and developed under conditions which make it larger, fatter, more rangy, and without the peculiar colors which characterize the brook form. * * * Presumably the young of any brook trout hatched out in the sea and fed in the sea would be the same." The inference to be drawn from this statement is that the "sea trout" is not only "brought up in the sea," but that it is hatched there also; this is an error of no small magnitude, for as the fish is never seen in the sea, and is never taken there, it is evident that it does not depart from the usual habits of our salmonidæ by spawning there. On the contrary, it always passes the season

of reproduction in fresh water streams, ascending them if possible to their very heads, and in such waters we always find the young from the condition of fryhood to the fingerling stage, and from that up to the mature fish.

It has been my custom to devote every moment of my spare time to nature studies, and in these I have never lost an opportunity when by the seaside to investigate the various kinds of fry that are found among the weeds, sand and pebbles at the edge of salt water and in the pools which have been left by the receding tide. I have exceptional facilities for this line of work, for my home is located within five rods of the bay shore. I have never in all my investigations found in salt or even brackish water either fry or fingerlings of any of the salmonidæ. Young herring, pollock, mackerel, and a number of other marine species were abundant, but not a single troutling. My experience in this respect is not exceptional, for of the many intelligent fishermen and anglers with whom I have conversed, not one has said he had ever seen the fry or other young of trout in salt water. No, the so-called "sea trout" cast their ova in fresh-water streams and the fry, instinctively for self-preservation, work their way up the little rills which empty into the streams, often for considerable distances.

On one occasion as I stooped to obtain a drink of cold water from a living spring which was at least twenty rods distant from one of the famous sea trout rivers of New Brunswick, I discovered in the water a number of fry, of which, after the expenditure of considerable perseverance, I captured three or four, which on examination proved to be the fry of trout. That those tiny creatures could have wriggled their way up the little rill, which barely trickled among the stones, mosses and water plants, for that long distance, was astonishing to me. That they had done so there could be no doubt, for adult trout could not possibly ascend to the spring to deposit their spawn in it.

Now with regard to the size of "sea trout." The article referred to states that owing to being "brought up in the sea they are better fed, grow larger and fatter * * * than those in the brook form." This statement is also capable of qualification, for in many localities where food is abundant the trout which do not descend to the salt water attain much greater size, plumpness and weight than do the others which go to salt water periodically. For example, the spotted trout in the Rangeley lakes, Maine, where there is the greatest abundance of minnows and other food, grow to a size such as is never attained by the "sea trout."

I have known of trout being taken at the Upper Dam which weighed 10, 11 to 12 pounds, and fish weighing from 6 to 8 pounds used to be brought into camp every day. I have taken my share of the large ones, having killed in one week one which weighed 7½ pounds, two of 6 pounds, one of 5 pounds, and two which overran four pounds, and my catch on one occasion was seven fish which weighed 32½ pounds, and this is something I have never equalled or even approached among "salters," as they are called in Massachusetts.

I have been informed by fishermen that the "sea trout" are so abundant in many of the small bays of Labrador and Newfoundland that they are caught by barrel-ful in herring sweep nets and cut up and used for cod bait. But none of my informants ever saw one among those immense numbers which exceeded five pounds in weight.

In the various rivers I have fished, I have found the average weight of the trout to be no greater than about three-fourths of a pound; that is, taking them as they came. I have found that two-pounders were not uncommon, and larger ones were often taken. In Musquodouit Harbor, about twenty-five miles northeast of Halifax, I have killed them of five pounds weight. The largest I ever killed in the Margaree River, Cape Breton, weighed a trifle over five pounds, and is figured in my "With Fly-Rod and Camera." At Prince Edward Island I never took one that exceeded two pounds in weight. In the various New Brunswick rivers one does not kill a large proportion of very heavy fish. In the Nepisiquit my largest was a pound and a half; in the Miramichi I have killed several which weighed over two and a half pounds each. In the Jacquet, which is one of the best trout rivers in the Province, I have taken many fish which weighed over three pounds. In the Restigouche and its tributaries the average of "sea trout" is, I think, not over, or much over, a pound. We used to get a lot of big ones near what is now the Restigouche club house, when the house was kept by dear old Col. Fraser. Ah, those were jolly days, indeed, and what a treat the old man's genial nature was! I have seen many hundreds of the fish caught near Campbellton and offered for sale in the town by the Indians, which did not average a half pound each. Very large "sea trout" are taken in the Big, or Grand, Cascadepia, and the little Cascadepia rivers, and in the other streams along the Quebec shore of the Baie des Chaleurs to and even beyond Gaspé.

If my memory serves me correctly I think the largest catch of these beautiful fish I ever made was on the great Bonaventure River, which used to be, and for aught I know, now is, famous for large sized trout; the catch numbered thirty and their weight was over sixty pounds. The fish were all silvery bright, just up from the Bay, and in their eagerness to take the fly often leaped clear of the water.

Yes, Mr. Chambers is right, the "sea trout" is one of the most gamy of fish. Although not as active as the grilse, nor indulging in such saltatory performances, nor as strong and vigorous a fighter as the salmon is, it gives, in the absence of these nobler game, a sport well worth the following. As I before stated, it changes its garb of silvery sheen after a brief sojourn in the river to the normal coloration of the spotted trout, *S. fontinalis*. As to its identity with that fish and non-identity of the European sea or salmon trout, I will not take space to discuss at length in this article. I will say, however, that I started in, a great many years ago, with the conviction that the sea trout, so-called, was, if not the European fish, a species quite distinct from our old darling, the spotted trout. So firmly was I impressed with this belief, I thought I would have no difficulty in proving that it was correct; but after all these years, and after examining hundreds upon hundreds of specimens taken in most of the Canadian waters it frequents, and comparing them anatomically in the most careful manner possible with undoubted specimens of *fontinalis*, I have been forced to abandon the idea I held and settle down to the realization of the fact that it is not a distinct species, or even a

variety, and goes down to salt water simply for the purpose of obtaining food which is not to be found in its native streams.

As a salmon angler, I have found the trout a perfect nuisance, for it comes to the fly as soon as it touches the water, and seizes it long before the large fish can rise to it. It also destroys more expensive flies in a week's fishing than the salmon will in the entire season. With a little practice an expert angler can shake off the pertinacious intruder without stirring up the pool very much; but no matter how skillful he may be in eluding or shaking off the trout, he will find that many a good day's sport with the salmon is marred by the "sea trout." As a rule, salmon anglers get but little sport out of the trout, for the reason that with their heavy tackle they quickly bring the fish to creel; but with a six or eight-ounce rod, preferably the former—for I hold that the keenest enjoyment is to be had with the lightest tackle practicable—a good sized sea trout, fresh-run and bright, will give the angler splendid sport. Most salmon anglers are after the nobler game, but when that is not to be had, the trout furnish an enjoyable substitute.

Fish and Fishing.

Landlocked Salmon.

IN a lake near Sussex, about midway between Moncton and St. John, N. B., there are salmon that are truly landlocked, instead of being only nominally so, as are the ouananiche of Lake St. John. And these salmon, if their present condition continue, will eventually become quite as distinct from the ordinary type of *Salmo salar* as are the so-called landlocks of Maine, concerning which, Colonel Andrew Haggard has been writing so charmingly in the London Field. By this I mean to emphasize my belief that, except in the matter of size, the landlocks of Maine resemble the best known type of *Salmo salar* less closely than do the ouananiche of Lake St. John. Both in manner and in appearance, and especially in the avidity with which they rise to surface lures, the Canadian ouananiche and its Newfoundland kinsman more closely approximate the salmon of the sea, which ascends fresh water to spawn, than the Maine fish does, though the latter more nearly approaches it in the matter of size. The landlock of Maine inhabits a less turbulent home than the fresh water habitat of either the freshly run salmon from the sea or the ouananiche of the Grand Discharge, and, as a rule, seeks its food in greater depths of water.

From a report by Mr. Isaac Sheasgreen, who has charge of the Miramichi fish hatchery for the Canadian government, I learn that about four years ago, 25,000 salmon fry were planted in the New Brunswick lake already referred to. The water of the lake is clear and cool, and in some parts is very deep. In others there are shoals with about ten feet of water. No mud exists, the bottom being clean and stony. At the outlet, which is very small, an arrangement has been made to prevent the fish from escaping. The lake, which is about two miles long by one broad and is beautifully situated, is owned by a party of gentlemen resident in Sussex, who made application for the fry in question. Two years after the planting of the fry, fourteen young salmon were caught in the lake, but in the following year the water seemed to be fairly alive with them, all about the same size, some ten inches in length and beautifully formed. One rod caught fifty in a day. Of course if this kind of fishing is allowed to continue, the lake will soon be exhausted. The planted fish will no doubt increase and multiply, if properly protected, just as the salmon in the Stormontfield ponds have done, but their progeny will gradually grow more dissimilar in both appearance and habits, to the salmon of the salt water.

The Restigouche Salmon.

Though both the hatchery men and the guardians on the Restigouche River find it difficult to account for

the apparent scarcity of fish and the poorness of the fishing there during the last season, I find that they are not prepared to admit that there is any steady decrease in the supply of the fish. They simply claim that the season was a phenomenal one, and certainly appear to have reason on their side when they assert that it is impossible that there should have been any such wholesale killing of the fish since the season of 1903, as would appear to have been the case if the smaller number of salmon killed was due to any marked reduction in the supply of the fish. In support of their theory they refer to some excellent scores made upon the river in the season of 1903. Thus in that year the Mitchell and Ayer Club, at Dawsonville, a few miles above Metapedia, landed 120 salmon; Camp Harmony Club over 100, while Messrs. Rogers, Brooks & Co., at Kedgewick, seventy miles above tide water, scored more than 200 salmon. Two rods on the Upsalquitch, during five days in July, landed thirty-eight salmon, and one rod in two days took fifteen salmon. All who traveled up and down the Restigouche and its tributaries during that season, declare that the salmon were never more plentiful than they found them on that occasion, and the guardians were unanimous in corroborating their reports. I now learn that a very large number of fish had ascended to their spawning beds on these rivers during the latter part of the present season, and that there is no present reason to fear for the future welfare of the salmon fisheries of the Restigouche.

It is very gratifying to note that the intelligent criticism of modern methods of fishculture, which have been printed from time to time in the columns of FOREST AND STREAM are bearing fruit and have attracted the careful attention of some of those engaged in the industry. The progress of biological research and the heavy outlay incurred in the operation of fish hatcheries alike demand that the science must prove itself a progressive one. I firmly believe, with many earnest students of the subject, that Mr. Alexander Mowat has struck a sound note in protesting against the waste of fish life involved in the too early planting of salmon fry. From his many years of practical experience he declares that the little fish should not be planted before the yolk-sac has entirely disappeared. If they could be held over and fed for a few weeks, much greater results would be produced. With this end in view, Mr. Mowat recommends the construction of a large retaining pond, well up toward the head or source of the Restigouche River, so that large numbers of alevins or fry can be retained and fed for a few months before being liberated. As the young salmon spends the first two years of its life in fresh water streams bordering on or emptying into the Atlantic Ocean, the fry, if retained a short time in ponds well up the rivers, would naturally have the advantage of feeding for eighteen or twenty months, throughout nearly the entire length of the river, while migrating to sea and before reaching the ocean. A step in this direction has already been made on a small scale. A pond has been built at the Restigouche hatchery for the purpose of holding over and feeding a certain number of the fry as an experiment. In addition to the pond, which is forty feet square, and six feet deep, several large tanks were erected outside, in conjunction with the pond, and about 100,000 fry were placed in the ponds and tanks and fed five times daily, great care being taken to keep all dead and decaying matter constantly removed. The food consisted of raw fish ground to a pulp, raw and boiled liver and blood. The fish grew and thrived well, were greatly admired by visitors and were really a beautiful sight. After having been a little more than three months in the pond, and being from one and a half to two inches in length, they were liberated when nearly five months old and quite capable of caring for themselves. This initial work has proved such a pronounced success that it ought to be prosecuted upon a much larger scale. Under the conditions which have hitherto prevailed, there can be no doubt that millions of young fish have been artificially hatched at the public expense, only to

become the helpless prey of predatory fish as soon as liberated from the hatchery.

Fishculture in Canada.

There has been an enormous increase during the last few years in the output of the Canadian government fish hatcheries. Twenty years ago it was only one-sixth of what it is to-day. Last year alone over 314,000,000 fry were distributed from the government hatcheries, an excess of forty millions over the preceding year. Until a few years ago, the following were the only species artificially hatched by the government: Atlantic salmon, British Columbia salmon, lake or salmon trout, lake whitefish, and lobsters; whereas, at the present time, instead of five or six kinds of fish planted under auspices of the Dominion government, no less than thirteen kinds are now hatched and distributed.

Since the government undertook the culture of black bass, four years ago, the demands for the fry from all parts of the country have grown to such an extent that Professor Prince admits that there must be a very large expansion of the work. It is likely to assume immense proportions, as there are no end of waters in the country devoid of sporting fishes, and offering all the conditions for fruitful bass ponds. This is one of the problems now confronting the fisheries department of the government. Another one is the necessity of more hatcheries on the Pacific Coast, in order to prevent the threatened destruction of some of the more valuable species of western salmon.

Smelt.

Just at the present time smelt are being taken in the St. Lawrence River by millions. They are exceedingly plentiful this year, and hundreds of city urchins are to be daily seen fishing for the toothsome delicacy from the wharves of the city, among the batture ice, content to shiver with cold for hours at a time, for the sake of the sport of hauling up the little fish, two and three at a time.

E. T. D. CHAMBERS.

A Word for Salt Water Fish.

NEW YORK, Nov. 25.—It amuses me to hear the praises of the fresh-water fish of various kinds, but somehow there are two or three or more kinds of salt-water fish that are worthy of mention; but leaving out tarpon, tuna, and striped bass, there seems none so poor as to do them reverence. Take the cero, or so-called kingfish, caught in Southern waters. Fish for him with black bass tackle and see where you would land! He comes out of the water, and no small jump, either; and when a fish can do what he can, hooked and on the end of a line, take care of himself against a shark, it strikes me he is game with a big G; and when it comes to being good to eat, if codfish were as scarce as salmon, they would be worth a dollar a pound.

This question of game in fish depends a good deal upon the tackle. Who would think of tackling a bluefish or bonito of eight pounds with a trout rod, line and reel? Why, the first rush would take the line, and a fly-hook would be crushed like a pipe stem! Yet I have caught an 8-pound brook trout on the fly in the Rangeleys on delicate trout tackle, and would not hesitate to try it again; but have not the slightest idea of tempting a blue or bonito with any such articles. With longer line and larger reel might land a small one with a trout rod, but it would be a case of time long drawn out.

I expect to go to Miami in March and have a shy at tarpon, barracuda, kingfish and amberjacks, and wish you were going along. Am mulling around fishing tackle and fishing tackle stores, and having a good time. There is a lot of fun in that, and some of the most pleasant hours I have are communing with rods, reels and lines, and congratulating them on the good they have done, and living over the various battles I have had with good fish. The whole business comes back to me, and all the surroundings are photographed in my memory, and it is fine.

C. H. MALLORY.

YACHTING

High Speed Gasolene Launches.

BY CLINTON H. CRANE, ASSOCIATE.

Read at the twelfth general meeting of the Society of Naval Architects and Marine Engineers, held in New York, Nov. 17 and 18, 1904.

THE application of internal combustion engines to the propulsion of launches is by no means a novelty, but great public attention has of late been attracted to the subject owing to the high speeds obtained by a certain number of small launches driven by engines of this type.

It might have been expected that the makers of marine gasolene engines would have developed a light engine from the heavy slow moving engine which has been on the market for years. However, the demand for a light weight motor has so far been met only by automobile makers, although marine engine builders are now beginning to take up the matter.

The older makes of motors weighed from 80 to 200 pounds per brake horsepower, and in sizes up to 75 horsepower have proved extremely satisfactory in all sorts of working vessels. Engines of this type manufactured by the Pennsylvania Iron Works (Globe Motor), Standard Motor Construction Company, and other well-known makes have run satisfactorily day in and day out with practically no attention or trouble.

The manufacturers of automobiles have been the first to realize the possibility of a light weight motor, and

have been able to reduce the weight per horsepower to between 8 and 20 pounds per brake horsepower in the best practice of to-day. To have divided the weight per horsepower by 10 is certainly a remarkable achievement.

The reduction of weight has been accomplished in three ways:

- First—The elimination of unnecessary material.
- Second—The employment of higher grade material.
- Third—The use of higher piston speeds.

The higher piston speed has necessitated modifications of design in four particulars—mechanical balance, ignition, lubrication and cooling. All four of these difficulties have been met with entire success in the engines used by automobiles.

The slight change of conditions from an automobile to a boat has given rise to unforeseen troubles with ignition and lubrication. The ignition troubles have been principally due to water affecting the insulation of the electrical gear for igniting the gases; and this, by care in installation, can be readily corrected.

The troubles with lubrication arise from the fact that in a boat the engine driving the screw is ordinarily set at an incline, the result being that the after cylinders and bearings receive too much oil, the forward too little. It may not be generally known that in a gas engine too much oil is as bad as too little.

Several systems of forced lubrication have been designed to meet this trouble, with more or less success,

but the adjustment of the oil supply is of such delicacy that I think it safe to say that most people can trace their troubles in high speed motors to this alone.

During the past year we have designed a dozen launches to be driven with light weight automobile engines of various makes, and the only troubles experienced have been with one or the other of these difficulties.

The extremely light weight per horsepower of the modern gasolene engines has presented the possibility of attaining higher speeds on the water than heretofore.

The past year, though not yet having realized this possibility in point of actual speed, has brought us to a point in relative speed never before attained to my knowledge.

I present to the society as a type of this high speed automobile launch, the Vingt-et-un II., designed by my firm. This boat on public performance has shown a speed of over 22 knots per hour.

To attain, for her length, a speed relative to this Turbinia would have had to make 35.5 knots an hour instead of 32.76, as is credited her by report. To attain for their length a speed relative to this, torpedo boats would have had to make 44 knots an hour instead of 30 knots as actually obtained.

From the fact that Vingt-et-un has attained such a high point on the speed curve, I feel that the record of a progressive trial run last September on this launch over a measured mile would be of interest to the society.

Vingt-et-un's principal dimensions are as follows:

HULL.		
L.W.L.	38ft.	9in.
Beam	4ft.	7in.
Draft of hull, mean.....		7in.
Wetted surface on trial, including struts, rudder, shafting, etc.....	146.3 sq. ft.	
Displacement on trial.....	3,850 lbs.	

ENGINE.

Smith & Mabley Simplex four-cylinders.		
Diam. cylinders	6½in.	
Stroke	6¾in.	
Rev. full speed.....	850	
Piston speed	956	
Brake horse-power full speed.....	68	

TRIAL TRIP OBSERVATIONS.

Run.	Time Over Measured Statute Mile.	Average Rev.
1 { Against tide... 7m. 17s.		380
1 { With tide..... 4m. 45 2-5 s.....		380
2 { Against tide... 6m. 7 2-5 s.....		438
2 { With tide..... 4m. 34 3-5 s.....		425
3 { Against tide... 3m. 31s.		670
3 { With tide..... 2m. 49s.		690
4 { Against tide... 3m. 7s.		740
4 { With tide..... Watch stopped by accident...		745
5 { Against tide... 2m. 38s.		850
5 { With tide..... 2m. 20s.		835
6 { Against tide... 3m. 10s.		728
6 { With tide..... 3m. 2s.		666
7 Run spoiled by driftwood getting on stem.		
8 { Against tide... 4m. 1s.		564
8 { With tide..... 3m. 30s.		597

In selecting a course to run this trial, owing to the small size of the boat, absolutely smooth water was a necessity.

This was especially true with a gasoline motor, as even a small amount of spray on the electrical apparatus for ignition is sufficient to impair the regularity of the engines. It was not possible to count the revolutions without removing the forward part of the engine cover. We therefore chose a measured mile course on the Harlem River laid out by the Engineering Department of the New York University, quite recognizing the disadvantages due to shallow water (an average of about 16ft.) and a strong tide (a maximum of nearly 2 knots). One man was placed at the forward end of the engine with stop-watch and revolution counter to note revolutions, the helmsman taking the times over the course with and against the tide. The difficulties of observation were increased by the large amount of floating wood which had to be dodged.

Runs were made with and against the tide with engine speeds between 380 revolutions and 850. It was found impossible to throttle the engine to a lower speed than 380 and have it run with sufficient regularity to make the result of any value.

The engine had before installation been tested on the brake for a maximum power at varying revolutions. This brake horsepower curve gave us a value of 68 horsepower, or 850 revolutions.

The information which we principally desired to obtain was the rate of increase of power at the higher points of the curve not already investigated.

The speeds were reduced from statute miles per hour to nautical miles per hour.

The speed revolution curve was obtained by laying in all the spots with and against the tide, and figuring the tidal correction for each of runs separately on the assumption, that for a small variation in revolutions a speed varied with the revolutions.

As will be seen, the speed revolution curve and slip curve, which was deduced from it, run very easily through the various spots.

In constructing the effective thrust curve, I made the following assumption, based on the well-known laws of screw propellers, i. e.:

$$TaR^2 \times (S + C).$$

Where T = effective thrust.

R = revolutions of propeller.

S = apparent slip.

C = a constant dependent on wake factor and on the shape of screw.

I assumed this constant to be 5, allowing for a wake per cent. of 3, and a screw correction of 2.

The formula then becoming

$$TaR^2 \times (S + 5),$$

Undoubtedly there is variation in this constant (C), but the curves of effective thrust and brake horsepower have been deduced on this assumption, and from the effective thrust curve the curve of the variation of power with speed was readily obtained.

The slip curves, and in fact all the curves, seem to agree in character very closely with the known curves of torpedo-boat practice, and within the limit of the observation the increased speed was accompanied by no apparent change of rate in the increase of power after 14 knots was reached.

On this progressive trial the boat was carrying about 350 pounds, more weight than her usual racing condition, due to the man on board and some extra tools and gasoline.

During the summer over several courses a mean speed of 22 knots has been obtained at an unknown number of revolutions, as in this case it was impossible, owing to the spray, to have a man in a position to count the motor.

Vingt-et-un has been able to maintain this high speed through, for her, very rough water. In the race for the Gold Challenge Cup she won the last two races on the Hudson in a strong wind blowing up the river against an ebb tide, without her speed suffering appreciably, as will be seen by the official figures. The course was given out by the officials as 16 nautical miles. By actual measurement on the chart it was 15½ nautical miles. The mean of the speeds up and down the river the second day was 21.16 knots, and the third day was 20.57 knots.

It seems to me that in addition to the model experiments in Washington there might be considerable advantage in trying small models of the proposed vessels, driven by their own power over rough water courses, as a boat's ability to maintain her speed in rough water is vastly more important than speed in absolutely still water.

The boat with all her equipment and a crew of two, in racing condition, with fuel for 50 miles at full speed, weighs 51 pounds per horsepower. The engines run with absolute regularity, maintaining their high speed for hours at a time with very little attention from the engineer. The regularity of the running is particularly apparent in comparison with steam-driven craft, where irregular firing and dirty fires make tremendous variations in the results.

Rochester Y. C.

BY THOMAS G. YOUNG, SECRETARY.

THERE are indications that, back in the seventies, or thereabouts, there was a yacht club in Rochester. But no authentic records are available as to its scope or plans, and it eventually ceased to exist. After which, for some time, yachting interest in the vicinity was maintained mainly by individuals. In the fall of 1886 a desire to combine for more effective development of the healthful and princely pastime was expressed; and after a few preliminary meetings in December of that year, the Rochester Y. C. was organized with forty-six members on the roll. A constitution was framed, and the following officers were elected: Com., Geo. H. Newell; Vice-Com., Matt Cartwright; Sec'y, Charles A. Wortz; Treas., Edmund Ocumpaugh; Fleet Captain, E. N. Walbridge; Meas., John J. Leary; Fleet Surgeon, Dr. W. S. Hall.

Rooms were rented and meetings held during the winter, at which papers on nautical subjects were read and discussed, and a good deal of enthusiasm created in the enterprise. Several additional members were enrolled, and in the following April the club was incorporated and took its place among the clubs of the inland lakes.

The summer programme consisted mainly of a stated

hauling out boats for summer repairs and for winter storage.

Schedules of local races and sailing days covering the entire season have constituted the usual summer events. Besides the cash and trophy prizes offered, a number of handsome cups have been donated as special trophies for certain racing events during each year, passing from one to another as success has perched on the banner of the winner.

Considerable interest has been taken in the annual circuits of the Inland Lake Yacht Racing Association; several of the rendezvous have been held at our port.

The increase of membership and the need of better accommodations led to the consideration of a more eligible site and a more commodious house. At the annual meeting in December, 1901, the project assumed definite form. An elegant site was procured on the east side of the mouth of the Genesee River, fronting on the lake shore. A subscription was started, and about May 1, 1902, plans were decided on, the contract let, and the work pushed forward so rapidly that the house was formally opened in the latter part of June following. The building is a three-story frame structure, 45 by 60 feet, with a piazza 16 feet wide extending around three sides of each story. The ground floor contains a good sized assembly room, a large apartment fitted with individual lockers, toilet room and shower bath, and a large storeroom. The second story is fitted with an assembly room same size as that on the lower floor, which is used as a reading room and resting place, secretary's office, buffet, ladies' parlor and toilet room, and a room 15 by 15 feet used for a private party dining room. The upper floor contains a dining room capable of seating eighty or more, while the broad piazza affords seating accommodations for even a larger number, and is the favorite place for café service in summer. The remaining space on this floor is occupied by the large kitchen,

HOME OF THE ROCHESTER Y. C.

day in each week designated as "sailing day," when a goodly number of the young fleet would turn out for an afternoon sail, carrying such of the non-yacht owning members as chose to avail themselves of the privilege. Reviews by the commodore, maneuvers by signal, and other marine tactics, lent spirit to the occasions, as did also invitations to the ladies to join the company on "Ladies' Days."

Early in the history of the club some boats of the better class were purchased at the seacoast and brought into the fleet; among which were Vennette, Choctaw, Major, Onward, and Cinderella. With the introduction of this new timber more of the racing spirit was engendered, and some very interesting contests were held. Especially noticeable among these importations was the famous Scotch-built cutter Madge, whose record on the Atlantic Coast before her purchase by members of the Rochester Y. C. was decidedly creditable. The introduction of this craft of a pronounced cutter type to American waters may be regarded as a prominent factor in changing the style of American yacht architecture from the old skimming dish pattern to a modified cutter form.

For a few years this yacht took the lead in the Rochester fleet, being, in fact, without a competitor capable of coping with her in fast sailing; but she was eventually laid aside, partly through being outclassed in the progress of yacht construction and partly by her owners failing to keep her in proper trim. She was finally hauled out on the beach, the immense lead appendage to her keel was chopped off and sold for junk, and her ribs left to bleach on the barren sand—a memento of a once famous "has been."

In the summer of 1890 a novel innovation was made in the building of a number of sailing dinghies of one type, and much pleasure was afforded both to the occupants of these little ships and to the spectators who witnessed their frequent contests in the river when outside sailing was not desirable, and involuntary plunge baths were not infrequent.

Soon after the organization of the club, the desirability of having a club house at the lake was very manifest, and after due deliberation a site was procured and arrangements made for the erection of a club house. Plans were prepared for a building of two stories and an attic. The lower floor contained storage lockers and a large room for housing spars and dinghies. The second floor was arranged with an assembly room, secretary's office, and was devoted to social purposes. A broad balcony across the east end afforded a good view of the river and anchorage. The attic was used for storage of extra canvas. A marine railway was also constructed for

fully equipped with two large coal ranges, pantries, refrigerators, and all the necessary paraphernalia for convenience in café service. A dumb waiter furnishes means of conveying provisions from the store room to the kitchen. There are also on this floor dormitories for the servants required in this department. The principal entrance to the building opens into a large hall, from which easy staircases furnish access to the upper floors.

The view from the broad balconies is exceptionally fine, affording unobstructed sweep of the lake coast for about twenty miles, thus giving an excellent opportunity to witness the races, the entire course being in full view.

The house stands as near the water's edge as safety will allow, and the level grounds extending inland are well adapted for ornamentation, and are being improved as fast as is feasible. It is contemplated to fit them out with tennis court, croquet ground, and other facilities for outdoor land recreation as may be required, which, together with the planting and decoration proposed, will conduce to make the entire plant a most desirable summer resort for the members and their families.

There are some items in the history of the club deserving of a passing notice. The Fisher Cup, which, since 1882, had been a contested trophy among the yachts on the lakes, was challenged for and won by Onward from the yacht Norah, of Belleville, on September 19, 1892. In November, 1895, by the terms of the original contract, being up to that time unchallenged, it became the bonafide property of the owners of Onward, who then donated it to the Inland Lake Yacht Racing Association as a perpetual challenge cup for yachts of 35ft. sailing length or over in the clubs of Lake Ontario and Bay of Quinte, forming part of the association. In September, 1900, it was challenged for by the Royal Canadian Y. C., and successfully defended by Genesee, of the Rochester Y. C., against Beaver, of the Royal Canadian Y. C. It is still in the custody of the winning club.

In 1896 the celebrated cup offered by the city of Toledo was raced for by Vencedor, of Chicago, and Canada, of Toronto, and it was won by the latter. The cup was then deeded by the owners of Canada as a perpetual international trophy between representatives of the two nations bordering on the Great Lakes—hence the name Canada's Cup. The Chicago Y. C. was the first to challenge and several yachts from that city were built for the trial races. The field having been opened for representatives from other clubs to try for the choice, the Rochester Y. C. prepared and put into the contest the yacht Genesee. The result of the trials at Chicago was so successful for the Rochester yacht that she was chosen as the representative of the Chicago Y. C. The

result of the contest between her and Beaver, of the Royal Canadian Y. C., off Toronto in August, 1899, was a complete victory for the Rochester yacht, and the cup passed into the hands of the Chicago Y. C., it being the challenger. In 1901 the Royal Canadian Y. C. again competed for the prize, and their representative, Invader, proved to be the winner. The sporting blood of the Rochester Y. C. was now thoroughly aroused, and Commodore Van Voorhis was promptly on hand to lodge a challenge for the next contest, which was accepted. By the terms of the contract the winning club has the privilege of choosing the size of yachts to compete for the ensuing struggle, and it was decided to enter the lists with yachts of 40ft. sailing length. This necessitated a greatly increased expense in building such a yacht, but the Rochester boys were equal to the emergency. A syndicate was formed, plans decided upon after designs by Mr. William Gardner, of Messrs. Gardner & Cox, and the contract for building the yacht placed in the hands of B. F. Wood, of City Island, New York. When completed she was, to all appearances, the finest craft which had yet appeared on the inland lakes.

The new yacht, named Irondequoit, entered the lists with Strathcona, of Toronto, in very deed a foeman worthy of their steel. On August 8, 1903, the contest began. The first two races, owing to some unaccountable mishaps, were unfavorable for Irondequoit, but her supporters were undaunted in their courage and faith in the capacity of the boat on which the reputation of the club was staked. Mr. Addison G. Hanan was placed in charge of the yacht, and her true qualities were brought out, resulting in winning the next three races in one of the most spirited and exciting contests ever witnessed on the inland lakes.

The coveted prize thus came into the custody of the Rochester Y. C. A challenge from the Royal Canadian Y. C. has been accepted by the Rochester Club, and active preparations are now being made by both interested parties. It has been decided to contest with boats of 30ft. class. Several new yachts are being planned for the occasion, and it is pretty well assured that the coming season will witness considerable sport in our nautical lines. The races will take place off Ontario Beach at Charlotte, N. Y.

About a year ago the handsome schooner yacht Helene was brought here by W. A. Stace and enrolled in our fleet. During the past summer the following additions have been made to the list: Pharamond, a 74ft. power boat, which has borne the pennant of Vice-Commodore Briggs; Mohawk, a staunch and commodious 35ft. sloop owned by Thos. B. Pritchard, the commodore-elect; Climax, by H. A. Barrows; Gladys, by F. A. Mabbett; Outlaw, by C. V. Aspinwell.

There are now enrolled in the fleet between 40 and 50 sailing craft, ranging from 15ft. to 110ft. waterline, and about 20 power boats of various dimensions.

The following gentlemen have held the position of commodore in the club since its organization: George H. Newell, 1887-1890; J. R. White, 1891; Matthew Cartwright, 1892; J. R. White, 1893; H. S. Mackie, 1894; A. T. Hagen, 1895; F. S. Todd, 1896; A. G. Wright, 1897; F. E. Woodworth, 1898; A. G. Wright, 1899-1900; Charles Van Voorhis, 1901-1903; Charles M. Everest, 1904.

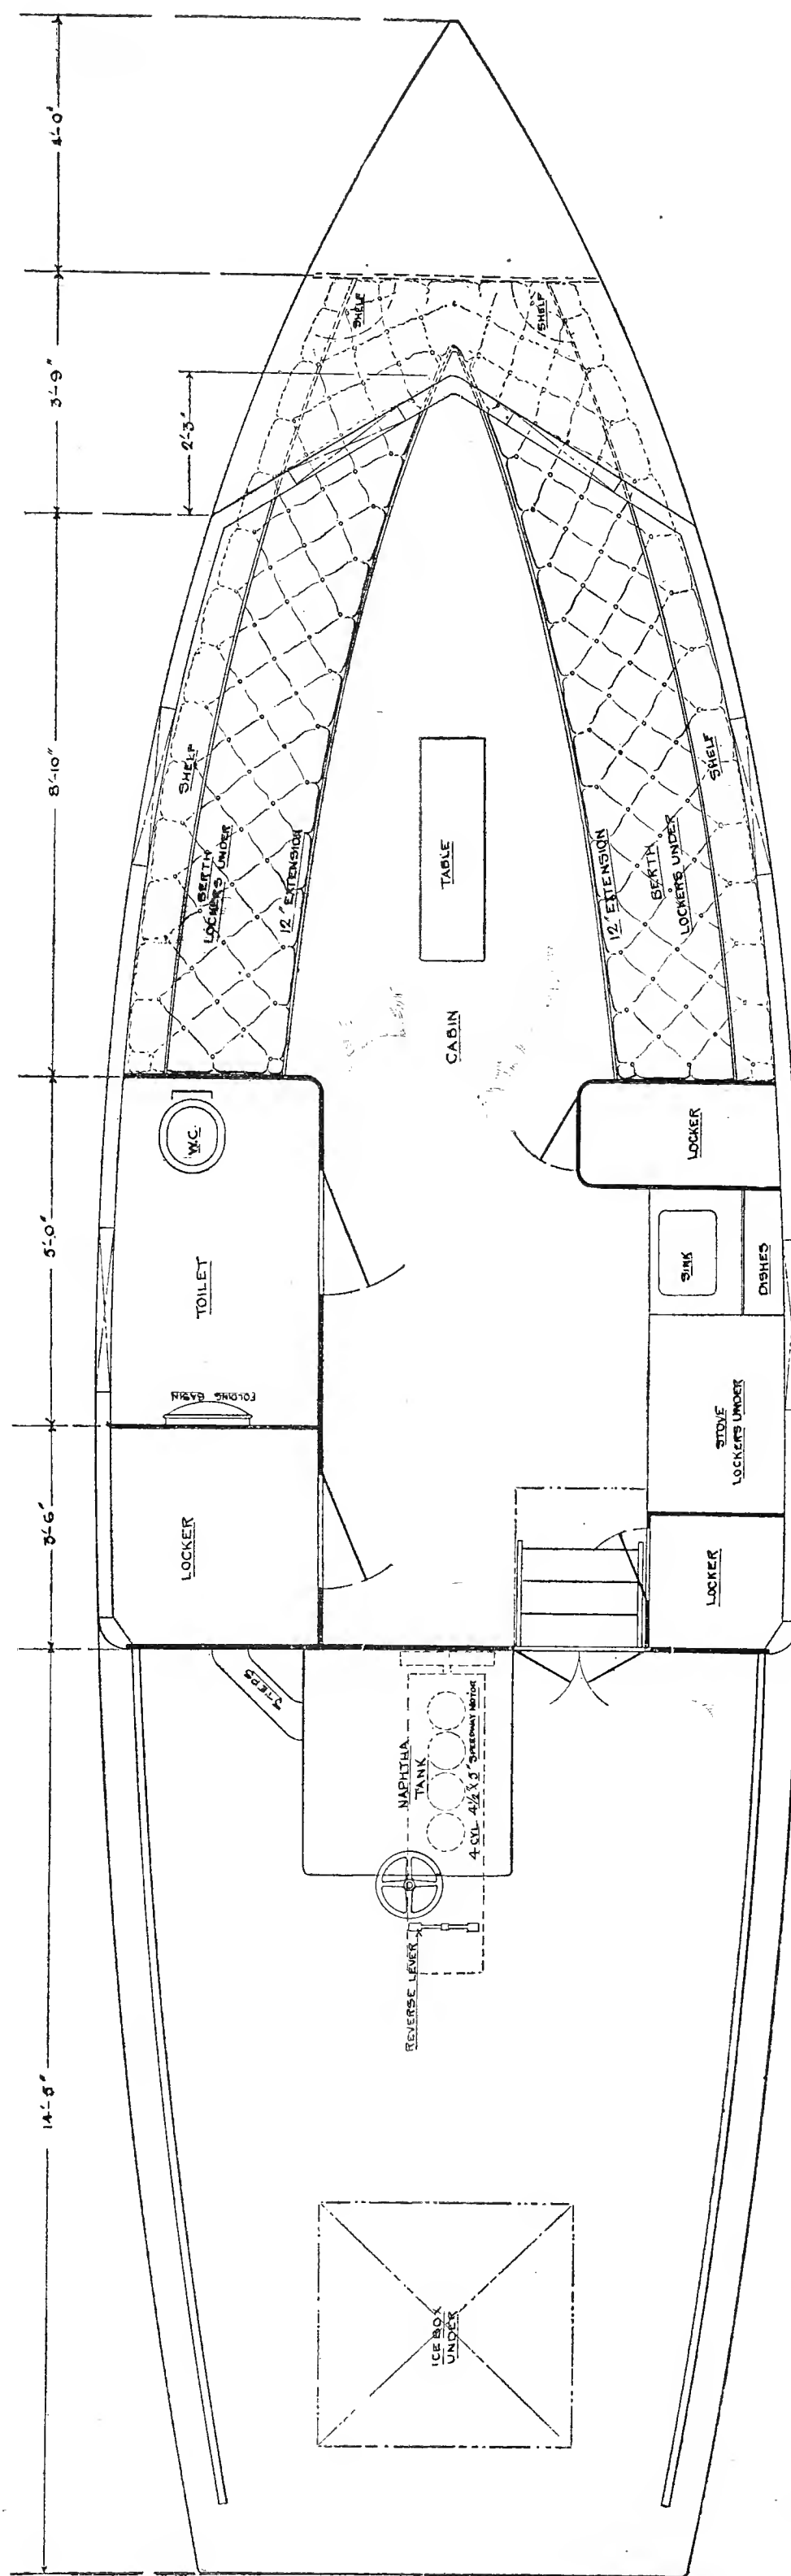

The officers just elected for 1905 are: Com., T. B. Pritchard; Vice-Com., L. G. Mabbett; Fleet Captain, Frank T. Christy; Sec'y-Treas., Thomas G. Young; Corres. Sec'y, C. V. Burton; Meas., W. H. Pillow, Jr.; Fleet Surgeon, Dr. W. J. Herriman. The present roll of membership is 350, and a considerable increase is looked for during the coming year.

Rhode Island Notes.

PROVIDENCE, R. I., Dec. 3.—Extensive improvements in club house facilities planned for the coming season by the two leading yacht clubs of Narragansett Bay afford good evidence of the steady growth of yachting interest in this vicinity during the past few years. This has been manifest for some time in the rapid growth of club membership as well as in the increased number of craft devoted to pleasure, especially in the line of power boats of medium size. Naturally there is an access of interest in organization and the several clubs, under this stimulus, show signs of an activity that promises well for this sport in Rhode Island waters during the next few seasons.

The Rhode Island Y. C. has for some years had a commodious club house admirably located at Pawtuxet, some six miles from the city, and for several seasons it has maintained a small club house at Potter's Cove, near the north end of Prudence Island, a few miles from Bristol, which has come to be a favorite yachting rendezvous for the whole bay. A few months ago, however, the whole property at Potter's Cove was bought by Mr. James A. Garland, of the New York Y. C., with the intention of building an extensive summer residence. This deal dispossessed the yacht club, of course, and it looked as if yachting days at Potter's Cove were over, except for Mr. Garland. During the past week, however, plans have been completed, by which the R. I. Y. C. will continue to have a summer home at the Cove. A tract of land has been purchased on the south side of the Cove, opposite the old club house, and at a meeting held this week it was decided to erect a building to contain a large dining room, ladies' rooms and sleeping rooms. The club house will be on a more ambitious scale than the old building, the principal purpose of which was the serving of the regular club clam bakes during the season, and the members are greatly pleased by the outlook. The building committee consists of Commodore F. T. Rogers, Secretary George E. Darling, Fleet Capt. Howard E. Barlow and Messrs. Scott C. Burlingame and Charles G. Easton.

Extensive alterations are to be made on the club house of the Edgewood Y. C. in the early spring. The rapid growth of the club necessitated a considerable addition to the building a year ago and now, for the same reason another enlargement is to be made. The new addition will extend 25ft. over the water front from the present building, and the full width of the structure. On the lower floor the additional space will be given over to a large smoking room and a broad verandah. The second floor will have broad window openings and will afford a commodious promenade space as an annex

HOUSE-BOAT CLOVER—CABIN PLAN.

Designed and built by the Gas Engine & Power Co. and Charles L. Seabury & Co., Consolidated. 1904.

to the present ball room. The building, which is to be of handsome architectural design, will be completed in time for the opening of the season.

F. H. YOUNG.

Queries on Marine Motors.

WHEN E. W. B.'s question was answered in this column in our issue of Nov. 26, we had in mind The Toquet Motor Company, which concern makes a specialty of a two-cycle marine engine that can be run in either direction and be made to ignite going ahead or backward after the upper center is passed. Under the date of Nov. 25 we have a letter from The Toquet Motor Company, of Saugatuck, Conn., and in part they say "this is a very important feature which we make a special point of."

N. B. E., Fall River, Mass.—I am told that with the jump spark ignition you are liable to receive a severe shock. Is this so? What precautions should be taken?

Ans.—You can get a severe shock from the secondary wiring or spark plug. The only precautions to be taken are to be sure and not come in contact with the secondary wiring or plug when switch is in. The cable should be inclosed by or run through ordinary rubber tubing as an additional precaution, and should run direct from the coil to the engine without coming near any part of the inside of the boat.

F. J. W., Bay Shore, L. I.—Which takes the less battery to operate, make-and-break or jump spark?

Ans.—This question is answered in an article published this week on "Ignition of Marine Gasolene Engines."

C. F. W., Pittsburg, Pa.—Where can I buy a good jump spark coil, and how much ought one to cost?

Ans.—Consult our advertising columns for coils. Probably \$7 to \$8.

Electric Marine Gasolene Engine Ignition.

BY A. E. POTTER.

IN this essential of gasolene engine construction there are in reality three types, the "wipe," where the insulated electrode wipes or rubs by a fixed insulated one, very rarely met with except in engines designed and built some years ago, not very plentiful even at that; the very common "make-and-break," and the modern "jump spark" ignition.

Marine engines are usually designed to use an "open," although occasionally is found an engine operating on a "closed," circuit. In the open circuit, contact is only made sufficiently long to magnetize the spark coil, while in the closed circuit the electrodes are in contact all the time, except when the spark is made and a very short time thereafter. It will be readily seen that open circuit takes decidedly less electrical energy and is more economical.

When an electrical circuit is completed, there are two currents passing in opposite directions, the positive through the established circuit toward the negative pole, and the negative toward the positive. Just so long as the circuit is complete, the two currents pass and waste. From this very fact decidedly more attention should be paid to the length of contact if the electrical energy is to be economized and our batteries are to last longer as a result. Even a damp atmosphere acts as a medium of connection, and for that reason the batteries should be kept in a dry place.

When an established electrical circuit is interrupted the two currents will leap across the intervening space and heat the air to incandescence. This is what causes the spark.

The electrical energy used for ignition may be derived from either chemical or mechanical means, or even by a combination of both.

Sal ammoniac batteries, either wet or dry, and caustic alkaline batteries, such as the Edison or Gordon, are chemical entirely, while magnetos and generators (often incorrectly called dynamos) are mechanical in their operation. The accumulator or frequently called storage battery is a combination of both.

The use of the dry battery has pretty generally superseded the wet sal ammoniac cell on account of cheapness, convenience, and cleanliness. The better and higher priced alkaline batteries, usually designated as oil batteries from the use of a sealing of oil to prevent evaporation and "crawling" of salts, on account of their long life, are very popular among marine engine operators because they can be depended on for long, hard usage. With proper attention and adjustment of the electrodes one set of six cells of the larger type will usually last two full seasons without recharging.

CLOVER—HOUSE-BOAT FOR SOUTHERN WATERS.
Designed and built by the Gas Engine & Power Co. and Charles L. Seabury & Co., Consolidated.

Houseboat Clover.

THE Clover is a combination of cruiser and houseboat, a new type of boat, but one bound to become popular. She was designed by the Gas Engine & Power Co. and Charles L. Seabury & Co., Consolidated, for a prominent New Yorker, especially for southern waters. Her extreme width and shallow draft make her commodious, and not especially expensive to run. She is 40ft. over all, 11ft. beam and has a draft of but 2ft. 4in., and is 14 tons net. Her power equipment is a four-cylinder, $4\frac{1}{2}$ in. x 5in. Speedway Model A. gasolene engine.

Boston Letter.

BOSTON, Dec. 5.—One of the neatest designs for a cruising gasolene launch is that of Tonopah, owned by John F. Anderson, of Philadelphia. The lines were drawn by Mr. Fred D. Lawley, and the boat was built at the Lawley plant at City Point. Although some feet shorter, the general appearance of Tonopah is very similar to that of steam yachts of the Scout, Mirage and Tramp type built by Herreshoff. A dummy smokestack makes the likeness all the greater. Tonopah is 70ft. over all, 66ft. waterline, 10ft. beam and 3ft. 6in. draft. She is propelled by twin screws, operated by motors of 50 horsepower each. These gave her a maintained speed on her trial trip of 12.3 knots an hour. Each motor has a separate gasolene tank of 200 gallons, the piping running from the tanks to where it again enters the boat to supply the engines. The tank capacity gives the boat a cruising radius of about 800 miles. The owner's quarters are forward, and consist of a main saloon, with extension transoms for sleeping accommodations. There is a large toilet room off the main saloon and there is plenty of locker room. Aft the main saloon is the galley, with sufficient accommodations for comfortable cruising. The greater part of the dummy stack takes the odors from the galley and also furnishes a most excellent place for the galley stove-pipe. The stack also furnishes a draft for the engine room, which is just abaft the galley. The crew's quarters are in the after part of the boat. The owner's quarters are finished in mahogany, the galley in pine, and the engine room and crew's quarters in butternut. A break in the cabin trunk forms the steering bridge, the helmsman standing on the plane of the main deck. A signal mast is placed forward of the steering space.

A number of launches are being constructed in the Lawley boat shop. One for Mr. Alfred Douglass, of the Boston Y. C., has been completed. This boat, which was designed by Mr. F. D. Lawley, has a cabin trunk, windowed in the forward part and partly open aft, to give air to the motor. The cabin trunk is raised

Accumulators, or storage batteries, have come into use latterly quite extensively, and as they become better understood will undoubtedly be much more common. The mistake that is made by manufacturers of these different types is that instruction is not properly given to the users and the importance of following out to the letter all suggestions tending to lengthening the life of the battery and preventing too frequent "battery troubles."

Some simple rules could be inclosed with each cell sent from the factory; for instance, something like the following:

"To avoid trouble and lengthen the life of this battery, it is very essential that the switch must not be left closed when engine is not running, and the contact of the electrodes must be just as short as possible. Keep dry and always remove from the boat when not in use."

Magnetos and electrical generators usually give excellent results. They need careful attention, however, and if they refuse to operate or generate a current recourse will have to be made to the old reliable battery. Salt water is their worst enemy. Magnetos are liable to have their fixed magnets demagnetized and are useless as a result. This is their most common trouble. But they will run in either direction, and range of speed is usually sufficient to run the engine slowly, although it is usually customary to use batteries when slowing down. Batteries are indispensable for use in starting. Magnetos generate alternating electricity, and for that reason are not adapted for jump spark.

There is a form of magneto on the market now which instead of the usual rotary motion, oscillates. By its use an engine can be started by hand as slowly as desired, without the necessity of a battery. Their price is rather high and probably accounts for the few in use. Magnetos or generators are almost absolutely necessary in ignition on closed circuits, for the amount of energy required makes it expensive for batteries if used.

Batteries of all kinds can be used in wipe, make-and-break and jump spark work on open circuit. Storage batteries must never be used on closed circuit. Generators in jump spark ignition must have their armatures specially wound to operate without ruining the coil. In the selection of an induction coil for use in connection with batteries for primary ignition, remember that a heavy 6-inch coil is much easier on your batteries than a light weight 10-inch coil.

CHANGES IN EDITHIA.—Mr. John H. Hanan's Edithia is at Morris Heights to have installed two triple expansion Seabury engines and boilers. The motive power of two large kerosene explosive engines proved unsatisfactory, and the owner being unwilling to use gasolene, the change to steam resulted. Edithia was designed by Gardner & Cox in 1903. When lengthened she will be some 140ft. long over all.

HOUSE-BOAT CLOVER—OUTBOARD PROFILE.

Designed and built by the Gas Engine & Power Co. and Charles L. Seabury & Co., Consolidated. 1904.

OPEN LAUNCH—ARRANGEMENT PLAN AND OUTBOARD PROFILE.
Designed by Messrs. Tams, Lemoine & Crane for the Smith & Mabley Co., New York City. 1904.

sufficiently to give full head room and at the same time is not high enough to give the boat a top-heavy appearance, which is noted on many small cabin launches. Mr. Douglass will use the launch as a tender for his 30-footer Shiyessa, and also as a ferry between the Hull and Rowe's wharf anchorages of the Boston Y. C. Another launch in the boat shop is for a Boston yachtsman, who wishes his name withheld for the present. This boat is 36ft. long, open, with torpedo boat stern, and will be driven by a 16 horsepower engine. In the west shop the frames for the new 90ft. schooner for Mr. F. F. Brewster are being trued up. In the east shop the 43ft. schooner for Mr. Bancroft C. Davis is receiving the finishing touches. The cabin work is being finished in the 30-footer for Mr. Albert Stone and an 83ft. twin-screw gasoline yacht is partly planked.

Messrs. Swazey, Raymond and Page have a number of designs of launches under way. One very neat design is of the hunting launch type, but with much more speedy appearance than is usually noted in boats of the type. She is intended for shore cruising, having a saloon forward. The engine is placed abaft the break of the cabin trunk. Chairs are placed about a very roomy standing room. This boat is 30ft. over all, 6ft. 9in. beam, and 21in. draft. The motive power will be a 10 horsepower gasoline engine. This firm has also turned out a 40ft. auxiliary yawl for Mr. Buckley, of Philadelphia. Among others of their design, is a 75ft. launch for western parties. This boat will be twin-screw, with engines of 50 horsepower each.

At Marblehead Messrs. Stearns and McKay are busy on new work and on alterations on yachts stored in the yards during the winter. They have designed a hunting cabin launch, with considerable room under a low trunk, for Mr. Nelson Frank, of Philadelphia. She will be 35ft. over all and 8ft. 6in. beam, with a 12 horsepower engine.

Mr. B. B. Crowninshield has an order for a 27-footer under the proposed new rating rule, for Rochester parties. Mr. Crowninshield is in favor of the general principles of the new system except that he thinks the centerboard boats are likely to be at a disadvantage. A number of sets of plans for new boats are being worked out on the Crowninshield boards.

Messrs. Burgess & Packard are at work upon a fast power launch, which is to compete in the American

Power Boat Association races on the Hudson next season. It is believed that this boat is for Mr. H. L. Bowden, for whom they designed and built Mercedes, U. S. A., last season. They are also designing a 40ft. automobile boat for Mr. William Wallace, which is to have an estimated speed of 28 miles an hour. They are also designing a 38ft. cruising launch for Mr. Wilder.

Mr. W. J. J. Young, who drew the lines for the steam yacht Pantooset, has designed a 21-footer for Dr. E. W. Gahan, of the South Boston Y. C., which Dr. Gahan is now building in his boat shop at Dorchester. This boat will be 27ft. 11in. over all, 20ft. 9in. waterline, 11ft. 4in. beam and 2ft. 9in. draft. She will displace 7,700 pounds with 1,400 pounds outside, and will carry 888 sq. ft. of sail. She will be raced at Halifax and Yarmouth.

JOHN B. KILLEEN.

Two Designs for Open Launches.

WE are reproducing this week two of Messrs. Tams, Lemoine & Crane's creations, designed for the Smith & Mabley Company, New York city. One is a 30ft. high speed launch tender, and the other is a pleasure speed launch 35ft. long. Both will be equipped with 30 horsepower Smith & Mabley "Simplex" 30 horsepower engines of four cylinders, each $4\frac{1}{2}$ by $5\frac{1}{2}$ inches.

The tender is of the usual oak keel and frame construction, with $\frac{1}{2}$ in. Honduras mahogany planking of the riband carvel type. Inside finish, deck, grating, etc., are also of the same material. Deck has considerable crown, but not as much as the usual turtle-back. Chairs and an upholstered after seat are shown, but if desired slatted folding seats can be had in addition. Stem is slightly retreating, and stern square with the usual balanced outside rudder.

A collapsible canopy top canvas hood with sliding glass front is provided to protect the after cockpit in rough water or wet weather. Directly aft of the steering and operating cockpit is a canvas-covered hatch effectively protecting the engine from water. Eyebolts for hoisting on davits are provided, of course. Total weight, including two men and 50 gallons of gasoline, will be under 3,000 pounds. Passenger capacity is from 6 to 12, with a guaranteed speed of 15 miles per hour, and fuel capacity sufficient for 12 to 15 hours' running at full speed.

The dimensions are as follows:

Length—	
Over all	30ft.
L.W.L.	28ft. 6in.
Overhang—	
Forward	11in.
Aft	7in.
Breadth—	
Deck	6ft. 1in.
Transom	3ft. 5in.
Draft—	
Hull	1ft. 1in.
At wheel	2ft. 1in.
Freeboard—	
Forward	2ft. 11in.
Least	1ft. 9in.
Aft	2ft.

The semi-speed launch is better adapted for running in Long Island Sound or similar stretches of water, and is a much more commodious and comfortable craft. The motor and boat can be handled from either cockpit, and the launch is guaranteed a speed of at least 14 miles at 850 revolutions per minute maximum, or 6 miles minimum at 300 revolutions per minute. The exhaust is as thoroughly muffled as in a high-class automobile, and is above the waterline. An innovation is the adoption of a small metallic clutch instead of the more common leather-faced cone. Reversing is by means of planetary gearing with thrusts both forward and aft the gear casing. The hull of this boat is of cedar, while the interior is of Spanish cedar throughout. Fittings are all well appointed, and upholstering to order. Passenger capacity is from 10 to 15 comfortably. The dimensions are as follows:

Length—	
Over all	35ft. 3in.
L.W.L.	30ft.
Overhang—	
Forward	1ft. 11in.
Aft	3ft. 4in.
Breadth—	
At deck	5ft. 11in.
Draft—	
Of hull	9in.
Of wheel	2ft. 2in.
Freeboard—	
Forward	3ft.
Least	2ft. $\frac{1}{2}$ in.
Aft	2ft. 3in.

LAUNCH TENDER—ARRANGEMENT PLAN AND OUTBOARD PROFILE.
Designed by Messrs. Tams, Lemoine & Crane for the Smith & Mabley Co., New York City. 1904.

II. The Horsepower Question.

From The Yachtsman.

HAVING expressed an opinion on any given subject, it is always a matter for self-congratulation to find that opinion indorsed by the voice of unquestionable authority. We have always considered the method of rating horsepower one of the weakest points in our own or any other rating rule, and, further, we have consistently given tongue to our opinion. In our issue of July 28 we published an article on the present status of the M.M.A., which concluded with the following words: "The weakest point in the present system (of rating) is the method employed for estimating 'horsepower.' It is unsatisfactory, and can never be anything else. There can only be one satisfactory way, a way that will measure the actual output of the motor in foot pounds per hour, and, until such a method can be applied in a simple manner, horsepower had better be left entirely out of any rating formula."

Now we have just received Vol. III. of Prof. Rankin Kennedy's latest work, "Modern Engines and Power Generators," and in the sub-section dealing with petrol motor boats he speaks thusly on horsepower:

"Hitherto, engineers have used the foot pound per second or per minute—33,000 foot pounds per minute as a horsepower, the watt (= 44.2 foot pounds per minute), the kilowatt, the C.G.S., the kilogrammeter, and have found these units ample for all purposes."

"The ancients used a unit called a nominal horsepower. Its origin is obscure and its meaning more so. The Marine Motor Association have introduced a somewhat similar arbitrary unit called a motor-power—M.P. for short. It is to be hoped it will never become common in use. Such meaningless terms only lead to confusion. There is only one set of units admissible in engineering—those based on the laws of nature—and engines can only be rated at the accepted horsepowers each of 33,000 foot pounds per minute on the brake."

"At the present day, there is no difficulty in, and no excuse for, neglecting scientific brake tests of any engine whatever, at any speed, to get an accurate measure of its brake horsepower (B.H.P.), and that is the power of the engine for the actual work to be done."

"The indicated horsepower (I.H.P.) is of scientific interest only, to enable the test to show the power wasted in the engine itself, to demonstrate the action of the valves, and the rise and fall of pressure in the engine cylinders."

"The motor horse (M.P.) can only be a rough approximation to the brake horse, and is arrived at by calculations made from the cylinder dimensions and number of revolutions per minute. It, however, ignores the fact that there is a considerable variation between I.H.P. and B.H.P. in engines built from the same patterns and run at the same speed."

Mr Kennedy then goes on to advise the testing of petrol engines by means of a dynamo-electric apparatus.

This expression of opinion, coming from an undoubted authority in the engineering world, amply bears out the principles we have always insisted upon—that horsepower must either be ignored entirely or else measured accurately by a rational and scientific method.

A brake test cannot conveniently be applied to every motor when fitted in a hull, and if we are to be independent of makers' statements, we must find some other method of estimating correctly the relative performances of motors.

Going straight to the root of the matter, let us put ourselves in the position of a member of the outside public who wishes to purchase a launch. In the first place, we know the seating accommodations we require; therefore, roughly, the dimensions of the hull. Secondly, we know the speed we wish to run at under normal conditions; and, finally, the cost of running must not be excessive. In other words, for any given hull driven at a certain speed, the time rate of fuel consumption must not be excessive. From this we can see that the ideal rating rule need take only three things into account—dimensions of hull, speed attained, and fuel consumption reduced to a suitable basis. Nothing could be simpler. The merits of boats would be judged by their actual performance, and the adoption of such a rule would inevitably tend to the evolution of a more economical kind of motor than we possess at present—a type of motor better fitted for actual commercial use.

Under such a rule it would not matter what the actual or fanciful horsepower of the motor might be—makers would still be at liberty to label them as they choose—but the actual performance of a launch as a hull-engine-propeller combination would be settled beyond the possibility of a doubt.

Such is the logical and scientific rating rule for the cruiser classes. The racers could still be left as they are, their one and only destiny being the attainment of the highest possible speed within their length class. Should a racer wish to show its paces amidst a herd of cruisers, it would be so heavily penalized by the very essence of a consumption rule that it would stand no possible chance.

The purely racing machine does good in its own way; it teaches lessons of incalculable value to the designer, the engine builder, and the propeller maker, but beyond that it has no commercial use. The cruiser classes, on the other hand, are the prototypes of the successful commercial and pleasure boats, and should be judged by different standards.

It may be objected that it is difficult to accurately gauge the consumption of a motor when installed in a launch, but a consumption rule has already been tried in France with a great measure of success, and little or no difficulty was experienced in gauging the quantity used. In the Reliability Trials, too, consumption was measured in the simplest possible manner, and again with fair accuracy. Indeed, should the rule be once adopted, there would be no lack of suggestions for accurately effecting the measurement, and it is to be hoped that such a fanciful difficulty will not prevent its adoption—at the very least, its consideration—at the next general meeting of the Marine Motor Association.

"Forest and Stream" Designing Competition No. IV.

Sixty-foot Waterline Cruising Power Boat.

\$225 in Prizes.

THE three designing competitions previously given by FOREST AND STREAM have been for sailing yachts. In this competition, the fourth, we are to change our subject and give the power boat men an opportunity. The competition is open to amateurs and professionals, except that the designers who received prizes in any of the three previous contests may not compete in this one.

The following prizes will be given:

First prize, \$100.

Second prize, \$60.

Third prize, \$40.

Fourth prize, \$25, offered by Mr. Charles W. Lee for the best cabin arrangement.

Mr. Henry J. Gielow, N.A., has very kindly agreed to act as judge. In addition to making the awards, Mr. Gielow will criticise each of the designs submitted; and the criticisms will be published in these columns.

The designs will be for a cruising launch propelled by either gasoline or kerosene motors, conforming to the following conditions:

I. Not over 60ft. waterline.

II. Not over 4ft. draft.

III. A signalling mast only to be shown.

IV. Cabin houses, if used at all, to be kept as low and narrow as possible.

V. Construction to be of wood, and to be strong, simple, and inexpensive. The cost of the boat complete in every detail must not exceed \$9,000.

VI. The location of tanks and engine or engines to be carefully shown. Either single or twin-screws may be adopted. The power and type of the motor must be specified.

VII. The boat must have a fuel capacity sufficient to give a cruising radius of 700 miles at a rate of 8 miles an hour. The maximum speed shall not be more than 14 miles nor less than 10 miles. The estimated maximum speed must be specified.

VIII. All weights must be carefully figured, and the results of the calculations recorded. A thousand-word description of the boat and a skeleton specification must accompany each design.

The design must be modern in every particular, without containing any extreme or abnormal features. We wish to produce an able, safe, and comfortable cruising boat, one that will have ample accommodations, so that the owner and his wife and two guests, or three or four men, can live aboard, and one that can easily be managed at all times by two or three paid hands in addition to the steward. The draft is restricted to 4ft. in order that the boat may have access to nearly all harbors, canals and rivers North and South, and may thereby widely increase the cruising field. We have in mind a boat that can be used North in the summer and South in the winter, and a craft well able to withstand outside passage along the coast in all seasons of the year.

Special attention must be given to the cabin arrangement. The interiors should be original, but devoid of any impractical features. Arrangements should be made for a direct passage forward and aft without going on deck.

Drawings Required.

I. Sheer plan. Scale, 1/2 in.=1 ft.

II. Half breadth plan. Scale, 1/2 in.=1 ft.

III. Body plan. Scale, 1/2 in.=1 ft.

IV. Cabin plan and inboard profile and at least one cross-section. Scale, 1/2 in.=1 ft.

V. Outboard profile. Scale, 1/2 in.=1 ft.

The drawings should be carefully made and lettered; all drawings should be preferably on tracing cloth or white paper, in black ink. No colored inks or pigments should be used.

The drawings must bear a *nom de plume* only, and no indication must be given of the identity of the designer. *In a sealed envelope, however, the designer must inclose his name and address, together with his nom de plume.*

All designs must be received at the office of the Forest and Stream Publishing Company, 346 Broadway, New York, not later than February 3, 1905. All drawings will be returned. Return postage should accompany each.

THE FOREST AND STREAM reserves the right to publish any or all the designs.

LARCHMONT Y. C.'s ONE-DESIGN CLASS.—Messrs. Tams, Lemoine & Crane have completed plans for the Larchmont Y. C.'s new one-design class, and Frank Wood, of City Island, has already commenced work on three of the boats. The three already ordered are for Messrs. A. C. Bostwick, A. Bryan Alley, and Clifford V. Brokaw. Probably even more boats will be ordered before the first of the year, so that the class will begin with ten boats. The design shows a beautiful boat, with long ends and easy lines. They are centerboard craft, double planked, 21ft. waterline, 35ft. 6in. over all, 8ft. 6in. breadth and 4ft. draft. The spars are hollow, and they will carry 600 sq. ft. of sail in the mainsail and jib. The boats will be fitted with roomy cockpits and moderate sized cabins.

Rifle Range and Gallery.

National Board Doings.

THE Committee on Legislation of the National Board for the Promotion of Rifle Practice has completed a draft of a bill which will be presented to Congress at the coming session, presumably through the Secretary of War, for the carrying into effect of the plan drawn by the Board in compliance with the act of March 2, 1903. More than a year was consumed in the consideration of the general subject by the National Board, and a most comprehensive plan was at length drafted and has been approved by the Secretary of War. The bill will be entitled "A bill to encourage rifle practice and excellence in marksmanship among citizens of the United States, so as to render them quickly available for efficient service in time of war." The title clearly indicates the purpose of the bill, which is to encourage marksmanship among the citizens, giving them instructions and affording facilities for practice without it being necessary for them to belong to military organizations, although suitable provision will be made for rifle practice by the National Guard, the Army, Navy, and Marine Corps. The Board will ask for an annual appropriation of one million dollars, to be expended under the direction of the Secretary of War, for training in rifle practice such citizens as desire to be efficient marksmen; for the construction and equipment of shooting galleries; for the acquisition, equipment and maintenance of national target ranges, and for the issue of arms and ammunition to schools and clubs, etc. To enable civilians to practice in the shooting galleries and on the national ranges, and to obtain the benefit of the provisions for the issuing of rifles and ammunition, clubs are to be formed of not less than ten members each, and the shooting galleries and ranges will be open to such clubs as well as to the Army, Navy, Marine Corps and National Guard. To reach the schools, both public and private, the age limit of membership to the clubs has been placed at fifteen years. Not exceeding one rifle may be issued to a club for each ten members thereof, together with five hundred rounds of ammunition per piece. After the first year, not exceeding fifty rounds of ammunition for each qualification as marksman may be issued free. All qualified marksmen will receive official badges and their names and addresses are to be filed in the office of the Military Secretary of the Army, so that a complete roster will be on hand of all the men in the United States who are familiar with the handling of the national arm and who are able to use it effectively. Such information would be extremely valuable in case of war.

Reports from nearly all civilized countries as to the work which is being done in those countries in the direction of rifle practice, have been secured containing valuable information which will be presented to Congress in support of the bill. It will be pointed out that in estimating the military efficiency of a soldier in battle, if we consider ten points as a standard of perfection, at least 8½ points are skill in rifle and revolver shooting.

The Board takes the position that "for practical purposes in battle, the man behind the rifle is the military unit, and if he is properly trained to hit what he shoots at, all other units will do good work," and insists that there is no way by which a rifle can be accurately shot at any range "without the individual training of the man who aims it and pulls the trigger."

After pointing out that the United States must depend, in time of war, upon the militia and volunteers for the bulk of the fighting force, the Board says that if the plans proposed in the bill are adopted, it is believed the United States will, within a few years, have more than five hundred thousand men, "who will have, for practical purposes on the line of battle, nearly all of the requirements for the most efficient enlisted men in the world."

Statistics of the existing regular army show that of the 60,000 aggregate, only 24,000 enlisted men of the infantry and 12,000 enlisted of the cavalry, or a total of 36,000 are being trained as marksmen. Of the National Guard forces, amounting to 115,000 approximately only about one-third of the States have ranges or make any pretense of training National Guardsmen as riflemen; the second third have the merest apologies for ranges, and quite a third have no ranges at all. It is therefore estimated that not more than 40,000 or 45,000 of the National Guard have been trained to shoot, which, together with the 36,000 of the regular army, make an aggregate available force of trained marksmen of only about 80,000 men in a country of 80,000,000 inhabitants. The National Guard is only available for services in time of war for a period of nine months, so that volunteer troops drawn from civil life would be required. Of a land force of 400,000 or 500,000 troops, at the very outside, under existing circumstances, only 80,000 or 20 to 25 per cent., would have been trained in the handling of a modern weapon, and in accuracy of shooting. The Board therefore argues: "If then, we must depend so largely on recruits drawn from civil life, they must be trained before the time of their use arrives, and means for their identification provided, in order that the forces enlisted shall be made up in as great measure as possible of soldiers who know how to use their pieces."

A resumé of what the other countries are doing in this direction shows that Great Britain, since the Boer war, is making strenuous efforts to encourage rifle practice. Hundreds of ranges have been built and every inducement is offered for boys and young men to practice. Ten thousand pounds sterling is annually appropriated by Parliament for the encouragement of rifle practice in England, which is augmented by many private donations. The King of England gives one thousand pounds annually for prizes, and Mr. William Waldorf Astor, formerly a citizen of the United States, recently contributed ten thousand pounds toward an endowment fund for the National Rifle Association of England. In 1902 the aggregate prizes at the great Bisley meeting amounted to \$50,000.

Canada, with a population of about seven millions, gives \$10,000 a year for the support of the Dominion Rifle Association, which receives at least as much from private parties. In France, rifle clubs, under the supervision of the Government, are maintained, assisted and encouraged to the utmost extent. In Italy, rifle clubs are formed under the direction of the Government in every community, and a considerable reduction in time of compulsory military service is allowed to those men who have qualified as marksmen. In 1898, Switzerland had 3,446 shooting clubs with 210,000 members, of which 163,000 qualified. Assistance is given by the Netherlands in money, arms and ammunition, while Norway and Sweden, in addition to organizing rifle clubs for adults, are giving special attention to the training of boys in schools from the age of eleven years upwards.

"When the whole world seems to be keenly alive to the importance of civilian rifle practice," says the report, "it seems strange indeed that the United States, the most progressive of the large nations, should have done almost nothing in this direction, although a greater proportion of its soldiery than that of any other country must be drawn from civil life, in case of war."

New York Central Schuetzen Corps.

THE regular practice shoot was held on the Zettler ranges, 159 West Twenty-third street, Nov. 30. Gus Zimmerman and R. Busse created quite a little diversion by their exciting finish on the ring target, Mr. Zimmerman winning by one point on his final target. Scores follow:

Ring target: Gus Zimmerman 236, 242; R. Busse 236, 241; F. Rolfe 235, 239; D. Scharninghausen 232, 233, C. Oltman 227, 226; A. Rohde 221, 229; G. Viemeister 225, 233; A. Ritterhoff 221, 226; W. J. Daniels 221, 227; J. von der Leith 224, 213; B. Eusner 222, 223; C. Gerken 224, 218; C. Tietjen 217, 225; Wessel, Jr., 225, 212; F. Schiller 219, 210; H. von der Leith 216, 209; H. L. Schrader 201, 222; Roffman 212, 212; H. A. Fincke, Jr., 206, 215; F. Bauman 216, 204; J. Eissinger 211, 203; J. C. Brummer 202, 212; D. Wuhrman 196, 207; H. Greverman 199, 200; G. Dielhoff 174, 182.

Bullseye target: Gus Zimmerman 53, R. Busse 81, Wessel, Jr., 95, Roffman 95, D. Wuhrman 105, D. Scharninghausen 107, J. Eissinger 114, B. Eusner 130, C. Oltman 132, F. Rolfe 137, H. Greverman 149, C. Tietjen 162, C. Gerken 165, W. J. Daniels 194, J. C. Brummer 195, J. von der Leith 180, G. Dillhoff 207, A. Rohde 213, H. L. Schroder 233, F. Bauman 264, H. von der Leith 275.

Massachusetts Rifle Club.

At the regular weekly shoot at Walnut Hill the following scores were recorded. Although a tricky 10 o'clock wind was blowing, several members tackled the 1000yd. range. Mr. Daniels succeeded in getting some very creditable scores under the weather conditions:

One thousand yard match: F. Daniels 45, 41, 43, 42; I. James 42; Charles 39; F. Carter 37.

Two hundred yards: R. L. Dale 219, A. Neider 206, F. F. Fitz 205, J. E. Lynch 203, M. Alden 202, S. C. Sampson 201, J. B. Hobbs 201, A. W. Hill 200, H. E. Comey 200, M. T. Day 197.

Standard target: C. A. Combs 84, R. S. Hunter 80, J. E. Lynch 76, M. L. Rose 75, M. T. Day 72, O. Moore 71.

Military revolver: Louis Bell 30, 30; R. L. Dale 28, 28; B. J. Smith 28, 28; M. T. Day 26.

Pistol match: E. E. Patridge 97, T. Anderton 91, Miss Lamb 90, J. B. Hobbs 74.

Zettler Rifle Club.

At the regular weekly shoot the following scores were recorded. Conditions, 50 shots per man on the 25-ring target. Owing to their absence from former practice shoots, several of the members fired 100 shots, to make up their back scores:

One hundred shots: L. C. Buss 2449, George Schlicht 2415, Owen Smith 2412, L. Maurer 2386, H. Fenwirth 2364, A. Begerow 2343.

Fifty shots: W. A. Tewes 1228, R. Gute 1214, C. Zettler, Jr., 1210, B. Zettler 1190, C. G. Zettler 1188, F. J. Herpers 1182, G. J. Bernius 1160.

New York City Schuetzen Corps.

SCORES follow for the practice shoot at headquarters 159 West Twenty-third street, Dec. 1, Capt. Busse being high man on both the ring and bullseye targets:

Ring target: R. Busse 241, 245; A. Kronsberg 241, 245; C. G. Zettler 231, 244; R. Schwaneman 226, 226; H. Radloff 225, 225; G. Schroeter 216, 226; Jos. Keller 221, 206; William Heil 208, 196; J. Metzger 199, 198, A. Wiltz 192, 181.

Bullseye target: R. Busse 65 degrees, A. Kronsberg 94, C. G. Zettler 94, A. Wiltz 96, R. Schwaneman 125½, J. Metzger 146, William Heil 150.

Lady Zettler Rifle Club.

SCORES follow for the second contest of the season on the ranges, 159 West Twenty-third street, all shooting on the 25-ring target, 20 shots per contestant, possible score 500: Miss M. Zimmerman 494, Miss K. Zimmerman 492, Miss B. Ludwig 490, Miss Miller 485, Mrs. Liegibel 483, Mrs. H. Fenwirth 481, Mrs. Schen 480, Mrs. F. Watson 477, Miss Ludwig 477, Mrs. Turbett 474, Miss L. Turbett 473, Miss Eusner 472, Miss Stoltz 470.

Ohio Rifle Notes.

F. Jackson won the November medal of the Twin Valley Rifle Club, West Alexandria, O., by a score of 44 out of 48, four shots, 100yds. offhand.

In the annual rifle shoot of Co. C, Third Regiment, O. N. G., held on the Piqua range, at 200 and 300yds., Corp. R. Fahnestock made high score with 67 out of a possible 100 shots.

Rifle Notes.

A well equipped rifle range has been opened under the supervision of J. A. Hauck, Jr., in the Universal Bowling Academy building, 275 Washington street, Brooklyn, corner of Tillary street. The ease with which this range may be reached should appeal to all lovers of the sport in Brooklyn Borough.

A team match recently shot between members of the U. S. Revolver Association, five men from San Francisco and five men of New York and vicinity, resulted in a victory for the Californians by a margin of several points. Each team shot on their home range, and the results were telegraphed across the continent. The conditions called for 50 shots per man at 50yds. Totals: San Francisco 2198, New York 2185.

Prof. John Loris, the expert fancy shot, was in town last week, having just returned from St. Louis, where he has been giving exhibitions at the Fair. Mr. Loris spent Tuesday evening at the Zettler ranges in Twenty-third street, renewing old acquaintances, it being some time since he has been able to be with us, owing to his extensive engagements abroad.

The Greenville range last Saturday was almost void of shooters. L. Maurer and Dr. W. G. Hudson were the only ones devoting their attention to the rifle. No official scores were kept. Messrs. Silliman and Armstrong, of the Manhattan Club, composed the revolver contingent.

Another out-of-town shooter who made us a flying visit last week was Thomas Anderton, of the Massachusetts Rifle Association. Mr. Anderton, we believe, is about to make New York his permanent home, having accepted the position as armorer of the Seventh Regiment, N. Y.

Harlem Independent Corps.

NINETEEN members participated in the second practice shoot Friday, Dec. 2. Scores are appended:

Ring target: H. Koch 461, G. Thomas 460, A. Fegert 452, J. H. Blumenberg 450, A. Miller 431, W. Mensch 423, H. Behrman 421, A. Olsen 420, Dr. Muller 401, P. Zugner 398, L. Lewinson 395, E. Modersohn 391, C. Wolf 389, S. Bauman 376, E. Hilker 374, J. Holtrieth 346, Ed. Miehlong 322, J. Fey 270, F. Lanzer 161.

Bullseye target: J. H. Blumenberg 34½, G. Thomas 60½, C. Wolf 76½, H. Koch 90, A. Fegert 107, A. Olsen 122, A. Muller 123, Ed. Muehlong 124½, L. Lewinson 169, W. Mensch 182, E. Hilker 252, S. Baumann 267.

Trapshooting.

If you want your shoot to be announced here send a notice like the following:

Fixtures.

Dec. 17.—Lakewood, N. J.—All-day shoot of Mullerite Gun Club. A. A. Schoverling, Sec'y.

1905.

Jan. 1.—Poughkeepsie, N. Y., Gun Club annual shoot.
Jan. 17-20.—Hamilton, Can., Gun Club live-bird tournament. J. Hunter, Sec'y.

Jan. 23-28.—Brenham, Tex.—Sunny South Handicap.

Jan. 31-Feb. 2.—Taylor, Tex.—Central Texas Handicap.

Jan. 31-Feb. 2.—Taylor, Tex.—Central Texas Handicap tournament. C. F. Gilstrap, Mgr.

Feb. 6-9.—Houston, Tex.—Len's Grand Southern Handicap. Alf. Gardiner, Mgr.

June 8-9.—Dalton, O., Gun Club annual tournament. Ernest F. Scott, Capt.

DRIVERS AND TWISTERS.

Hon. Tom A. Marshall, of Keithsburg, Ill., has completed arrangements for a trip to Panama in the near future.

A ten-man team of the Ossining, N. Y., Gun Club have arranged to visit Poughkeepsie on Saturday of this week, to engage in a team match with a team of the Poughkeepsie Gun Club.

The annual meeting of the Interstate Association is fixed to be held on Thursday of this week. It is quite probable that there will be some strong bidding for the Grand American Handicap.

The Bergen Beach Gun Club have fixed upon Jan. 2 for a New Year's tournament, to be held on the club's grounds, Avenue N and Seventy-first street, Brooklyn, N. Y. Shooting will commence at 10 o'clock.

A match between Messrs. E. Buckwalter and J. Stevens was shot at Point Breeze race track, Philadelphia, on Saturday of last week. The conditions were 25 live birds, \$25 a side. Buckwalter won by a score of 23 to 22.

Dec. 19 has been fixed on by the Florists' Gun Club, of Philadelphia for an all-day target tournament. An interesting feature will be a five-man team contest between teams of the East and West. The members of each team will be from the highest expert professional talent of America. Five will be from the region west of the Mississippi.

The season's trapshooting tournaments at Pinehurst, N. C., will commence on Jan. 17 and continue to April. All the traps, tower, expert and magautrap, will be used in the different events. The dates include a three-day club championship contest. In addition to the regular programme, many informal sweepstakes and other events will be arranged.

The team of the Crescent Athletic Club, at New Haven, Conn., Dec. 3, defeated the Yale team by the score of 298 to 276. The weather was of the winter kind. Snow squalls interfered with the efforts of the shooters. Mr. H. M. Brigham, of the Crescent team, was high man with a score of 43. There were eight men to each team, and each shot at 50 targets. The Yale team entertained the victors at a banquet in the evening.

Mr. Elmer E. Shaner, secretary-manager of the Interstate Association, arrived in New York on Tuesday of this week, on business pertaining to the annual meeting of his Association. The unprecedented success of the Association tournaments this year is a source of much gratification to him. Besides being the acknowledged champion in tournament management, he is a perfect encyclopedia in knowledge pertaining to shooters and shooting.

The secretary, Mr. H. W. Mallinson, writes us that the Amackassin Heights Gun Club, of Yonkers, N. Y., will hold a tournament on Monday, Jan. 2. The programme provides ten events each day, each of which will have twenty-eight merchandise prizes. This is the first tournament of the club, it being a new organization of thirty members, each of whom will do all in his power to insure a good time and good sport to the visitors. Programmes can be obtained of the secretary.

Mr. Rider Walker, who during several years past has been a talented and industrious business representative of two Western contemporaries, has accepted a position with the U. M. C. Co. as a representative in the West. Mr. Walker's thorough knowledge of the ammunition business and of trapshooting competition, supplemented by untiring industry and suavity, make him a valuable acquisition to the skillful staff of U. M. C. lieutenants.

At the meeting of the Montclair, N. J., Gun Club, on the evening of Dec. 3, officers were elected as follows: President, Mr. W. T. Wallace; Secretary, Mr. Edward Winslow; Treasurer, Mr. S. C. Wheeler; Field Captain, Mr. C. W. Kendall. The treasurer's and secretary's reports showed the club to be in a prosperous condition. Concerning Mr. Winslow, some words of just praise are due for his courteous and constant attention in the matter of sending scores for publication. It is not generally appreciated that much of a club's prosperity or adversity rests on the ability and industry of the secretary.

BERNARD WATERS.

Crescent Athletic Club.

BAY RIDGE, New York, Dec. 3.—There was a light attendance owing to the absence of many of the shooters, who were in attendance at the team match with Yale. Scores:

Trophy shoot, 15 targets, handicap:

Hdp.	Brk.	Tot'l.	Hdp.	Brk.	Tot'l.

Kenyon.....1	11	12			

Crescents—Yale.

NEW HAVEN, Conn., Dec. 3.—The team contest between the Yale Gun Club and the Crescent Athletic Club was held on the grounds of the Yale Gun Club, near the Yale field. The weather was uncomfortable, and unfavorable for good scoring, there being a raw wind, with snow squalls, and the averages were materially affected in consequence. Mr. H. M. Brigham, of the Crescents, was high with 43. Mr. J. Kineon, of Yale, was high man on his team with 39. The 50 targets per man were shot in strings of 25, and at the end of the first 25, the contest stood a tie. Messrs. Clark and Fox, two of Yale's best shots, were absent, and the Yale team was correspondingly weakened. Scores:

Yale—Kineon 39, Sturgis 36, Thompson 33, Alden 31, Goswell 33, Pugsley 34, King 34, Borden 36; total 276.

Crescent A. C.—Brigham 43, Lott 41, Remsen 39, Bennett 39, Stephenson 38, Southworth 34, Keyes 33, Palmer 31; total 298.

After the shoot the Crescent team was entertained at a banquet at the University Club by the Yale team.

Florists—Clearview.

WISSINOMING, Pa., Dec. 3.—Two of the strongest teams in the Philadelphia Trapshooters' League series, met in a contest here to-day on the grounds of the Florists' Gun Club. The match was a close one, 6 targets being the difference between scores of winners and losers. The Clearview Gun Club took the lead at the start, when their first three men scored 65 to the Florists' 36, made by their first three men. The highest score attained by the high men was 22, and of these there were seven, namely, Sheeler, Sanford, Coleman and Landis, of the Florists' and Davidson, Bell and Fisher, of the Clearviews. Each man shot at 25 targets, and there were ten men on a side. The scores:

Florists—Shew 16, G. C. Bell 20, Sheeler 22, Massey 19, Park 12, Anderson 21, Sanford 22, Coleman 22, Huttenlock 19, Landis 22; total 195.

Clearview—Bell 22, Davidson 22, Springer 21, Ludwig 21, Dr. Charlton 12, Fisher 22, Downs 19, Keithler 14, Elwell 17, Dyer 19; total 189.

Narberth—Hill.

CHESTER, Pa., Dec. 3.—The Narberth Gun Club team defeated the Hill Rod and Gun Club team in a shoot of the League series by a score of 158 to 140. Unpleasant weather was against high scoring. The highest score was 21 and was made by three—Barker, of the Narberths, and Miller and Urian, of the Hill. Scores:

Narberth.	Hill Rod and Gun.
Barker.....21	Miller.....21
Halberstadt.....20	Urian.....21
Duffield.....18	Birney.....19

The Dixon Measure.

AN inquirer asks us concerning the identity of Dixon, of powder and shot measure fame. We regret that we cannot furnish any information concerning the personality of Dixon, or, indeed, whether any Dixon, as associated with powder measures, ever existed. Perhaps some of our readers can furnish the desired information.

The Missouri League of Trapshooters.

MOBERLY, Mo.—The final tournament of the Missouri League of Trapshooters was held in Kansas City, Nov. 24 and 25, with fine weather the first day, but a cold, chilly wind from the north on the second day. The out-of-town attendance was very good; that of Kansas City very poor, there being only two out the first day and none to shoot the entire two days' programme.

The special feature of the tournament was the settlement as to who was going to win first high average for the year. J. S. Thomas at one time only led Dr. C. P. Clapp for same by one target, Mr. Thomas finally winning. Also the shoot-off for final ownership of the handsome silver cup donated the League by the Peters Cartridge Co. Four gentlemen were eligible to enter this contest by previous qualification, they being J. S. Thomas, C. W. Zufelt, Harve Dixon and Dr. C. B. Clapp. The contest was at 20 targets. Thomas scored 19, Zufelt 15, and Dr. Clapp 20 straight. Mr. Dixon was not present.

The annual business meeting was held on the evening of Nov. 24, at the Midland Hotel. The name of the League was changed to Missouri and Kansas League of Amateur Trapshooters. Membership fee still remains the same, \$1 for life membership.

It was decided to hold four tournaments of two days each during 1905, and that not less than \$50 should be added to each day's programme; also that half of the events shall be divided by the Rose system, and the other half by the per cent. system.

The following officers were elected to serve for 1905: President, Dr. R. L. Hamilton, Richmond, Mo.; Vice-President, Dr. J. W. Hardy, Sumner, Mo.; Secretary and Treasurer, Dr. C. B. Clapp, Moberly, Mo.; Trustees: R. S. Elliott, Kansas City, Mo.; J. S. Thomas, Pleasant Hill, Mo.; Dr. J. A. Patterson, Butler, Mo.; G. W. K. Mackie, Scammon, Kans., and Ed. O'Brien, Florence, Kans.

J. S. Thomas was presented the \$100 grade Parker gun donated the League by Parker Bros., for high average for the year. Dr. C. B. Clapp was presented an order for the \$72 Lefever ejector gun, donated the League by the Lefever Arms Co., for second high average for the year. Dr. J. W. Hardy was presented an order for the 16-gauge Marlin repeating shotgun donated the League by the Marlin Fire Arms Co., for third high average. G. W. K. Mackie was presented an order for the donation made the League by the Stevens Arms & Tool Co., for low average during the year. D. C. B. Clapp was presented the \$72 L. C. Smith ejector donated to the League by the Hunters Arms Co. for making the highest score out of 100 targets shot at in the special event, known as the L. C. Smith gun event, his score being 99. The Doctor was also presented with the silver cup donated by the Peters Cartridge Co. and won by him in the final shoot-off.

Wm. Heer, the gentlemanly trade representative, won first high average both days, while Charlie Spencer easily won second high average.

Gun and sporting goods manufacturers have been loyal to the League this first year of its organization, and all our members fully appreciate what has been done.

We are always glad to see the professional shooter, let him come from where he may. We know he has a great big heart, and, with him, it never fails to be in the right place. Come again, boys, you haven't injured our tournaments, but, on the contrary, always have inspired and stimulated by your good shooting, good jokes and good appetites. We are always glad to see you.

Nov. 24, First Day.

Mullerite Gun Club.

EDGEWATER, N. J., Nov. 30.—The shoot of the Mullerite Gun Club, held on the North River Gun Club grounds to-day, was well attended.

No. 4 was the Mullerite Handicap, 100 targets, \$4 entrance, divided into four events each, 25 targets. Mr. C. W. Floyd (Jap), with his allowance of 8, scored 99, and was high man. Scores:

Fulford Memorial Fund.

WILMINGTON, Del., Dec. 1.—Owing to the great number of friends of the late E. D. Fulford, who would like to make contributions to the Fulford Memorial Fund, and who perhaps would not be able to give as much as some others, and not wanting their names to appear alongside of those of others who have contributed larger amounts, the committee in charge of this fund has asked me to hereafter not publish the amounts given by each one, but to simply furnish the names and the total amount, and to keep the amount of the individual donations for the information of the committee only.

I think this a very good idea, and since my last report of subscriptions under date of Nov. 4, when the total aggregated \$80, I have received \$94, making the total to date \$174, the subscribers being as follows: Seneca G. Lewis, Sim Glover, Geo. L. Piercy, A. C. Barrell, E. H. Tripp, T. A. Marshall, H. McMurchy, L. H. Schortemeier, C. L. Kites, H. D. Kirkover, W. H. Heer, John S. Sanders, Everett Smith, Edw. Reinecke, Texas Field and Sportsman, Sportsmen's Review Pub. Co., Buffalo Audubon Gun Club.

Since this fund will be held open by me only until Feb. 1, I hope those who intend to subscribe will kindly send their contributions at the earliest possible date.

JAS. T. SKELLY.

Springfield Shooting Club.

ON Christmas, Dec. 25, the Springfield, Mass., Shooting Club will hold their annual turkey shoot. There will be a programme of eight events, 125 targets in all. Principal event will be the fifth, starting as near 1 o'clock as possible. For this event there will be three turkeys to shoot for. Whether they will all three be put up for three high guns in one event, or have three events, a turkey for each one, will be decided by the number of entries; \$1 entrance, including price of targets. Loaded shells for sale. Nice warm club house. Don't stay away on account of the cold. No sweeps. Hot lunch served at noon. Everybody welcome.

MISFIRE.

WESTERN TRAP.

Cincinnati Gun Club.

CINCINNATI, O.—The weather on Dec. 3 was very disagreeable, being cold, with some rain. The attendance was fairly good, but the conditions prevented the shooters from doing their usual good work, as the scores will show.

Luther Squier was at the grounds, but did no shooting. He starts for the East again on Monday, Dec. 5.

There are ninety-seven entries in the cup race to date. No one has yet tied Faran's score of 25 straight.

In the cash prize event to-day Gambell was high gun with 41. Ahlers, Don Minto and Maynard following in the order named with 40, 39 and 37. The practice shooting was cut short by the weather, and comparatively little was done. The scores:

Cash prize shoot, 50 targets:			
Targets:		Targets:	
	15 15 20		15 15 20
Gambell, 16.....	13 13 15—41	Hesser, 16.....	9 11 14—34

55, 32; Holmes 20, 16.			

Practice events: Peters shot at 170, broke 109; Roll 125, 87; Gambell 105, 83; Hesser 100, 66; Leever 75, 59; Maynard 75, 52; Ahlers 60, 43; Falk 45, 25; Block 45, 25; Williams 30, 23; Andrews 55, 32; Holmes 30, 16.

Notes.

Dr. Campbell and Jos. Haines, of Greenville, have been hunting in northern Minnesota. They returned home, bringing four moose and several deer. The moose were killed in seven days.

Charlie Becker, of Dayton, proposes to hold an all-day turkey shoot at Englewood on Dec. 20. Rifles and shotguns will be used.

The first half of the match between H. Oswald, of the Rohrer's Island Gun Club, and Wm. I. Spangler, of the Welfare Gun Club, was to have been shot on the latter's grounds, Dec. 3; but as Mr. Oswald is hunting in Mercer county, it was postponed. The last half of the match is scheduled to be shot on the Rohrer's Island grounds on Dec. 17. The match is the result of the challenge recently issued by Mr. Oswald, which was accepted promptly by Mr. Spangler. The conditions are 200 targets, 16yds. rise, \$100 a side. Both men are good shots and have many friends in their respective clubs, who will back their favorite with cash.

A new club is the Champaign Hunting and Fishing Club, which has just been organized at Urbana, O.

Sportsmen of Anglaize county are raising a fund for the purpose of buying and sowing a large quantity of wild rice around St. Mary's reservoir. The reservoir is a favorite place for ducks and geese, but they always leave before daylight. The idea is to provide plenty of good feed, as well as shelter, so that the birds may stop for a while.

Ossining Gun Club.

OSSINING, Dec. 3.—The appended scores were made to-day at one of our regular bi-monthly shoots. Events 2 and 3, at 25 clay birds each, distance handicaps, for two prizes donated by Wm. H. Coleman. The first, a cake dish, was won by E. F. Ball, after winning by the toss of a coin from Blandford, who tied with him from 20yds. The second prize was won by J. T. Hyland, with 16 from 16yds. This prize was a fancy clock. The birds were fast and the light bad.

The team of this club, ten men, go to Poughkeepsie on the 5:54, Saturday, 10th inst., for a team match.

E. T. Ball made 21 from 19yds., which was fine work.

Events:	1 2 3 4	Events:	1 2 3 4

E Jones	7	12 19			

Sweepstake event No. 1, 25 targets: Chadburne 17, Depew 11, Christ 9, E. Hansell 9, Seitz 10.

Event No. 2, 25 targets: Chambers 20, Thompson 20, Mann 15, Chandler 14, Depew 12, E. Hansell 13.

Event No. 3, 10 targets: Chadburne 9, Seitz 7, Depew 5, Christ 3, Martin 5.

Gun Room Topics.

REMARKABLE it is how a sportsman's love of shooting increases side by side with his increase in skill in the sport, however that increase in skill may have been secured. There are shooters, it is said, who are so devoted to shooting that they read every line that is written on their special subject, even to the dry, technical essays that sometimes adorn the pages of the journals of sport. We have met sportsmen well qualified to tackle the technical side of shooting, and even to enlighten experts themselves on many practical points in the art of using the gun, as well as in the loading of the ammunition used in it. It is evident that they had made a close study of almost all the latest theories and discoveries in ballistics, and had brought them all down to the first principles of the science, which they found of service to them in their daily work in the field. They are, to be sure, by no means a large proportion of gun lovers; on the contrary, they are comparatively few in number, but their spoken word goes far with their brother sportsmen in convincing them in favor of or against a contemplated change in the accessories or in the methods of shooting. Such men are always trying to improve their shooting form, and in many cases it must be admitted it can stand some improvement. Few of them, in truth, are crack shots, despite all the study they have given to the subject; most of them, in fact, strange to say, would be called bad shots, who do not see why they should lag behind if great pains in investigation can produce improvement in shooting skill. Consideration of the fact mentioned would almost lead one to the conclusion that the good shot, like the good poet, is born, not made. And it is perhaps more than partly true. The good shot is born, but he requires development, whereas all the attempts to develop the naturally bad shot only result in making him a little less bad. So with the poet to some extent. Like the shooter, he requires education to do thorough justice to his talent, and without that education he always remains a poet, perhaps, but a poor one. The uneducated poet is as rare as the unpracticed shot, possibly rarer and less to be admired.

In every covert in England, now being exploited by shooting parties, the pheasants are skillfully driven over the guns. The popularity of this method is such that no one nowadays at a big shoot dreams of bringing down his birds in the older manner, now only to be seen in the opening week of the season, when keepers have to kill a few outlying birds. The most marked effect of the advent of almost universal driving in game shooting is the striking change it has necessitated in the construction of the guns, and in the ammunition used in them. To meet the requirements of the driver there have been evolved the driving gun and the driving cartridge. The chief object of manufacture of the former is to avoid the close pattern with either barrel, and that of the latter to do away with objectionable recoil to the shoulder of the shooter. These two ends are gained by taking away all choke from both barrels of the gun, which becomes a plain cylinder in the left as well as the right barrel, both of equal importance and doing equal work in the coverts, and by making a special explosive, of mild recoil, whose best points are brought out at distances round 30 yards from the muzzle of the gun, which is rather over than under the range at which driven pheasants are usually shot. What the pheasant shot wants is a light gun that gives its best killing pattern at 30 yards, and a light load of both powder and shot that, though thoroughly effective at that distance, gives his shoulder no unpleasant feeling of recoil, even when fifty or a hundred cartridges are discharged as quickly as possible at one stand. He wants comfort for himself in shooting, as well as efficiency in his cartridges, and he at the same time wants guns and ammunition that will kill his driven birds without smashing them to rags. And by the skilled efforts of gun-makers and ammunition manufacturers nowadays, he is enabled to get exactly what he requires, guns and cartridges that specially suit his method of shooting, and that only.

What the sportsman understands of recoil in his gun he expresses by the word "kick," or punishment inflicted upon the shooter. But this arises from a very general misconception of the true meaning of the words, which are by no means synonymous terms. The old-fashioned term "kick" is the blow struck upon the shoulder often accompanied by a knock upon the cheek. But these results do not come with increased unpleasantness as recoil increases—rather the contrary—depending chiefly on the suddenness or slowness with which the energy of recoil is developed independent of its measured value in figures. It is the difference between the push and the blow, both, it may be, of equal strength. The quicker the explosion, speaking generally, the greater the "kick," even though the recoil value may be less. But the rule holds good only up to a certain point well known to experts, when "kick" is decreased and recoil increased even to the straining of the gun. The two extremes in sporting explosives are the slow explosion in which the energy is expended as projective force and the "kick" is absent, and the quick explosion in which the "kick" is strong, but a large part of the energy developed is expended in destructive force and the recoil is lessened. In such calculations the weight of the gun plays its part, and the lighter the gun the more the tendency to "kick" is developed, assuming the same components throughout in the cartridges.

The covert shooter, however, requires light guns, and yet less

"kick," and to supply his wants both the gun-maker and the ammunition maker, during the last ten years, have been striving hard. They have succeeded in giving him guns that can be quickly and easily handled in the coverts, owing to their combined lightness and strength; that do not give very close patterns with either barrel at 30 yards, and that are loaded with nitro compounds that give effective results at that average range, and yet have no smoke, blow-back, or unpleasant, or even perceptible "kick" to the shoulders of covert shooters. Attention had to be directed to these points, owing to the quickness and amount of shooting necessary at each stand in the coverts within a comparatively limited time, when the pheasants are streaming thickly overhead, conditions very different indeed from those that prevailed before driving became popular in the shooting of all winged game. Times have changed, and guns and cartridges have changed with them. Close patterns at 40 yards and strong charges of powder and heavy charges of shot have had their day, and have become unfashionable, because unnecessary. Not only have they become unnecessary, but it was seen to be desirable to dispense, if possible, with many of their drawbacks. These, when driving first came in, consisted of gun-headache to the shooters, with continued "kick," inflamed eyes from smoke and blow-back, and frequent misses, due to too close patterns at short distance, of the birds from the gun. Then, again, the distances having been shortened, lighter loads became advisable, less powder and less shot, so that the birds could be clean killed, but not riddled with pellets. All these advantageous changes were only secured by laborious and painstaking experiments with the latest and most efficient apparatus for which the shooter of pheasants has chiefly to thank the manufacturers of both his guns and his ammunition, acting, of course, to some extent under his directions as to the precise description of accessories he required for the changed conditions in pheasant shooting, attributable solely to his own sporting skill and that of his keepers. But the joint efforts of all have succeeded in raising pheasant shooting to the high degree of popularity it enjoys to-day, a popularity that shows no sign of decreasing hereafter, but rather of increasing with the increase of hand-bred pheasants, and of the pleasures now attendant on bringing them down in well organized covert shooting.—Nevis in the County Gentleman.

IN NEW JERSEY.

Montclair Gun Club.

MONTCLAIR, N. J., Dec. 3.—Eight events were run off this afternoon. Events Nos. 1, 7 and 8 were for practice. Events Nos. 2 and 3 were each for a box of shells, miss-and-out. Event No. 2 was won by F. Engle; event No. 3 going to Bush on the fifth round. Event No. 4, 15 targets, all rightquarterers, entrance money to winner, was tied for by Babcock and Kendall, both breaking 11. On the shoot-off, Kendall was the winner.

Event No. 5, 25 targets, unknown angles, handicap, was tied for by Bush and Cockefair, but on the shoot-off the prize, a pearl-handled knife, went to Bush.

Event No. 6, 25 targets, all straightaway, was won by Holloway, he receiving a box of shells.

This evening the club held its annual election and dinner. W. T. Wallace was elected President; Edward Winslow, Secretary; S. C. Wheeler, Treasurer, and C. W. Kendall, Field Captain.

The annual reports showed the club to be in a very prosperous condition.

Events:	1	2	3	4	5	6	7	8
Targets:	25	15	15	25	25	25	25	25
Fred Engle	19	3	0	10	13
C. Babcock	20	1	1	11	17

C. L. Bush	5	8	21	21	21	16
H. F. Holloway	22	16	..
R. N. Scheffey	16

Handicaps apply only on events 5 and 6.

EDWARD WINSLOW, Sec'y.

North River Gun Club.

Edgewater, N. J., Dec. 3.—No. 4 was the handicap event for the Mullerite medal. Three wins are necessary to retain the medal. Two tied for it, Messrs. Truax and Schram. The latter was unable to remain to shoot the tie off.

No. 5 was a handicap event for silver cup won by the club at the Rockland county fair; cup to be won five times by a member of the club before it becomes his property. The first "leg" was won by Mr. Fred Truax, his score being 24, including one added target. Scores:

Events:	1	2	3	4	5	6
Targets:	15	15	15	25	25	20
Eickhoff	1 9	2 14	2 14	3 20	3 19	14
Keynolds	0 12	0 8	0 12	1 16	1 18	..
Truax	0 12	0 10	0 10	1 25	1 24	17
Morrison	1 8	2 6	2 9	3 18	3 18	..
Schram	2 9	2 12	3 10	6 25	6	..

At Pinehurst.

THE full tournament programme of the shooting season at Pinehurst, N. C., from Jan. 17 to April, is as follows:

Jan. 17—Fifty targets, handicap, expert traps; prize, sterling silver cup.

Jan. 31—Fifty targets, handicap, magautrap; sterling silver cup.

Feb. 14—Ten targets, right; 10 left; 10 unknown; 10 overhead; handicap; Tower trap; sterling silver cup.

Feb. 28—Annual team shoot between the Carolina and Holly Inn, 100 singles, magautrap, scratch; shield for winning team.

March 7—Fifty targets, scratch, expert traps; sterling silver cup.

March 21—Ten targets right; 10 left; 10 unknown; 10 overhead; 10 double; handicap; tower trap; sterling silver cup.

March 27, 28, 29—Annual Pinehurst Gun Club championship gold medal tournament; scratch; open to those who have contested in one or more previous tournaments; 50 targets, expert traps; 50 targets, magautrap; 10 targets, right; 10 left; 10 unknown; 10 overhead; tower trap.

There will also be a shoot for the annual Pinehurst championship cup (sterling silver), open to all those who enter the same; one contestant cannot take both prizes.

The entrance fee for all events but the championship is 25 cents.

The trophies are all handsome Gorham cups and Frick medals.

The traps at the gun club grounds are always available for use, an attendant being stationed there most of the time or sent upon request at the general office. Only the usual charge for birds is made, as the club members pay no dues.

At Point Breeze.

At the Point Breeze race track, Philadelphia, on Dec. 3, several matches were shot. The weather was unfavorable for all the shooters, being cold and uncomfortable. Messrs. E. Buckwalter and J. Stevens were the contestants in the main event, the conditions of which were 25 birds, \$25 a side. Buckwalter scored 23 to his opponent's 22, and won. Each lost a bird dead out. The scores:

E. Buckwalter	222222032222*222222222222—23
J. Stevens	22222*22222*22222202222222—22

A sweepstake and other matches were as follows:

Match, 10 birds, \$10 a side: Aiman 9, McShane 7.

Match, 10 birds, \$10 a side: Aiman 8, Murphy 7.

Match, 25 birds, \$10 a side: Aiman 13, Talbot 13. Called at the end of the fifteenth round on account of darkness.

Open sweepstake, 5 live birds, 30yds. rise, \$3 entrance: Murphy 5, Poulson 4, Stevens 4, Williams 4, Buckwalter 3, McShane 3, McAnany 3, Talbot 3, Thomas 3, Jones 3.

SIDE LIGHTS OF TRADE.

The Peters Cartridge Company, Cincinnati, O., have for 1905 issued a calendar which is one of the handsomest ever issued by any ammunition concern. The subject is a field scene entitled "Noon Hour," and portrays two up-to-date sportsmen, with pointer and setter, taking the midday rest by a nook of fence, field and woods. A number of quail, lying on the ground, show that the morning hunt has been a success. The subject, while familiar, is treated in a new way, and the coloring is so well done, that each copy has the effect of an original sketch. The Peters Cartridge Company will furnish this calendar free to any dealer, or will send it to any address on receipt of ten cents.

Iver Johnson Arms & Cycle Works, Fitchburg, Mass., have patented and are manufacturing the Iver Johnson revolver grip, a light and detachable implement which enables the user to hold a revolver firmly, steadily and securely. The manufacturers will be pleased to furnish full description to all applicants.

Messrs. Schoverling & Welles, 2 Murray street, New York, have issued a beautiful calendar for 1905, which they will be pleased to send to the applicants who apply for it. A mallard duck, awing, is the pictorial feature. The coloring is realistic, and the calendar in its entirety is both ornamental and useful.

Spratt's Patent (America), Limited, Newark, N. J., has issued a calendar for 1905 which is illustrated in colors, the themes being of dogs, cats, poultry and game birds. Everything pertaining to them in health and disease is listed in the calendar. It will be sent to applicants who apply early.

Answers to Correspondents.

No notice taken of anonymous communications.

Mr. C. F. Suback, City.—Your letter of Nov. 30 was answered to the address given (New York), but has been returned by the post office as not found. We have a letter awaiting you at this office.

BAKER GUNS SHOOT HARD

and are SAFE.

They are noted for this wherever known, and that is almost everywhere. Ask the man who owns one. Fine Trap and Medium Field Grades, \$25.00 to \$200.00 and up. Inquire of your dealer or send for full descriptions.

BAKER GUN AND FORGING CO.,
Cor. Liberty & School Sts., BATAVIA, N. Y.

MY TRAP SCORES

A pocket trap score book, containing 50 pages of score sheets and the Interstate Association Rules for target and live bird shooting, and for shooting under the Sergeant System. The cover bears the title "My Trap Scores," and the pages, in number and form, are arranged to make a complete record of the shooter's doings at the traps. The pages are ruled to make a record of the place, date, weather conditions, number of traps, number of shooters, gun and load used, events, etc. The score sheets are ruled for 25 targets. Bound in leather. Price, 50 cents.

FOREST AND STREAM PUB. CO., 346 Broadway, New York.

FOREST AND STREAM.

A WEEKLY JOURNAL OF THE ROD AND GUN.

COPYRIGHT, 1904, BY FOREST AND STREAM PUBLISHING CO.

TERMS, \$4 A YEAR. 10 CTS. A COPY.
SIX MONTHS, \$2.

NEW YORK, SATURDAY, DECEMBER 17, 1904.

VOL. LXIII.—No. 25.
No. 846 BROADWAY, NEW YORK.

The FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. The editors invite communications on the subjects to which its pages are devoted. Anonymous communications will not be regarded. While it is intended to give wide latitude in discussion of current topics, the editors are not responsible for the views of correspondents.

Subscriptions may begin at any time. Terms: For single copies, \$4 per year, \$2 for six months. For club rates and full particulars respecting subscriptions, see prospectus on page iii.

THE SHIRAS BILL.

WE reprint the text of the measure introduced in the House by Hon. George Shiras 3d, of Pennsylvania, to put wildfowl under Federal control as to shooting seasons.

The bill has awakened wide interest, as is shown by the comments on it which we print from the pens of State game commissioners and wardens and others. The New York League convention in Syracuse last week indorsed the principle of a Federal wildfowl law. It is probable that other game protective associations will express similar views.

JOSEPH W. COLLINS.

WE record with sorrow the passing away of Joseph W. Collins, Chairman of the Massachusetts Commission of Fisheries and Game. Captain Collins was seized with pneumonia on Monday of last week, and died on the following Friday, December 9.

His death is a public loss. When the direction of the Massachusetts fish culture and protection and the preservation of game was intrusted to Captain Collins, upon his appointment to the Commission five years ago, he brought to the office those rare qualifications for the work which his friends knew meant a new era in the fish and game interests of the Commonwealth. A deep sea fisherman, an expert in naval construction, a student of the life histories of fishes and of fish culture, an administrator of high executive ability, and withal equipped with earnestness, enthusiasm and devotion, and a genius for hard work, he addressed himself to the task set before him, revolutionized the methods of work of the department, impressed upon the entire service his own spirit, commanded for it the public respect and confidence and co-operation, and placed the Massachusetts Commission in the first rank of those which were doing honest, intelligent service and achieving results. His breadth of view, intelligence of perception, and practical common sense methods contributed to a success which was doubly assured because his whole heart was in the work.

The results achieved by the Massachusetts Commission are known to the citizens of the Commonwealth and to a wide public, as manifest in the game and fish conditions now prevailing in such bright contrast with those of five years ago. We have said that the death of Captain Collins means a public loss. It will be difficult to fill the vacant place. Whoever shall assume the duties he has laid down will find the task simpler than the one he undertook; it has been made simple by those five years of upbuilding which entitle him to the grateful memory of the public he has so richly and so permanently benefited.

NOT A DEFEAT.

THE New York Court of Appeals has sustained the Appellate Division in finding for the defendants in the celebrated suit brought by the New York game authorities to recover penalties from the Arctic Freezer Company for the possession of game in close season. The original suit was for penalties aggregating \$1,168,315; but one after another of the counts was dismissed until the sum at issue on final appeal was \$9,960, this amount being the penalty for 100 grouse, 100 quail, 96 woodcock, and 100 ducks, the possession of which in close season by the defendants was assented to by both sides for the purpose of making an agreed issue.

The State has lost its case. But in a larger sense it has not suffered a defeat.

The Court of Appeals has followed its own precedent in the Buffalo fish case by holding that the language of the statute, under which the suit was brought, did not show an intention on the part of the Legislature to make the prohibition of game possession in close season applicable to game which had been imported from without the State. Under such an interpretation, manifestly the

Arctic Freezer Company was not liable for the game birds which it had derived from sources beyond New York.

But while deciding in the specific case before it that the statute did not prohibit the possession of game killed without the State, the Court is extremely careful to say that its finding does not affect the question of the constitutionality of a statute which should forbid the possession of imported game.

So solicitous are the learned Justices lest their decision should be misinterpreted, they have taken occasion to set forth very clearly and convincingly the principle that it is quite within the power of the State to regulate possession both of its own game and of that which has been brought in from other States. There is no uncertainty in the language in which the Court declares as to the power of the Legislature to close the game market to all game:

The right to pass laws for the protection of game being conceded, as in view of the authorities it must be, the method of affording protection is necessarily within the discretion of the Legislature. It may provide a close season for the taking of game, and may prohibit the possession or sale of game during that season. It may close the game market throughout the State during the period of prohibition, in order to remove temptation from poachers and pot-hunters, who are apt not to run the risk of taking game out of season if they cannot sell it. To do this effectively it may be necessary to close the market as to game taken without the State, as well as within, for there are no marks by which birds killed in Michigan can be distinguished from those killed in New York. When enacting a game law, the Legislature may provide for its ready enforcement, not simply by making the possession of game during the close season presumptive evidence of a violation of the statute, but it may go further, and, in order to prevent evasion, fraud and perjury, may prohibit the possession of game in this State during the close season, even if it was taken in another State and brought here during the open season. The action of Congress has taken away all questions of interstate commerce, so that the State can act with entire freedom, and can prevent the shipment of game into or out of its own territory; and if game is imported, it can regulate or prohibit the sale thereof. Such provisions are warranted by the police power, and are not in conflict with either the State or Federal constitution.

Such a reaffirmation of the constitutional authority of the State to control all game within its borders, whether native or imported, alive or dead, is a new victory for game protection.

THE PRESIDENT'S MESSAGE.

IN the President's message, sent to Congress last week, there is not a little that possesses a special interest for sportsmen. One of his recommendations will appeal with great force to the big-game hunters, among whom Mr. Roosevelt himself is such a shining light.

It seems now a good many years since the FOREST AND STREAM first called attention to the great opportunities offered for the preservation of our great game by the forest reservations, and declared that in each of these forest reservations there should be set apart as a refuge for big game a large area, where hunting should be absolutely prohibited, and where such big game might live and increase unmolested. At that time we pointed out that the Yellowstone Park was such a refuge in fact, though not in name, called attention to the great increase there of the large wild animals, and explained that what had happened there might—with proper protection—happen anywhere else in the mountains. Soon after this, the suggestion was taken up by the Executive Committee of the Boone and Crockett Club, who, recognizing its reasonableness, advocated it with great earnestness, and for some years now it has seemed to all big-game hunters a thing that should be done, and done quickly. Public opinion has grown about it, and the time, we believe, is not distant when the necessary action will be taken by Congress.

No one knows better than President Roosevelt how important this matter is, and it is gratifying to be able to quote from his message the following recommendation:

In connection with the work of the forest reserves, I desire again to urge upon the Congress the importance of authorizing the President to set aside certain portions of these reserves or other public lands as game refuges for the preservation of the bison, the wapiti and other large beasts once so abundant in our woods and mountains, and on our great plains and now tending toward extinction. Every support should be given to the authorities of the Yellowstone Park in their successful efforts at preserving the large creatures therein, and at very little expense portions of the public domain in other regions which are wholly unsuited to agricultural settlement could be similarly utilized. We owe it to future generations to keep alive the noble and beautiful creatures which by their presence add such distinctive character to the American wilderness. The limits of the Yellowstone Park should be extended southward. The cañon of the

Colorado should be made a national park, and the national park system should include the Yosemite and as many as possible of the groves of giant trees in California.

Undoubtedly the number of our national parks should be increased, and those which we possess should be enlarged, whenever this can be done without infringing on the rights of people. Besides the parks recommended by the President, may be suggested the main divide of the Rocky Mountains, from the Great Northern Railway north to the Canadian boundary line, and from the western border of the Blackfoot Indian Reservation west over the mountains beyond McDonald Lake and creek. This is the famous St. Mary's country, so well known to many of our readers.

Mr. Roosevelt's remarks about the forest reserves will be indorsed by everyone who has given any study to the subject, and his recommendation—more than once made before—that all Government forest work should be placed in the Department of Agriculture ought at once to be acted on by Congress.

The paragraphs concerning the natural products of Alaska possess also especial interest. We have frequently called attention to the rapid destruction thereof of fish and game since the discovery of gold, and consequent irruption of white settlers, and when we recognize that the lives of the natives—and often of the white immigrants—depend on this food supply, its protection becomes important from the human as well as the sentimental standpoint. The message says:

Salmon hatcheries should be established in many different streams, so as to secure the preservation of this valuable food fish. Salmon fisheries and canneries should be prohibited on certain of the rivers where the mass of those Indians dwell who live almost exclusively on fish.

The Alaskan natives are kindly, intelligent, anxious to learn, and willing to work. Those who have come under the influence of civilization, even for a limited period, have proved their capability of becoming self-supporting, self-respecting citizens, and ask only for the just enforcement of law and intelligent instruction and supervision. Others living in more remote regions, primitive, simple hunters and fisher folk, who know only the life of the woods and the waters, are daily being confronted with twentieth century civilization, with all of its complexities. Their country is being overrun by strangers, the game slaughtered and driven away, the streams depleted of fish, and hitherto unknown and fatal diseases brought to them, all of which combine to produce a state of abject poverty and want which must result in their extinction. Action in their interest is demanded by every consideration of justice and humanity.

The salmon canneries as yet are confined to southern Alaska, where they have enormously reduced the supply of fish, and have made some streams absolutely barren. In the northern rivers—to mention only the Kuskokwim and the Yukon—the salmon form almost the sole food supply of the natives, and if this food supply shall be cut off, nothing will remain for these poor people save death by starvation. The erection of canning factories on the shores and streams of northern Alaska should be prohibited.

This we believe to be the opinion held by Mr. Geo. T. Emmons, of the United States Navy, whose long residence in Alaska and careful study of the natural, and later artificial, conditions there, makes him better qualified than almost any other man to speak on this subject.

A FEW years ago the forest fires of Michigan and Wisconsin horrified the public by their destruction of human life. Lumbering towns, saw-mills, and the log cabins of settlers, were swept out of existence, while men, women and children fled to swamps, rivers and lakes, that were not overtaken before reaching such refuges, and those hid themselves beneath the waters, in the effort to escape from the flames.

As settlements have increased in the more remote districts, and as the horrors of fire have become more and more appreciated, people have learned to take greater precautions. Almost all the Western States have laws—more or less well enforced—prohibiting under severe penalties carelessness with regard to outdoor fires. Since cattle became so numerous on the prairies west of the Missouri River, and since the burning over of the range is the greatest misfortune that can happen to a cattleman, every cowboy is a fire guard. Those who have read President Roosevelt's interesting book, "Ranch Life and the Hunting Trail," are familiar with some of the expedients to which cowmen resort to extinguish fires that have unluckily started on the range.

THE SPORTSMAN TOURIST

Under the Tall Pine Tree.

IF 'tis ever your lot, dear friends, to wander down to sunny Dixie in the bleak and barren snow time of the North, I hope you will chance upon the "happy hunting grounds" in and about Moss Neck, North Carolina, where there seems to be a perpetual evergreenness, and you walk upon pine needles and breathe the life-giving, aromatic odor of the pines. There the noble partridge whirs away from beneath your very feet, and you dream the long days away in a sort of perpetual, glorified October.

There is the Lodge, the dear, bright Lodge, where you are welcomed on the night of your arrival by the courteous General and his charming wife, and as you gaze about you upon the cheery interior with its wide, bright windows, hunting trophies, its many guns and hunting pictures, and best of all, upon its glorious open fires of the famous "light 'ood," dancing up its wide chimneys and sending out its crimson glow upon all around; you register a solemn vow that nothing short of absolute duty will tear you away from this enchanted spot in oh! so long a time—

Are you a sportsman? Then what keen delight to start out bright and early for an all day tramp. To wander through large forests of pines and beautiful bright holly with its glassy leaves and scarlet berries, to hear the whir of the partridge and see large coveys rise before you, on the wings of the winds and off to the thicket—and to see the rabbits scud away from beneath your feet; but last, and best of all, to come home heavily laden with many braces of the noble quail. To come back very late and very tired, but perfectly happy; to tell the deeply interested people of the Lodge all about your mighty prowess, and then to dine on quail and other good things of this earth and to sit around a roaring "fat pine" fire and go over again your day's work—the number of doubles you made and how you killed that last bird as it whirled and flew over your head. All this to the accompaniment of some good old Scuppernong wine, with a "night cap" after (just to take the chill off and to finish up a good day's sport) of a little North Carolina old corn whiskey.

Among the objects of greatest interest about Moss Neck is that mysterious tribe of Indians known as the Croatans. And although it may surprise you much to know that in this noble, free country of ours there are a few people outside of our dusky African brother who are free and equal, and that there are some Indians who do not live on reservations and have not had their land taken away from them—still such is the case. But it was an accident and happened in this fashion:

"Long years ago," as far back as the days of Sir Walter Raleigh, that noble gentleman (if I remember correctly) came with a colony and settled upon Roanoke Island. There they found a race of friendly Indians with whom they lived on amicable terms. After a bit, however, Sir Walter sailed away again, leaving about a hundred settlers and the friendly Indians and promising soon to return. But all things did not turn out as Sir Walter anticipated and he was prevented from returning by some slight inconvenience in the way of having his head chopped off or some other little difference of opinion between himself and the good Queen Bess.

So years passed before anyone again landed on Roanoke Island, and when they did they found it deserted alike by white man and Indian, and the only sign that it had ever been inhabited was a piece of board stuck up on a pole and upon which was written the name Croatan.

Years after this, when they explored further down, they found not far from the coast of North Carolina a race of very civilized, friendly Indians—a seemingly polyglot race, many of whom had English names and spoke English, and yet they lived and looked like Indians, and the name of the tribe was Croatan. And that is the worthy, clean and law-abiding race that you now see in and about Moss Neck. A race strong in their dislikes, but strong in friendship, and if you treat them well your good friends forever and ever.

Should you ever go to Moss Neck or the Lodge, there is one person I want you to meet and that is Diana Hunter. Diana is a good sportswoman, but Diana, like Cæsar, was ambitious. Unlike the noble Roman, however, it did not bring her to an untimely end, but only a partridge died. It was in this fashion: Diana had shot many an unsuspecting bird "settin'" (I believe sitting is the more polite phrase, but not in North Carolina.) Full a score of trusting robins, thinking she looked entirely harmless, sat perfectly still on a comfortable twig, and met an early death. And many an empty shell had Diana nailed, when thrown high in the air for her by some of the young sports at the Lodge. But, as I say, she was ambitious, and kill a bird on the wing she must and would. Twice she went out with the General and with no sport whatever beyond a mild question, after the birds rose and the shots vollied out, of "Did you shoot that time, General?" And the General, being as much like George Washington as Diana like Cæsar, was obliged to answer "I shot, Diana."

But the third time out she made up her mind, and then the quail was as good as dead. After skirting about a stubblefield for a short time good "Jim" made

a stand and good "Guy" backed him. My! what a beautiful covey it was, and the General was so busy making doubles and doing other fine "stunts" that he never knew what Diana was doing off there on his left until he was aroused by a war-whoop that an Indian would have thought undignified, and looking around in amazement he saw Diana jumping up and down in her tracks, regardless of mud and water and yelling, "Oh! I killed one," "I killed one," and so she had! Killed him neat and clean and going straight away like a bullet. After that she killed six more on the wing, and now she is looking for more worlds to conquer. (But I believe that is like Alexander, not Cæsar.) Anyhow, my Diana is like the great ones of this earth.

You need not laugh, Madam! For if you think you can do better than six birds the first season's shooting on the wing, and a new gun to which you are not well used, all I have got to say is, I dare you to try!

And if you are good perhaps Diana will take you with us for a drive to Lumberton, eight miles away—a quaint, flat little Southern town with its cottage-like houses, its old world court house and its many teams of mules and bales of cotton. And the ride there is so beautiful and unusual. Over long echoing bridges that span the creek and the Lumber River, otherwise known as Drowning Creek, on account of its treacherous sands; through tall clumps of oaks and cypress, hung with great bunches of mistletoe and the lovely, feathery, gray Southern moss; through forests of beautiful, brilliant holly upon which the sun seems always to shine as though it said: "I am with you always to cheer you on your way, down here in Dixie."

And last and most, and best of all—the pine tree—the noble, mighty pine, with its long, green "straws," its giant trunk, its beautiful evergreen top, waving and murmuring and shaking its kingly head to the strong breeze, like the sound of many waters.

Verily, "I love these pines because a voice is theirs that ever whispers of the infinite sea." H. M. G.

Floating Down the Mississippi.

A Journey Through the Swamps.

Nor far from Casen's there were several "rag houses" or tents on the west side of the river, and on the opposite side there were some fires built under long sheet-iron boiling pans set in the slope of the river bank. Near each pan were two negroes—man and woman—standing at sink-like tables picking over the contents of the sinks with rapid motion. The pickers merely glanced at me, and then turned to their work. They were engaged in the most exciting sure-thing gambling imaginable, and gambling has charms for the black man above anything else he can do.

They were picking the meat from shells after having boiled them in the vats to kill the mussels. It was "sure-thing" gambling, because the shells were worth \$10 a ton at least, while any one of the shells might contain a pearl worth a thousand dollars. Commonly a negro in the bottoms will stop everything to look at a stranger, but these did not, and they begrudged the time it took to answer the questions I had to ask. They were digging a thousand pounds of shells a day per man—and as they worked 25 days a month, their wages amounted to \$125. In lumber camps they could earn from \$1 to \$2 a day, and the best they could do in the cotton fields picking would be \$2.50. In addition to the shells were found "slugs," or rough pearls, with a market value of \$1.25 per ounce; and pearls which would bring from \$1 to \$5,000.

The negroes were from White River, where the first pearl boom and rush of the lower Mississippi happened some years ago. Now that the hordes of fortune seekers had depleted the White River beds, they were seeking pearls and shells in other streams. Some of them came from the valleys of streams whose sandbars were covered with shells, and now that the White River excitement had died away, they remembered the shells of their home streams, and returned to them with their tongs, frequently to discover valuable beds of button pearl, and even the "priceless pearls."

It was a long time before the St. Francis was "museled," because it was so nearly inaccessible, and its scant population gave few or no recruits to the White River rush. But on the lower reaches the sand-bars were seen to have "dead shells" on them, and these led to the discovery of large beds here and there along the river, and finally to the advance up stream by the more ambitious.

On coming into one eddy—stillwater—I found two negroes in johnboats dredging. It was work similar to digging oysters. Beds are discovered by treading on the river bottom with the tongs back and forth till the crinkling of shells is felt. The tongs are made of two feed-forks bent and jointed by a blacksmith. Above the joint handles are fixed so that when the handles are opened the forks separate. The handles are simply a round pole sawed up the middle, and when they come together, shears-fashion, a good grip is had on the round surface. A bed twelve feet under water can be reached with these. But in deeper water "crow's feet," a gas pipe with a long trail of string and grapples made of twisted telegraph wire, is dragged along the river bottom broadside to, the mussels closing on the grapples. In very shallow water

men waded in with feed forks and pitched the shells into the boat. Of the workers in the South, the pearl hunters were the most eager of any that I saw.

Soon after I saw the negroes, I drifted around a small bend in the river, and there on the sand-bar were wild turkeys—lean, sleek, gourd-shaped birds—with the sun glinting across their backs, and the large-eyedness described so often by hunters. Thirty yards away, feeding and looking nervously about, they allowed my boat to approach much closer. I was in a quandary. I had never killed a wild turkey; my ro-gauge was loaded with BBs, and I even looked along the barrel at one particularly interesting big fellow as they walked into a willow maze toward the woods. But I didn't shoot, for it wasn't worth while to do so merely to kill. I was less scrupulous with ducks, for I needed them to eat, but a turkey is a different proposition, being too fine a bird to take from Arkansas neighbors. A few miles below I came to Parkins, and mailed letters there. Away back there in the swamps, the town looked lonely, more than any place yet seen, but the echoing cry of a locomotive awakened one's hopes. Parkins is one of the three railroad crossings.

Below Parkins, at the railroad bridge, is the house of the St. Francis Club. An old, gray-haired mammy there said none of the members were round, just a visitor from Little Rock. "Not many of the club members comes heah now. They got to lawing and rowing and fussing, and they done fit up and ain't coming no moh." The Arkansas non-resident laws pinch harder in some localities than in others. As I started to go on down the river a man asked would I set him over the river, which I did. But when he saw I was going on down river, he came on with me for half a mile, and pointed out his tent on the bank; he was a pearler, and wouldn't I come in for the night? So I became acquainted with Joe Fondrens.

Fondrens' wife and two children live with him in his big tent. The little tots were rosy-cheeked, plump, and as happy as could be. Under the table were two boxes, one filled with ginger-snaps, the other with soda crackers, and whenever they wanted to, the boy and girl took one or a handful to eat. Their appetites for such were no longer ravenous. They had had enough.

On the far side of the river were two cows, which sometimes swam across to the tent to be milked. When they didn't swim, Fondrens and his wife crossed in the johnboat and milked them. The family drank slightly sour, tainted milk by preference; but there was a plenty of sweet milk for the stranger when we all gathered round for supper. Clear-eyed, open-faced, strong and healthy, Fondrens leaned back in his chair or lounged on the cot easy before the world, able to make a hundred dollars a month without sweating much over it. The cold weather which fringed the edge of the stream with glassy ice did not trouble him—he would go to town after supplies, or sit around and play with the children on such days. With the weather right and the water comfortable, he'd lift his living—a good one—from the bottom of the stream at the foot of the bank.

The ground in the tent was covered with old carpets, and Mrs. Fondrens went over them with a broom just as fussily as though it was in a "frame house and not a tent," the men folks chuckling about it as usual. Two stoves kept the tent more than warm on a cool night, good hackberry furnishing the blaze. When the lights were out the outdoors seemed closely related to the indoors of the tent. I had never slept in an inclosed tent before, save on my boat. It was unlike the lean-to; it was not as if housed in by boards; the stillness, light, sensation of sleeping under the open sky was there, without the chill atmosphere. I slept with both eyes shut.

Fondrens' vat for boiling out holds 500 pounds of shells. The vat rests parallel to the bank, or any way so that under it can be poked sticks and wood to boil the contents. A single length of stove-pipe serves as a chimney. When the water comes to a boil, or near it, the mussels open up, killed. Then they are thrown with a fork to the table—sink—where the musseler plucks out the meat and throws it down the bank, where the hogs eat it, and the shells to the pile, worth \$10 a ton right there, or \$12 on the cars.

They dig one day and cook the next; sometimes, if not too tired, digging and cooking on the same day. In twenty-five days, in addition to the value of the shells, as much as \$75 worth of slugs are picked out, and sometimes a pearl worth from a dollar to—what one's luck is worth. Some men pay little attention to the slugs and pearls—the little things are overlooked and go into the shell heap or down to the swine, perhaps slipping between the cracks of the ill-constructed sink into the mud drips. Fondrens' pardner had such a sink, and "never did have any luck with the pearls."

The pearl of high price is round and radiant—the ball pearl. There is the button pearl, flat, and biscuit, not so flat, and the pear-shaped, the egg-shaped, and capsules; Fondrens' best was pear-shaped and brought \$60. He had one or two little fellows, worth \$20 or \$30, which he showed me.

But mostly the shells yield "slugs." Why such a name was given to pretty trinkets I can't understand. They are of all shapes, some of which have names. A rosebud, for instance, is flat on one side and crinkled on the other, and are worth a dollar to \$50. Many are dog-teeth—long, pointed, and round or grooved.

These slugs are sorted by some of the shellers, and unusually large ones bring as much as a few dollars, and

some only a quarter, while from \$1.25 to \$5 an ounce, if care is taken to assort them. How these slugs are worked over for the market by the jewelers may be imagined by the advertisements of "real" pearls for sale in various papers. A trick of the trade is to take some of the shoulders of mere button shells and from a round knob work out a "perl" with the dull side hidden by the setting. It makes as pretty an ornament as the genuine ball pearl, but is worth only the time spent in working it out.

They find the mussels in beds, usually just below the bend off a sand-bar, and in the deeper water toward the bluff bank. The large shells are down the center of the bed, and toward the edge are the little ones. Dredge out the big ones, and the space is filled in from the sides. The line of mussels is well marked, and the darkies I saw began at the upper end of the bed, worked clear across it, and then back again, a distance of six or seven feet where I saw them. Some beds are as wide as the river. At the edge the tongs sometimes landed on the sand, and then darky just wiggled and walked it along on the bottom till the sound of shells being trod on came up the handles with the feel, whereupon he got the tong maw over a bunch and brought them up. Most of the St. Francis shells are "nigger heads," and are better for button making than the Higginson eyes. Rarely is a Higginson eye caught in the St. Francis, though I saw a couple of the shells there. "Wash-boards" are not much account, and are thrown away, but white clams and butterflies are worth \$40 a ton, and are used in making pistol grips, and such finery. The diggers, so far as I heard, never sort the shells, but get \$10 a ton for them, including the bunch of white clams that often run as high as a hundred pounds to the ton of digging.

I was at Fondren's till the morning of December 16, and then pulled on down the river, and found the banks growing higher as I went further on, as I had been told they would. The woods were of novel appearance because of the vines that now hung conspicuously from the trees, some like ropes clear from the top of a 75-foot branch, causing one to wonder whether they climbed up and then swung clear, or reached down. There were matted tangles and again great trees under which no brush was growing. A look across the bottoms from the top of a bank showed a mass of flat lands, some of it dead level and some rolling gently, and some in almost hummocky roughness. There were ditch-like sloughs leading away with the rims higher than the ground on either side, as if they had really been dug with shovels. Some of these have names, are Horse Shoe Bayous and Big Lake Sloughs. They indicate ancient courses of the St. Francis, or where the mud was softer during the overflow than elsewhere, and oozed away in mucky flood, leaving natural drains and a series of pond holes.

I saw some mallard ducks at intervals, and soon came to associate them with clearings just below the sand-bars where I put them up. They were not very wild, but still kept at long range. Why they choose to rest and feed just above the swamp land farms I could not determine; yet the sand-bars for miles would be barren of this game, and then they would appear when the thinning underbrush, the deadenings, and the straggling fences, with yelping dogs, staring canerooters and slouching humans, indicated the advance of civilization into the "bresh."

On the sand-bars I saw the tracks of a considerable variety of animals—coons, mink, rabbits, wild turkeys, a deer or two, and some wildcats. One might say that it was just a long succession of woods, sand-bars, and clearings marking the miles from end to end of the St. Francis that I saw. It was clearly a "monotonous" region, of the sort that some temperaments find utterly unbearable. There was no "excitement" in the air, a Baltimore oriole giving the loudest yell I heard, and great flocks of undignified, chattering, impudent robins coming down to splash and drink morning and evening were the most of the company I had. The robins did not hold their heads up and hop around as on a northern lawn; but some actually walked and chattered like blackbirds, though not so loud. Sometimes I saw fox squirrels running among the branches, or on the ground, and frequently I saw hawks, and several eagles—big fellows.

Just above Big Bayou I found a little tarred paper and drift-wood cabin boat, with a man of reddish mustache in the doorway, who said his name was Charlie Gunlock, the companion of Mitchell on many trips, and who was glad to hear from his friend. A few days before he had shot at a deer three times "200 yards away," and it didn't move till the last shot, when it jumped sideways and fell dead, all three bullets in its breast, put there in the cold-blooded fashion that German hunters have. He was going to Wynne in the morning with fifteen 'coon hides dressed better than any other hides on the river. At Big Bayou, a few miles below, I was at the mouth of one of the streams coming clear from St. Francis Lake, another outlet of the swamps, but impassable on account of low water and fallen trees.

Port Levesque is the post-office, a couple or three miles out from Wilkinson's Ferry, and the place where Wittsburg's mail goes now, since its post-office was discontinued.

Wittsburg was a steamboat town forty years ago—2,000 inhabitants, and a thriving trade, lots of whiskey and full of life. The houses have all been torn down, and as I floated past in the current, Crawley's Ridge, where the town had been built, presented just a pastoral scene—some forest, farming in what had been the principal streets, and a lone horseman coming down to ford the stream. But the ridge was a welcome sight—an elevation called by the swamp people "our levee," to which they flee when the artificial one along the Mississippi breaks, and to which they swim their cattle, sometimes for ten miles, resting them on the ridges in water knee-deep. Wilkinson, of the ferry at Big Bayou, told of a noted old steer that refused to be driven and escaped the dug-out cowmen to swim without resting for six or seven miles through the woods and over the opens to safety.

"I've seen cattle standing side-deep in the water," Wilkinson said, "and it as cold as ice. They'd just stand there with their noses out, and all of a sudden they'd roll over, and go floating away, with their legs out, chilled and stiff. Yessir. If it hadn't been for people living in a fool's paradise and expecting the levee was going to hold and not driving their cattle over to the ridge, not any cattle would be lost. But them engineers promise the levee'll hold, and people believes them, and then—it breaks;

it always does when the water's a little high, and we get drowned out. If we had any say there wouldn't be no levee. We'd get our land covered over with silt after a time and it would be well fertilized, and by and by we'd be above the water. If the Government's got to spend money shoveling dirt, and paying big money out, why don't they build mounds to put the stock on and for people to go, too—a mound on each plantation, and then everybody would be all right; or why don't they do like Eads said, and build levees crosswise the valley, and check the current and make it drop the sediment? I'll tell you why they don't. They know that if they got the bottoms filled in a hull lot of them levee board grafters'd lose their jobs, or their children would, and then they'd have to think up a new scheme, when the old scheme would do just as well. Why—why?"

And so on. The man back in the bottoms is up on the levee question from his point of view. He keeps a flat-boat lying alongside his house when the river gets up, and he's becoming more and more forehanded, not paying so much attention to Government predictions as he used to as regards the levees holding, but getting his cattle back to the great natural levee known as Crawley's Ridge; as soon as the rise becomes menacing at Cairo, the cattle are rushed to the hills.

Not far below Wittsburg is Crown's Ditch, noted because of a man's efforts to drain a lake back from the river a bit. He spent some thousands of dollars digging, and then the discovery was made that the lake level was about 12 feet below the level of the river, so they stopped digging. Crown Ditch Eddy had a fine bed of shells in it, and many a white clam was taken out there.

Wittsburg was the place to which Old John Pattison came from his home in the brakes fifteen miles away. Pattison was a noted swamp angel. He had a past that kept him in the brakes, and a present that was interesting. One time he swam the river at Wittsburg when it was high and ice was forming. He hit the trail for home, not minding what happened, being in a hilarious condition. His two dogs found a panther in the road and tackled it. Another panther came to the rescue of the first, and a third came, too. Old John awakened to the fact that something was doing in the murk blackness of night, dismounted from his horse and drew his knife. He found a pile of dogs and panthers in the road, a lively, screaming pile, but which he couldn't make out well enough to see what was which. He thought a while, and then noticed that the dogs had different hair from the cats, upon which he took to jabbing the knife into the cat hair hilt deep. In the morning, a neighbor came along and found Old Pattison with his feet on a pile of three dead panthers, and his head on his two sleeping dogs, himself also sleeping, a contented smile on his face, a bloody knife in his hands, and icicles in his long whiskers.

For several days the sun had been gradually fading away in a haze. Along about noon on December 18 I missed the sun altogether, and glancing around saw that the haze was come to be a cloud, covering the sky, while the air was damp and shivery. I began to freshen up on the oars, and hunt some secluded nook in which to pass a rainstorm. It was a long pull, my spirits growing gloomier as the sky came down closer to the tree tops. It seemed as if the rain would not hold off another minute; stray whiffs of mist did come at intervals. I pulled hard on the oars and made good time, but I hit logs once in a while, there not being enough current to indicate their presence.

It was such a day as had seen me swamped on the Mississippi, though much colder. I wanted a little bayou or pocket out of reach of winds, and went searching for one. But the river was much wider now than above Parkins, where numerous bayous come in, and the banks were far higher—thirty feet from the water to the crest of the steep "slip bank." The afternoon waned as I rowed on and on. No pocket presented itself, and the weather grew grayer, moister and gloomier as the twilight closed down.

Not far ahead was L'Anquille River, coming into the St. Francis, but though the name as pronounced by a man whom I hailed at a landing sounded familiar, I could not place the stream, nor tell from which side it came into the St. Francis.

Dusk came, and as I rounded a bend a high ridge of land loomed before me—Crawley's Ridge. I could see a tent or two, some shacks, and partial clearings on the hillside, while before me another stillwater was entered by the St. Francis at right angles. It was a long, wide reach of water, and which way to go was now a question; either way might be up stream, and as far as I could see there was no sheltering place for my boat. It was worse, in fact, than a mile up the St. Francis. But I could not see anything plainly. Suddenly, far to the left, a glimmer of lamp light showed so close to the water's edge that it could mean only one thing—a cabin boat. I had heard stories of St. Francis River shanty boat men, and I recalled the bloody theme of some of these. Nevertheless those clouds dragging among the trees along the back of Crawley's Ridge were more ominous. As the skiff headed toward the light, the wind began to blow, lifting along the eddy and snatching bits of spray from the tops of little waves. A hundred rods further on the waves were rolling a foot high, but I ran under the bow of a steamer-hull model boat, and a little man, bow-legged and crippled, came to the door to see what the stroke of oarlocks meant.

"Come in, come in!" he said, on seeing me. "Come in; the ain't no women folks here to bother you! Come right in, stranger!"

Then the rain began to pour down like a summer shower, and inside with my duffle I was ready to listen; and well I might be, for my host was an Aries Person of the Fire Triplicity.

RAYMOND S. SPEARS.

Camera Shots at Big Game.

MESSRS. DOUBLEDAY, PAGE & Co. have published a new edition of "Camera Shots at Big Game," by Mr. and Mrs. A. G. Wallihan, with an introduction by President Roosevelt. The volume was described at length in FOREST AND STREAM at the time of the original publication, and we have now only to repeat that it is the best collection of photographs of living wild North American animals that we have ever seen.

The picture of the leaping cougar, which forms the frontispiece, is very wonderful, and could only have been taken by a combination of good luck, good judgment and high photographic skill, such as rarely come together.

The price of this edition, although it contains several new pictures, is but \$5.

In Elephant Land.

How well do I remember my first view of an elephant. The little country village in which I resided had been profusely placarded with the announcement of an exhibition of wax figures, accompanied with that of a living elephant, which was the first that had been exhibited in the burgh. Of course I was on the move early on the morning of the show in company with a majority of the youngsters of the vicinity for the purpose of inspecting the footprints of the animal in the streets. Being the leading feature of the show, it had been driven into the village during the night, as many of the inhabitants had never seen one. When the show was opened in the afternoon I was taken to it by my father, and found it crowded with visitors, a greater portion of whom spent the major portion of their time in front of the animal, keeping its custodian busy answering questions and preventing the constant attempts to annoy it. As I stood and gazed at it, lost in wonder, little did I imagine that I would ever meet the elephant in its native haunts. On one of my first trips up into the interior, after my arrival in Natal, South Africa, my attention was attracted one day by meeting what I first imagined were several gigantic loads of hay. When my team drew near enough to make a close inspection I was amazed to discover that what I supposed was hay was elephant tusks piled up and lashed on to the wagons with thongs of raw hide. The ivory was in transit from a store, well up in the interior, down to the coast for shipment to England. Subsequently, I learned that it was a common practice of the country stores to fit out traders with all the supplies necessary for barter with the natives, to be paid for in ivory at a fixed price per pound.

My first sight of elephants in their native haunts was while I was with a friend, who was prospecting for gold. He had discovered an alluvial deposit near Lydenburg, and received a reward from the Boer Government for his find, which caused him to increase exertions in hopes of making further discoveries. We had passed into the Lourenço Marquez District, and reached the banks of one of the branches of the Crocodile River, when we entered a territory governed by a native chief, who would not allow an elephant to be killed in his kingdom except by his own hunters. During the whole of our stay in his territory we were accompanied by a party of his followers who never suffered us to get out of their sight. Finally, becoming convinced that we had no intention of hunting, beyond killing enough of the various species of antelopes to supply our party with fresh meat, they proffered to show us a herd of elephants which were in our immediate neighborhood. Gladly accepting the proffer, we accompanied them some five or six miles from our camp, when we were placed in concealment on the top of a hill which overlooked a small stream at its foot, and gave a fine view of the rising ground beyond. After remaining hidden some time, the gestures of the native, who was left with us, caused us to turn our eyes toward the uplands in front, when the agitation of the foliage gave warning of the passing of the expected game. In a few minutes the elephants became partially visible through the intervening underwood, and I counted sixty-three, which were plainly perceptible to my astonished gaze, and were evidently but a portion of the entire herd. After the last one had passed out of sight our custodian piloted us back to the camp, and I vowed never to be caught in a similar predicament again. The feeling of having been within a short distance of an animal I had always vehemently wished to kill, and having been prevented from making the attempt, so perturbed me that some time elapsed before I recovered my composure.

My next encounter with them took place on the banks of the Zambesi River while on my way to the Victoria Falls. For several days I had been accompanying a party of Boers, who were on a regular hunt for ivory. Having formed the acquaintance of a portion of them sometime previously, I was generously invited to join the gang, and was furnished with a gun of suitable calibre for large game. We were about breaking up camp one morning when several of the party, who had been on a scout during the preceding night, made their appearance and reported that they had seen indications which plainly demonstrated the presence of a herd of tuskers within a short distance of our quarters. All the preparations for moving were immediately suspended and the hunters promptly arranged for a secret onslaught on the much coveted game. By the scouts we were taken several miles from our camp and distributed in carefully concealed positions, stretched along in a line for a considerable distance, to intercept the progress of the herd, which were reported to be feeding along slowly and not aware of our propinquity. It required a strong effort on my part to follow the instructions given me to remain perfectly quiet and allow the game to advance on me instead of stealthily making my way toward it. Finally my patience was rewarded by catching a glimpse of the tips of a pair of tusks just protruding from a dense mass of foliage about a hundred feet from me. It seemed an age before the head of the animal appeared, when I breathlessly took aim and pulled the trigger. In my confused state I neglected to hold the butt of the huge rifle firmly against my shoulder, and consequently received so sudden a jar that I abruptly sat down with such force that it was some seconds before I recovered consciousness and concluded to remain seated in order to escape any stray bullet fired by others of the party at game in my immediate vicinity. So soon as there was a cessation of the fusillade I resumed an upright position and made my way back to the spot where I had seen the head, and it was with a feeling of inordinate exultation that I cast my eyes upon the body of a huge elephant, whose skull had been perforated by the ball of the gun which had given me such a hasty tumble. In a short time I was joined by the rest of the hunters and congratulated on my good luck. Three other carcasses completed the number which had been killed, and I received the hearty congratulations of the party for having secured next to the finest pair of tusks. They were soon separated from the skull and carried to the camp with those acquired by the others.

Immediately after breakfast camp was broken up, and we proceeded along up the banks of the river without again getting in the vicinity of the thoroughly frightened animals. We camped again about half a mile from the river, and during the night I was awakened by a stir in the camp, and on turning out was informed that there were evidently lions in the vicinity. The warning of their proximity had been given by the oxen, which detected their scent, and immediately rose up, snorting and rattling the traction chains to which they had been tied by bits of rawhide. The Kaffirs hurriedly kindled huge fires, which served to frighten away the intruders, and the camp resumed its usual quiet.

The next morning the Boers prepared to inflict punishment on the midnight marauders, mounting their horses and riding off, guided by the scent of about half a dozen dogs, which were kept purposely for such occasions. Of course I accepted the invitation to accompany the party, as the proceeding was a novelty to me and I was eager to see how success was to be accomplished. We cantered off for about half a mile, when a partially open country was reached. The dogs began to circle and in a comparatively short time they surrounded a small copse and squatted on their haunches, giving vent to sundry growls and barks. The Boers immediately formed a cordon just outside of the canines, which, at a prolonged shout from their masters, advanced toward the edge of the thicket with increased baying. They did not reach its margin before a portion of them turned tail in a hurry, being followed by a huge male lion which was instantly riddled by the bullets of about half a dozen rifles in the hands of the Boers seated on their horses within a short distance of the ferocious animal. The whole affair was brought to an end completely and successfully in so short a time that I was astounded at the shrewdness and dexterity of the human and canine participants.

A few days subsequent Victoria Falls were reached, and after thoroughly examining them we turned our faces southward, bent on securing more ivory. Several days passed before the scouting party, who always kept ahead of us, brought news of having found the trail of quite a large herd. Camp was immediately formed, and the scouts again started to locate the game precisely. Our patience was not severely tried, as within a day they returned, reporting having seen a great many within a comparatively short distance. We immediately left the camp and followed the guides to a spot where they proposed to drive the herd. I was again placed in ambush and succeeded in securing another tusker without the contretemps of my preceding shot. Six was the number which were slaughtered, and my Boer friends seemed pleased at the prospect of securing a good crop of ivory. As their proposed route diverged from the one I intended taking, we parted company, and I wended my way back into the Transvaal without any more exciting incidents. Some time subsequent I happened to meet with some of the party, who informed me that they returned from the hunt with over a hundred tusks.

While connected with the Zoological Garden in Cincinnati I received a letter from Mr. Bailey, manager of the Barnum show, requesting me to call on him during a proposed visit to Cincinnati, as he wished to consult me relative to a female elephant in the collection. On reporting he told me that he wished me to examine the animal and try to ascertain if she was with young. He accompanied me inside the tent and handed me over to the keeper with directions to give me all the information in his possession. After questioning him closely, I got him to stand alongside the animal while I tested her teats, when I discovered that she was bearing milk. Going back to Mr. Bailey I told him that he might expect a calf about the first of the March following. He seemed much astonished and pleased, and acknowledged that there was not a party about the entire establishment who knew the period of gestation of an elephant. On the 10th of the following March I received a telegram from him announcing the birth of the calf, and while passing along the streets I met Uncle John Robinson, an old showman. On showing him the dispatch he burst out in a volley of oaths, asserting that the whole affair was an imposture, and he was surprised that I believed a word of it. As many of the readers of *FOREST AND STREAM* may feel some interest in the matter, I append the following data, taken from experiments conducted in India:

Period of gestation of an elephant, about 20½ months; height at birth, 2ft. 11in.; first year, 3ft. 10in.; second year, 4ft. 6in.; third year, 5ft.; fourth year, 5ft. 5in.; fifth year, 5ft. 10in.; sixth year, 6ft. 1½in.; seventh year, 6ft. 4in.

FRANK J. THOMPSON.

Satank's Raid.

Editor *Forest and Stream*:

The old Kiowa chief Satank was probably one of the meanest Indians that his tribe has ever produced, and none of his tribe are angels without wings, either.

He had been keeping our Government in hot water and the cavalry chasing after him for years before the Civil War and since then, but had retired now to his reservation at Fort Sill.

Early in the spring of 1871, I think it was, General Sherman started on a visit to all the frontier posts, and in the course of time got up to our post, Fort Richardson, Texas. To get there he had to travel in an ambulance up from Fort Griffin, the next fort south of us, and the old chief somehow found out that he was coming, and conceived the brilliant idea of capturing him. He was not going to kill the General, he afterward told us, only going to make him a prisoner. "And how about the many soldiers General Sherman would have with him, were you going to kill them?" I asked him. He only grunted in reply. Those soldiers would have had a short shift of it with him, had he met them, and they not put him out of business.

Satank got up a big war party of young Kiowas and Comanches, and took as his aides a Kiowa chief Santanta, and a young, good looking Comanche named Big Tree. I had known Big Tree for a number of years now, and

was surprised when I heard of his going. I thought he had more sense than to let this old fraud trail him off with him.

When Satank left his camp, he headed west, the place that he meant to go to was south of him, and a plain wagon road ran right to it, but he had no use for wagon roads just yet; he might need one later on. Going the way he did, he would have to make a big circle to get to where he meant to go. He made the circle too big, and got to the road he expected to meet Sherman on just twenty-four hours after the General had passed. He was in Richardson now. Satank got there in time though to strike a camp of three wagons that were hauling corn up to the post, and, killing three of the men, he tied them to the hind wheels of their wagons with trace chains, built fires in them, then cut the front spokes out of one wheel on each wagon, cut open the sacks, spilling the corn all over the country; then taking the team horses and harness, put out west again.

Two at least of these three men he had burned before they were dead, as I testified when the Indians' trial took place. The shape that these men's bodies were in when we got to them convinced me that they had been burned alive. Why he had not burned these wagons, instead of going to the trouble of disabling them as he did, always was a puzzle to me, and when I asked Big Tree about it years after this, he could not tell me. He did not know.

There had been a citizen traveling with these wagons. After being shot, he got away, and hiding until after dark, then made his way to Richardson, getting in at daylight next morning. A detail of twelve men under a sergeant and myself was sent off right away to bury these men. We went at a fast gallop, and got to the place, twelve miles from the post, in an hour.

This was the worst sight I had ever seen, and I saw that burned battle field in the Wilderness, Virginia, with the dead bodies all over it. The sergeant and I stood looking at these men.

"What do you think of this?" he asked me.

"I'll tell you what I will think after this. Always before this, when we have killed a Kiowa, if I have been there I have stopped our Tonkawas when they began to cut him up. We can't very well stop them from scalping, and I don't try; but hereafter if the Tonkawa does not scalp and cut up the Indians, I'll do it myself."

The most of the men we had here did not want to touch these burned bodies; one young fellow, a mere boy, sat down on a wagon tongue and began to cry.

"Get up and grab a pick," the sergeant said to him, "and go to work. When you have been here as long as we have, you won't mind these things any more than we do."

The sergeant and I, with one or two of these men who had seen too many dead men before this to care much about it now, got the chains off these men, and after straightening them out as well as we could, laid them in the wide grave that the rest of the men had dug, covering them with the empty grain sacks.

"You should be able to repeat the burial service," the sergeant said to me. "Try it."

While the men stood there uncovered, I repeated the Episcopal service, and then the Lord's prayer. Then the grave was covered up.

Just as we were through, General Mackenzie, with all the cavalry at the post, got there. He only halted long enough for us to tell him that we had these men buried and to show him Satank's trail. Then we took the trail after him. We followed the trail for the next two days, and seeing that it headed for Fort Sill now—the Indians had only gone this far out of the way to throw us out—we left their trail and went direct into Fort Sill, but it took us two days more to get in. There we found all three of the chiefs in the guard house; General Sherman had got up here now, and as soon as the Indians had got in, he arrested them.

The officer in command here, a colonel of colored cavalry, told him that if he did anything to their chiefs the Kiowas would go out now.

"Let them go out," Sherman is reported to have said, "and be blessed to them. I have Mackenzie down here at Richardson to help them in again, if you can't do it."

The three chiefs were now turned over to us to be taken to Texas and tried by the civil court. We put handcuffs on all of them, and as a mark of honor, Mackenzie had a pair of leg irons put on Satank; the General knew him. They were put in an army wagon that had no cover on, then three men were put in with them as a guard, and a heavy mounted guard rode on each side of the wagon.

We had not gone a mile—the post of Fort Sill was still in sight—when old Satank made a grab for one of the guard's carbines; he got it, but before he had time to use it, this mounted guard had him full of pistol balls.

His body was thrown out on the road now for his friends to pick up and bury. He had started this row just to get shot. He knew what was waiting for him down in Texas, and wanted to start for the happy hunting grounds from here and take a few soldiers with him. He had to go alone, though.

One of the balls that was fired at the chief flew wide of the mark, going clear through a young Mexican who drove the wagon. We picked him up for dead and sent him to Sill. Four years after I met him again. He was still driving mules, but he drove for a square man now; we soldiers were too ready to shoot, he said.

When we camped that night the two remaining chiefs, Santanta and Big Tree, were taken out of the wagon, laid on the grass, then with a few soft lariats ropes we proceeded to stake them out. I had the job, doing it while the officer of the day, one of our captains, stood there to see it done properly. I tied a rope to each of Santanta's wrists and ankles, then hauling them taut, pinned the other ends down. I did not use any extra care not to hurt him; he was a Kiowa. Next I began on Big Tree, and tried to leave his ropes a little slack; I did not want to hurt him.

"Haul out those ropes," the officer of the day said. "You are not trying to tie that man. What do you want to save him for?"

I hauled them out now, while Big Tree lay looking this captain right in the eye.

"It is lucky for you," I thought, "that this man is going straight to the gallows, or he would hunt you up and have you out if it took him a lifetime to do it."

When we had got to within twenty miles of Jacksboro, the town alongside of Fort Richardson, we camped for a day. Herc Mackenzie was told that about every man in this part of Texas was in town, ready to lynch these Indians. We started early next morning, and when within two miles of town, the Indians were taken out of the wagon, two men in our troop were taken off their horses, the Indians put on them with their legs tied under the horse's belly, the troop formed by fours, and the Indians put right in the center of it. Then we were told to fill our magazines, load, and advance carbines, and we moved on again. When we had got within sight of town, we could see that every street there was packed with men and horses. "If there is as much whiskey there to-day as there generally is, some of you and us will go to sleep in the next hour," I thought. "I won't be one of them, but I don't want to see any of you or us killed."

When we had got to the foot of the main street, the men here crowded back, giving us just room to ride in between them, and closed in behind us as soon as we had passed. I noticed that all were sober, and began to breathe freely. These men were no fools. When sober they would never try to get these Indians. Not a man here said a word; a few of them would just nod to those of us they knew. The cross streets were also packed solid with men and horses; if some half-drunken fool should fire a shot now—that is what I was afraid of—these men would have been shot down by dozens before our officers could stop the firing. We rode to the jail, and here found one of our troops that had come in around us holding both ends of the street; they had cleared it and kept it clear. The Indians were turned over to the sheriff now, and we went home.

I met one of the citizens a few hours after this, and asked, "Where was all your whiskey to-day? I saw none."

"There was none. The marshal closed the barrooms when he heard you were coming," he said. "He did not want a battle fought here over two blanked Indians."

In a few weeks the Indians were given their trial, and I was called as a witness. I was glad of it. I wanted to get into that court room. I was anxious to see how a Texas lawyer would go about defending the Indians. He had been assigned by the court to defend them, and he did it just as I would have done—put the whole of the blame on old Satank. He had so much influence over the young men, he said, that they dared not disobey him. But all the lawyers in Texas could not have saved those Indians. That jury had them convicted long before it had been told to "step into the box." They were sentenced to be hung; then the President commuted it to life imprisonment, and in a few years pardoned them.

Satanta soon after this died; it was said that a squaw had poisoned him; he is buried in the cemetery at Sill, and for years after his death the squaws kept his grave covered with colored glass, broken chinaware, and such stuff. Big Tree got to be a good Indian; he never was a very bad one, and he never gave us any more trouble.

In the winter of 1876 I was out with a band of Comanches all winter hunting buffalo, and one day going on a hunt of my own in company with two Indian boys, we got so far off that we had to camp out. I met Big Tree and his party, and he and I went into camp together. This was the first time I had seen him since he had been pardoned. That night, as we lay on his blanket at the fire, I got him to tell me all about this raid. He began when they had left camp to go on it, and wound up with his life in Huntsville prison; then he said "But why need I tell you all this? You know it; you were there."

"How is that, Big Tree?"

"Why, you were the little chief who tied me down that night when the big chief made you pull my ropes out tight."

"I thought you had forgot that, Big Tree."

"No, I never forget anything. Why did you want to tie me the way you were doing? Did you want me to get away?" I have always thought that you did."

"No, I knew you could not get away. That man at your head, who stood there all night, would have shot you had you tried to get away, and if he did not do it, then I would. We were told to shoot you if you got loose. Had we let you escape, we might have been shot ourselves; but I did not want to hurt you, Big Tree."

This was stretching it, of course. We would not have been shot, but would have been given six months or a year in the guard house and a dishonorable discharge.

"Well, I have looked long and far for that big chief who told you to pull those ropes tight on me. I want to see him, but I never can find him," said Big Tree.

"And you never will find him. He died many moons ago," I replied.

CABIA BLANCO.

[Many of our readers are old enough to recall the trouble with the Kiowas in 1870 and 1871, and the capture and trial of Satank, Santanta and Big Tree; the two former Kiowas and the last a Comanche.

The history of that time—that is to say the old Indian Bureau and Military Reports—together with much other data, have been brought together in Mr. James Mooney's admirable "Kiowa Calendar," published by the Bureau of Ethnology at Washington. These reports differ in minor details from that given by Cabia Blanco, but the testimony which we print to-day is that of an eye witness and a close observer, and so is far better entitled to credence than the general and perfunctory reports made to the different Government departments. In these reports it is intimated, if not distinctly said, that the three Indian prisoners were taken from Fort Sill, each riding in one army wagon, and each accompanied by two guards, and that Satank attacked with a knife the sergeant of the guard who was riding in the wagon with him.

Cabia Blanco, however, tells us that the three prisoners left Fort Sill in one wagon; that he assisted in putting them into the wagon; that Satank had no knife, so far as any of the soldiers knew, and that no one was cut by Satank; moreover, that the sergeant of the guard was not riding in the wagon, but on his horse by the side of the wagon.

Satank, spelled by Mr. Mooney Set-Angya, means Sitting Bear.

Mr. Mooney quotes Mr. Laurie Tatum, at that time agent for the Kiowas, as saying that the prisoners were put into two wagons, Satank being in one, with soldiers, while Santanta and Big Tree rode in another. George

Washington, a Caddo Indian, is said to have ridden alongside of the wagons as they left Fort Sill. Mr. Tatum further states that, "With a butcher knife, which he [Satank] had secreted, he started for the guard in the front part of the wagon, cutting one of the soldiers slightly in the leg. They both jumped out, leaving their guns. Satank picked up one of them and commenced loading it, wanting to kill one more man. Before he got it loaded, he received several shots, and in twenty minutes died." At the time of his death Satank was the chief of the most important Kiowa soldier organization, known as Chief Dogs, and when singing his death song he referred to this band.

He was supposed to have secret powers, and on this account was more or less feared and hated by his tribe.

Satank was an old man when he died. He had long been a leader among the Kiowas. He was one of the three men who, about the year 1840, went to meet the Cheyennes to arrange peace preliminaries between that tribe and the Kiowas, Comanches and Apaches, and who, as a peace offering, brought back to the Cheyennes

the scalps of forty-two Cheyenne Bow String soldiers, killed two years before by the Kiowas and Comanches.

The story of Satanta's death Cabia Blanco repeats as it was much later told to him, with accompanying legends, generally believed at the time. As a matter of fact, however, it appears that Satanta, having been released on parole in 1873, was rearrested in 1874 on the ground that he had been mixed up in an outbreak led by Stumbling Bear, and was returned to prison at Huntsville, Tex., where he was confined until 1878, when he committed suicide by throwing himself from the second story window of the prison to the ground. Satanta (White Bear) was a great orator, and was long a prominent man among the Kiowas. According to Mooney, he first earned his title of orator of the plains in connection with events which led to the treaty of Medicine Lodge, in 1867. He was prominent in the councils of his tribe, and was the speaker at all councils held with the white people, and a number of his orations have been reported in part. Mr. Mooney gives a concise statement in regard to his prison life and

tragic death, written by Mr. L. A. Whatley, superintendent of the Texas penitentiaries. He says:

"At the July term of the district court of Jack county, in the year 1871, Satanta was convicted of murder and sentenced to life imprisonment in the Texas State Penitentiary. He was received at the Huntsville prison on the 2d of November, 1871. Upon the recommendation of President U. S. Grant, Governor E. J. Davis, on August 9, 1873, set Satanta at liberty upon parole, i. e., conditioned upon his good behavior. It seems, however, that he violated the parole, for he was arrested and recommitted to the prison at Huntsville by Lieutenant-General Sheridan, on the 8th of November, 1874. On October 11th, 1878, Satanta committed suicide by throwing himself from the second story of the prison hospital, from the effects of which he died within a few hours. He was buried at the prison cemetery, where his grave can be identified to this day. During the period of his incarceration in this prison, Satanta behaved well, but was very reticent and stoical."

NATURAL HISTORY

Maine Wolves.

Editor *Forest and Stream*:

In Mr. Grinnell's last article on "The Trails of the Pathfinders," he quotes Mr. Gregg as saying of the gray wolf, "I have never known these animals, rapacious as they are, to extend their attacks to man, though they probably would if very hungry, and a favorable opportunity presented itself."

This agrees with all I have ever been able to learn about wolves in Maine. As my father, when I was a child, used to buy a large part of the skins of the wolves killed in eastern Maine, and I used to see the hunters who took them and hear their stories, and when I grew older hunted where wolves were quite plenty, I have had fair opportunities to know something of their habits, but have never known of any authentic instance of anyone ever being attacked by them. I have heard men tell of marvelous escapes from them by outrunning them, and writers of newspaper stories often tell of their uncles or grandfathers being attacked by wolves; but as far as I have ever been able to learn, these stories had no more foundation of truth than the wonderful bear fights which are so common every year in our Maine papers; which fights only occur at desks where there is a man and perhaps a bottle, but never any bear.

Springer, in his "Forest Life and Forest Trees," relates for truth some of the old stock lies which were used to frighten the green men in our lumber camps. He states as follows: "Three teams in the winter of 1844, all in the same neighborhood, were beset by these ravenous animals. Sometimes one, and in another instance three in a most unwelcome manner volunteered their attendance, accompanying the teamster a long distance on his way. They would even jump on the log and ride, and approach very near the oxen. One of them actually jumped upon the sled and down between the bars when the sled was in motion," and he goes on to tell of the teamsters carrying firearms to protect themselves. Now, these stories are all of the same kind as a few years later were told to tenderfeet of attacks of catamounts, ding-weasels, side-winders, and walruses.

The only thing in Mr. Springer's accounts which has a particle of truth in it, is where he tells of a family on Mattawamkeag living in a log house happening to have some poison with which they saturated some meat which they threw out on the ice. "Next morning early the meat was missing, and on making a short search in the vicinity six wolves were found dead as hammers, all within sight of each other." The facts in this case were that Dr. McCaulister, of Amherst, Maine, was the first man who, as far as is known, ever used any strychnine. He killed several wolves with it, and got some for my father. This strychnine he procured from Philadelphia. It was of French manufacture, and was pulverized, put up in oval bottles with a monogram on the seal, and cost \$2.50 a bottle. A Mr. D. P. Wood, of Baskahegan Plantation, was down at Bangor and told my father of how plenty the wolves were near him. My father got a bottle of this strychnine for him. The first night he laid out baits he killed six wolves. It was not laid out by any family nor on the ice, as Mr. Springer states, but in a back pasture. Mr. Wood killed fifteen wolves before spring. He brought the skins to my father. They all had the upper jaw left on the skin for the purpose of obtaining the bounty of \$10 on the nose. I well remember holding the skins on a log for Mr. Wood to cut the upper jaw off. My father had ten of these skins dressed and two robes made of them. One of these robes, although not in use for many years, is still in my carriage house in a good state of preservation, although made over fifty years ago.

Previous to the use of strychnine, some wolves were trapped, and I have seen quite a number which were trapped on Chemo Bay, within sixteen miles of Bangor. I have known but four wolves shot in eastern Maine. After poison began to be commonly used, the wolves began to decrease, although I think fully as much by migration as by being killed. While plenty till the early '50s, there were extremely few left by 1860. In 1857 I carried to Chesuncook a skin which had been sent down to obtain the bounty. In the winter of 1859 Frank and George Fairbanks, who were trapping near the Mooseluck farm on Aroostook, found part of a moose, which they had left on a hand-sled, badly eaten. They set a beaver trap for it, and fastened the trap chain to the sled. On visiting it the next morning, they found a large wolf in it. He had gnawed the sled badly, and would soon have escaped with the trap. This is the last wolf that I have any record of which was either shot, trapped or poisoned; but late in the '70s a very large wolf was found drowned in Union

River above Ellsworth. He had chased a deer into the river where there was shell ice and logs, and was unable to get out. This skin was sold to me and afterward was kept for a show at Bar Harbor by a guide named Nicholas Caman, who got it of me.

In years when beech nuts were abundant, our wolves used to eat a good many, and I have seen where wolves had fed on deer and beech nuts in the same day. I once saw a very large wolf caught in June in a bear trap, whose stomach was filled with green beech leaves. The animal must have been forced to eat them by hunger, which accounted for his getting into a bear trap, as a wolf is about as hard to trap as a fox. I have had one pass close to a bear trap set in a natural opening in a bank of cedar so that it showed no sign of any man's work, and which was baited with all the entrails of a freshly killed deer. I have several times had one come up to the back of a log trap, and with his teeth pull up a part of the boxing from the frozen ground, but in no instance did he touch the bait which was thus exposed.

In conclusion I will say that although wolves made sad havoc among our deer, as well as farmers' sheep, I have never known of a case of their troubling either men or cattle.

M. HARDY.

BREWER, Maine.

The Buffalo.

Editor *Forest and Stream*:

In your issue of Saturday, October 29, I notice an article entitled "The Tragedy of the Plains," by Romanzo N. Bunn; there is also an article on the same subject by Mr. Allen Kelly; both of these gentlemen are trying to prove that what buffalo were not killed by Col. Bill Cody and Buffalo Jones, perished in a great blizzard.

From the early spring of 1871 to and including the winter of 1875 I killed buffalo for their hides. In all that time I did not earn a single cent in any other way. I speak of that great body of buffalo that roamed between the Platte River on the north and the Arkansas on the south. Buffalo Jones made his appearance on the range about the time that I and many others quit for the want of material to work on. However, there still remained two herds, one in the far north and one on the Staked Plains of Texas. They were small in comparison with the great middle herd, and they did not last long, but certainly went the way of the rest to the tanneries.

The five years I spent killing buffalo were spent not with the object of forcing the Indians on to reservations, nor for the laudable purpose of opening up this vast country for settlement, but for the sole purpose of getting money to spend with the post sutlers and other dealers in troubled water at 25 cents per trouble.

The prime cause of the extermination of the buffalo was brought about mostly by a Kansas City hide dealer named J. N. Dubois, who shipped several bales of buffalo hides to German tanners, who claimed to have a process for making good leather of them. Up to 1871 our American tanners were unable to make leather of them that was suitable for any purpose where spongy leather would not do. However, after the first year of the slaughter which began in 1871 in the neighborhood of Bunker Hill and Russell stations on the Kansas Pacific Railroad, the American tanners discovered the secret, and no more were shipped to Europe. Early in 1871 J. N. Dubois sent out circulars offering to buy at a good price all hides killed at any time of the year. Of course robe hides were always in demand, and buffalo meat was always good in the winter season; but summer hides never had a place in the markets until J. N. Dubois, the Kansas City hide man, opened up the demand. It was also he who introduced the South American hide bug poison that enabled us to preserve summer hides, and he instructed us how to peg out the hides and dry them smooth for shipment. I am not qualified to tell an interesting tale on this subject, but I do know the truth of the buffaloes' disappearing.

Col. Bill Cody is entitled to great praise for the way he has handled himself. Instead of being a drunken hide-hunter, he was smart, and always something of a gentleman; he was handsome, and undoubtedly was a fine shot and a very picturesque hunter, but I have yet to hear of his practicing the methods of still-hunting for hides. He got his great reputation first as a meat-hunter for the Kansas Pacific grading camps, and then from his dashing appearance on horseback for the amusement of wealthy foreign and American visitors to the great American buffalo range.

It has been said that soldiers slaughtered the buffalo. I never knew of their slaughtering much of anything but their rations. In the winter before the Custer massacre I

was a witness to Sitting Bull's efforts in killing thousands of buffalo and drying the meat for the campaign in which so many lost their lives. Sitting Bull came to the headwaters of the Republican River with hundreds of warriors, and sent out soldier Indians or police to notify all hunters that they could kill for meat only, and no more than was needed, while his warriors laid in a tremendous supply. I have often wondered why Buffalo Jones did not notify Uncle Sam of this move of the Indians, and thus prevent that terrible disaster; but come to think of it, Buffalo Jones had not yet made his appearance on the range. I was one of the youngest of the hide-hunters, but I know that dozens yet remain who will verify my statement. They are numerous in the neighborhood of old Fort Wallace; and if there is any real desire for the sake of history to hear the truth, we are the rank and file and not the circus element, and I think can be relied on. Mr. Buffalo Jones and Colonel Bill Cody did really nothing toward exterminating the buffalo. Mr. Jones caught a lot of calves at the wind-up, and thus his real place is as a perpetuator, which is far more to his credit.

One writer has said that the real disaster to the buffalo was a terrible blizzard. I agree with him, but the blizzard began in J. N. Dubois's hide house in Kansas City, then extended to the manufacturers of Sharps sporting rifles in Connecticut, and finally ended on the Great American Desert, where now are so many beautiful towns and happy, contented people.

JOE W. HUTT.

LIGHT, Maries County, Missouri.

The Search for the Loon.

To the man that hopes to start and find the loon's solitary nest, and photograph this shy, elusive bird, my advice is "don't."

For miles through swamp and drowned lands, up rivers and to the head of long, winding creeks, through all the waters of the Atonabee River, with its marshy edges, far and wide in that best of all game lakes, Rice Lake, Canada, on its many islands, closely search its deep bays, where the wild rice and wild cherry, those best of duck foods, grow luxuriantly, the search has led. It is my pleasant business to "snap" the feathered game, small furbearing animals and game fishes in all their various seasons of mating, nesting, rearing, flocking and migrating, but of all the wary ones that breed in these long stretches the loon carries off the prize.

The male bird with an ingenuity that is almost uncanny, frequents all other places but the vicinity of the island on which the nest is placed. To see him slowly swimming around a secluded bay is to decide that the nest is right there. After hours of careful hunting he is next seen haunting the shores of a neighboring island, as if on strict guard. That island is then most thoroughly searched and he is sticking like its shadow to the next one. Then when he has led you far enough afield he dives and is seen no more.

The female all this time is miles away up the lake, making the nest, laying the two big olive green, red and brown spotted eggs and hatching them out, and usually in the dusk of evening she is joined by her far traveled mate; he settles himself for slumber near the nest and tomorrow repeats his deceptive practices. Luckily my work has led me far and wide over the surface of the lake and time solved the riddle and found the nest.

There is a little island far up in the western end of the lake belonging to the Ojibways, unused, seldom visited. Here in the deep tangle of last year's dry undergrowth on Grape Island, while searching for a sandpiper's nest, I heard a great rustle of dry grape vines and then a splash into the lake, fortunately on the lee side. Creeping carefully through the brush I saw the pointed bill and gray head of the female loon show for a second, held flat as a snake's on the water, about a hundred yards out. So at last, by mere accident, the nest was discovered. It was placed near a big granite rock that had been pushed by the spring ice above far in among the trees, a sun searched spot, but far out of the wanderings of trapper, hunter or guide. A circle of dry wild rice straw that had also been pushed in here by the great power of the ice, contained one big egg, no great energy displayed in the building of this nest, but carefully lined with a coating of soft feathers, it made a very consoling picture after the long hunt.

The female sat watching about a quarter of a mile out, and at last, thoroughly alarmed, gave out that weird call that is so fearful on a dark night on a lonesome lake; almost at once he answered, the wooded

shores re-echoing his wild cry. I hastily planted the camera, pointing along the path to the nest, jumped into the canoe and paddled off. As soon as the point of the island hid the craft, I doubled and drew the bass-wood up on the further shore and crept to my well-concealed "hide," knowing from previous experience that he would come ashore if he was sure the enemy had left.

Watching through the vines, I saw him coming closer every dive. Once within gunshot of the shore, he swam along and carefully peeped—no other word will express this clever action—around the corner of the island. Apparently satisfied all was well, he swam back, and from where I crouched I could hear him coming through the dry vines and grasses; straight at me he came until within eight feet of the camera. As the hunter makes a shot straight at his game, so I shot mine, and, truly, gun never gave keener feeling. At the click of the shutter the big bird turned and ran and swam out to his mate, where, with many a low call and loud eerie screech, he told her all.

Not wishing to "snap" the nest until the second egg was laid, with well-filled sail the canoe rapidly sped home, pursued by the maniacal laughter of the two great birds as they rose and fell on the foam-crested waves of the lake.

Several days elapsed before the canoe grated on the pebbles of the little island. The female at once left the

from, and as he had jumped to his feet in a blinding flash with the nerve-racking scream echoing in his half-awakened mind, I did not wonder he thought it was supernatural.

But it is in the fall the strange habits of the great northern diver are best displayed, decoying off the points of the island. Well hidden behind the "bough-house" you will see one of these great birds swimming and diving in mid-lake. After a while it discovers the flock of decoys, and so great is its bump of curiosity, that it is not satisfied until it has visited and found out all about the wooden ducks. By long dives it cautiously approaches the point, when about ten yards outside the flock it stops and, with bill flat on the water and neck stretched out like a snake's, it remains perfectly still, intently eyeing the decoys. Down with a dive so true that hardly a ripple is left behind, it goes and pokes its sharp bill right among the flock. The unnatural stillness awes it for a moment, and then it slowly swims with body still submerged to the nearest duck, with its bright eyes fixed on the counterfeit bird, and every feather on its head erect, it attacks it from behind, picking vigorously at it. The non-resistance seems to alarm it, for down it plunges once more, only to renew the attack on the next bird it approaches; but just stick your head up over the "hide" if you want to cause the visitor to disappear and not return to the surface until it is three or four hundred yards off.

tions occur as little islands throughout the Hudsonian zone, sometimes only a few acres in extent, or again covering several square miles. The plants and mammals tell the story, and even the natives follow the climate of their race. Thus the true Eskimo extend down the coast of Behring Sea to the vicinity of Nushagak, and are represented on the peninsula by Aleuts, while Indians derived from the Athabaskan stock occupy the territory assigned to the Hudsonian. Plate VII. shows a map giving the life zones and distributions of coniferous trees.

Among the specimens collected by Mr. Osgood and his party were a number of species of large game. One of these believed to be now on the point of extinction is Grant's caribou (*Rangifer granti* Allen), of which Mr. Osgood says:

"Signs of caribou were seen at the upper end of Lake Clark, along the Chulitna and Kakhtil rivers, and near Becharof Lake. The animals were formerly very abundant in all this region, but are now much reduced in numbers. Their distribution, however, is undoubtedly continuous from the peninsula to the mainland of Alaska by way of the region of lakes Iliamna and Clark, and the idea that the supposed species *granti* is entirely isolated from the other caribou of Alaska is unquestionably erroneous. The few tracks of caribou seen were those of solitary individuals, or of very small bands of five or six. Several caribou were killed by natives in July, 1902, some twenty miles northwest of Keejik, Lake Clark. One

nest and swam away from the shore, calling loudly for her mate, as before the cry was answered almost at once. No doubt he had followed the canoe for miles up the lake, and was even now close beside the mother bird, listening to her story of alarm. As the plans of the previous day had worked so well, they were all repeated, and like a rehearsal of a play, he repeated his. Up the little path, with body held erect on his clumsy feet set so far behind, he waddled, every moment glancing suspiciously from side to side. At last he was just where I wanted him, and if he couldn't hear my heart beat he was stone deaf. At the metallic click of the shutter he threw his head up, looked a moment, and then rapidly waddled back to the water, to join his lady and again tell her of that unusual noise.

As there was still only one egg, it looked as if she was an old bird and would only lay one, or, for some reason completely beyond me, one was to be the total of this hatch; so taking advantage of a vagrant shaft of sunlight, the camera "clicked" once more, and my Grape Island work was done, for it seemed the female would not approach the nest until assured by the male that all was well.

One month later, before a brisk south wind, the canoe flew around the north point of Grape, and now there were three loons in the water, one, the size of a sandpiper, instantly dived with never a ripple; the beautifully marked male, with his black and white throat band and dark green head, threw his bill up and, with a short screech, dived beneath; the female, a handsome big bird, came straight at the canoe, fluttering and diving, and once she came up within a paddle length. I was making heroic endeavors to get the sail down and the camera ready, but by this time canoe, birds and all had drifted into rough water, and the loons were completely lost to sight. The young one was as graceful a little bird on the water as a teal, and its dives were literally clean out of sight.

On all these northern lakes a pair or two of these interesting birds bring forth their young, their wild, shy habits keeping them almost unseen. All through the summer the long wild cry is heard. One night, returning from a concert at Hiawatha (Ojibway Village) before a fair wind, but under a sky black and gloomy with heavy thunder clouds, the canoe ran full tilt into one of these big birds, evidently asleep on the lake. With a mighty splash and a cry so full of throbbing terror, it disappeared in the darkness, and only involuntary balance on my part saved the canoe from upsetting. As my chum, asleep in the bow, rose at the wild cry and stood erect in the bounding craft, my nerves were tingling, and a vivid flash of lightning disclosed our pallid faces to one another. He sank back into his place, asking what it was, and, although I knew, I could not tell him, so badly had it upset me. The storm struck us with full force, and it took all I knew and a little more—which is luck—to guide the darting canoe safely over those wild miles to the sheltered bay at camp. Here, in the darkness, paddling under the great pines, he asked me where the cry came

One of these clever divers got the anchor line of one of my decoys tangled around its wing through over zealous examination of the flock. I watched the fight with interest, and as the big whistle-wing was made of cedar and very light, it acted as a sort of life preserver to the thoroughly exasperated bird. Every time the loon came up the decoy popped up beside in a truly maddening manner. I have always thought the loon mistook it for a fair up and down fight now, for the way it let into that wooden shape with bill and wings was a caution. To add to its alarm, I stood up at this point of the conflict, intent on rescuing the decoy before it was too far out in the lake. The canoe afloat, a few strokes put me right in the battle, the bird, encumbered as it was, could still dive a few yards. Standing up, the tell-tale bubbles showed me the way; but the line was passing around the wing until the bird and decoy were separated by its full length. At last a mighty struggle, and the piece of lead was lost; the end of the line slipped through and the bird escaped, although I had once touched its back as it dived.

Many are the odd experiences with these birds told around the "shanty" fire, when the nipping November winds are blowing. It is possible for three good paddlers in three canoes to tire one of these great swimmers out; but as we never shoot them, they are seldom caught. With guns and three canoes it would simply be slaughter, as they cannot take wing unless a fairly strong wind is blowing. The best way to hunt them is with a 4x5 Bullet—truly the camera is mightier than the gun.

BONNYCASTLE DALE.

Some Life of the Alaska Peninsula.

NUMBER twenty-four of North American Fauna, the publication of the Biological Survey, under the charge of Dr. C. Hart Merriam, contains an interesting paper on Alaska. It is by Mr. Wilfred H. Osgood, an assistant in the Biological Survey, whose previous experience in northern explorations have especially fitted him to do work such as this.

The present paper contains an account of a trip made during the latter part of the summer and the fall of 1902 to the base of the Alaska Peninsula. This was crossed, work was done on both coasts—that is to say, on the north Pacific coast and that of Behring Sea, as well as some work in the interior. Travel was chiefly by canoe, but the weather being bad less ground was covered than had been hoped. The route, as shown in the sketch map given on Plate I, from Cook Inlet to Lake Iliamna, down the Nushagak River to Bristol, across the peninsula and Shellikoff Straits to Karluk and Kadiak, and then to the Kenai Peninsula and home.

A full account of the region traversed, and many photographs, give a capital idea of the country, much of which is bald and treeless, though in the eastern portion there are white spruces, many of which are fifty feet high and a foot and a half in diameter. The Hudsonian and Arctic life zones here meet and overlap. Tundra condi-

was also killed in July by a prospector about fifteen miles northeast of Cold Bay. During the winter of 1901 a herd of twenty was seen by natives between Becharof and Ugashik lakes, and several were killed, and in the winter of 1902-3, seven were killed on Becharof Lake near Smoky Mountain. Two skulls, labeled 'Nushagak,' secured by McKay in 1882, are in the National Museum. They were doubtless procured by natives at some distance from Nushagak. A party of natives, encamped near us at the mouth of Becharof Lake, were engaged, in the latter part of September, in a caribou hunt. During two weeks of steady work six hunters succeeded in killing a total of six animals. Their method is a lazy one, but with unlimited time gives a fair degree of success. They build a small, innocent-looking cairn of rocks on the summit of a hill a few hundred yards from their camp, to which one of them would go every hour or two and scan the surrounding country. In case a caribou was sighted, the whole party would then go out to stalk it. The animals are very light-colored at this season, and are easily seen at a long distance.

"The large herds which occur further west on the peninsula do not, as a rule, come as far east as Becharof Lake, although small herds are scattered all along. These herds are being rapidly killed off both by white men and natives, and at the present rate the caribou of the Alaska Peninsula bid fair to be exterminated in a comparatively short time. Nearly the year round they are brought in regularly to all the mining and fishing camps along the peninsula, being hunted not only for their flesh, but also for their skins, which are in great demand. The mail steamer which runs along the south side of the peninsula takes on a supply of caribou meat on nearly every trip. The animals are usually killed in the Port Moller region, and the carcasses taken to the mining village of Unga, where the steamer makes regular stops. On the October run, when I was a passenger, caribou chops, roasts, and stews were a feature of the bill of fare. On each trip since then a good supply has been on board. On the December run, nine carcasses were secured at Unga for consumption on the vessel, and in January about the same number were consumed, as I am informed from reliable sources..

[TO BE CONTINUED.]

"Monarch, the Big Bear."

DETROIT, Dec. 5.—*Editor Forest and Stream:*—There can be no doubt of Dr. Robert T. Morris's ability to make good his invitation to Messrs. Seton, Brown and Kelly to dine with him—provided all hands accept. Possibly the Doctor thinks it would be great fun to get those men together and see how they would manage to avoid bears as a topic of conversation. It would be another triumph of tact for him to keep them away from the matter which offered an excuse for bringing them together.

I thank the Doctor for his hospitable invitation, but fear I may not find it convenient to be present.

ALLEN KELLY.

GAME BAG AND GUN

Big-Game Refuges.

From "American Big Game in Its Haunts," The Book of the Boone and Crockett Club, 1904.

THE buffalo (in 1888) had already been swept away. Since that date two species of elk have practically disappeared from the land, one being still represented by a few individuals which for some years have been preserved from destruction by a California cattle company; the other, found only in the Southwest, in territory now included within the Black Mesa forest reservation, may be, perhaps, without a single living representative. Over a vast extent of the territory which the antelope once inhabited, it has ceased to exist; and so speedy and so wholesale has been its disappearance that most of the Western States, slow as they always are to interfere with the privileges of their citizens to kill and destroy at will, have passed laws either wholly protecting it or, at least, limiting the number to be killed in a season to one, two or three. In 1888 no one could have conceived that the diminution of the native large game of America would be what it has proved to be within the past fifteen years.

That the game stock may re-establish itself in certain localities, the Club has advocated the establishment in the various forest reserves of game refuges, where absolutely no hunting shall be permitted.

Through the influence of William Hallett Phillips, a deceased member of the Club, a few lines inserted in an act passed by Congress March 3, 1891, permitted the establishment of forest reserves, and Hon. John W. Noble, then Secretary of the Interior, at once recommended the application of the law to a number of forest tracts, which were forthwith set aside by Presidential proclamation. Since then, more and more forest reserves have been created, and, thanks to the wisdom and courage of the Chief Magistrates of the Nation within the past twelve years, we now have more than sixty millions of acres of such reservations. These consist largely of rough, timbered mountain lands, unfit for cultivation or settlement. They are of enormous value to the arid West, as affording an unending water supply to much of that region, and in a less degree they are valuable as timber reserves, from which hereafter may be harvested crops which will greatly benefit the country adjacent to them.

It is obvious that effectively to protect the big game at large there must be localities where hunting shall be absolutely forbidden. That any species of big game will rapidly increase if absolutely protected is perfectly well known; and in the Yellowstone Park we have ever before us an object lesson, which shows precisely what effective protection of game can do.

It is little more than twenty years since the first efforts were made to prevent the killing of game within the National Reservation, and only about ten years since Congress provided an effective method for preventing such killing. He must be dull indeed who does not realize what that game refuge has done for a great territory, and of how much actual money value its protection has been to the adjoining States of Montana and Idaho, and especially of Wyoming. The visit of President Roosevelt to the National Park last spring made these conditions plain to the whole nation. At that time every newspaper in the land gave long accounts of what the President saw and did there, and told of the hordes of game that he viewed and counted. He saw nothing that he had not before known of, nothing that was not well known to all the members of the Boone and Crockett Club; but it was largely through the President's visit, and the accounts of what he saw in the Yellowstone Park, that the public has come to know what rigid protection can do and has done for our great game.

Since such a refuge can bring about such results, it is high time that we had more of these refuges, in order that like results may follow in different sections of the West, and for different species of wild game; as well for the benefit of other localities and their residents, as for that wider public which will hereafter visit them in ever increasing numbers.

A bill introduced at the last session of Congress authorized the President, when in his judgment it should seem desirable, to set aside portions of forest reserves as game refuges, where no hunting should be allowed. The bill passed the Senate, but failed in the House, largely through lack of time, yet some opposition was manifested to it by members of Congress from the States in which the forest reserves are located, who seemed to feel that such a law would in some way abridge the rights and privileges of their constituents. This is a narrow view, and one not justified by the experience of persons dwelling in the vicinity of the Yellowstone National Park.

If such members of Congress will consider, for example, the effect on the State of Wyoming, of the protection of the Yellowstone Park, it seems impossible to believe that they will oppose the measure. Each non-resident sportsman going into Wyoming to hunt the game—much of which spends the summer in the Yellowstone Park, and each autumn overflows into the adjacent territory—pays to the State the sum of forty dollars, and is obliged by law to hire a guide, for whose license he must pay ten dollars additional; besides that, he hires guides, saddle and pack animals, pays railroad and stage fare, and purchases provisions to last him for his hunt. In other words, at a modest calculation, each man who spends from two weeks to a month hunting in Wyoming pays to the State and its citizens not less than one hundred and fifty dollars. Statistics as to the number of hunters who visit Wyoming are not accessible; but if we assume that they are only two hundred in number, this means an actual

contribution to the State of thirty thousand dollars in cash. Besides this, the protection of the game in such a refuge insures a never-failing supply of meat to the settlers living in the adjacent country, and offers them work for themselves and their horses at a time when, ranch work for the season being over, they have no paying occupation.

The value of a few skins taken by local hunters is very inconsiderable when compared with such a substantial inflow of actual cash to the State and the residents of the territory neighboring to such a refuge. Moreover, it must be remembered that, failing to put in operation some plan of this kind, which shall absolutely protect the game and enable it to re-establish itself, the supply of meat and skins, now naturally enough regarded as their own peculiar possession by the settlers living where such a refuge might be established, will inevitably grow less and less as time goes on; and, as it grows less, the contributions to State and local resources from the non-resident tax will also grow less. Thirty years ago the buffalo skinner declared that the millions of buffalo could never be exterminated; yet the buffalo disappeared, and after them one species of big game after another vanished over much of the country. The future can be judged only by the past. Thirty years ago there were elk all over the plains, from the Missouri River westward to the Rocky Mountains; now there are no elk on the plains, and, except in winter, when driven down from their summer range by the snows, they are found only in the timbered mountains. What has been so thoroughly accomplished will be sure to continue; and, unless the suggested refuges shall be established, there will soon be no game to protect—a real loss to the country.

The Cold Storage Case.

Text of the Decision of the Court of Appeals, Dec. 6, 1904. The People of the State of New York, Appellant, v. Jacob V. Bootman et al., Respondents.

Appeal from a judgment of the Appellate Division of the Supreme Court in the first judicial department affirming a judgment rendered by the Trial Term dismissing the complaint. Also appeal from an order affirming an order which made an extra allowance to the defendant.

Frank S. Black and Henderson Peck for appellant. Louis Marshall and Julius Offenbach for respondents.

VANN, J. This action was brought to recover penalties to the amount of \$1,168,315 for alleged violations of the Forest, Fish and Game Law in that during the close season of 1901 the defendants had in their possession 7,560 grouse; 4,835 quail; 1,776 ducks; 8,848 plover; 7,108 snipe; 8,328 snow-buntings; 1,008 redbirds; 7,607 sandpipers; 788 yellow-legs and 96 woodcock.

Six out of the nineteen counts of the complaint were disposed of by demurrer, which reduced the amount involved to about \$325,000 (40 Misc. Rep. 27; 72 App. Div. 619; 173 N. Y. 622); and this sum was reduced by concession to about \$9,960. The facts as settled by stipulation are as follows: Between May 22 and June 2, 1901, the defendants, as co-partners, and in their possession at the city and county of New York one hundred grouse, one hundred quail, ninety-six woodcock and one hundred ducks, "being of the same grouse, quail, woodcock and ducks mentioned and described in the first thirteen counts of the complaint." Said game birds were not killed in the State of New York but in other States of the Union, where they were purchased by the defendants. They were brought into this State in the month of November, 1900, when it was lawful to possess them here and the defendants kept them on storage in the State of New York until the commencement of this action. After their purchase by the defendants outside of the State, they "were exported from States in which they were purchased to and received by them in this State by means of transportation agencies engaged in inter-State commerce and in the original packages in which they were packed by the shippers thereof." It was further stipulated that they were of the fair market value of \$5,000 and that the action was duly brought on the order of the chief game protector of this State.

Upon the trial said stipulation was read in evidence and both sides rested, whereupon the trial judge dismissed the complaint and the plaintiff excepted. The Appellate Division, by a divided vote, affirmed the judgment entered accordingly and the plaintiff appealed to this court.

The Forest, Fish and Game Law, as in force when it is alleged that the penalties in question were incurred, became a law on the 19th of February, 1900. (L. 1900, ch. 20, General Laws, ch. 31.) It is to some extent a revision but chiefly a re-enactment of the Game Law of 1892 and the Fisheries, Game and Forest Law of 1895, as amended at various times. (L. 1892, ch. 488; L. 1895, ch. 395.) So far as the questions presented by this appeal are concerned, it is the same in substance as the acts considered by the court in *People v. Buffalo Fish Company* (164 N. Y. 93), where it was held that the Fisheries, Game and Forest Law, as amended, applied only to such fish as were taken from the waters of this State, and not to those imported from a foreign country. This conclusion was based upon the ground that the Legislature did not intend by the general language used in a statute so highly penal in character to include fish caught outside of the State. While three judges dissented from that conclusion and three others who sit in this case but did not sit in that, might also have reached a different conclusion had the subject been before them for judicial action, we all feel bound by the rule of *stare decisis* to recognize that decision as settling the meaning of the act then under consideration so far as it was involved in the question at that time before the court.

As the language used in that act in relation to fish does not differ in substance from the language used in the act now before us in relation to game, we are required by the same rule to hold that the Legislature in enacting the Forest, Fish and Game Law, as it stood when the defendants are alleged to have violated it, did not intend to make penal and criminal the possession in this State during the close season of game killed without the State and brought here during the open season.

It is claimed, however, that the passage by Congress of a statute known as the "Lacy Act," removed an obstacle which had previously prevented the application of our game laws to the possession of imported game, and that the operation and effect thereof were expanded accordingly. That act provides in substance that foreign game when transported into any State shall be subjected to the laws of that State, enacted in the exercise of its police powers, to the same extent as if such game had been produced in such State, and shall not be exempt therefrom by reason of importation in original packages. (31 U. S. Stat. at Large, ch. 553.) It became a law by the approval of the President on the 25th of May, 1900, nearly three months after the passage of the Forest, Fish and Game Law. If the Federal statute had been passed first it would not be unreasonable to believe that the Legislature intended to so expand the meaning of our game laws as to forbid the possession of imported game during the close season. It was not passed, however, until after the enactment of the State law, and hence can have no effect upon its meaning as declared by this court in the *Buffalo Fish Co. case*. The defendants had a right to act on that decision as a correct interpretation of the statute and to purchase and possess the game in question at the time and in the manner admitted by the stipulation. A statute which not only imposes heavy penalties but also makes a violation thereof a misdemeanor should not receive a forced construction but should be construed strictly as required by the general rule governing the subject.

While the Legislature did not act in time to affect this action, it has since removed all doubt as to its present intention and has thrown some light on its previous intention, by so amending the Forest, Fish and Game Law as to provide that "wherever in this act the possession of fish or game, or the flesh of any animal, bird or fish, is prohibited, reference is had equally to such fish, game or flesh coming from without the State as to that taken within the State." (L. 1902, ch. 194.) That amendment when read in connection with the Lacy Act, and the decisions of the Federal courts, made thereunder, removes from the region of discussion the questions considered in the *Buffalo Fish Co. case* in relation to the application of the Forest, Fish and Game Law to imported game, which was decided, and the effect of the commerce clause of the Federal Constitution, which, although discussed, was not decided. (Matter of Rahrer, 140 U. S. 545; Vance v. Vandercook Co., 170 U. S. 438.)

It was held by a majority of the learned justices of the Appellate Division that the Legislature has no power to make the possession of imported game unlawful, as it would violate the provisions of our State Constitution relating to the protection of property. We do not assent to this proposition. For time out of mind and in all jurisdictions, laws passed for the protection of fish and game have been regarded as sanctioned by the police power which belongs to every sovereign State. The game and the fish within the boundaries of the State belong to the people in their unorganized capacity and may be taken by any citizen without fee or license at any time during the open season. It is to the interest of the State that neither should be wasted or destroyed and that both should be carefully protected, especially during the breeding season. Without protection the fish and game will soon disappear and the people thus be deprived of an important source of food supply, as well as a delightful recreation which promotes health and prolongs life. The protection of game falls within the legitimate exercise of the police power, because it is directly connected with the public welfare, which is promoted by the preservation and injured by the destruction of so useful an article of food, free at the proper time to all the people of the State. Laws passed for this purpose do not interfere with private property, for there is no property in living wild animals and only as the law permits their capture is there property in wild animals after they are caught or killed.

It was lately declared by the Supreme Court of the United States, when affirming a judgment of this court, that "the preservation of game and fish has always been treated as within the proper domain of the police power, and limiting the season within which birds and wild animals may be killed or exposed for sale, and prescribing the time and manner in which fish may be caught, have been repeatedly upheld by the courts." * * * The taking and selling of certain kinds of fish and game at certain seasons of the year tend to the destruction of the privilege or right by the destruction consequent upon the unrestrained exercise of the right. This is regarded as injurious to the community, and, therefore, it is within the authority of the Legislature to impose restriction and limitation upon the time and manner of taking fish and game, considered valuable as articles of food or merchandise. For this purpose fish and game laws are enacted. The power to enact such laws has long been exercised, and so beneficially for the public that it ought not now to be called into question." (Lawton v. Steele, 119 N. Y. 226, 152, U. S. 133, 138; citing *State v. Roberts*, 59 N. H. 256; *Commonwealth v. Chapin*, 5 Pick. 199; *McCready v. Virginia*, 94 U. S. 391; *Vinton v. Welch*, 9 Pick. 87, 92;

Commonwealth v. Essex Co., 13 Gray, 239, 248; Phelps v. Racey, 60 N. Y. 10; Holvake Co. v. Lyman, 15 Wall, 500; Gentile v. State, 29 Ind. 409; State v. Lewis, 33 N. E. Rep. 1024.)

In a more recent case it was said by that high court: "From the earliest traditions the right to reduce animals *feræ naturæ* to possession has been subject to the control of the law-giving power. * * * In most of the States laws have been passed for the protection and preservation of game. We have been referred to no case where the power to so legislate has been questioned, although the books contain cases involving controversies as to the meaning of some of the statutes. * * * The adjudicated cases recognizing the right of the States to control and regulate the common property in game are numerous. * * * The wild game within a State belongs to the people in their collective sovereign capacity. It is not the subject of private ownership except in so far as the people may elect to make it so, and they may, if they see fit, absolutely prohibit the taking of it, or traffic or commerce in it, if it is deemed necessary for the protection or preservation of the public good." * * * The right to preserve game flows from an undoubted existence in the State of a police power to that end, which may be none the less efficiently called into play, because, by doing so, interstate commerce may be remotely and indirectly affected. Indeed, the source of the police power as to game birds flows from the duty of the State to preserve for its people a valuable food supply." (Geer v. Connecticut, 161 U. S. 519.)

The right to pass laws for the protection of game being conceded, as in view of the authorities it must be, the method of affording protection is necessarily within the discretion of the Legislature. It may provide a close season for the taking of game, and may prohibit the possession or sale of game during that season. It may close the game market throughout the State during the period of prohibition, in order to remove temptation from poachers and pot-hunters, who are apt not to run the risk of taking game out of season if they cannot sell it. To do this effectively it may be necessary to close the market as to game taken without the State, as well as within, for there are no marks by which birds killed in Michigan can be distinguished from those killed in New York. When enacting a game law the Legislature may provide for its ready enforcement, not simply by making the possession of game during the close season presumptive evidence of a violation of the statute, but it may go farther and, in order to prevent evasion, fraud and perjury, may prohibit the possession of game in this State during the close season, even if it was taken in another State and brought here during the open season. The action of Congress has taken away all questions of interstate commerce, so that the State can act with entire freedom and can prevent the shipment of game into or out of its own territory; and if game is imported, it can regulate or prohibit the sale thereof. Such provisions are warranted by the police power, and are not in conflict with either the State or Federal Constitution. This appears from the authorities already cited, to which we add the following: Smith v. Maryland (59 U. S. 71); State v. Randolph (1 Mo. App. 15); Haggerty v. I. M. & S. Co. (143 Mo. 238); Roth v. State (51 Ohio St. 209); Wagner v. State (97 Ill. 320); Ex parte Maier (113 Cal. 476); Smith v. State (155 Ind. 611); State v. Rodman (58 Minn. 293); Commonwealth v. Savage (155 Mass. 393); Organ v. State (56 Ark. 270); Allen v. Wyckoff (48 N. J. Law, 90, 93); People v. Gerber (92 Hun, 554); Association for Protection of Game v. Durham (19 J. & S. 306).

While it is our duty to affirm the judgment of the Appellate Division, we have felt constrained to consider the constitutional question discussed by that learned court, lest the conclusion announced should be regarded as a precedent and result in evil. We do not affirm because, as held below, the statute would be unconstitutional, if construed according to the claim of the plaintiff, but because it should be construed in accordance with our prior decision.

The order granting an additional allowance, of \$2,000 should also be affirmed, because the court had power to make it, inasmuch as the action was difficult, owing to the number of statutes to be construed and authorities to be examined, and extraordinary, as it originally involved over one million dollars and required unusual care in preparing for trial. While the demurrers reduced the amount claimed to about \$325,000, the stipulation making the final reduction is dated but two days before the trial began. An extra allowance is made to reimburse the successful party in a difficult and extraordinary case for the expense of the litigation, which depends to some extent upon the amount claimed. The plaintiffs could not allow the defendants to prepare for trial on the theory that a large sum was involved and then subvert the power of the court to make an allowance accordingly by stipulating to reduce their demand, after substantially all the preparation had been made. If this could be done two days before the trial, we do not see why it could not be done after the trial had commenced and the entire preparation made. As the power to make the allowance existed, the amount thereof, subject to the limitation of the statute which was not exceeded, was within the discretion of the courts below, and beyond our power to review.

The judgment and order should be affirmed, with costs.

Cullen, Ch. J., Gray, O'Brien, Bartlett, Haight and Werner, JJ., concur.
Judgment and order affirmed.

The Catcher Caught.

WHITESVILLE, MISSOURI.—While duck hunting with a companion upon Rice Lake in Minnesota this fall, a bird along the beach was noticed making ineffectual efforts to fly. It could hardly raise its head from the ground, and from a distance seemed to be all bill. We rowed toward it, and upon investigation found a mud-hen or "blue-peter," with a large clam hanging to its beak. The bird had evidently intended making a meal upon the clam, and was not quick enough to get away from the snap of the powerful shell. The lower part of the bill was broken, and the bird could neither fly nor swim. J. F. CASE.

A Colorado Lion Hunt.

(Concluded from page 468.)

For some time the lion savagely snapped at the stones we dropped on him, much to our diversion. The dogs crowded one another near the edge of the precipice in their eagerness to see the lion and occasionally crowded me. As I got on my knees to lean over and drop a stone on the lion's tail a big dog planted his fore-feet on my shoulders. Perhaps he did this to get a better view, or it may have been because he was not able to say "down in front," he adopted this method of giving me a gentle hint that I was obstructing his view. The action was not pleasant to me. I did not relish the idea of being shoved over the precipice and dashed to pieces below, with the possible alternative of landing on the ledge where the lion was located. Our efforts at last resulted in causing the tormented beast to seek refuge elsewhere. After abandoning the ledge he ran upon the top of the precipice and came so close to me that I could have touched him—but I didn't. A little foxhound nearly ventured too close and his impertinence was rewarded by a snap from the lion which grazed the dog's head and slit his ear in twain. Instead of taking to a tree, as we had vainly hoped he would, the lion discovered a way of getting down upon another ledge of the precipice, more inaccessible than the first, and became concealed from view. It became evident that we were taking too many chances, so the guide and myself found a way, very steep and rough, below the lion's last resort, where it was just possible to see, several hundred feet away, the head and neck of the animal. I took careful aim and fired. The bullet went a little higher than I intended, breaking the lower jaw. I wished to preserve the skull entire for a mount, but the character of the wound inflicted made this impossible. In spite of the injury received the tawny form glided along the almost perpendicular side of the precipice, picking out here and there a foot-rest to aid in its ascent. I fired another shot which struck behind the shoulder but did not stop the animal from reaching the top of the precipice, where the dogs soon discovered him. I was not too late to see some of the fight. In the scrimmage the lion got Turk's head partly in his mouth, and for a moment I felt alarmed on account of the dog. Fortunately, the lion's lower jaw, being broken, refused to work, and Turk got off with light punishment—merely a scalp wound, from which the blood flowed freely.

I began to arrange my camera, intending to take a snap-shot of the melee, but the shade of the trees made the light bad for an instantaneous photograph, which was the only one that could be taken of a moving scene; the guide, seeing my dilemma, caught hold of the lion's tail, while still fighting the dogs, and dragged the tangled bunch a few yards down the side of the hill into the sunlight. When this was done the lion was dead, and I was not able to accomplish my purpose. As I surveyed my first lion trophy I could not help admiring the game fight it had put up against hopeless odds. There could be no skepticism respecting the execution of its terrible teeth, because not a few wounds were inflicted on the dogs. It must have weighed 170 to 180 pounds and its skin was in fine condition, but, unfortunately, the skull was ruined, although I still had hopes of saving it.

After hard hunting for about a week the dogs were on a fresh scent and in a short time they treed a small lion which the guide called a "kitten," because it was not full grown. The branches of the tree were quite close together and near the ground. One of the dogs managed to climb a considerable ways up the tree by the aid of the easy support the branches afforded and was in some peril. The report of my rifle helped to swell the chorus of the dogs which only abated when their jaws were employed to a better purpose on the struggling "kitten." The poor beast which had climbed the tree remained a disappointed spectator of the fight, being unable to take part. Afterwards I helped him down from his ridiculous although somewhat dangerous position.

Upon a number of occasions the dogs have climbed trees for a considerable distance above the ground. The piñon trees, where the lions frequently take refuge, are supplied with branches which begin to sprout out near the base, rendering the feat easier of accomplishment, but, nevertheless, it is a remarkable sight to see a dog up a tree, sometimes furnishing an unwilling subject for a camera. Anyone wishing to obtain some impression of how a dog would look in such an attitude can have his curiosity satisfied by examining the photographs of wild animals in Mr. Wallihan's remarkable book, where snap-shots were taken of some of the dogs which were in the pack I hunted with.

We had barely skinned the "kitten" when we heard the pack at some distance, baying another animal. We rode as rapidly as possible in the direction we heard the noise. We soon arrived at the edge of the valley, which lay some five or six hundred feet below. The chorus broke upon our hearing with great distinctness. The country beneath was free from big timber, being dotted profusely with piñon trees and smaller growth, with here and there great pillars of red sandstone fashioned into mushroom shapes by the erosion of the elements through countless ages. In the clear, bright sunshine every object stood out with great distinctness, producing a curious and beautiful effect.

It was an attractive sight to watch the pack as it swiftly coursed about in the valley. It finally disappeared around the base of the mountain. We took a short cut across the spur of the mountain and soon caught the steady baying of the dogs and I knew that something was treed or cornered. On the side of a steep slope, which extended hundreds of feet down to the valley, stood a piñon tree with a fine, large lion perched in its branches—a more beautiful pose for a photograph I could hardly imagine. The light was good and the surroundings all that could be desired to produce the proper effect. The guide suggested a doubt in regard to the lion's remaining in his present position very long and that one of us should cover him with a rifle while the other used the camera. My love of sport is not so platonic that I could readily

forget the deadly part of the pastime for the æsthetic. So I held the rifle carefully pointed at a vital spot, and after a little space the animal quivered as though just about in the act of taking a spring out of the tree, which, had he effected, would have sent him down the slope at a speed that would have distanced the dogs; once at large in the rough country which spread through the valley he would have given us another long and fatiguing chase with a good chance of losing him. Before the trembling limbs could launch into space a bullet pierced his heart and he tumbled from his perch and rolled nearly a hundred feet down the mountain side, where his further descent was arrested by the dogs in no gentle fashion. The struggle with the lion was brief. The guide and myself had more of a struggle with the dogs in driving them away from the carcass.

I was disappointed to learn that the guide had not succeeded in getting a photo. If I could have had a snap-shot with the camera at the lion close by, while in the act of springing, with satisfactory results, I would have had something of more value than the animal's skin.

I added a few more trophies to my collection before finishing my hunt for that season. My experience, however, had convinced me that the best reminiscences of a hunting trip are good photographs of wild animals in their natural state. The ease with which trophies can often be secured, so far as the question of skill is concerned, has somewhat taken the keen edge off of my desire to kill. Securing a good trophy is quite as often a question of time and patience as skill. Coolness is also required, for frequently easy shots are missed through being over anxious.

EDGAR F. RANDOLPH.

MORRISTOWN, N. J.

The New York League.

THE New York State Fish, Game and Forest League has placed itself on record as looking forward to the strict enforcement of the present game laws, and favoring the appointment of ten additional State game protectors. The League held its annual convention at the Yates Hotel in Syracuse on Thursday, Dec. 8, and the attendance was very large, upward of forty different organizations of sportsmen from various parts of the State being represented. The principal business of the meeting was the consideration of proposed amendments to the game laws and the adoption of a number of recommendations along that line. Charles H. Mowry, of Syracuse, chairman of the legislative and law committee, presented a report which formed the basis of interesting and friendly discussions on the matters treated. Among other things, Mr. Mowry said: "The question is asked down at Albany, often, if we are not pretty well satisfied with the game laws at present? We have been forced to acknowledge that we have secured almost everything, but we are not yet satisfied. With scarcely an exception, it is the feeling of the Assemblymen that we ought to look toward the enforcement of the game laws now in effect, to observe what we have instead of looking ahead to still more restrictive laws. Well, we have succeeded in holding what we fought for, particularly the bill prohibiting the sale of certain kinds of game; and I tell you that the result has been beyond our expectations. There were never so many birds before as were left in the thickets this fall."

The recommendations submitted by the legislative and law committee were substantially as follows:

First—That hunting of deer in this State be permitted only under a license, the same to be on sale by the county clerk of each county. That a fee of \$25 be charged to non-residents of the State, and 75 cents to residents. That to the license be attached two coupons to be fastened to the carcass of the deer as they are killed.

Second—That special protectors in the employ of regularly incorporated game associations or boards of supervisors have the same right of search as the State game protectors have.

Third—That maskinongé shall not be taken less than twenty inches in length.

Fourth—That trout and game birds shall not be sold or exposed for sale until five days after the open season.

Fifth—That the League looks forward toward the strict enforcement of the present game laws.

The above recommendations were taken up separately, and, after being duly considered, all were adopted. Mr. Mowry then read a number of letters from sportsmen advocating such new measures as the committee had decided upon. Some of these communications stated that there were open violations of the game laws in their part of the State. The eastern Adirondacks came in for special criticism, because of the methods used there in running game to earth. The chairman emphasized the fact, that perfect protection to game would not be possible unless every member of the League "camped on the coat tail," as he expressed it, of the members of the Legislature in his respective district.

The resolution on deer hunting provides that a bill be drawn and presented to the Legislature providing that all non-resident and unnaturalized deer hunters be made to secure a license costing \$25, to allow them to hunt deer in this State, or a license costing \$10, to permit them to hunt other animals or game birds. This was the substance of the resolutions presented by Mr. Fanning. Chairman Mowry later said that the bill would also include a tax of \$1 on all resident hunters, the licenses themselves to have two tags attached, these to be placed upon the deer when shot.

A motion to prohibit the taking of trout of less than eight inches evoked considerable discussion, and was voted down.

An attempt was made to have the time limit of five days in regard to the sale of trout and game birds, as provided in the recommendation above referred to, reduced to twenty-four hours; but the majority of the delegates believed that under such an arrangement the law breakers would have as much of a chance for activity as ever. Hence the resolution was not changed.

A motion looking toward an open season of five

days for pheasant was promptly squelched.

Robert B. Lawrence, of New York, called the attention of the meeting to the bill in Congress, to place all migratory wildfowl under Federal protection. The subject was discussed at some length, and the League agreed upon the following recommendation: "While not admitting that the bill introduced by Mr. Shiras is the best means possible, the New York State League herewith commends the general principles of the bill that migratory birds should be placed under Federal protection."

The members of the League in the recommendation to Congress wish to have it emphasized that they favor the protection of all birds and not alone of game birds. It was the sentiment of the meeting that the infraction of the game laws in the south ought to be curbed in some way, and national legislation was the only thing that suggested itself as a remedy.

R. P. Grant, of Clayton, asked the moral support of the League in behalf of a plea, which the Anglers' Association of the St. Lawrence River will make to the Legislature; namely, that a steam yacht to cost at least \$5,000 be purchased for the use of the protector in charge of the lower Ontario and Island region of the St. Lawrence, that he may better perform his duties, which include not only the protection of game and fish, but the keeping in order of the State parks at the islands.

Hon. Charles R. Skinner also spoke in favor of this measure, and pointed out that it was backed by Mayor George Hall, of Ogdensburg and would have a friend in Senator George Malby, if the latter, as expected, is made chairman of the Senate Finance Committee.

This request awakened western delegates, and they promptly put in a bid that such a steam yacht be also placed at the disposal of the Niagara River protector, and although the northern delegates wanted their request to go through unaccompanied, an amendment by Mr. Hoover was also passed. It was said that the expense of maintaining such a yacht on the St. Lawrence would amount to about \$2,000 a year, at least; but Mr. Skinner said that the "proud State of New York ought to be willing to pay that," and stated that at present the protector there has only his own rowboat in which to cover an area of many square miles.

A resolution, offered by E. A. Bowman, was adopted to the effect, that a bill providing for the appointment of ten additional State fish and game protectors, to be located one each in the counties of Albany, Orleans, Niagara, Ontario, Genesee, Broome and Chenango and the others as directed by the Legislature, be presented to the latter body.

A spirited discussion arose at one stage, regarding the present law preventing the hunting of wildfowl in the spring. Delegates from the north were in favor of its repeal, but after lengthy arguments, it was decided to let the present laws remain as they are.

By a unanimous vote on the report of the nominating committee, which consisted of E. A. Bowman, John D. Whish and Henry Killick, the following officers were elected for the ensuing year: President, H. S. Wicker, Lockport; Vice-President, W. S. Gavitt, Lyons; Secretary, Ernest G. Gould, Seneca Falls; Treasurer, A. C. Cornwall, Alexandria Bay. Organization Committee—Robert B. Lawrence, New York; J. H. Forey, Syracuse; W. E. Wolcott, Utica; E. A. Bowman, Medina; Melson C. Smith, Geneva. Legislative and Law Committee—Charles H. Mowry, Syracuse; R. H. McCormick, Albany; W. S. Gavitt, Lyons; R. P. Grant, Clayton; John R. Fanning, Rochester. Auditing Committee—Aaron Mather, Bridgewater; C. W. Hatch, J. R. McLaren. Biological Committee—James Annin, Jr., Andrew Irving, Heary Killick. Messrs. Smith, McCormick and Fanning are the only new officers.

The report of Treasurer Cornwall showed that the League had about \$170 in the treasury. It was decided that President Wicker should appoint additional members of the organization committee, and that an effort should be made to strengthen the League by the addition of more clubs in all parts of the State.

W. E. WOLCOTT.

UTICA, N. Y., December 10.

Our Big Game.

MR. DWIGHT W. HUNTINGTON, the artist, author of "Our Feathered Game," has written a new volume, uniform with that one, entitled, "Our Big Game," also published by Chas. Scribner's Sons.

Mr. Huntington's experience goes back to the days when the buffalo still roamed the plains, and when elk, deer and antelope also inhabited those wide regions, which then were without settlers, and into which the cattle had scarcely begun to penetrate. These prairies are now occupied; farms are found wherever there is water, wire fences bar the traveler's way, and the game has almost wholly disappeared. Of buffalo there remain wild but a handful in the National Park, and a few in the Northwest Territories on the eastern flanks of the Rocky Mountains. The elk have retreated to the timbered mountains; the antelope, extinct in many places, are found now only on the high, dry plateaus where the lack of water makes settlement impossible.

The decrease of big game is due almost as much to the settling up of the country as to the killing off of the animals. The greater part of the game was killed by skin-hunters, and the settlement of the country prevented any subsequent increase. As soon as railroads penetrated any game country and furnished an easy method of getting the hides to the market, the skin-hunters came in and slaughtered the game as rapidly as possible. In old times one might often see, even at a distance from the railroad, great wagons built like hay-ricks on which were piled the dried hides of elk, antelope, deer, and mountain sheep, so high as to make it difficult for the four horses to pull the heavy load. As settlers came into the country, the few animals left by the skin-hunters had no opportunity to reproduce their kind unmolested, and gradually, as people became more numerous, the wild things wholly disappeared.

It seems evident that the pendulum has now swung as far as it can in the direction of killing, and that a better

spirit is rapidly growing up. Many men and many associations formerly altogether devoted to the destruction and capture of game are now giving far more consideration to its preservation, and it is gratifying to note that Mr. Huntington also takes this ground.

It is not many years ago that the FOREST AND STREAM first urged the establishment in the various forest reserves of the West of certain game refuges where no hunting should be allowed, but where the game should be absolutely protected. We have seen the result of such absolute protection in the Yellowstone National Park, where game of all kinds native to the region is very abundant. Even the wild buffalo, although for years they have wintered in a most inclement region at the head of Pelican Creek where the snows are so deep as to cover all vegetation, are beginning slowly to increase in numbers, while the tame herd, under fence, fed and properly guarded, has doubled in the last three years.

Mr. Huntington evidently has the idea of these game refuges in mind, but appears to be unaware that hunting is still permitted in the forest reservations where, as a matter of fact, it ought to be forbidden. If a large area in each forest reservation were absolutely protected, the big game of the West would not only hold its own, but would very rapidly increase; and, in the neighborhood of each forest reservation so protected, there would be hunting such as travelers in the West used to know thirty years ago. Private game preserves such as the Austin Corbin Park, the late Mr. Whitney's October Mountain preserve, and some others, are useful and interesting, but can do little more than increase stocks of game, which may be used later to stock public preserves.

Mr. Huntington's volume is divided into Four Books. The first, covering 122 pages, treats of the deer family, including wapiti, moose, mule deer, black-tail deer, Virginia deer, and woodland and barren ground caribou. Book second, 61 pages, deals with the ox family—the bison, muskox, mountain sheep, white goat and antelope. The bear family is considered in book three, occupying about 40 pages, and the cat family in book four in 15 pages. An appendix gives the Latin names and brief descriptions of a number of the chief species of large game.

Mr. Huntington's volume is a very convenient general manual, which will interest most game hunters and is a capital book to put into the hands of boys. It is excellently illustrated by 16 half-tone plates from photographs, of which those of the moose, the elk and the mule deer are extremely interesting. It has a full index and is well worth reading.

A Federal Game Law.*

An Act to Protect Migratory Game Birds of the United States.

WHEREAS, experience has shown that laws passed by the States and Territories of the United States to protect game birds within their respective limits have proved insufficient to protect those kinds and classes of said birds which are migratory in their habits, and which nest and hatch their young in States other than those in which they pass the usual hunting season, and in some cases breed beyond the boundaries of the United States;

And whereas such local laws are also inapplicable and insufficient to protect such game birds as, in their migrations, are found in the public waters of the United States, outside the limits and jurisdiction of the several States and Territories;

And whereas the absence of uniform and effective laws and regulations in such cases has resulted in the wholesale destruction and the threatened extermination of many valuable species of said game birds, which cannot be practically restored or re-stocked under State laws applicable in the case of game birds having their permanent habitat within the respective States and Territories, therefore,

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled,

Section 1. That all wild geese, wild swans, brant, wild ducks, snipe, plover, woodcock, rail, wild pigeons and all other migratory game birds which in their northern and southern migrations pass through or do not remain permanently the entire year within the borders of any State or Territory shall hereafter be deemed to be within the custody and protection of the Government of the United States, and shall not be destroyed or taken contrary to regulation hereinafter provided for.

Sec. 2. That the Department of Agriculture is hereby authorized to adopt suitable regulations to give effect to the previous section by prescribing and fixing closed seasons, having due regard to the zones of temperature, breeding habits and times and line of migratory flight, thereby enabling the Department to select and designate suitable districts for different portions of the country within which said closed seasons it shall not be lawful to shoot or by any device kill or seize and capture migratory birds within the protection of this law, and by declaring penalties by fine or imprisonment, or both, for violations of such regulations.

Sec. 3. That the Department of Agriculture, after the preparation of said regulations, shall cause the same to be made public, and shall allow a period of three months, in which said regulations may be examined and considered, before final adoption, permitting, when deemed

*House Bill No. 15601, introduced Dec. 5 by Hon. George Shiras 3d, of Pennsylvania, and referred to the Committee on Agriculture, Hon. Jas. W. Wadsworth, of New York, Chairman.

proper, public hearings thereon, and after final adoption to cause same to be engrossed and submitted to the President of the United States for approval.

Provided, however, that nothing herein contained shall be deemed to affect or interfere with the local laws of the States and Territories for the protection of game localized within their borders, nor to prevent the States and Territories from enacting laws and regulations to promote and render efficient the regulations of the Department of Agriculture provided under this statute.

STATE OF NEW YORK,
FOREST, FISH AND GAME COMMISSION,

ALBANY, N. Y., Dec. 10.—*Editor Forest and Stream:* I am in receipt of your letter of the 9th inst. inclosing the text of a bill introduced in the House by Hon. George Shiras 3d to give Federal protection to wildfowl.

I certainly favor this measure. It may be the only one that will prevent the total extinction of many species.
D. C. MIDDLETON, Commissioner.

STATE OF NEW YORK,
FOREST, FISH AND GAME COMMISSION,

ALBANY, N. Y., Dec. 9.—*Editor Forest and Stream:* In answer to your letter of the 8th, with copy of proposed legislation by Representative George Shiras 3d, of Pennsylvania, I would say that if a law could be enacted by the general government that would furnish more adequate protection to migratory birds and which would be constitutional, the general public would be more than delighted. This surely would bring to the assistance of each State department Federal support, and as no State in the Union is doing what it should in the way of an adequate police force for the protection of game, it must be an improvement over the present system.

I will not attempt to raise a question as to the constitutionality of such a measure; but a previous act by Congress known as the Lacey Act, that went into effect May 25, 1900, and which provides that "all dead bodies or parts thereof of any foreign game animals or game or song birds transported into any State or Territory, or remaining therein for consumption, sale or storage, shall, upon arrival in such State or Territory, be subject to the laws of such State or Territory," is doubtless as far as Congress felt they had power to act, and that any attempted legislation must necessarily be subject to the laws of this or other States; but be that as it may, the masses who are interested in the protection of game, song and insectivorous birds, will feel like embracing any opportunity that will prevent said birds from becoming exterminated.

This matter was brought up yesterday at the annual meeting of the New York State Fish, Game and Forest League, and while it was a new idea to all, and there was not ample time to go into the matter exhaustively, the League passed a resolution approving a measure of this kind if the zones referred to in section 2 of the Shiras bill would not make two dates in this State, and we also asked that the measure extend to all migratory birds that are now protected by the law of this State. Doubtless the Law and Legislative Committee of the League will confer with the representatives of this State in Congress, urging that they favor this measure as amended by the resolution passed by the League.

As the provisions of the act are such that it shall be generally published and distributed and an opportunity given for hearings before final adoption, the public will have an opportunity to fairly consider and doubtless learn what the intent of the Department of Agriculture is as to legislation and fully determine whether it is advisable to urge its passage.
J. W. POND.

STATE OF OHIO
FISH AND GAME COMMISSION.

COLUMBUS, O., Dec. 10.—*Editor Forest and Stream:* Replying to your favor of the 9th inst., permit me to say that I have read carefully the bill introduced by Hon. George Shiras 3d, of Pennsylvania, in the House of Representatives, and individually can express my entire approval of its intent, purpose and plan. Such a Federal law would unquestionably do more good than all the local laws applying to migratory game. It would mean the preservation of wildfowl for succeeding generations, whereas under the conditions of the present there is hardly the promise of adequate supply for this generation. I am sure that my associates upon the Ohio Fish and Game Commission will take the same view of the matter, and in anticipation of that, it gives me great pleasure to offer the foregoing.
J. L. RODGERS,
President.

STATE OF WEST VIRGINIA,
Office of
GAME AND FISH WARDEN.

HINTON, W. Va., Dec. 10.—*Editor Forest and Stream:* I am in hearty accord with the measure of Hon. George Shiras 3d, to protect migratory game birds by Federal laws. It is a wide step in the right direction, and will receive the support of this department in this State.
FRANK LIVELY, State Warden.

COMMONWEALTH OF PENNSYLVANIA,
Office of the
BOARD OF GAME COMMISSIONERS.

HARRISBURG, Pa., Dec. 12.—*Editor Forest and Stream:* I most heartily indorse the effort that is being made to give Federal protection to our migratory birds, and am ready to do all in my power to secure legislation of this kind. I want to say, though, that I favor the adoption of a measure that will meet the necessities of the occasion, and not a collection of meaningless words and phrases, such as what is now known as the Lacey Bill.

JOSEPH KALBFUS,
Secretary of the Game Commission.

WASHINGTON, D. C., Dec. 11.—*Editor Forest and Stream:* In response to your request for an expression of my opinion on the proposition of Mr. Shiras in a bill entitled, "An Act to Protect Migratory Game Birds of the United States," I assume that you are not seeking my opinion as to the legality of a measure which departs so

radically from past interpretations of the common law upon which all protective legislation at the present time vested in the various State governments is based. Certainly the reasons for national legislation on the subject are well set forth in the preamble of the bill, and should appeal to all the sportsmen of the country. I sincerely hope the measure will pass, and that its constitutionality will be quickly demonstrated. It should meet with the indorsement of all State Legislatures which are enacting laws for the protection of game birds. I see no other way to save the woodcock, the extermination of which within a stated number of years is prophesied by the best authorities on the subject. If the measure proves to be a good law, why not have a similar law for the protection of migratory fishes, and thus avoid the wanton slaughter which sometimes occurs through conflicting laws or conflict of authorities of adjacent States? Take for illustration the slaughter of salmon in the Columbia River during the past closed season, permitted by the game wardens of both Washington and Oregon, and as a result of which it has been impossible to obtain for either State or national hatcheries the customary quota of eggs for purposes of propagation. These are my personal expressions on the subject.

JOHN W. TITCOMB.

SAGINAW, Mich., Dec. 10.—*Editor Forest and Stream:* I have yours of the 8th inclosing notice of the Federal game law. I had already written to Congressman Fordney, Representative from our district, bringing this matter to his favorable consideration. He is a sportsman, and I know he will do what he can. This is certainly a move in the right direction. If the people really desire to protect game, and if they really wish to prevent our bird life becoming extinct, then here is a chance for them to show it, for this is the only practicable solution of the problem.

W. B. MERSHON.

STATE OF MINNESOTA,
BOARD OF GAME AND FISH COMMISSIONERS.

ST. PAUL, Minn., Dec. 10.—*Editor Forest and Stream:* Yours of the 8th inst. at hand and contents noted. You can rest assured that I am in hearty sympathy with the bill introduced by Hon. Geo. Shiras 3d, of Pennsylvania, and the bill, in my estimation, fills a long felt want, something that ought to have been out a long time ago, and it certainly deserves the active support of every game protector in the United States.

It is a fact that the different States have tried to protect the ducks, especially in the spring when they are mating or in their flight to their breeding grounds north. While States like Minnesota have been consistent in the enforcement of our laws in regard to spring shooting, other States all around us have allowed it, and the consequence is that our law has been nullified to a certain extent; but if this Federal law can be passed, it will do away with that and place every State on the level, and will do more to protect the aquatic fowl of the United States than anything that could be devised by the different States.

We see in Minnesota the benefits of stopping spring shooting, and I have no fear of the results if this bill of Mr. Shiras is adopted and becomes a law.

I have taken the liberty of writing to the Senators and each of our Representatives in Washington, and have requested that if consistent, I hope they will support this measure. It is a just one and ought to become a law.

SAM. F. FULLERTON, Executive Agent.

Newfoundland Notes.

EFFORTS are being made to induce the Government or the Reid Newfoundland Company to send an exhibit to the New York Sportsmen's Show. We ought to be able to send one of the very best exhibits possible. Our seal, bear, caribou, grouse and sea bird specimens would interest sportsmen the world over; and as for our salmon, sea trout, grilse, and brook trout, we ought to be able to furnish the very best specimens in America.

I send you a clipping from a late local paper giving a graphic description of a fight between a bear and wolf. It will not be an uninteresting addition to the discussion of "Bears I Have Met." The story is told by a trapper from the upper reaches of Grand Lake, whose letter to a friend in the city reached him by Saturday's mail. He gives an interesting experience of his sojourn in the wilds of the country. "I am alone," he said, "and I wish to be. I am a recluse of the forest; I have been trapping for thirty years, and the life is a pleasant one. Early in September, with some others, I canoed up this splendid lake, and after enjoying a good time with them, a rough crew, many of them loggers, some sportsmen, and others tourists, started on my work in the interior. I had a small canoe which could be paddled only by one, and I gave some people an opportunity to try their skill, but they came to grief, and I often laughed heartily at their expense. Deer were seen and shot, and some of the Americans marveled at my skill as a deer stalker and salmon catcher. Splendid antlers were secured, and the products of the lake and its tributaries often afforded savory meals of salmon, trout and venison. The visitors when leaving said the country was an El Dorado for sportsmen, and parted from me with many regrets. But I was after game which would bring me in gold. Inured to hardship, I determined to face further inland than ever before, and often waded weary portages with canoe on back, but pitching camp after a hard day's traveling enjoyed the rest which my labors had earned. The scenery was beautiful, and the forest denizens were my companions. I trusted to my good rifle to repel any incursions which beasts might make to my camp. On October 15 snow began to fall. It was quite calm, and the big flakes descended noiselessly, changing the landscape, and the trees bent with their burden of crystals. Rabbits were snared or shot, and I feasted royally. Fox, lynx, muskrat and other skins were taken by day, but one night quite an adventure occurred. Rabbits were plentiful, and from the camp the bones were thrown around. For days I had seen the tracks of animals that showed big game to be about, and was on the alert each morning tracing the tracks through the forest. Guessing that bears or wolves were about on the night of the 21st, a brace of dead rabbits was left a few yards from the camp, and I tracked for hours for my quarry. The weather had become mild, and as nothing occurred, I rolled myself in my blanket and fell asleep, when suddenly something hit the place, and the

canvas covering came down with a bang. Crawling as best I could from underneath my shelter, rifle in hand, I ran to a tree, up which I climbed, and saw two animals in deadly combat. The night had become clear, and the moon shone full on the scene. The fight was a deadly one. A full-grown wolf had captured the rabbits and was tearing them with his fangs when a black bear, which evidently had visited the place before, came upon the beast. The latter turned on bruin, dropping his meal and avoiding the blow aimed at him, fastened his teeth in the bear's flanks, bringing bruin to earth, and both rolled over and over. The bear several times shook the wolf off and ran for the rabbits, but the wolf disputed his right, and once, grasping one of his forepaws, bit it through, crippling it. Bruin vainly thought to hug him with the other. The member, however, did good work in the struggle, as it tore the wolf down, and the fur and blood flew in all directions. Maddened with pain, the wolf fastened on the bear's neck, and over and over they fought, flattening the canvas of the tent and destroying everything inside. Big tufts of hair and flesh fell from the bear, who was getting decidedly the worst of the encounter with his broken paw, when I drew a bead on him and my rifle woke the echoes, shooting bruin through the heart. As he rolled over, the wolf painfully emerged, but ran to take the rabbits, when another shot brought him down. This only hamstrung the beast, which lay growling with his prey in his mouth, but another well-directed and deliberate shot gave him his conge. I secured two fine skins. I will remain up country till March, and will write out any further incidents of note."

From Massachusetts.

BOSTON, Dec. 10.—*Editor Forest and Stream:* Your readers have all heard of the Rev. H. K. Job, who has delivered illustrated lectures on birds in many cities and towns. In the lecture at Cambridge last week he showed on the screen many pictures of egrets. He said for the life of him he would not tell where the extensive rookery, discovered by him, was located, for if he did, "there'd be an army of millinery gunners organized for their extermination."

The lecturer also showed blue herons in the everglades; buzzards in Southern cities; shore birds along the coast; pelicans, red-backed sandpipers, curlew, on the beaches; plover, their nests, eggs and young, and other species of game birds. He gave a graphic account of his visit to the Magdalen Islands, showing numerous sea fowl, black ducks, bittern nests, with young. Wilson's snipe on her nest, razor-billed ducks, gulls and terns. At the close he explained that his first interest in bird life was developed by his experience as a sportsman, and urged his hearers to give them the "right hand of fellowship." Members of Audubon societies, he said, should welcome their assistance in efforts to protect birds and animals.

On Tuesday evening a goodly number of members of the State Association met at the Copley Square Hotel for dinner, and were pleasantly entertained by an account of recent moose hunting trips by the president, Dr. M. A. Morris, and Mr. George Perry, all of whom have had successful trips this fall. Dr. A. R. Brown conducted the musical part of the entertainment, assisted by Mr. Bruce Belmore as pianist. On Thursday evening the board of management took action looking to the renewal of the work of last spring in restocking with quail. The committee appointed in November to present a list of officers for next year presented a report. The election will be held the second Wednesday of January. The president was authorized to appoint a committee to arrange for the annual dinner. Reports from northern New Hampshire show the killing of a large number of deer this season, and in the southern part of the State, where they have no open season, they are rapidly multiplying, having been seen in groups of from four to eight in several towns just over the border of Massachusetts.

Yesterday I met Mr. Farley, of Boston, who has just returned from a trip of several weeks duration in the Ox Bow region of Aroostook county, Maine, where he found game surprisingly plenty. He had the fortune to secure a moose and a good buck. He says he could have shot a dozen deer but for legal restrictions and had he been so disposed. There is some discrepancy between the reports from Bangor of the number of moose killed this season, as shown by the number tagged there, one giving it as 208, the other 198. At any rate, there is no doubt of a slight falling off this year, as compared with 1903, when there were 215 shipped. The season closed at midnight of Nov. 30. Deer shipments to Friday noon show a footing of 4,008, as against 4,274 to the same time in 1903. The decrease in the number of moose has been a surprise, for they have been reported all along as very numerous; "many moose seen," has been the report of visitors during the summer and fall. In the number of bears killed there has been an increase of twenty-two, as reported. In a very few days the deer record will be completed, the season ending at midnight of Dec. 15.

A hunter from the Hoosier State claims the honor of getting the largest moose secured in Maine this year. The animal is said to have weighed 1,400 (?) pounds—the largest on record for several years. It was killed in the Chesuncook region. The head was out of the ordinary, but a good one. On the left was a treble web with seventeen points; on the right were twelve points; spread 56 inches.

Mr. E. C. Frost, of S. Framingham, as the result of a few days' trip, brought from the Rangeley region two fine bucks. After a month in camp a party of four Fitchburg sportsmen has returned with four deer.

Since I wrote you last week the sportsmen of our State have met with a great loss in the death of Capt. J. W. Collins, for the past five years chairman of the Massachusetts Fish and Game Commission. Your correspondent is not alone in regarding this event as a great calamity to the State. The Captain was taken with pneumonia on Monday, and passed away at his home in Brighton on Friday. Funeral services will be held at the house on Monday at 10 o'clock. In a future letter I hope to present to your readers a resumé of the work accomplished by the board since Capt. Collins took the helm in 1899.

CENTRAL.

Two Guides for Sale.

JERSEY CITY, Dec. 8.—*Editor Forest and Stream:* Your editorial, "He Pays His Fine," reminds me of a visit I received from a certain guide coming from Montana, early in August, 1903. He wanted to know the camp address of a guide in New Brunswick; he had written to his home address, but had received no reply; it was a matter of importance, could I give him the camp address?

He then showed me the letter that must be answered. It was from our New Brunswick friend, in which he had agreed to take our friend from Montana and his two friends to kill moose in the close season. The sum and substance of the letter was that it would be all right for him to come in with his two "sports," but to come in as trout fishermen; the Montana man could not act as guide, but he could pole a canoe, thereby saving a dollar a day. They were to arrive in the moose country in the latter part of August, and be out before the opening day, September 15. They were to bring trout-rods, not rifles; he would supply the rifles. His charges per day would be the same as all of his parties pay in open season, with the proviso that in the event of their killing moose he would have to charge them extra for the risk he was taking. It gave other valuable advice to our Montana friend.

I left New York September 14 that same year to hunt moose. In order to reach my country I had to pass through this man's country. I learned on my way in that he had two men in in August, and that they had left early in September, before the opening day. In passing through this man's country I met him and one of his "sports." He had three sportsmen in for the opening season. They had seen nothing. On my way out three weeks later, I met him again; his first party had left; they had seen no moose, and only succeeded in killing a cow caribou or two. Three weeks in one of the best moose countries in New Brunswick, and the opening weeks at that, and no moose. Perhaps our trout fishermen can tell why!

To get back to our Montana friend. After reading the letter we left the office and I questioned him in regard to shooting in his country. He gave all the information asked; told me my chances for game were good, and finished by saying he had just returned from a two months' trip through his country with a "sport" from New York (the name is connected with one of New York's leading papers), in which they had killed mountain sheep, elk and deer. They went down the Missonri in a house-boat, I believe he said, and for which trip, where the killing must have been done in June and July, he said he received \$1,500.

What are the chances for sportsmen in the country of either of these gentlemen for securing game after living up to the letter of the law and coming in in the open season?

Such is the reputation of "two leading guides" as I know it from the lips of one and the pen of the other. Perhaps your editorial, "He Pays His Fine," is the outcome of the one's dirty work; then again my man may be still another, for no doubt there are others.

OTTO KEIM.

Shooting a Sitting Duck.

PHILADELPHIA, Dec. 11.—*Editor Forest and Stream:* Comfortably located in a blind or club shooting box, perhaps heated with an oil stove, with an attendant to pick up dead birds, arrange decoys, etc., it is an easy matter to criticise those who, under entirely different circumstances, may elect to "pot" a dusky mallard. But how about him who marks down one of these wary birds in a pond hole with little or no cover and makes a stalk of perhaps half a mile, the greater part of which is on hands and knees and through mud, only to find his quarry a long gunshot away; must he forthwith arise and say "Shoo!" before shooting? I have never heard of yelling at a deer to get it in motion under like circumstances.

A certain Blunt Old Man, more or less well-known, himself an ardent duck shooter as well as fisherman, has recently in public print mildly ridiculed the class of "exclusive sportsmen" who refuse to partake of nicely-cooked trout unless assured that they were taken on the fly. I am not sure but some of the same argument may be applied in other directions.

I recall an occasion near the end of a highly unsuccessful ducking trip, when a few birds for the friends at home were almost a necessity. Seated in mud and water at the edge of a small pond, I anxiously watched the flight of seven dusky mallards, and when I saw they were about to pay me a visit no fears of wet clothes kept me from sinking lower and lower into the mud. As the leader was about 1/16 of an inch from a sitting position in the water, and his followers 1/8, 2/8, 3/4, etc., inches (estimated) from the same position, I fired. As the survivors made a frightened leap in the air, two drew together and came down at the crack of the second barrel. As I gathered five plump birds I did not at that time realize by what a narrow margin I escaped being a social outcast. I do now. As the meeting comes to order I will take a seat with M. Hardy.

OCEAN.

Editor Forest and Stream:

Blunt Old Man seems to be in for a scoring now from correspondents, on account of his ideas about hunting. But circumstances alter cases. I have been busy for the last few weeks looking up all the proverbs in the English language in an attempt to win \$250 a Pittsburg paper offers, and I am filled up with proverbs now. I would not crawl up on a flock of quail and shoot into them while they were sunning themselves. I can once in a while hit one or more of them when they fly; and if they were slow about flying, I would kick a clod in among them and make them fly. But in the case of the duck, if he will not fly, what are you to do? I met a duck of that kind early this fall, the only one, by the way, I had a chance to get. They were late in coming in here, and when they did come, the weather was too cold. I had already laid my boat up and had quit; I can't stand cold weather as well now as I could forty years ago.

The Union Arms Company, of Toledo, sent me a new gun this fall, and I was anxious to try it just as soon as the law was off the ducks; the law came off at the proper time, but the ducks did not arrive. I took the gun across

to the Peninsula one afternoon, and tramped around among the swamps where the ducks ought to be, because there is plenty of wild rice there for them; but they had not come to get it yet; and not finding anything else except squirrels to shoot at, and not wanting the squirrels, I set up a board to try the gun for pattern, and found the pattern to be all right, then started for home.

There is a wide mud flat here between the channel and the city; and just inside of this channel, paddling around on the mud flat, I saw a lone duck busy feeding. He let me pull to within a hundred yards of him without noticing me, and taking in the oars I let the boat drift and got ready to shoot when he would fly. But he was not doing any flying. He no doubt had been one of those ducks that had put in the summer here; and we had not tried to shoot him for so many months now that he probably thought we had quit shooting ducks. I was within 60 yards of him, and yelled at him to get out of that; but he kept on fishing. "Then take it sitting," I told him. I did not stop to think then that I was putting myself in Blunt Old Man's class, and I sent him a charge out of the new gun. I had promised to tell the company that made this gun whether or not I could kill ducks with it. It killed this one. He must have got about all of the charge of No. 5 that I sent him. When I had picked him up I found him to be a fine redhead, one of the largest I have ever shot here. I could not use him after getting him, so I gave him away.

CABIA BLANCO.

ERIE, Pa.

Views of a Blunt Old Man.

Editor Forest and Stream:

In your issue of Dec. 10, Mr. L. F. Brown characterizes as pot-hunters men who shoot wild ducks sitting at rest. Then he says:

"If one of these pot-hunters were a guest at the club house of almost any shooting club, and should fire at ducks when they were at rest or asleep, he would have a very uncomfortable experience furnished to him by almost any club member who saw him. Many clubs punish such shooting by a fine, or even by expulsion for a new offense after admonishment."

Your correspondent doubtless sincerely believes that this is true. Just as sincerely I believe that it is untrue. My acquaintance with duck shooters and my observance of their shooting ways tell me that they entertain no such finicky notions about killing a duck on the water. Mr. Brown says that for doing this a guest at a club would be censured. This is mere assertion. I dispute it and challenge him to prove it. The burden of proof is on him. Let him substantiate the statement by actual, definite citation of the clubs where shooting at sitting ducks entails fines and expulsions. I do not believe that there are such clubs. Mr. Brown says there are; it is up to him to give us their names.

Your usually intelligent contributor, Charles Cristadoro, is all at sea in his remarks on this subject. I did not defend shooting a sitting grouse or running quail, nor advocate trout dynamiting. It is not necessary to do all these things simply because one shoots ducks sitting. To put it technically, the approval and practice of water-swatting ducks does not involve, nor necessarily imply, the approval and practice of the ground-swatting of quail. If Mr. Cristadoro will inquire around among his duck shooting friends, he probably will find that the majority of them are scrupulous about contending for shooting flying on upland game, but advocate and practice taking a duck any old way. Let him institute the inquiry and report results in FOREST AND STREAM.

One thing at a time. When we have settled about the sitting duck, I shall be glad to converse with Mr. Cristadoro about the ground shooting of quail. I believe that I can show him that his shooting-on-the-fly man does not have all the argument of sportsmanship on his side. But we will let this pass until after Mr. Brown has given us something to back up his ducking proposition.

Mr. Brown wants my name. Why? We are discussing principles, not men. It does not matter who I am. Mr. Brown might not recognize my name as that of one whose dictum on duck shooting would be received as final. Nor is his inviting me to "come out" any answer whatever to the contentions which express the sincere convictions of

A BLUNT OLD MAN.

German Forests.

NEARLY one-fourth of the surface of the entire German Empire is covered with forests (about 48,000 square miles), more than one-sixth (38,000 square miles) being occupied by what the Germans call "hochwald," that is, forests of full-grown trees.

The area occupied by trees of the pine family is more than three times as great as that occupied by all the varieties of deciduous trees combined. Of the 5,658,000 acres of deciduous trees, 1,172,000 acres are oak, 467,000 acres are birch, alder, and aspen, and 4,019,000 acres are beech, etc. Of the 18,495,000 acres of needle-leaved trees, 1,327,000 acres are pine, 29,000 acres are larch, 5,482,000 acres are red fir, and 657,000 acres are white fir.

About 2½ per cent. of this "hochwald" is owned by the Crown, nearly 40 per cent. by the State, 15 per cent. by municipal governments, and about 40 per cent. by private persons.

The entire area devoted to forests is to-day nearly 20,000 acres greater than it was twenty years ago. Between 1883 and 1900 the decrease in the area of forests of deciduous trees amounted to 567,000 acres, while the gain in the extent of the forests of pines, larches, and firs was 76,000 acres.

GEORGE H. MURPHY,

Vice and Deputy Consul-General.

LANKFORT, Germany, Oct. 21.

Deer Hunting in Ontario.

ILTON, Dec. 5.—So far I have seen no estimate from the chief game warden of the number of deer killed in Ontario during the season which ended on November 15 last, nor any report of number handled by the express companies. I hunted in the Magnetawan section of the Parry Sound district, from which more deer are shipped annually than from any other. On my way to camp I was told by settlers that there were not

so many deer as usual, and that a large number had starved to death last winter on account of the great depth of the snow, and a strong crust which remained on it for a long time. Judging from what I saw in the woods in the way of tracks and other signs, there were about half as many deer where I hunted as there were in 1903. Hunters and hounds, however, were more numerous than ever. On my way home I was told by express agents that the number of deer passing through their hands was much smaller than usual. I saw few bucks and a great many fawns. One party had seven deer, the total weight of which was a little over 500 pounds. The weather throughout the season was exceptionally fine. There was no rain or snow, and dogs could be run daily. As very few hunters were without dogs, there seems to be no doubt that the deer were scarcer than usual.

In my opinion the time has come for a change in the game act as far as deer are concerned. Though hounds are always used in my party, six out of its eight members are in favor of the prohibition of hounding. I would go further. I would like to see the killing of does and fawns prohibited. In my party there is a rule that all fawns must be spared; but I do not know of any other party which has a similar rule.

W. P.

British Columbia Game Law Amendments.

VICTORIA, B. C., Nov. 28.—*Editor Forest and Stream:* I think you will be interested to learn that Mr. Hawthornthwaite, member of the Provincial Parliament, has promised at the next session of the local Legislature to introduce the amendments to the game act advocated by the Victoria Fish and Game Club.

Of these amendments the most important is one prohibiting the sale of blue, or dusky, grouse, a bird which is in considerable demand in the markets, and for this cause is rapidly being exterminated.

It is hoped that other changes to make the game act more effective may be introduced. The efforts to prohibit the sale of game have not so far proved altogether successful; but it is hoped amendments may be made which, in the future, will make such sales practically impossible.

J. M.

A Club in the South.

NEW YORK, Nov. 30.—*Editor Forest and Stream:* I would like to inquire through the medium of your paper if ten or a dozen companionable gentlemen cannot be found who would like to form a club in a most desirable location I know of in South Carolina.

It is becoming more and more difficult to find large tracts of land that can be leased or even purchased. They are being taken up rapidly. It is only a question of a very few years when no large consecutive bodies of land can be controlled in this way. I would like to hear from anyone whom this letter interests, or who thinks favorably of joining a club.

COURTLANDT BABCOCK.

Alligator Lake.

CHARLES E. WHIPPLE returned Thursday from a stay of three weeks at John F. Haynes's island camp in Alligator Lake, Hancock county, Me. His cousin, Frank Howard, of Pittsfield, and F. H. Eastman, of West Springfield, left this city with him on November 8, and returned after a stay of two weeks, bringing three of the four deer which the party killed. On their way into camp they saw a large bull moose, which had been shot a few days previously, about three miles from Alligator Lake, and which was being hauled to Bangor. There was considerable snow in the woods during their stay there, and they saw many deer, partridges and rabbits, and plenty of moose signs, but no moose except the one referred to above. Two local parties have already made engagements for Mr. Haynes's camp next summer and fall.—Springfield Republican, Dec. 4.

The Only Medium.

MESSRS. E. A. BUCK & Co., the well-known and reliable manufacturers of still-hunting shoes, write to the FOREST AND STREAM as follows:

BANGOR, Me., Dec. 6.—Please continue our advertisement as heretofore, as we consider the FOREST AND STREAM the only medium for reaching the best patrons of outdoor sports. We have orders from England, South Africa, Germany, North Wales, British Columbia, Alaska, and other foreign places, and many of these orders we can trace directly to our advertising in the FOREST AND STREAM.

E. A. BUCK & Co.

A Dog's Ruse.

In a recent number of London Nature, a correspondent tells a very good dog story as follows:

"A friend of mine, Mr. W., owns a Manchester terrier of which he is very fond, and for that reason receives more than doggy attention. The dog passes most of his time in the library, where a basket and rug are provided for him, but he prefers, when it is possible, to take possession of his master's easy chair. A short time ago I had occasion to call on Mr. W., and the dog was, as usual, occupying the chair, from which he was removed to his basket. He showed his resentment of this disturbance of his slumbers by becoming very restless. Presently he trotted over to the door, which he rattled by pushing with his nose, his usual method of attracting attention when he wished to go out. His master immediately rose and opened the door, but instead of the dog going out, he rushed back and jumped into the chair his master had just vacated! The rapid wagging of his tail and the expression of his face showed the dog to be very pleased with the result of his ruse. The dog has repeated the joke once or twice since, with much evident delight of himself."

This would seem to be a variant of a not unfamiliar dog habit. We have been told of occasions when two or more dogs were feeding together and one would run off a little distance and bark furiously, thus inducing the others to leave their food in order to learn what the dog was barking at, when the barking dog would slip back and eat as rapidly as possible, thus getting more than his share of the food.

Cabia Blanco's Indian Story.

Editor Forest and Stream:

When reading this controversy as to whether Captain Kelly or Ernest Thompson Seton should be given the credit for these bear stories (I would give the credit to Captain Kelly; but let him and Seton settle that to suit themselves), I have thought of another way in which authors (?) sometimes get the credit that belongs to someone else. One of these "authors" once took credit, without making any bones about it, either, to a story of mine. He is welcome to it.

I was at a small post in New Mexico in 1882, and having nothing to do except carry a mail, which I did for the most part after night, and take charge of a small library that my troop had, and shoot rattlesnakes—they were about all we could find there to shoot—I tried to kill the time then, as I often do now, by writing boys' stories.

I happened to get hold of a boys' paper that had lately been started in New York and was running a serial story telling the boys all about Indians, buffalo, and the Rocky Mountains; and thinking that I knew nearly as much about those things as the writer of the story did (what he did not seem to know about any of them would fill a good sized volume), I went to work and ground out a story for the paper, meaning to make the paper a present of it.

Starting my boy hero off from his home in Philadelphia with his pocket handkerchief full of supplies that he had stolen out of his aunt's kitchen, I took him clear across the continent to California, finding him plenty of Indians, of course, for him to fight on his way there. My Indians acted more like real ones than this other author's did. Then, after giving the boy about all the adventures he could take care of, I next had him find a gold mine—he could not go to California and not find one, of course; then I brought him home. The postage on this was about \$1; postage then was 3 cents, and as I did not care to pay another dollar to get this valuable production back again, I told the editor that if he did not want it, to destroy it.

I did not hear from him or the story again for the next ten years, and in the meantime his paper died a natural death.

In 1892 I happened to pick up a boys' paper which is still living, and here found my story with another man's name signed to it. All the change he had made in the story was to give it a new title. I wrote to the editor, claiming the story as being mine, but telling him he was welcome to it and to about half a ton of others that I had, if he wanted them. He did not want them then, and has not wanted them since. I have tried him or his successor twice since then, only to be told that they had a supply of boys' stories on hand. But he wanted that one bad enough to cause him to republish it about once in every ten years since then, or as often as the boys who have last read it have grown up; and their brothers now read this story as a new one.

CABIA BLANCO.

Forestry Quarterly.

THE Forestry Quarterly, published at Ithaca, N. Y., under the editorship of Dr. B. E. Fernow, claims to be the first and only professional forestry journal in the United States. Its purposes are to aid in the establishment of rational forest management; to offer an organ for the publication of technical papers of interest to professional foresters in America; to keep the profession in touch with the current technical literature and with the forestry movement in the United States. The first volume was published under the auspices of the New York State College of Forestry by the students, alumni and faculty of that institution. With its second volume, owing to the discontinuance of the college, the journal enters upon an independent career, being conducted by a board of editors identified with the profession and coming from the various centers of professional forestry work.

While the aims and scope of the Quarterly will remain the same as heretofore, a more generally representative board of editors is expected to give greater professional interest, render its pages more authoritative, and increase its serviceability generally. It is expected to make the journal of interest not only to students and practitioners of forestry, but also to all who are interested more or less directly in the management of woodlands, especially lumbermen and those charged with the forest policies and interests of the various States.

Copies of the first volume, containing 176 pages, may be obtained on payment of \$1.

Subscriptions to Volume II, are invited.

The yearly subscription price is \$1, and single numbers are 25 cents each.

Life of Father De Smet.

MR. FRANCIS P. HARPER announces a very important work on early Western travel, dealing largely with the American Indians. It is "The Life and Writings of Father Pierre-Jean De Smet," who relates his experiences and observations made while traveling 180,000 miles, from the years 1801 to 1873.

The set of four noble volumes of over 1,600 pages is made up from the original unpublished manuscript journals and letter books kept by Father De Smet, and from his printed works. It is edited by Major Hiram M. Chittenden, U. S. E., and Mr. Alfred Talbot Richardson, with historical, geographical, ethnological and other notes, to which is added a life of Father De Smet.

The History of the Native Races of North America can never be fully written without consulting these writings, as they give minute and accurate descriptions of Indian villages, their lodges, customs, mode of warfare, hunting, games, superstitions, Indian tortures of captives, legends and traditions. One-half the material is now for the first time printed. The set is illustrated with portraits, views of old trading posts, scenery, etc., and a large folding map, showing posts, trails, waterways, Indian tribes, etc., in great detail, on which is marked in red the route of Father De Smet. The set is uniform with Dr. Coues' edition of "Pike Expeditions," and Major Chittenden's "American Fur Trade of the Far West." The published price is \$15 net for the four volumes.

Book of Clever Beasts.

READERS of FOREST AND STREAM who have followed with interest the various discussions in its columns within the past few months concerning the writings of Messrs. John Burroughs, Ernest Thompson Seton, W. J. Long and other writers on popular history, will do well to purchase a copy of Miss Myrtle Reed's very clever "Book of Clever Beasts." It will well repay reading. It is full of humor of a most kindly, but telling, quality, and we have read it with very great pleasure.

All communications for FOREST AND STREAM must be directed to Forest and Stream Pub. Co., New York, to receive attention. We have no other office.

All the game laws and fish laws of the United States and Canada are given in the "Game Laws in Brief."

SEA AND RIVER FISHING

An American Angler Abroad.

In telling of some recent experience while visiting England, the desire uppermost in my mind is to give to my brother anglers at home some notion of the interesting and charming personalities whom I met there, as well as the delightful things that I saw. I must begin by saying, that as an angler, I felt at all times like the child visiting the parent.

Mr. R. B. Marston.

It was my great good fortune soon after reaching London to meet Mr. R. B. Marston, the editor of The Fishing Gazette—the paper recognized everywhere as the encyclopedia on fishing in British waters. And I believe that the strongest credentials that I carried into Mr. Marston's office, were my love of fishing and my warm sympathy with all members of the angling craft wherever they may be. I have many times in life heard it said of successful men, that "the principal reasons of their success in life, is the love of their work." I have never seen the man to whom this saying applies so aptly as in the case of Mr. Marston. He loves his work and his friends, and he has more of both than is the good fortune of some of us.

Through Mr. Marston's courtesies to me, I was introduced at the Fly-Fishers' Club, where I met many of the club members, and I was shown through the various rooms used by men who are certainly born anglers. Many specimens of fish adorn the walls, all being contributions by the members. Nor are the specimens confined to fish taken in English waters, but there are fish from many parts of the world; over the fire-place in the main saloon is one of the finest specimens of the tarpon I have ever seen.

To me the most interesting room in the Fly-Fishers' Club is the work room. In this room, at odd hours, the members make their own flies, and in doing so, they have at their command a study from nature to imitate. This nature study consists of a cabinet of many shallow drawers; these drawers are divided into squares, probably two inches, lined with metal, and in each one of these small sections is a natural fly carefully preserved in liquid the color of water; over this is glass; the case is hermetically sealed, and the fly floats so that it rests in the center of its compartment and against the glass. In many instances the male and female flies of the same species are together; and every species of the flies known in Great Britain is here preserved. From this vast collection of the "real thing" flies, the fishermen make the copied artificial fly. On the same table with this cabinet is another cabinet containing all kinds of feathers, hooks, silk, tools and snells—all club property, and all for the use of the members of the Fly-Fishers' Club. Many of the members would as soon take a salmon or brown trout with a chub, as to take one with flies not of their own handiwork. They are born anglers every one of them; they match their own genius with a nature shy indeed, thus reaping the joy of a victory just sweet enough to tell about.

The Piscatorial Society.

I shall ever deem it a piece of good fortune to have visited England at the time of the annual supper of the famous Piscatorial Society. The club rooms of the society are open to the members and their friends every Monday evening after 6 o'clock; and once a year the club gives a supper and entertainment. And from the members I met there and the things I heard and saw, I can easily understand Vice-Chairman Walker's suggestion on this occasion, that these suppers should be held oftener, either quarterly or semi-annually, for a more delightful gathering of congenial spirits I have never met. I use the term congenial spirits, as it seems best to describe the close relationship existing among the various members of the society. In referring again to congenial spirits, I am thinking of the pictures that adorn the walls of the reception saloon. All around this room close together hang cartoons of each and every member of this club. The head and face of each man is an exact reproduction of a photograph; the body and legs of each have been produced from descriptions given a very clever artist of some particular hobby of the original. One, for instance, pictures a prominent member on an old-fashioned high-wheel bicycle, riding into a stream at high speed while bait-casting for fish. Another shows a member sitting in a boat fishing, with fish piled up to his arm pits, and the boat sinking, but the man still fishing on; and a hundred and more others are quite as interesting. In the main saloon, there is probably the finest collection of big game fishes in the world. The walls of the vast room are covered with them from four feet above the floor to the ceiling, all mounted behind oval glass and completely inclosed. The specimens of salmon are magnificent, and so are the brown trout, pike, chub, grayling and others. In one end of the room I found a fine specimen of the American small-mouth black bass. Mr. Marston was keenly interested in my description of this fish and his fighting ability.

At the supper there were probably one hundred and fifty members and their friends, and the good fellowship existing between them was manifest at all times. President H. H. Brown, as toastmaster, was heartily responded to by the Hon. Secretary Mr. T. Farnsford, Col. Graham Gordan, Vice-Chairman Walker, R. B. Marston, Sub-Committee Blundell, and others. And true to the letter and the spirit of the sympathy and love existing between anglers wherever they may be found, the American angler abroad was most cordially welcomed by all, and the keen affection of relationship best shown by Col. Graham Gordan,

leaving his seat at the table and going to the piano and playing the "Star Spangled Banner," which every member joined in singing as fervently as though they had been born under its starry protection.

My next interesting visit was in the private library of Mr. Marston, where I had the pleasure of seeing and examining many precious old volumes of rare books—among them original editions of Izaak Walton, printed early in the seventeenth century, and a book of nature, published nearly a century before in German, from which Walton gathered much data for his writings. I regret that my time in this library was so limited—it was like a five-minute stop for dinner to the hungry traveler with a rare meal before him.

W. Baden Powell.

There is probably no man in England or, in fact, anywhere else, who is more entitled to the term "natural sportsman" than W. Baden Powell; a yachtsman of national fame; a hunter of all kinds of game, and an angler whose advice is often sought and diligently followed. I had the pleasure of an evening with him, and the evening was entirely too short. In his collection of sportsman's accessories, I saw a rare pair of guns, recently made from his own ideas—the only pair of its kind in existence. The forearms of these guns are so constructed, that the thumb and finger slide in a groove on the sides, so that in swinging from right to left or left to right, the position of the gun is not altered either on the shoulder or before the eye.

Of his rods much might be written that would be of interest. They have all been constructed on scientific lines from Mr. Powell's own specifications. The work bench, where he makes his own salmon and trout flies, proves an interesting corner to the visiting angler, as well as to the owner.

Dragnet.

I had read many of "Dragnet's" clever witticisms in times gone by, and was anxious to meet face to face this wielder of the rod and pen. I had this pleasure at the Piscatorial Society supper. His genial smile and abundant welcome are with me still, and will remain. Dragnet is infectious, and this is true of them all.

I didn't need the streams and lakes and rivers in England to impress me best with English anglers. It was behind the pipe in cozy places that I learned many things about angling and formed a sweeter regard for my fellow man.

T. E. BATTEN.

The Log of a Sea Angler.

BY CHARLES F. HOLDER, AUTHOR OF "ANGLING," "BIG GAME FISHES," ETC.

I.—Crab Camp.

ONE glides gently from the snows of winter into the lap of spring in going down the Atlantic Coast in the former season. We are menaced with ice fields off Delaware Bay. The next day something undefined has happened, and a day or two later a butterfly comes fluttering aboard, blown off shore with the odors of verdure from low-lying Florida to tell us the story of summer and the fountain of youth. It is then that we take out the rods and talk over the fishing with a sympathetic disciple of Ananias, who is also on the trail of the tarpon or something else at Pass Cristian or somewhere along the shores of the delight makers.

While we were wrangling over the height of kingfish jumps a large shark came alongside. He had a pronounced notch in his dorsal fin, and our skipper informed us that the same man-eater had followed him for several months. This is serious, as one of the crew had shot away the dorsal, and it was supposed that the great creature was on his trail.

Key West rose out of the silver sea last night, and I am in the center of a cocoanut grove, where the soft wind plays upon a thousand æolian harps, and the musical rustle sounds like gentle rain. The air is like velvet on the cheek, and filled with the perfume of innumerable flowers. Surely the fountain of youth is not far away in the grove, where the mockingbird sings the night long. Some time during the night the boys from C's plantation serenaded me, and when they came in to drink my health, I noticed that they had scarlet passion vine blossoms wound about their heads. Their soft voices, the tinkling of guitars, banjos and triangles, the deep bass of a conch shell carried me far away.

Outfitted and sailed on a little steamer for Garden Key, where they welcome strangers. That night S. took me down to the "quarters" to look up boatmen, and found there Long John, Bob Rand and Chief, playing seven-up by the light of a single candle. Between them was a pitcher of water and a small bottle of well-known and patent pain killer, which served as the not over-joyous tipple. Bob, with true politeness, pushed the latter toward me, but I declined; self-preservation is the first law of nature. They each poured out a large spoonful, filled up the glass with as much water as their conscience permitted, and drank our health. The trouble was obvious: there was no whiskey on the key; and I understood that cologne would not be safe at times.

These three men are characters, and doubtless live here for reasons best known to themselves. Long John is six and a half feet in his stockings, which he never wears; is thin beyond understanding; his face is red as a beet; even his little eyes look burned by the pain-killer. John's hair is dyed black, or rather green. Bob is also red as a beet, but shorter; and Chief would be, but he is a Seminole of a pure type; not the stoical, morose Indian you read of, but a good-natured jolly fellow, always laughing.

How a man can look so pleasant on an habitual diet of pain killer is one of the unsolved mysteries of the reef.

I intended to engage one man, but took them all, as they are partners in a sailboat called the Bull Pup, and she looks it. The men are to hunt up fishing grounds, take me out, and do the cooking in camp on the various keys.

Took a survey of the ground in a rowboat—a perfect fishing ground. Garden Key is thirteen acres in extent, and lies in the center of a growing atoll. A deep blue channel surrounds it, and the navies of the world could float here if the channel was wide enough to swing them—a perfect harbor for vessels transport size. To the west three miles is Loggerhead; to the southwest, Bird Key; to the northeast, East Key; then Middle and Sand keys, all capped with mangrove and bay cedars, lying like gems *en cabuchon* in a setting of turquoise.

Sailed for East Key early in the morning; reached it after a two hours' run. The Bull Pup is well named. She wrestles with every wave and fights it out. Wish I had increased my insurance before I left the mainland. She is about 20ft. long, with a full square bow, a small cabin aft that has more smells than anything I have ever met. At first I thought it was one smell, old bilge, but I believe I counted fifty, then gave it up. Amidship is a large well into which we toss our fish, so none are wasted. Ran up into the lee of East Key at noon; hot, but pleasant. The island has about five acres, and the brush comes down to within one hundred feet of the water, affording a good sandy beach as white as snow, and made up of ground coral and the secretion of a seaweed. It is filled with crab holes—spirit crabs, so white that at first I could not distinguish them. When I laid down and kept perfectly quiet they came out by hundreds, and eyed me for a while, then began to move, climbing upon my legs; but the moment I stirred, they disappeared like magic.

The men pushed into the hot bush, I following, and finally found a clearing near some cactus. Here we pitched the tents while Chief cut a quantity of branches which he thrust into the ground, forming what he called a summer house, a *ramada*. By night we were in shipshape, the Bull Pup anchored offshore, and the dinghy hauled up on the beach. I doubt if I can get used to the birds. The moment we landed they rose in such numbers that I could hardly see through them, each screaming at the top of its voice, floating over us with a particularly graceful motion, with bill pointed downward. Many of them are terns, a few noddies, dark with white heads. The terns nest in the sand anywhere, while the noddies build a rude nest like that of a dove. Its egg is nearly white, while that of the tern is very speckled. There is no water on the island, but Bob, after taking his bearing, dug up a five-gallon keg from the sand where he had planted it some time before. We used that, and when we left filled it from our supply. Bob said he kept it there as one time he was caught offshore in a hurricane and blown on to East Key. He got ashore, but nearly perished for want of water before he was found. Ever since water has been kept here and all the men have the bearings. The eggs are so thick that it is impossible to walk in the bush without stepping on them; there must be tens of thousands. At night the birds settled down and the only sounds were the peculiar ringing of the water on the sand hard by and the boom and crash of the sea on the neighboring shore, a melody that soothed me to sleep on my bed of sweet-smelling bay-cedar boughs.

How long I slept I don't know, but I was awakened by Chief stumbling over the tin plates and his artistic swearing in Seminole. The men were trying to get off without disturbing me to turn a turtle for breakfast.

"Green turtle mighty nice," said Chief.

"Turtle balls a doggone sight better," put in John.

"Calipie for me," said Bob.

As for me, why, the turning of a turtle was what I came there for; so I shook the soldier crabs out of my clothes, and we filed out of the bush and headed for the beach. Chief led the way, and went directly down to the water's edge, where the ripple of the waves made music and sent millions of phosphorescent lights darting here and there, or stranded some large dazzling light on the beach. We walked along silently in single file, splashing our bare feet in the water, wading in the shallows for nearly half a mile, when suddenly Chief stopped, and I saw, leading up from the water over the gleaming sands, a double mark, as though someone had lain flat and with a swinging motion attempted to make a trail up the beach. We followed this up, and not ten feet from the jush came upon a big green turtle which must have weighed 150 or 200 pounds. She did not move or pay any attention to us, and was laying her eggs in a hole about two feet in depth, occasionally scraping in sand. We stood watching her, when suddenly she made a rush for the water, her flippers flying like windmills. Not being *en rapport* with such work, I got on the wrong side and had my eyes and mouth filled with sand, and fell upon the reptile's back, which would have carried me along easily; then Bob and Chief grasped her on the same side and lifted, and I gave her the congé, turning her over when she beat her breast with sturdy blows, as a gorilla is said to do when perceiving its prey or enemy. Bob quickly slit the flippers with his knife, making a small orifice with a piece of rope yarn tied the pairs so they could not move. A more helpless object than the turned turtle does not exist; its solid back, so good a protection from some enemies, here prevented it from turning.

Leaving our game, we returned to the water and took up our march again, just at the edge. The moon was half full, and light clouds were moving from the west arly clouding it—an ideal condition of things for turtleturning, as on a clear night a turtle can see a man two hundred yards off, so brilliant is the star and moonlight here. As a test, I found I could read the large print in paper

by the light of the moon; and one night I improvised a better light yet. I caught a large jelly-like creature called pyrosoma, a marvelous light-giver, and placing it in a tall jar, Bob stirred it with a twig while I held the book, and I may say that I have read by the light of a jellyfish, which reminds me that some years ago Dr. DuBoise sent me a photograph which he had taken by the light of one of the phosphorescent insects.

We had gone about an eighth of a mile when Chief, who was in the lead, stopped and lifted his hand for us to also stop. The peculiar musical trill or tinkling of the water as it gleamed about our feet, the distant cry of some far-away bird, the occasional crash of some great fish a long way off, were the only sounds. But peering over Chief's shoulder I made out an indistinct object standing in the phosphorescence, not one hundred feet away; then I heard a distinct hiss, like escaping steam. Not a move was made. That the turtle was suspicious and had stopped at the water's edge was evident, and it would turn and make off at the slightest alarm. So we stood and literally held our breath.

Suddenly I had an uncontrollable desire to sneeze. I smothered myself as best I could, but the quiet was disturbed, we saw the dim shape turning, and as one man rushed ahead. The animal had completely turned, and was in about a foot of water when I tripped over its broad back and fell sprawling upon it, the fore flippers striking the water like the flails of a windmill, while the men tried to seize them. In its struggles it moved ahead rapidly, and as the water deepened suddenly, I found myself drenched, and received several blows in the face, which threw me off. Chief now fell upon the turtle and grasped it at the back of the neck, and endeavored to lift it so that John and Bob could get hold of the flippers; but the big creature seemed twice as heavy as the other turtle, was indeed a loggerhead. Chief called to me to keep away from its head, as it would bite, so I slipped behind. At that instant the turtle made a vicious rush, and we all stepped into a deep place over our heads; the turtle diving took Chief under and disappeared, the latter coming up immediately and swimming back.

I had heard that turtles were stupid, but my observations do not carry this out, and I have watched them many a night. A green turtle when it came up to breathe, thirty feet offshore, first stopped and looked around. Seeing the coast clear, she swam in and grounded; then again looked around and came out of the water and listened. At least this is what I assumed was the mental process. I was lying not fifteen feet from her; she must have seen me; but doubtless thought I was a bunch of weed, for after apparently listening she moved up the beach, a hard and laborious process. She stopped about twenty feet above high-water mark, then moved along the brush ten feet or so, then in part of a circle, then facing the sea she began to scrape up the sand with her hind flippers. The operation of laying fifty eggs occupied about twenty minutes, and she was out of the water three-quarters of an hour. When she had finished, she moved around clumsily, and appeared to push the sand over the eggs, then wheeled about over the spot so that every trace of her presence was destroyed; then instead of going directly down from the nest she clambered along the sand for a distance of thirty or forty feet, and I went with her, but lower down, when she turned and made for the water quicker than I would have believed. Half way down she met me; I sprang upon her broad back, and she carried me to the water's edge with ease; there I let her go. I hunted up the eggs and had difficulty in finding them, though I had seen them laid. Turtle eggs are an acquired taste, and I am confident I shall never acquire it. The men ate them raw with relish.

Reached camp at 4:30, and having cut up the turtle and taken my first lesson in dissecting one, I brought home about ten pounds of meat as my share, and Bob began to cook calipic, Chief to make turtle balls—a sort of hash—and Long John prepared a steak. It was every man for himself, and I compromised on some of all. Our breakfast, considering that we were at the jumping-off place, one hundred and fifty miles from anywhere, was worth remembering. Friend grunts, taken alive from the well of the Bull Pup, roasted young crayfish, green turtle steak, green turtle balls, green turtle calipic, hoe cake, with plenty of "hoe" to it, coffee, "Long John's special" fried potatoes, snipe roasted over the coals.

Our camp was primitive. A tent for myself, bed of bay cedar boughs; the men preferred the ramada. We had rubber blankets, in case of rain, an old stove, or the top of one, dug up out of the sand where Bob had cached it some time in the past; so we had some of, if not all, the comforts of home. I was surprised at the knowledge the men had of the island. They knew where every cactus patch was. I discovered this when we were crossing it. I would enter what appeared to be a lead, and Bob would say, "This leads into a patch of cactus," and it did. I learned later that they knew it so well because they had dug about every foot of it over for Spanish booty that is supposed to have been buried here. On the east side a big galleon was wrecked some years ago when galleons sailed the Spanish main, and an old sea captain, whom I later met, found a thousand dollars on the beach; so once a year Bob retired to East Key, fortified himself, and dug.

At the first sign of sunrise, and it came up through vermillion skies, on a sea of glass, the birds began their cries, and discovering our presence it became a roar beyond belief in its intensity, and at times maddening. Yet it was possible to stop it for a second or two. Shouting at the top of my voice, every bird became silent, and with one accord the vast swarm swooped down several feet, then rose again to continue the babel of sounds. There was one revenge—their eggs were excellent, and we ate them in every style. They were also a ludicrous source of danger when walking through the bush with hundreds of terns struggling upward. Many dropped their eggs in midair, and Long John received one of these missiles fairly on the top of his head. The glittering generalities in which he indulged need not be recorded. Long John had a superior air, but it did him an injustice; he was just a plain man.

All communications for FOREST AND STREAM must be directed to Forest and Stream Pub. Co., New York, to receive attention. We have no other office.

New Hampshire Commissioners.

THE Fish and Game Commissioners have done some good work in New Hampshire during the past year, in enforcing the laws placed in their charge. The Concord Patriot published a complete list of the names and residences of the parties against whom the laws have been enforced; from which it appears that \$5,475 in fines have been collected; beside that Timothy Chauncey, of Albany, for killing a deer in the close season, was given six months in jail; Augustus and William L. Evans, of Stewartstown, illegal fishing, 60 days in jail; Philosse Auger, killing deer, six months in jail; Leslic Merrow, Conway, dogging deer, 60 days in jail.

The offenses for which fines were collected were, fishing in closed waters; killing fawn; dogs killing deer; killing deer in closed season; dog chasing deer, second offense; illegal fishing; killing raccoon in closed season; hunting deer in closed season; hunting deer without license; killing fawn without license; killing otter in closed season; hunting with a ferret; lobster car not marked; short lobsters; killing song birds; taking partridge out of the State; using gill net; catching short trout; chasing deer with a boat; selling trout; short bass; putting sawdust in waters; killing woodcock in closed season; snaring partridge; shipping partridge out of the State; short fish.

The above shows that the office of Fish and Game

JOSEPH W. COLLINS.
From a Photograph in 1893.

Commissioner is not a sinecure position by any manner of means. It requires pretty sharp eyes and vigilant attention to catch violators of the law whose scene of operations is largely in the woods, ponds and brooks over such an extended territory. Of course the commissioners are not responsible for the hedgehog business, which did not come under their supervision.

Three Pounds in Three Hours.

Editor Forest and Stream:

In your issue of December 10, Mr. Henry Stewart has an article entitled, "The Rainbow Trout," in which he says: "A 3-pounder hooked by me in one of the ponds from a boat, near dusk one evening, occupied all my attention for three hours, when he kindly leaped into the boat."

I have told a good many stories in your columns, and have had such kind treatment from the angling fraternity, as to make me hesitate to express any doubt of any fish story; but I cannot refrain from saying that it is difficult to believe that the stop-watch used in recording the time consumed by this remarkable fish was perfectly accurate.

I have caught many rainbow and black-spotted trout, some pretty nearly equalling the weight of Mr. Stewart's old and long-attached friend, and even in swift water have never known the largest of them able to make any resistance after ten minutes' play or so. I have taken *fontinalis* and grise of three pounds and considerably over very many times on light tackle and in the most favorable water for them, and while I used no method of timing the fight, I am convinced that the strongest and biggest of them all, in the swiftest water, was landed within twenty minutes at most, and probably less.

The *fontinalis* in the North Carolina mountains are decidedly less vigorous and strong, weight for weight, than those found in more northern waters, and trout taken in a pond ought to be landed considerably sooner than those of the same weight in running streams.

I hope that the remaining statements in Mr. Stewart's extended article are less likely to incur the reproach of inaccuracy than the one I have quoted.

A. ST. J. NEWBERRY.

CLEVELAND, O., Dec. 10.

Lake Champlain Fishing.

THE committee appointed by the Senate and Assembly at their last session to take up matters with a like committee from Vermont and the Parliaments of Ontario and Quebec, consisting of Senators S. G. Prime and T. H. Cullen, and Assemblymen Willis A. Reeve and H. W. Knapp, together with a representative of the Forest, Fish and Game Commission, who is to act with said committee, met at the office of the Forest, Fish and Game Commission on the 29th of November and organized by the election as chairman of Chief Game Protector J. W. Pond, who had been previously designated to represent the Forest, Fish and Game Commission. One of the main objects of this committee is to secure the repeal by the Parliament of Quebec of a law which now permits the wholesale netting of fish in that portion of Lake Champlain lying within the Dominion of Canada during the early part of the season when pike, pickerel and bass are on their spawning beds. The committee above referred to have been recently advised that resolutions had been offered in the Vermont Legislature with a view of appointing a committee and that the Legislature of Vermont are enacting measures in the interest of fish protection in Lake Champlain which pleases very much the entire population of this State where it borders Lake Champlain, and the numerous anglers and tourists who visit that beautiful summer resort from Albany and vicinity. The committee's work with the Province of Ontario will be confined to recommending legislation for uniform laws along the Niagara and St. Lawrence rivers, also Lake Ontario.

A Tarpon Fishers' Club.

MR. GEO. R. COLLINS, of Kansas City, Mo., who has fished for tarpon in Florida waters for the last ten years, wishes to get in correspondence with persons and associations interested in fishing and hunting, for the purpose of organizing a tarpon fishing club. His further idea is to build a club house on an island in Charlotte Harbor, and to build up a tarpon club that will equal the Tuna Club of California. Mr. Collins writes that he owns several available islands in this region, and that he will donate one to the proposed club.

The Kennel.

Death of Mr. R. H. Moore.

THE death of our esteemed old friend, Mr. R. H. Moore, the well-known artist in black and white, has removed a very prominent figure from the dog world. Mr. Moore, as a delineator of prize dogs in pen and ink, stood without a rival. Although not doggy himself, he had a remarkable grasp of the features of the classical canine, and whether it was an imposing St. Bernard, a bulldog, Chow Chow, or a diminutive toy, his pencil seemed to traverse the necessary lines as faithfully as if the artist had been a born specialist of each variety. There can be no doubt that Mr. Moore's sketches of up-to-date canine life have been one of the great factors in the education of the kennel public, and will be handed down to posterity as marking the position and progress of dog breeding during the latter half of the 19th and beginning of the 20th century.

Mr. Moore was specially retained to contribute to our contemporary, *The Stock-Keeper*, when it came to London now twenty years ago, and has been its faithful illustrator up to the time of his death. Indeed, so recently as a week ago he was busy drawing sketches for this paper, laying down his pencil never to take it up again.

A genial soul, who took life philosophically, and never made an enemy if he could help it, the late Mr. Moore was a gentleman who will be greatly missed, and whose position it will be difficult, if not impossible, to fill. His death took place on the 27th ult., as the result of bronchitis, at the age of about 60 years.—Our Dogs.

The Rescue.

Adown the lane on frenzied feet
Fled like a wind the maiden sweet;
A large dog followed on her trail
With open mouth and truncate tail.
Shriek after shriek the maiden gave;
And would no hero run to save?
Well, we should smile! For at her cry
The hero came in quick reply.
With resolution naught could clog
He fiercely whistled to the dog!
And at his master's note the chase
The dog forsook with perfect grace!

* * * * *
They married? Ah, ca va sans dire!
Elsewise 'twould be a case most queer.
But oftimes, when the lady sleeps,
The husband wakes and weeps and weeps,
And drones, as if he'd slipped a cog,
"Why did I interrupt the dog?"

—New Orleans Times-Democrat.

At Home with the Flamingos.

EVERY ornithologist, every lover of nature, and every lover of beauty, ought to read Mr. Frank Chapman's very remarkable article in the current *Century Magazine*.

Mr. Chapman is well known as an experienced naturalist, and one who has done much hard work. It is for that reason that he has attained his present eminence. What he did in the case of the flamingos was to discover, after years of inquiry, the breeding place of a great colony of birds, to visit that colony, to take up his quarters in a blind, at first at the border of the colony, and then literally in its center, where he observed the life habits of the birds and took twelve dozen photographs of them at the shortest possible range. Such work we fancy has never been done in the case of any other bird, and certainly not in the case of any large and rare wild bird. Mr. Chapman's article is most interesting; his pictures are admirable, and the *Century Company* has done its part in bringing them out in a series of beautifully colored plates. Author and publisher alike are to be congratulated on this extraordinary and interesting production.

YACHTING

Horsepower Rating.

BY A. E. POTTER.

THE recent adoption by the English Marine Motor Association of the rule that all horsepower rating shall be based on actual fuel consumption, marks a decidedly important step in the development of carburation and other important points in design, construction and operation of marine gasoline engines. One pint of gasoline consumed in one hour, constitutes one horsepower. This is their new rule.

The recent ruling of the American Power Boat Association that all engines should have a speedometer attached, was evidence of the unsatisfactory rule for horsepower rating employed here last summer.

The average American-built marine gasoline engine does not use gasoline as economically as it ought. This is well known throughout the trade. Some engines are designed to secure favorable ratings by means of different proportions and speeds, without reference to the amount of fuel used.

The great advantage of a consumption of fuel rating would lie in its relation to the perfection of carbureting apparatus. When we come to study the catalogues of various engines of both types, we find the consumption of fuel per horsepower is often entirely ignored, and in some cases grossly exaggerated. For instance, one manufacturer may claim that his engine will develop a certain horsepower at a consumption of less than one pint per hour. It may be true that their engines have been operated honestly at a certain speed within a limit of one pint, while at an increased or decreased speed the variation would be considerable either way. When I say honestly, I refer to a brake test conducted in a strictly practical and intelligent manner, the speed of the engine being known, not guessed at. A case in point: An engine is run at 650 r. p. m., and has a net pull on a 5 ft. brake beam of 18 lbs. The brake horsepower would figure 11.1384. In case the speed was estimated at 800—and it is a very hard matter for any one to estimate accurately at any such speed—the horsepower would figure 13.7088.

This same engine would probably not show the same fuel consumption per horsepower at different speeds, depending, among other things, on the amount of power absorbed by the engine and cooling water, increased or decreased volume of each charge in turn depending on the temperature of incoming gas, the frictional resistance at both inlet and exhaust, muffling, leaks in valves and past the rings, tension of valve springs, lift of valves, timing of opening and closing, perfection in carburation, regularity, speed, etc.

It will be an incentive to the modern student to carefully go over his work comparatively with that of other designers, proving his work and ideas in obtaining best results. It will weed out the dreamer, the bungler, the follower and crank, and give due credit to the man who can demonstrate his ability to furnish a superior article in the line of marine gasoline engines. Scientifically and practically, it ought to tend to perfect gas engine design and construction fully equal with that attained by the steam engine.

There is a class who continually harp that no improvements can be made in the four-cycle engine, that all theories have been carefully worked out and proven. It is my opinion, based upon a long study of the explosive engine, that the next few years will prove conclusively that absolute perfection in the explosive engine will probably never be reached.

With the increased consumption of gasoline from the use of the gas engine, its price must steadily advance. While at present we seem to care little for the expense of operation, in countries such as Australia, where the price is 75 cents, they "count the cost."

Queries on Marine Motors.

J. A. B., Southampton, Eng.—Have just received FOREST AND STREAM dated Nov. 12, and wish to avail myself of your inquiry department. What carbureting system is considered the most economical for two-stroke engines? My engine uses at least 50 per cent. more petrol than a neighbor's, both engines made by the same manufacturer and same dimensions. Is this not unusual?

Ans.—It is usually considered that float feed carburetors are more economical than vaporizing valves, but comparative economy tests will show great variation. Sufficient attention is not paid to fuel consumption. At five times the price, it would stand one in hand to watch out. 2. It is not unusual for two different makes of same sized two-stroke, or, as they are called, two-cycle engines to show marked difference in consumption; but for the same make to show such a vast difference would lead one to suppose that from defect in construction, variation in the location and size of ports, imperfect carburation, difference in amount of muffling, leaking, rings, etc., one engine was not doing so much work as the other, and the other was wasting fuel.

M. M. R., Baltimore, Md.—My engine is a double cylinder of 16 horsepower. When I start I close the auxiliary air valve and then gradually open it to perfect the mixture. If I open it a little too much the speed increases perceptibly for a few revolutions, and then the engine slows down, begins to "back fire" and stops. What is the cause, and how can I remedy it?

Ans.—Your engine does just the same as all engines using similar method of carburation. It goes to show that, in order to run without stopping, the mixture must be a little too rich in gasoline to make up for uneven proportions. If your forward cylinder ignites first, the after one usually gets the richer mixture. In some cases changing the exhaust cam and ignition so that the after cylinder ignites first will help matters. If

you will take notice you will find that the after cylinder is the one that misses explosions, rather than the forward, when mixture is bad.

A. B. S., Troy, N. Y.—I wish to paint my engine. Aluminum does not seem to look well when in contact with grease. What would you advise using?

Ans.—Clean the engine carefully with kerosene, then naphtha, and wipe dry, removing all bright parts, which can be polished with emery cloth and oil. With fine sandpaper smooth all rough parts, and give it a coat of good, ready-mixed gloss carriage paint. This will be found to last longer than enamel paint, and will stand heat and wet better.

B. B. J., Portland, Ore.—How much power ought it to take to drive a 24-inch, two-bladed propeller? My engine is a double-cylinder, 12 horsepower, and I think cylinders are 6½ in. diameter and stroke 5½ in. 2. The propeller that came with the engine, 24 in. diameter, drove the boat 6½ miles, with engine running 340. Next one, 22 in. diameter, at 318 r. p. m. showed speed of over 7 miles, while one I designed myself, 24 in. diameter, two-bladed, allowed the engine to run over 400 r. p. m. and the boat did not make 5½ miles. I am not going into the propeller wheel business, but would like your views on the results obtained.

Ans.—The diameter of a propeller wheel does not enter so much into power computation as pitch, amount of blade surface, speed, regularity of the blades, one to another, frictional resistance in the water and submergence. Providing your boat was not too heavy and of fairly easy lines, your engine ought to drive a 24 in. diameter wheel, 30 or 32 in. pitch, provided the blades were 8 to 10 in. wide, 350 r. p. m. at a wharf trial, provided the wheel could be kept submerged. We think, however, that probably your engine diameter is 5½ in. and stroke 6½ in., for it is not the usual custom among Americans to use a stroke shorter than the bore. Some modern English manufacturers have adopted the short stroke, one in particular making his cylinders 5 in. diameter, 3 in. stroke. 2. In a comparison of your three wheels, you should look to the engine speed as well as the speed of the boat. The 22 in. diameter wheel was better proportioned than either of the others, for it took less power to drive the boat 7 miles than to drive her 6½, or even 5½ miles at higher engine speed. If your engine did not have too much vibration at 400 r. p. m., a wheel of the same general design as the 22 in. diameter, but with 12½ to 15 per cent. less pitch, ought to give you even better than 7 miles per hour. It would seem that the two 24 in. wheels both had excessive pitch and too little blade surface. Pitch probably was irregular, and the blades not true with each other.

Ocean-Going Motor Boats.

MR. W. E. H. HUMPHRIES, a Cambridge science graduate who has devoted himself to the study of the use of high-power internal combustion engines for submarine vessels and is a practical motorist of wide experience, writing on motor boat building in the publication To-day, says that the folly of those makers who propose competing in the Atlantic motor boat race with 40 ft. boats furnished with 100 horsepower motors should be apparent when he states that they would require for the journey 15 tons of fuel, which would occupy more than the whole cubic space of the hull. Mr. Humphries fears that many of the competitors in the trans-Atlantic race will fall into the mistake of throwing any handy big engine into any convenient boat without regard to the question of design, proper engine bed, distribution of weight, etc. The motor boats which crossed the English Channel, "excellent as they were for their own particular purposes, were more or less freak boats," because in design they fell away from the lines normally maintained in marine practice. In yacht designing "the highest ambition of those who aim at speed is to exceed a speed in knots greater than the square root and a quarter of the vessel's length. The Atlantic liners cannot do it; motor boats and the torpedo boat destroyer can, but such speed is only attainable at enormous extravagance and by making the vessels mere receptacles of vibrating machinery and limiting their range."

Writing on this subject for the Pall Mall Gazette, he expresses the opinion that to cross the ocean in a manner to fulfill the published details a boat must be nearer 400 ft. than 40 ft. The conditions of the race are that the boats shall be able to travel at a speed of at least 15 knots, shall carry all their own fuel, lubricating oil, and spare parts, and shall start with at least six persons on board. This at once rules out of the contest all small racing craft, for, apart from questions of accommodation and seaworthiness, they could not carry the fuel to feed their engines. The normal consumption of a petrol engine may be regarded as one pint per horsepower per hour, which means that for every 100 horsepower of the engine there is consumed approximately 300 gallons per day. With a 15 knot boat the passage from Havre to New York might be expected to occupy from twelve to fifteen days. Hence for every 100 horsepower of the engine it will be necessary to carry 4,500 gallons of fuel, occupying approximately 723 cubic feet of space and weighing 15 tons, or more, if fuels heavier and less efficient than petrol be employed. To complete the absurdity, the Calais-Dover racer would require, to enable it to cross the Atlantic, a bulk of petrol of greater weight and greater displacement than the boat itself. Seemingly nothing smaller than a torpedo boat destroyer could attempt to fulfill the conditions laid down, and for a vessel of these dimensions an engine of 500 horsepower would not be excessive.

MARSHALL HALSTEAD, Consul.

BIRMINGHAM, Eng., Oct.

Design for an Open Launch.

WE are publishing this week, through the courtesy of Messrs. Small Bros., the designers, the complete plans of an open cruising launch. The boat was designed for Mr. H. W. Hornthal, of Norfolk, Va. As a comfortable, roomy boat for general day use, she has given the greatest satisfaction to her owner. She develops a speed of about 12 miles under favorable conditions.

The dimensions are as follows:

Length—	
On deck	31ft. 9in.
Greatest	34ft.
L.W.L.	32ft. 6in.
Overhang—	
Forward	9in.
Aft	9in.
Breadth—	
Extreme	7ft.
L.W.L.	6ft. 1in.
Draft—	
To rabbet	1ft. 8in.
Extreme	2ft. 4in.
Freeboard—	
Forward	3ft. 9in.
Least	2ft. 1in.
Aft	2ft. 4in.

The forward cockpit is 8 ft. long and the after cockpit is 9 ft. long. Between the two there is a deck space of 3 ft. 9 in., giving great transverse strength. Under this deck space the engine is placed well out of the way, yet can be easily reached.

The Société Nautique of Geneva.

BY JOHN F. REVILLIOD, VICE-PRESIDENT.

THE Société Nautique, of Geneva, Switzerland, was established in 1872. It is the only yacht club in that place, and since it was organized its growth has been steady. To-day it has many members and quite a number of native-built boats enrolled. The club has always been managed in the ablest and most conservative way by the various gentlemen who have held office from the time of Dr. Vincent, the first president.

Aside from the natural beauties of the Lake of Geneva, which are incomparable, the lake is of such a shape that a regatta may be witnessed from any point along the shore.

It has now 350 members, at the head of which every year a committee of eleven members is elected. The members of the committee for 1904 are: President, E. de Royer; Vice-Presidents, Felix Warner, John F. Revilliod; Secretaries, Philip Serex, Jean Mirabaud; Treasurers, Armand Martin, Henri Orange; Trustees, Eugene Corte, Charles Serex, Frederic Seylaz; Training Chief, Oscar Hunziker. The committee looks after the organization of the regattas of the year and fixes the dates thereof; it publishes a report of the regattas of the past year. It sometimes happens that members of the club go to the Mediterranean during the winter season and take part in the various regattas. The club has members that are exceedingly keen on yachting. M. Godinet, the naval engineer, is a member, and many of the boats sailing on the lake were built from his designs. He was of assistance in getting the new formula for measuring and classifying sailing yachts. The society has on one of the prettiest quays of the town of Geneva a club house, which is more comfortable than luxurious, and is built in the shape of a U; in the center part is a club room and reading room; and in the two wings the rowing boats are stowed away. A jetty on the north side enables the sailing boats and launches to be safely anchored.

A good many of our members live on the shores of the lake in charming country places, and on regatta days in the morning one can see the coast full of white dots—the sails of their boats being put in shape for the regatta. The race committee can almost tell beforehand how many boats will take part in the regatta of the afternoon.

In the Société Nautique of Geneva boats are divided into three sections—sailing, rowing, and motor launches. The sailing yachts are divided into eight classes: Fifth class for yachts over 5 tons; fourth class for yachts from 3 to 5 tons; third class for yachts from 2 to 3 tons; second class for yachts from 1 to 2 tons; first class for yacht up to 1 ton; one-design class, ¾ ton. Series A for small boats with 20 square meters of canvas; series B for small boats with 15 square meters of canvas, measured according to the following formula:

$$T = \left(\frac{L - \frac{P}{4}}{4} \right) \times P \times \sqrt{S}$$

180

L=Length.

P=Perimeter in meters.

S=Sail area in meters.

The sailing section came into existence in 1903. It was founded by several members owning sailing yacht and besides the general subscription to the society, they pay an annual fee of \$50, the whole amount of which is given in prizes. The members of this section have regattas of their own besides those of the society. There are about fourteen regattas during the season, and they are sailed on Sunday. The society gives generally a medal for three yachts racing together in one class, two medals for four, and three medals for seven yachts. Besides these medals the sailing section usually gives one or two prizes, either silver plate or something else.

The regattas take place on Sunday. The course is generally laid off in triangular shape; if the wind is strong enough the course is sailed twice over. There are some challenge cups, and the late Dr. W. Mareet gave

OPEN LAUNCH—LINES, SECTIONS, OUTBOARD AND INBOARD PROFILES AND ARRANGEMENT PLANS.
Designed by Small Bros. for H. W. Hornthal.

three big silver flower-stands as perpetual challenge cups for the big, medium, and small sailing yachts. The one-design boats race in one class.

Rowing Section.—At all times some rowing has been going on in the society, so those who like that sport have founded the rowing section. There are some good teams, who often won the national championship. One training chief and two commissaries manage this section.

Motor Launch Section.—There are about 20 motor launches besides the steam launches. The first motor launch regatta took place in 1901, but no classification was adopted but the number of horsepower and the length; the 4 horsepower boat had to race against the 6 horsepower craft, etc. This was not satisfactory, and a commission of several members tried to solve this difficult question. Now they have adopted the formula of the American Power Boat Association.

Boston Letter.

BOSTON, Dec. 11.—Whatever may be done by the clubs of Massachusetts Bay, in regard to accepting the proposed new rating rule, it is quite certain that there will be no new developments, so far as building is concerned, except in the classes that have already been formed here and raced, chiefly 22-footers, 18-footers and 15-footers. There may be more or less racing of handicap classes, which form of competition became somewhat popular among the older yachts last season, the allowances being arranged upon a percentage basis. In some cases the remedy of one-design classes has been applied where restrictions have been believed to have been weak; but it is not at all likely that one-design classes will ever become very popular in Massachusetts Bay.

The greatest development will be found in the 22ft. class, in which it is believed that there are as many as six boats already ordered, with more to follow. Messrs. Small Bros. have designed two of these boats, one being for Mr. H. H. White and the other for Mr. H. L. Bowden. Mr. H. H. White is also to have another 22-footer designed by Mr. E. A. Boardman, so that he will have two types from which to choose the faster boat for championship honors—that is, if both of the designs should be built to. Under the rules, only one boat can compete in the same class entered by one owner, and so Mr. White's search for championship honors may prove doubly expensive. Mr. B. B. Crowninshield will have one of his designs in the 22ft. class for the first time next season. Mr. Crowninshield will not state for whom he is designing the boat, but it is believed that she will be for Mr. W. H. Joyce, who owns the 22-footer Tayac. Mr. E. A. Boardman may have another boat in the 22ft. class. It is said that he has already designed the boat for a member of the Eastern Y. C., and that the order for building her has been given to the Lawleys, but Mr. Boardman denies any knowledge of such a craft. It is strange that in Massachusetts Bay, where there has been so much development in small classes, that those intending to build give orders to the designers to maintain the strictest secrecy. It does not avail much, as a rule, and is more likely than anything else to keep yachtsmen out of classes in which they would build if they had some idea of how many yachts were coming out and who the owners would be.

Mr. C. C. Hanley, who built Genesee, and who has turned out many champions in the Massachusetts Bay classes, is to try a hand in the 22ft. class. He is to design and build a keel boat for Mr. A. C. Jones. Mr. Hanley feels confident of being up with the leaders with this boat, and his record in the past in small boats would lead one to believe that he has considerable ground for this confidence. It was confidently expected that Mr. George Lee would be in the game with a new boat of Boardman design, but he has changed his mind and will race one of the older boats; and thereby hangs a tale. It seems that Mr. Lee, who is the owner of Peri II., has been watching Medric, owned by Mr. H. H. White during the past season and when, in an exchange of skippers in a scrub race at Provincetown Mr. Lee sailed Medric and beat Peri II., he became all the more impressed with her ability. So, instead of building a new boat, he purchased Medric from Mr. White, through Messrs Small Bros. Dr. Morton Prince, who has become an enthusiast in racing, has purchased Mr. Lee's Peri II. through Mr. E. A. Boardman. Dr. Prince has commissioned Mr. Boardman to make such alterations as will improve Peri II., and she will be raced constantly next season. It is thought that there will be other new 22-footers before the spring. It would not be surprising if Messrs. Burgess & Packard should get an order for one before very long. No new boat has been heard from yet for Mr. Summer H. Foster, the sponsor of the 22ft. class, but it is believed that he will be out with one when the season opens.

Messrs. Burgess & Packard have received an order for a racing 30-footer, but who the yacht is to be for has not been announced. They have also received the order for the new floating hospital ship for the city of Boston. They have orders for two 15-footers whose owners' names are withheld. They are at work on the lines of a 25ft. and a 23ft. launch.

Ten one-design 17-footers are being built at Lawley's, from designs of Mr. E. A. Boardman, for members of the Cohasset Y. C. It is understood that it was not the desire of the members to have the boats conform to the restrictions of the Massachusetts Eighteen-Foot Knockabout Association, although they could have done so easily enough, and in this resolve a compliment is paid indirectly to the Y. R. A. of Massachusetts, as well as to the Massachusetts Eighteen-Foot Knockabout Association. The reason is said to be because it was feared that if the boats conformed to the association restrictions, they would not stay at home, but would be out chasing the Y. R. A. of Massachusetts circuits. Mr. Boardman last week received an order for a Seawanahaka Cup challenger from a syndicate of Manchester Y. C. members headed by Mr. A. Henry Higginson. It has been stated that Mr. Boardman has received two orders for Seawanahaka boats, but this is really the first one. It is expected, however, that he will receive an order for a second boat. This designer has turned

out the lines for a fleet of one-design 14ft. sailing tenders, which will be raced at Manchester.

Col. W. R. Nelson, of Kansas City, Mo., who has been for some years a summer resident of Gloucester, has sold his cruising schooner Hoosier to Mr. Edgar Harding, of the Eastern Y. C. The Hoosier is a fine type of cruising yacht, 125ft. over all, 104ft. waterline, 25ft. 2in. beam and 12ft. 5in. draft. She was designed by Mr. Isaac Mills, and was built on the molds of the Burgess fishing schooner Fredonia by Mr. John Bishop, of Gloucester.

Mr. Alanson Bigelow, Jr., is to have a fast cruising gasoline launch from plans of Messrs. Swasey, Raymond & Page. She will be used by Mr. Bigelow as a ferry between Boston and Scituate. The new boat will be 65ft. over all, 60ft. waterline and 8ft. 8in. beam. She will have a 75 horsepower engine. Messrs. Swasey, Raymond & Page have orders for two 40ft. cruising launches; a 35ft. auxiliary yawl; a 36ft. auxiliary yawl; three 30ft. cabin launches, and one 30ft. speed launch.

At the annual meeting of the Beverly Y. C., held in the committee room, 322 Exchange building, Boston, on Friday, Dec. 9, the following officers were elected: Com., Lewis S. Dabney; Vice-Com., W. E. C. Eustis; Sec'y, F. A. Eustis; Treas., Lawrence Whitcomb; Meas., F. E. Cabot. Members of Council at Large—E. M. Farnsworth and N. H. Emmons. Regatta Committee—Howard Stockton, Charles Whittemore, F. E. Cabot, Chas. H. Taylor, Jr., Joshua Crane, Jr., R. W. Emmons 2d and F. A. Eustis. House Committee—Dr. E. S. Wood, W. E. C. Eustis, N. H. Emmons, Lawrence Whitcomb and Louis Bacon. Admission Committee—F. L. Dabney, F. A. Eustis, F. W. Sargent, John Parkinson, Jr., and David Rice. A committee, consisting of David Rice, J. L. Stackpole and R. W. Emmons 2d, was appointed to report to the club, as soon as possible, recommendations for revising the rules of the restricted classes of the club and also to recommend restrictions for a new 15ft. class. The reports of the secretary and the treasurer showed the club to be in good condition.

JOHN B. KILLEEN.

British Letter.

SOME few weeks ago there was considerable discussion in the yachting papers of this country upon the subject of yacht sailors and their racing money, and indirectly the subject of their wages was brought in. The contention of many owners was that the prize money which it is usual to allot to the crew of a winning yacht is out of all proportion to the value of the prize won, especially in view of the fact that the men are paid a very good weekly wage for their services, and are supplied with clothes and grub money when racing. There is no question but that the cost of yacht racing has increased enormously of late years, owing to the development of the modern type of vessel with her heavy lead keel and immense spars and sails. It is also equally beyond doubt that the value of the prizes offered has not increased, but rather diminished, so that a considerable amount of extra expense falls on the back of the owner. Add to this the fact that the life of racing yachts, however successful, rarely lasts more than two seasons, and that when done with as racers they are very difficult to dispose of; and it will be seen that the owner of a modern racing yacht is severely handicapped as compared with racing men of twenty years back, and it behooves them to do all they can in the way of proper economy.

It has been the custom for many years to give the crew one pound apiece for every first prize won; ten shillings for any other prize, and five shillings per man for each race when no prize is won. Some owners consider this excessive, and there can be little doubt that they are right. The mate gets a regular wage of thirty-two shillings a week—more in some cases—and the crew twenty-six shillings a man, besides which various sums from one shilling six pence to two shillings six pence a man are allowed for grub money on race days. For owners who pay their men so liberally as this and also provide them with clothes, shoes, caps, oilskins and sou'westers, to be saddled with prize money in the ratio quoted above, seems, to say the least of it, unjust.

A meeting of owners was held at the Royal Thames Y. C. on Nov. 1, to consider the question of prize money, and it was understood that an agreement was come to that prize money should bear a certain proportion to the value of the prizes won. What that proportion was to be was, however, not fixed, but was left for a future meeting to decide.

It is a healthy sign to see the matter taken up by a club, but it would be far more satisfactory to find the attention of the only body that is capable of dealing with such a subject directed to it. That body is, of course, the Yacht Racing Association, but it is to be feared that it will not make any move in the matter, seeing that it will do nothing to improve its rating rule or to bring in tables of scantlings to insure yachts being solidly and substantially built. The Y. R. A. is invariably afraid to make a move in times of stress, and we have in consequence the unpleasant spectacle of the ruling body in yachting matters, refusing to take up anything in the way of reform. Nobody wishes to give the professional yachtsman less than his due; but it is quite certain that the majority of owners cannot afford to pay them more than they deserve, and when it is considered how these same men make a living during the winter months—some in fishing smacks, some in coasters and nearly all working hard during the cold, bitter months when the sea is a very different place to what it is in the sunny summer months—it is felt that a reasonable reduction and rearrangement of prize money will be no injustice to them. The Y. R. A. ought certainly to take the matter up and settle it at once, so that the next season may be begun with a clear understanding between owners and crew.

Following on the news that we are to have a Herreshoff 52-footer in competition with our boats next season, comes the equally welcome intelligence that Mr. W. P. Burton, one of our most ardent amateur helmsmen and keenest of yachtsmen, is going to replace his Fife boat Lucida with a 52-footer from the

board of the young Glasgow designer Mylne, a former pupil of the late Mr. G. L. Watson. Mylne is already represented in the class by Moyana, which was last year's crack and very little inferior to this year's champion Maymon. Mr. Burton had thoughts of getting a boat from Herreshoff, but in view of the fact that one has already been ordered by Mrs. Turner Farley, who will be a newcomer to the class, he thought it more in the interest of the sport if he went to a British designer. He has made a wise choice, for Mylne has had a most successful record for some years past, and at the present moment he leads the list of Clyde winners in no fewer than five classes out of eight. Moyana is a beautifully proportioned boat; but Mylne will have no difficulty in improving upon her, as she is only the second 52-footer he has designed, and Mr. Burton may be sure of having a very fast boat. The building of two new vessels for this class assures its success for another year.

E. H. KELLY.

"Forest and Stream" Designing Competition No. IV.

Sixty-foot Waterline Cruising Power Boat.

\$225 in Prizes.

THE three designing competitions previously given by FOREST AND STREAM have been for sailing yachts. In this competition, the fourth, we are to change our subject and give the power boat men an opportunity. The competition is open to amateurs and professionals, except that the designers who received prizes in any of the three previous contests may not compete in this one.

The following prizes will be given:

First prize, \$100.

Second prize, \$60.

Third prize, \$40.

Fourth prize, \$25, offered by Mr. Charles W. Lee for the best cabin arrangement.

Mr. Henry J. Gielow, N.A., has very kindly agreed to act as judge. In addition to making the awards, Mr. Gielow will criticise each of the designs submitted; and the criticisms will be published in these columns.

The designs will be for a cruising launch propelled by either gasoline or kerosene motors, conforming to the following conditions:

I. Not over 60ft. waterline.

II. Not over 4ft. draft.

III. A signalling mast only to be shown.

IV. Cabin houses, if used at all, to be kept as low and narrow as possible.

V. Construction to be of wood, and to be strong, simple, and inexpensive. The cost of the boat complete in every detail must not exceed \$9,000.

VI. The location of tanks and engine or engines to be carefully shown. Either single or twin-screws may be adopted. The power and type of the motor must be specified.

VII. The boat must have a fuel capacity sufficient to give a cruising radius of 700 miles at a rate of 8 miles an hour. The maximum speed shall not be more than 14 miles nor less than 10 miles. The estimated maximum speed must be specified.

VIII. All weights must be carefully figured, and the results of the calculations recorded. A thousand-word description of the boat and a skeleton specification must accompany each design.

The design must be modern in every particular, without containing any extreme or abnormal features. We wish to produce an able, safe, and comfortable cruising boat, one that will have ample accommodations, so that the owner and his wife and two guests, or three or four men, can live aboard, and one that can easily be managed at all times by two or three paid hands in addition to the steward. The draft is restricted to 4ft. in order that the boat may have access to nearly all harbors, canals and rivers North and South, and may thereby widely increase the cruising field. We have in mind a boat that can be used North in the summer and South in the winter, and a craft well able to withstand outside passage along the coast in all seasons of the year.

Special attention must be given to the cabin arrangement. The interiors should be original, but devoid of any impractical features. Arrangements should be made for a direct passage forward and aft without going on deck.

Drawings Required.

I. Sheer plan. Scale, 1/2in.=1ft.

II. Half breadth plan. Scale, 1/2in.=1ft.

III. Body plan. Scale, 1/2in.=1ft.

IV. Cabin plan and inboard profile and at least one cross-section. Scale, 1/2in.=1ft.

V. Outboard profile. Scale, 1/2in.=1ft.

The drawings should be carefully made and lettered; all drawings should be preferably on tracing cloth or white paper, in black ink. No colored inks or pigments should be used.

The drawings must bear a *nom de plume* only, and no indication must be given of the identity of the designer. In a sealed envelope, however, the designer must inclose his name and address, together with his *nom de plume*.

All designs must be received at the office of the Forest and Stream Publishing Company, 346 Broadway, New York, not later than February 3, 1905. All drawings will be returned. Return postage should accompany each.

The FOREST AND STREAM reserves the right to publish any or all the designs.

YACHTING NEWS NOTES.

For advertising relating to this department see pages ii and iii.

LAKE YACHTSMEN MEET AT DETROIT.—Many freshwater yachtsmen went to Detroit on December 3 to attend the meetings of the Interlake Yachting Association and the Yacht Racing Union of the Great Lakes, held at the Russell House. The Yacht Racing Union elected Mr. Thomas B. Pritchard, of Rochester, chairman, and Mr. J. D. Rutherford, of Toronto, secretary. The Y. R. U. does not at present recognize boats of less than 25ft. in length. It was moved that this length be reduced so that smaller boats might be recognized, but no action was taken. The Yacht Racing Union is a federation embracing the Lake Yacht Racing Association of Lake Ontario, the Interlake Yachting Association of lakes Huron and Erie, and the Lake Michigan Yachting Association.

The Interlake Yachting Association elected the following officers: Com., George H. Worthington, Cleveland; Vice-Com., Franklin H. Walker, Detroit; Rear-Com., John F. Craig, Toledo; Sec'y-Treas., Warren J. Brodie, Cleveland; Fleet Surgeon, Dr. J. P. McInnis, Toledo.

New rules were adopted by the Interlake Y. A. covering the 16ft., 18ft. and 20ft. classes. The new rules call for cabins on all boats except those of the 16ft. class.

ANOTHER 52-FOOTER ORDERED.—Only a fortnight has passed since we published the welcome news that Mrs. Turner Farley had ordered a 52ft. rater from Herreshoff for racing in British waters next season. Now comes the equally welcome intelligence that Mr. W. P. Burton, owner of Lucida, has commissioned Mylne to turn him out a new boat for the same class. Mr. Burton announced the fact at the dinner of the Orwell Corinthian Y. C. on November 19, when he stated that he, too, had been in correspondence with Herreshoff, but had made up his mind that it would be more in the interests of the class if he went to a British designer. We congratulate him on his choice. It is true that Mylne during his short career has only been responsible for two of the class—Forsa and Moyana—but the clever young designer has shown conspicuous ability in dealing with the Clyde 20-ton one-design class and the South Coast one-design class, and the Clyde carries on its bosom during the summer months a whole fleet of smaller boats of his creation which bring him into direct competition with Fife, of Fairlie, with results eminently satisfactory to the former pupil of the late Mr. G. L. Watson. Forsa was not quite a success, but Moyana, in spite of continuous bad luck, was the crack boat of last year, and is very little inferior to this year's champion, Maymon.

If Mylne's new boat should prove a great advance upon Moyana, Herreshoff will have a hard nut to crack, for Mr. Burton does not give much away in the handling of his vessels, and he is as keen a yachtsman as is to be found anywhere round the coast. The interest in the 52ft. class for 1905 may be said to be assured. What most people will be curious to know is how the American designer will tackle the English rating rule, and whether he will make any considerable departure from the form of body which has been adopted by our designers, with little modification, since the rule came into being in 1901.—London Field.

MOTOR BOAT RACES ON LAKE WORTH.—The Palm Beach Power Boat Association will give races for motor boats on Lake Worth. The races will take place on February 1-3, and there will be four events each day. Mr. Henry M. Flagler is president and Mr. Fred. Sterry is secretary and treasurer of the Palm Beach Power Boat Association.

TWO FISHING SCHOONERS IN OCEAN RACE.—The fishing schooners Independence II. and Ingomar left Gloucester, Mass., on November 29 and raced from that port to Bay of Islands, N. F. Ingomar won, reaching her destination on December 2, after the fast run of four days. The race was arranged between the captains of the two vessels, and the stake was a fur coat. Heavy N.W. winds were encountered, and the weather was decidedly sloppy. The nasty weather conditions did not prevent the captains from cracking on all sail, and as the two schooners kept well together until Cape Breton was reached, it may be imagined that the race was an exciting one.

TURBINE STEAM YACHT ALBION.—The triple-screw turbine-engined steam yacht Albion, launched on November 24, has been built for Sir George Newnes, Bart., M. P., by Messrs. Swan, Hunter & Wigham Richardson, at their Neptune Works, Newcastle-on-Tyne, from the designs of Sir William White, K.C.B. The steam turbines and main propelling machinery have been designed by Hon. Charles A. Parsons, C.B., and manufactured at the Turbinia Works, Wallsend-on-Tyne.

The principal dimensions of the Albion are: Length over all, 270ft.; breadth, 34ft.; moulded depth, 20ft.; tonnage (yacht measurement), about 1,260 tons.

A fundamental idea in the design is the adoption of moderate speed, and the utilization of the relatively large dimensions in the best possible accommodation. On the contract trial the maximum speed contemplated is 15 knots, and for this speed ample power has been provided. In the design of the turbines it has been laid down that there shall be unprecedented economy of coal at cruising speeds; which involves a new departure as compared with other turbine-propelled yachts.

Very large bunker capacity has been provided; sufficient, indeed, to enable the Albion to perform the longest ocean passages, and to undertake a voyage round the world if required. At present coal is to be used, but the bunkers have been built so as to be suitable for oil fuel, and the cylindrical boilers can be readily adapted for burning oil. The bunkers are so placed as to minimize the labor on coal trimming, while the consumption of fuel will simply lighten the draft of water, leaving the trim of the yacht and her stability practically unchanged.

There will be three masts, but only steadying sail, steam power alone being depended upon for propulsion. The three shafts and three propellers will give practical security against breakdown, and the reversing and maneuvering power is very large.

The provision for accommodation is exceptional in extent. The drawing and dining rooms, as well as the owner's apartments—including two sleeping cabins, a writing room, bath-room, etc.—are placed in a long deck-house and connected by a broad longitudinal corridor. All these rooms are of large size, with ample provision for light and air, while they are high above water. Above this deck-house is a promenade deck, extending about two-thirds the length of the yacht.

The fore end forms the principal navigating station, with chart houses and all necessary fittings, and an upper bridge is also fitted. A spacious smoking room is built on the promenade deck. Arrangements are made by which a portion of the upper deck, immediately before the drawing room, can be screened off by shutters extending down from the promenade deck to the bulwarks, and used as a supplementary lounge, or "sitting out" place. In the tropics this space would afford excellent sleeping quarters.

On the lower deck forward there are seven staterooms and three bath-rooms, with a central corridor 5ft. wide, at the after end of which a broad and easy staircase leads to the deck-house, sheltering the access from the upper deck. Besides the staterooms in this forward compartment, there are a large writing room and a separate ladies' sitting room; abaft the engine room there are five staterooms with bath-rooms for gentlemen, and one of these rooms is fitted for photographic work.

There are eight transverse water-tight bulkheads, and, in addition, there is a water-tight steel lower deck extending throughout the length, except in the region of the boiler room. The boiler room, engine room, and coal bunker each form a separate compartment.

Electric power is to be used for nearly all auxiliary purposes—steering, cable work, warping, boat-hoisting, ventilation, lighting and heating—a very powerful installation, with turbo-generators, has been provided. Among the special features of equipment may be mentioned a powerful oil motor launch 36ft. in length, a sailing boat of large size and arrangement for lifting and stowing a motor car.—The Yachtsman.

SMALL ONE-DESIGN CLASS FOR SEACLIFF Y. C.—Nine members of the Seaclyff Y. C. have ordered one-design boats which are being built at the Greenwich Yacht Yard, Greenwich, Conn. The boats are small craft of the type known as Larks.

CHANGES ON GERMAN EMPEROR'S SCHOONER METEOR.—For some time past Messrs. A. Cary Smith & Ferris have been corresponding with a representative of the German Emperor regarding changes on the schooner Meteor. It has been definitely decided what alterations will be made, and plans have been drawn by the designers which cover all the changes. More rake will be given the stern post, and changes will be made in her sections forward. Some twenty tons on inside weight will be removed, and the equivalent in lead will be placed on her keel. It is believed that these changes will make the boat faster and also reduce her rating so that less time will be given to competitors in the future.

"RECENT DESIGNS."—Messrs. Gardner & Cox have issued an interesting little brochure entitled "Recent Designs." The pamphlet is well illustrated by numerous photographs of this firm's many successful boats. The reading matter describes some of their recent productions. A copy may be had by writing to Messrs. Gardner & Cox.

THE HISTORY OF YACHTING, 1600 TO 1815.—Captain Arthur H. Clark's book, "The History of Yachting, 1600 to 1815," published under the direction of the New York Y. C., has been distributed to the subscribers. The work is a beautiful example of book-making, and it will be reviewed in these columns in an early issue.

Canoeing.

Officers of A. C. A., 1905.

Commodore—C. F. Wolters, 14 Main St., East Rochester, N. Y.
Secretary—H. M. Stewart, 85 Main St., East Rochester, N. Y.
Treasurer—F. G. Mather, 30 Elk St., Albany, N. Y.

ATLANTIC DIVISION.

Vice-Commodore—W. A. Furman, 846 Berkeley Ave., Trenton, N. J.
Rear-Commodore—F. C. Hoyt, 57 Broadway, New York.
Purser—C. W. Stark, 118 N. Montgomery St., Trenton, N. J.
Executive Committee—J. C. MacLister, U. G. I. Building, Philadelphia, Pa.; L. C. Kretzmer, L. C. Schupp Building, New York; E. M. Underhill, Box 262, Yonkers, N. Y.
Board of Governors—R. J. Wilkin, 26 Court St., Brooklyn, N. Y.
Racing Board—H. L. Quick, Yonkers, N. Y.

CENTRAL DIVISION.

Vice-Commodore—Lyman T. Coppins, 691 Main St., Buffalo, N. Y.
Rear-Commodore—Frank C. Denmler, 526 Smithfield St., Pittsburg.
Purser—J. C. Milson, 736 Mooney Brisbane Bldg., Buffalo, N. Y.
Executive Committee—F. G. Mather, 30 Elk St., Albany, N. Y.; H. W. Breitenstein, 511 Market St., Pittsburg, Pa.; Jesse J. Armstrong, Rome, N. Y.
Board of Governors—C. P. Forbush, Buffalo, N. Y.
Racing Board—Harry M. Stewart, 85 Main St., East Rochester, N. Y.

EASTERN DIVISION.

Vice-Commodore—D. S. Pratt, Jr., 178 Devonshire St., Boston, Mass.
Rear-Commodore—Wm. W. Crosby, 8 Court St., Woburn, Mass.
Purser—W. S. Stanwood, Wellesley, Mass.
Executive Committee—Wm. J. Ladd, 18 Glen Road, Winchester, Mass.; F. W. Notman, Box 2344, Boston, Mass.; O. C. Cunningham, care E. Teel & Co., Medford, Mass.; Edw. B. Stearns, Box 63, Manchester, N. H.
Racing Board—Paul Butler, U. S. Cartridge Co., Lowell, Mass.; H. D. Murphy, alternate.

NORTHERN DIVISION.

Vice-Commodore—Chas. W. McLean, 303 James St., Montreal, Can.
Rear-Commodore—J. W. Sparrow, Toronto, Canada.
Purser—J. V. Nutter, Montreal, Canada.
Executive Committee—C. E. Britton, Gananoque, Ont.; Harry Page, Toronto, Ont.
Board of Governors—J. N. MacKendrick, Galt, Ont.
Racing Board—E. J. Minett, Montreal, Canada.

WESTERN DIVISION.

Vice-Commodore—Burton D. Munhall, care of Brooks Household Art Co., Cleveland, Ohio.
Rear-Commodore—Charles J. Stedman, National Lafayette Bank, Cincinnati, Ohio.
Purser—George A. Hall, care of Bank of Commerce, Cleveland, O.
Executive Committee—Thomas P. Eckert, 31 West Court St., Cincinnati, O.; Dr. H. L. Frost, 10 Howard St., Cleveland, O.
Board of Governors—Henry C. Morse, Peoria, Ill.

Rifle Range and Gallery.

Fixtures.

Jan. 16-20.—Pittsburg, Pa.—First annual tournament of the Iroquois Rifle Club.

New York City Schuetzen Corps.

It is a keen pleasure to note the large attendance at the gallery practice shoots of the above society. Over 75 per cent. of the members appear regularly at each shoot, always eager for the fray, always looking forward to the evening when they again meet, knowing well the good fellowship extended to all and for which this club is noted. Under the leadership of Capt. J. H. Hainhorst, and with such men as ex-Sheriff Wm. F. Grell, Capt. J. G. Tholke and others taking an active interest in the contest, it is not to be wondered at when one exclaims at the large attendance. Popular leaders make popular clubs. Scores:

R. Gute 243, 243; G. Ludwig 237, 241; B. Zettler 235, 237; C. Meyer 239, 228; J. C. Bonn 237, 226; J. N. Herriman 232, 230; C. Schmitz 231, 226; O. Schwaneman 223, 233; J. Von Ronn 227, 228; G. Thomas 218, 235; F. Facompre 226, 227; D. Peper 224, 229; Capt. J. H. Hainhorst 221, 232; H. B. Michaelson 224, 215; G. W. Offerman 221, 228; J. H. Meyer 229, 220; H. Haase 230, 219; J. Facklamm 224, 224; H. Beckman 223, 224; H. Lohden 214, 231; N. C. L. Beverstein 219, 225; H. Nordbruch 223, 220; C. Sievers 231, 211; H. Offerman 220, 220; W. Dahl 221, 218; A. D. Beckman 223, 214; C. J. Brinkama 220, 217; H. Kroeger 219, 217; J. Willenbrock 221, 214; A. W. Lemcke 221, 213; H. Gobber 221, 213; J. G. Voss 220, 213; Dr. C. Grosch 217, 215; C. Mann 223, 208; G. H. Wehrenberg 217, 213; H. D. Meyer 205, 225; H. Hesse 216, 212; J. Jantzen 217, 218; H. Martens 225, 200; M. J. Then 215, 210; A. Evers 210, 214; H. Quaal 209, 214; H. C. Hainhorst 218, 204; R. Ohms 210, 211; C. Roffman 208, 213; ex-Capt. J. G. Tholke 213, 207; L. C. Hagenah 210, 208; J. Paradies 213, 205; J. Bradley 207, 207; G. H. Fixen 205, 207; H. Kahrs 189, 222; H. Decker 207, 201; J. C. Brinckman 195, 212; A. Giebelhaus 198, 210; Von Der Leith 216, 186; M. V. Dwingels 186, 215; C. Konig 206, 195; W. F. Grell 187, 213; Aug. Beckmann 198, 202; W. Ulrich 188, 210; H. Koster 211, 187; W. J. Behrens 216, 179; N. W. Haaren 211, 183; H. Hoenisch 194, 200; L. N. Goldstein 188, 200; F. Lamkna 191, 193; W. Schaefer 191, 190; A. Lederhaus 197, 184; H. Leopold 181, 198; A. Sibbers 202, 177; J. F. R. Ernest 193, 172; F. Schulz 185, 174; B. Kumm 166, 169; G. Bohlken 142, 189; F. Gobber 169, 144.

Bullseye target: G. Ludwig 25½ degrees, F. Gobber 46½, H. Kahrs 47½, J. H. Meyer 49, N. C. L. Beverstein 53, A. J. F. Sibbers 58, W. J. Behrens 60, A. W. Lemcke 90½, H. Quaal 93, J. G. Tholke 93, A. Beckman 93½, J. Facklamm 94, R. Gute 94½, C. J. Brinkama 97, C. Mann 99.

New York Independent Corps.

The following scores were recorded at headquarters, 159 West Twenty-third street, Thursday evening, Dec. 8. Capt. Gus Zimmerman led the race for high scores with a total of 490 out of a possible 500 for his 20 shots. Scores: Gus Zimmerman 244, 246; Lambert Schmidt 244, 244; A. Begerow 236, 243; F. Liegibel 237, 229; F. A. Young 236, 235; Geo. Zimmerman 236, 231; H. Koch 233, 232; J. Billschier 225, 239; E. Kiefer 228, 230; B. Eusner 224, 232; J. Schmid 227, 229; J. Facklamm 223, 224; H. J. Behrens 226, 214; E. Gartner 217, 211; F. C. Halbe 187, 197.

Zettler Rifle Club.

SEVERAL high scores were recorded at the regular weekly practice shoot, held Dec. 6. L. C. Buss was again high man, with R. Gute and W. A. Tewes close seconds. Scores: Louis C. Buss 1229, W. A. Tewes 1223, R. Gute 1223, Owen Smith 1213, C. Zettler, Jr., 1209, H. C. Zettler 1201, A. Begerow 1198, C. G. Zettler 1196, L. Maurer 1187, T. H. Keller 1178, F. J. Herpers 1177, B. Zettler 1168, H. Fenwirth 1158, G. J. Bernius 1153.

Italian Rifle Club.

AN even dozen shooters faced the targets in the opening practice shoot of the above club, Dec. 5. Ten-shot scores follow on the 25-ring target, all shooting offhand, 75ft.: Selvaggi 241, Olbieri 234, Branchi 233, De Fellice 229, Cassetti 229, Muzzi 228, Ramondi 227, Minervini 226, Stoebili 219, Gaglione 212, Corbions 210, D'Angelo 206.

Ohio Rifle Notes.

Capt. O. O. Fisher, of Co. L., O. N. G., led the scores at target practice on the Sidney range, with 42 out of a possible 50.

An effort will be made by parties interested to secure the location of the proposed government rifle range for the militia at some point convenient for Co. M, of Greenville, and Co. 1, of Union City.

Rifle Notes.

A Philadelphia firm has secured the contract for the manufacture of the telescope sights to be mounted on the large guns on the new battleships now building for the U. S. Navy. We all know that the Government is rather tardy about accepting anything that is new, without an exhaustive trial, therefore, the letting of this contract is proof positive of the superiority of the telescopic sight.

Frank A. Foster, for many years connected with a firearms company, died recently at his home, Norwich, Conn., after a brief illness.

The following is taken from the Brooklyn Eagle: "Washington, Dec. 7.—Charles H. Laird, an expert rifle shot and winner of the international championship in 1879, is dead here as the result of a stroke of paralysis. He was born in Columbus, O., in 1847, and had been employed in the Post Office Department for twenty-five years. In 1879, he won the Wimbledon cup in New York, which gained him the title of international champion, and he was a member of the National Guard team of the District of Columbia, which won the \$5,000 Hilton trophy four consecutive years. He was one of the twelve men of the National Rifle Club which went to Dublin in 1880 to shoot against the Irish team, and won a cup, his score being thirteen consecutive bullseyes at 800yds. In the National Guard shoot at Bennings, D. C., in 1884, he scored fifteen consecutive bullseyes out of a possible fifteen, making a total score of 541 out of a possible 675 at 1000yds. He thrice won the Gittings diamond trophy, and had a large collection of other medals."

U.S. AMMUNITION

FOR

SERVICE OR SPORT.

UNITED STATES CARTRIDGE CO.

114-116 Market Street, San Francisco.

The Interstate Association's Annual Meeting.

The annual meeting of the stockholders of the Interstate Association was held at Oakland, N. J., on the morning of Dec. 8 last, but was adjourned later to the offices of the Laffin & Rand Powder Co., 99 Cedar street, New York, where the meeting was again called to order at 1:50 P. M., with President Irby Bennett in the chair. Every company that is a stockholder in the Association was represented at the meeting, among those present being Mr. Irby Bennett, of the Winchester Repeating Arms Co.; Mr. Thomas Hunter, of the Hunter Arms Co.; Mr. J. Howard Marlin, of the Marlin Fire Arms Co.; Mr. A. C. Barrell, of the Union Metallic Cartridge Co.; Mr. T. H. Keller, of the Peters Cartridge Co.; Mr. Paul North, of the Chamberlin Cartridge & Target Co.; Messrs. Louis and W. F. Parker, of Parker Bros.; Mr. Charles Tatham, of Tatham & Bros.; Mr. J. T. Skelly, of the E. I. duPont Company, and Mr. A. W. Higgins, of the Laffin & Rand Powder Co. The Hoyt Metal Co., the American E. C. & Schultze Gunpowder Co., Ltd., the Hazard Powder Co., and the Remington Arms Co. were all represented by proxy. Mr. B. Waters of FOREST AND STREAM; Mr. Will K. Park, of Sporting Life; Mr. W. R. Hobart, of the American Field, and Mr. M. Herrington, of Shooting and Fishing; honorary members of the Association, were also present, as was Mr. Elmer E. Shaner, secretary-manager of the Association.

The minutes of the special meeting, held Jan. 2, were read and approved.

After the general routine business, the report of Mr. A. W. Higgins, treasurer, was presented for the year ending this date. The report showed that the Association was in good financial standing, there being a substantial credit to the account of the Association. Upon motion, the report was received, approved and filed, and a vote of thanks tendered the treasurer.

The report of the secretary-manager was then read by Mr. Shaner, the report being subjoined:

PITTSBURG, Pa., Dec. 3, 1904.

To the President, Officers and Members of the Interstate Assn.

Gentlemen: In submitting my twelfth annual report of transactions of the Secretary-Manager's office, I might condense the work, like Cæsar, by saying that as usual we came, saw and conquered, were it not that the public interest in the one sport that shows no signs of ever growing stale, is unflagging, and demands at least a cursory review, as in its third lustrum since my connection it continues to absorb interest, growing by what it feeds upon, and I must again repeat that the season was unquestionably the most successful in its history—more contestants participating, more targets being trapped, and more money divided in purses than during any previous year.

The records of this office show that the sport of trapshooting is yearly growing stronger, and it will continue to do so while the public appreciate the fact that our nation's safety rests in the ability to shoot. To a company of marksmen, President Roosevelt said: "You may put a uniform on a man and a rifle in his hand, and then drill him, but if you do not educate him how to shoot to hit, another man can come along with a club and put him out of business." And ex-Secretary of War Root says: "I know of nothing more important in the way of preparation for war than teaching the young men of the country to shoot straight." When to this we can add that it is almost the only competitive sport remaining unvitiated by dishonesty, we can plume ourselves without fear of invidious criticism. In scanning the interim between 1893 and 1904 we have seen how "tall oaks from little acorns grow," and how the Interstate Association has grown to be the parent organization of its kind until its branches overshadow all the land.

The wisdom of the decision to confine our work during the year to the South, Southwest, Middle West and Northwest has been abundantly justified, for by it trapshooting has received an impetus that is patent to all observers. Westward the star of empire still takes its way, as well as in Bishop Berkeley's time.

Tournaments.

The first tournament of the season was held in Bristol, Tenn., April 6 and 7, on the grounds of the Bristol Gun Club. Though it rained almost continuously during the first day, promising May flowers galore, the contestants were not much edified thereby. The shooting, however, was exceptionally good, twenty-six contestants making a slight fraction under 90 per cent. for the entire day. The second day's shooting maintained the credit of the first, and the best of humor prevailed, and a large attendance of ladies lent interest to the work.

The second tournament was held under the wing of the Americus Gun Club, of Americus, Ga., April 27 and 28. The only thing complained of was the high wind, which had to be endured, as Old Probabilities could not be called to account. Magnolia Dell, where the tournament was held, had charms sufficient to neutralize the discomfort caused by fractious Æolus. Everything in

the way of creative comfort was at elbow, and the shooting was superb, both by amateurs and manufacturers' agents.

The third tournament was held at Nashville, Tenn., May 4 and 5, under the auspices of the Cumberland Park Driving Club, and the attendance was larger than anticipated, all sections of the country being represented. The weather was ideal, and the mockingbirds sang in sympathy with the general feeling. The shooting was good, and there was sufficient enthusiasm left from the first day to last until the close of the second.

Of course the fifth annual Grand American Handicap target tournament, held at Indianapolis, Ind., June 21 to 24, was the event of the season. It was held on the grounds of the Indianapolis Gun Club, and its assistance to make the meet perfect, I wish to specially acknowledge. Aided by all that up-to-date science in this line could devise, the enormous number of 155,300 targets were trapped during the tournament. The plan previously outlined of dividing contestants into five sections proved all that had been claimed in its favor. It established perfect equity as to weather, lights, waits, time of day, etc. Much time was saved and all the traps kept at work from start to finish. All who had shot under the old system unanimously gave adhesion to the new. Though preparation kept the manager and his assistants at work most of the preceding night, the result justified the outlay of effort. The event was characterized by the chivalrous demeanor of contestants and spectators, many of the latter ladies, and all "went merry as a marriage bell." Owing to the sizes of the event, it was necessary to its successful handling that the rules should be rigidly enforced, and they were, contestants yielding cheerful accord. The plan was made to be enforced, and contestants were required to conform. On the whole, the result justified the pains necessary to organize successful management. No readjustment nor afterthoughts were necessary, and as one contestant expressed it, "The whole thing ran only a little less smoothly than the Solar system." To enlarge further on the Indianapolis success would be painting the lily. It points the way to a limitless series of triumphs.

From Tennessee to Minnesota is a far cry, but our regular meet at Winona, Minn., July 4, 5 and 6, showed that Old Sol's progress north had warmed the veins of the Minnesotans to culmination, and the affair was well sustained for two days. Though the third day's attendance fell off, the result was sufficient to show that interest was awakened in southern Minnesota, and considerable eclat was generated by the Winona team capturing the La Cross Chronicle cup. The affair was under the patronage of the Winona Sportsmen's Club, and it left nothing to be desired.

At Grand Forks, N. D., we found everything that sportsman's heart could desire, on July 27 and 28. The Grand Forks Gun Club did nothing by halves when it took a long lease on its grounds; it intends to be a permanency, and like all organizations in its section, knows no such word as "fail." The event was one that would have caused the Hudson Bay Company's ancient hardy navigators of the Red River of the North to unbutton their eyes, could they have contemplated the future. Some of the foremost trapshooters, amateur and professional, were present, and good scores were the rule.

The seventh tournament of the season was given at Hot Springs, S. D., Aug. 24 and 25, under the fostering care of the Hot Springs Gun Club, and it was a good one—one necessary to draw visitors' attention from the fascinations of the most wonderful of nature's works—in close proximity to the wind cave, and also to the mausoleums of the diplodocus and other wonderful animals of pre-Adamite time. Though the background is not favorable for high scores, creditable records were made. A high wind marred the first day's work to some extent, but the second day's weather was better, and interest was unflagging to the close.

Whether attributable to politics, petroleum or other cause, the tournament at Huntington, W. Va., Sept. 7 and 8, was a frost. The first day's scores were good enough, but the patronage was so inadequate that it was deemed advisable to declare the second day's events off, to the disgust of all lovers of the sport, and especially to the Huntington Gun Club.

The wind-up for the season was held at Concordia, Kans., Sept. 28 and 29, where everything was in concord, except the weather. The tournament was under the auspices of the Concordia Blue Ribbon Gun Club. Whether the name had significance or otherwise, certain it is that the first day's weather was "very moist." Though Juliet said there was nothing in a name, yet the term "Blue Ribbon" is generally suggestive of the cold water adherents. Scores made were as good as could be expected, if not better, and the weather of the second day was so fine as to cause forgetfulness of the first day's discomfort.

Looking Forward.

While to some it may appear supererogatory to say more than has been said eulogistic of trapshooting, a few suggestions may not be inopportune. On the field of action trickery is out of the question, and is little to be apprehended in general, as the quali-

ties necessary to make a good trapshooter also, generally speaking, make him an honest man and too self-respecting to descend to chicanery. But, notwithstanding, the ounce of prevention prescribed in our rule as to manufacturers' representatives was timely and tends to prevent friction, while the parties proscribed are generous enough to admit its justice. In this connection I cannot forbear to suggest that some similar discrimination against expert amateurs might be healthful, and I have no doubt that most of them are sufficiently broad-minded to admit of its justice. The continued success of our organization depends on fostering a love of the sport among those who have not attained, but are desirous of acquiring, proficiency as marksmen, and their ardor should not be dampened by pitting them on even terms against expert amateurs, who are frequently equally expert with the most noted manufacturers' representative. As in horse racing and other sports, incumbrances are imposed to equalize, so I respectfully suggest some remedy equivalent. I am sorry to say that there is a widespread suspicion in the minds of the trapshooting fraternity that some in the category mentioned procure concessions from the manufacturer, which give them an undeserved advantage over the rank and file. Such discrimination cannot fail to be deleterious to the interest of clean sport, and, if possible, should be provided against and such forced from under cover as far as possible. Though the Interstate Association's well-earned character defends it, yet, like Cæsar's wife, it should be above the suspicion that may harbor in some tender minds. I have done all in my power to mitigate the evil, and respectfully solicit any assistance that can be afforded.

I think it will be well to confine our work for 1905 to virtually the same territory as in 1904, and it might be judicious to extend our work even further west, as the Occident is very appreciative.

The Grand American Handicap at Targets for 1905.

We have applications from a number of cities, and the place selected for holding it in 1905 demands careful consideration. We should select the place that promises the greatest good for the greatest number. All will agree that the Grand American Handicap cannot continue to grow indefinitely. It must inevitably reach a limit. In fact, I question the advisability of allowing indefinite growth. It has already reached proportions that put it almost, if not quite, beyond the power of humans to handle it successfully and maintain a true equity. Only those in immediate contact with the situation appreciate the magnitude of the work in connection with the Grand American Handicap, the major part not being visible from the surface. The detail, which is immense in amount, and which must be mastered prior to the actual time for holding the tournament, makes the work of conducting it appear comparatively easy during its few days' continuance; but all who have taken active part in it, know that it is sufficiently nerve-racking to satisfy the most strenuous, compelling much consumption of midnight oil and headache.

Miscellaneous Mention.

The work of the Secretary-Manager's office has reached such proportion as to virtually absorb all my time. Correspondence during the year now closing has been larger than ever before, and its growth during years past has not been spasmodic, but regular, making night work obligatory much of the time during the tournament season.

The properties of the Association are stored in Pittsburg, and fully covered by insurance.

In Conclusion.

I wish to repeat my thanks to our members for continued earnest support and uniformly generous treatment, and in this connection, the sportsmen's journals for their undeviating support and catholic comprehension of the situation and its requirements. Very respectfully submitted,

ELMER E. SHANER, Sec'y-Mgr.

The secretary read an application for membership from the Lefever Arms Company, the same being passed upon favorably.

The secretary also read letters from the Hazard Powder Company and from the American E. C. & Schultze Gunpowder Co., Ltd., withdrawing their memberships from the Association, the resignations being accepted.

A list of applications for tournaments during 1905 was read and referred to the Tournament Committee, as were the six applications for the Grand American Handicap of 1905.

Before adjourning, the stockholders of the Association elected a board of five directors, who in turn elected the officers for 1905. The five directors were: Messrs. Bennett, Bruff, Higgins, duPont and Parker.

The following officers were then elected: President, Irby Bennett; Vice-President, W. J. Bruff; Treasurer, A. W. Higgins. Mr. Elmer E. Shaner was unanimously elected to fill the office of Secretary-Manager.

The following committees were then appointed:

FOREST AND STREAM.

A WEEKLY JOURNAL OF THE ROD AND GUN.

COPYRIGHT, 1904, BY FOREST AND STREAM PUBLISHING CO.

NEW YORK, SATURDAY, DECEMBER 24, 1904.

VOL. LXIII.—No. 26.
No. 847 BROADWAY, NEW YORK.

SIX MONTHS, \$2.

The FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. The editors invite communications on the subjects to which its pages are devoted. Anonymous communications will not be regarded. While it is intended to give wide latitude in discussion of current topics, the editors are not responsible for the views of correspondents.

Subscriptions may begin at any time. Terms: For single copies, \$4 per year, \$2 for six months. For club rates and full particulars respecting subscriptions, see prospectus on page iii.

BUFFALO RELICS.

THE note on buffalo wallows, printed in another column, brings up many memories of a feature of the old West that is fast disappearing. Much has been printed about the buffalo trail, the buffalo wallow, the buffalo chip, and the buffalo rubbing stone—all of them, except the last, rapidly passing out of memory, and never again to be studied. All that is known about such relics left by America's greatest modern mammal should be set down. How valuable would be any observations—if we had them—concerning the ways of certain creatures that used to be, but are no more! Suppose that a naturalist like Mr. Chapman had spent a few weeks in the home of the great auk, or the dodo or Steller's sea cow, studying the habits of either of these; how great would have been the value of his observations to science.

As suggested by our correspondent, some buffalo wallows remain which to the present day bear no vegetation in the center, while others contain a growth of grass and weeds much more luxuriant than that of the surrounding soil, presumably on account of the water caught and held in the wallows. We are disposed to attribute this difference to the amount of use that the wallow has had; one used infrequently, or for a comparatively few years, still retaining the seeds and soil needed to produce the grass and weeds common on the prairie. A wallow which had been used for many years, however, would eventually be without seeds for germinating. The rolling and rubbing of the great beasts would grind up and destroy a certain proportion of the seeds, while a far greater proportion, mixed up with the mud of the wallow, would be carried away on the backs and sides of the animals that used the wallow for a bath. The tramping through the concavity and the rolling and spinning about of the buffalos would gradually wear through the loam or soil lying on the top of the prairie, turning it into mud which would be so carried away, and the gravel or hardpan beneath would at length be reached.

In time the buffalo, using the wallow in wet weather or when it contained water, would have carried away not only the seeds which would produce the grass and weeds, but also the soil necessary for the germination of seeds. After the soil had been removed, the chance that grass would sprout and grow on the hardpan, gravel or rock at the bottom of the wallow would be very slight, for are we not told of seed falling upon a rock that "as soon as it was sprung up, it withered away because it lacked moisture?" These reasons seem to afford satisfactory explanation of the lack of vegetation in some of the old buffalo wallows.

In the old buffalo trails the situation is somewhat different. Here the soil, ground up by the passage of countless feet for many generations, was blown away in fine dust by the constant winds of the prairie, but only the lightest of it was carried away, and many of the seeds would remain, sinking down lower and lower as the trail was deepened.

Another set of conditions prevailed in the old paths which still form trenches close about the rubbing stones in the buffalo ranges of the north. These trenches now hold only gravel and large stones, for the soil and the seeds, triturated against the stones and the gravel by the hoofs of the animals which walked about the rubbing stone, have been blown away. Here again there remain neither seeds to germinate nor soil to support them if they did germinate.

In many portions of the West, especially on the more unsettled northern plains, within the former range of the buffalo, the old trails may still frequently be seen, leading over the hills in different directions down to watering or crossing places that the buffalo once used. These trails are usually greener than the surrounding prairie. In them there has been no lack of seeds to germinate. Not only

have they held the seeds of the past, but the seeds of recent times have blown into them and grown, and now, nourished by the richer soil of the trail, they show up brightly, green long after the remaining prairie has turned brown.

And the buffalo bird is still in the land! Not so noticeable as in old days, yet still frequently seen, perching calmly on the back of horses or cattle, or walking on the ground among their feet. There was a time—but it is many years ago—when a flock of buffalo birds accompanied each little bunch of buffalo—almost each lonely old bull that fed on the prairie. But his name has recently been so far forgotten that it is only in 1900 that a student of birds in a printed paper said of the buffalo bird that it would be interesting to know if it formerly associated with the buffalo!

This species has been seen with buffalo, cattle, horses, and elk, and may very well have accompanied other species of large game.

SOMETHING ABOUT FURS.

VERY few people, except those connected with the fur trade, or who have had their attention directed to it, have any notion of the enormous destruction of animal life which takes place each year among fur-bearing animals, or of the very extraordinary way in which the supply of these animals appears to keep up. Even individuals in the fur trade, unless their attention is especially called to it, have little information on this point, and for the outsider the only way to gain any comprehension of it is to study the catalogues of the great fur dealers of England and the Continent.

There are only a few species which seem to be verging toward extinction; such are the sea otter, the beaver, over large tracts of country, certain sorts of fur seals, and a West African monkey. Northern Asia and northern North America still produce vast quantities of fur, and will long continue to do so.

Perhaps the most valuable fur in the world is that of the sea otter, formerly abundant on the shores of the Pacific Ocean in northern Asia and North America, but now in great danger of extermination, unless it shall soon be efficiently protected. Between 1772 and 1774 about 10,000 skins of the sea otter were taken in the Aleutian Islands, and the fur was so eagerly sought after that at the end of the eighteenth century 120,000 skins were taken each year. The results of such destruction could not be doubtful. The number killed soon fell to 15,000 each year, and in 1867, when Alaska was sold to the United States, it was 700. In 1901 it was 406, while in 1903 Messrs. Lampson & Co., of London, sold 463 skins, but they had none in January, 1904, and none in October. It is not unusual for a sea otter skin to sell for \$500, while remarkably good skins may bring two, three, or five times that price.

The only skin which approaches the sea otter in value is that of the black or silver fox. It is said that good skins of the black fox have been sold in St. Petersburg at from \$1,500 to \$4,000. A pair of silver skins in London sold for \$2,400, while a single skin is said to have brought \$1,000.

The Arctic foxes, known as white fox and blue fox, are in great demand. In 1903 Lampson & Co. sold more than 20,000 white skins and nearly 3,700 blue ones. Both these skins seem to be increasing in value. It is not long ago since the price of white fox skins ranged from \$1 to \$4. They are now said to be worth from \$16 to \$25, while the price of the blue fox skins runs from \$50 to \$75.

Almost 50,000 wolverine skins were sold in London last year, at prices ranging from \$4 to \$8 for good skins. Of Russian sable, nearly 30,000 were sold, or three times as many as were sold in all London in 1891. These expensive furs run from \$2.50 to \$75 in price, but occasionally skins are found which bring from \$250 to \$350 each. The Siberian sable, which is much more abundant, more than 470,000 skins having been sold last year, is an inexpensive fur, worth only about 50 cents apiece.

Mink and marten are cheap furs, and bring low prices, but the best pine marten bring from \$7.50 to \$12.50.

Otter skins again are costly, as are beaver, the supply of which, as has been said, seems to be failing.

Passing over a multitude of smaller and less well-known skins, it is to be noted that in the March sale of 1903, no less than 403 musk-ox skins were sold, as against

practically none at previous sales. These are valuable for robes, but the surprising increase in the number leads one to imagine that there is great danger of the extermination of this ancient species.

The Alaska seal catch this year was small, only 13,000 skins, against 19,000 last year. The skins taken at the Commander Islands appear to have been lost by the foundering of the ship that was bringing them. There are a multitude of other pelts used for different purposes, but hardly known to most readers, of which we need not speak, further than to say that last year nearly 1,000,000 skunk skins were sold at prices ranging from 25 cents to \$1.75.

WHITE MOUNTAIN FOREST RESERVE.

LAST week Senator Burnham, of New Hampshire, presented to the Senate a favorable report of the Committee on Forest Reservations on a bill to establish a White Mountain Forest Reserve. The report presents strong reasons in support of the measure; for careful investigation shows that the attacks on the forests of New Hampshire are to-day more severe than in any other part of the country.

The bill provides for the appropriation of \$5,000,000, of which \$1,000,000 shall be made immediately available, for the purpose of establishing in the White Mountain region a forest reserve, not to exceed 1,000,000 acres. It is pointed out that New Hampshire cannot afford to do this by herself, nor should she be asked to when the question is largely one of regulation of streams, which is of importance to Massachusetts more than to New Hampshire. No less than five rivers passing through Massachusetts have their sources in the White Mountains.

It is well recognized that the growth of timber is slow, and that the reforestation of areas cut over is a matter of from 60 to 100 years in the case of many species of trees. It can hardly be expected that private owners will look ahead far enough to conserve their forests for so distant a crop, and the Government should step in. The White Mountains have been for many years a health and pleasure resort visited by many eastern people, and only through the preservation of the forests can this aspect of the section be preserved.

IN the County Court of Malone county, N. Y., the suit of William G. Rockefeller against Oliver Lamora for trespass has been decided in favor of the plaintiff, and Mr. Rockefeller has been awarded 18 cents damages. The suit was a test case to determine Mr. Rockefeller's right to exclude the public from his Adirondack property. It was contended on behalf of the defendant that certain trails through the Rockefeller lands having been used for more than twenty years were public ways from which the people could not be shut out; and that the waters had been stocked from the State hatcheries and were in consequence free to the public for fishing. Both of these contentions were overruled. This prolonged fight between the two opposing interests has aroused much feeling in the vicinity and through the Adirondacks, where the old residents are naturally jealous of their rights, real or fancied, and the newcomers are impatient of interference with their estate-forming schemes. Local sentiment is illustrated by the fact that while Lamora had no personal means to fight his legal battles, funds were promptly forthcoming by popular subscription. The result of the present contest will probably not change local feeling; the men who have fished all their lives in Adirondack waters will still consider that they should enjoy the privilege perpetually.

WE have read with regret and sympathy the report of the affliction of Dr. J. H. Long, who has been suddenly, and it is feared permanently, bereft of sight. The same feelings must be shared by everyone; we can conceive of no other sentiment being entertained, not even by the harshest critic of Dr. Long's animal stories. In the absence of any authorized information which would indicate that this author's misfortune has resulted from criticisms of his nature writings, it should not be assumed that the criticisms have had anything to do with it. Certainly such a charge as a correspondent makes to this effect in another column should be sustained by something more substantial than mere sympathetic surmise; and until enlightened to the contrary, we shall cherish a belief that it has no other basis.

For Christmas Reading.

The Old-Fashioned Skate.

THE skating this Christmastide is fine, and Joe and I have spent two hours on the pond in delightful exercise. It has been a good many years since I had a skate on my foot, yet, save getting used to these modern machines, I would not think it had been a year; for the cunning was still there, and Joe could hardly keep pace with me, though I am sixty-five years old. Ah, but we could skate in those old days, and we had skates! It seemed to-day as if I were hustling over the ice with nothing on my feet, so irresponsible are those things they now call skates. To be sure, there was a kind of dead weight clinging to the soles of my shoes, but nothing that reminded me of skates. But there was nothing on my foot to tie a skate to, for with the old skate has passed the old boot. You cannot skate in shoes. So, as Joe and I glided over the ice, old memories came thronging back thick and fast. I thought how I would like to try my old skates with their long, low irons turned up over the toes, brass thimbles on the ends, heel-strap, toe-strap, and strings run out of leather cut from last year's boot-leg.

"What do I mean by run? I might have known you would not understand that word. Well, to 'run' a string, you took the best part of your last year's boot-leg, cut it into a square, stuck a pegging awl through the center, pinning it to a piece of board; then you stuck your jack-knife into the board at the edge of the leather, where, by turning the leather once round, you made it circular—your knife must be sharp—then you started your string the right size, made a gauge of a bit of wood, put it against the edge of your knife holding the leather down and gauging the size of your string; then you pulled the awl out and, holding the gauge in the left hand, you pulled away on the string with your right until the old boot-leg was all string. Don't you remember how Dido cheated the Africans? She run that bull's hide into a string. Leather strings were better for skates because a bit elastic, not so unsympathetic and cold as the 'cod-line,' and your feet would get numb.

"Don't know how skates were tied on? Why, you run this string through holes in the toe-straps, across the toe of your boot, passed the ends inside the heel-strap—that was an endless strap passing through the wood of your skate and round the counter of your boot—then you crossed the strings over the instep, passed the ends under the strings on the side of your boot, brought them together and tied fast, and you knew there was something on your feet.

"Why don't I get my old skates out and use them?

"Ah, distance lends enchantment! Illusions are sweet! And when you run the risk of dispelling them, and, at best, gaining nothing instead, you would better let the past be past. Besides one cannot take 'gone bys' out of the old days in which they had their natural setting and not sacrifice their charm. No, my old skates are hanging just where I want them to hang, in the old shed loft, where they have hung and rusted, straps, strings and all, these forty-five years. I go and take them down whenever I visit the old home, which is seldom enough now, and sometimes, when no one is near, I put them on; but the straps and strings are brittle, and I like not to strain them. But, oh, what throngs of memories they bring back! The old brook where we boys learned to skate, the old river, the dear, old anxious mother, and the old romance of a boy's life.

"It was on the river we had our best times, for there the numbers were increased, and we met our fate in the dark eyes, sweet face, and long curls of a little girl a few years younger than ourself, and with whom, on frosty evenings, hand in hand, we glided up and down the river. But others met her, and skated with her also. It was a strife between three of us who should draw Jeanie on his sled, or help her to skate. Bashful boys, all of us, yet in our awkward way we managed to monopolize her."

"Which got her?"

"Wait and see.

"We all met her at about the same time, and all three instantly became slaves. She lived on the other side of the river, where, winsome and bonnie, she reigned the belle of the district, and it was a great triumph for us, coming from afar, to win her from her own school chums. But nothing was too much trouble for either of us, if only it won the smile of Jeanie. Then we each tried to get ahead of the other, but never with any degree of success. We could hoodwink John and Foss, and all the rest, but not one another.

"One clear Christmas evening, when the first twenty-one years had slipped away, I took my skates and hastened to the old trysting place on the river, and living nearest the skating place, reached the gravel head first, and was rewarded by the privilege to strap Jeanie's skates on for her—girl's skates were strapped on. I eagerly performed the task, and hurriedly, for there were other things I wanted to say, and the skaters were coming. So abruptly, almost desperately, I said:

"I'm twenty-one to-day, Jeanie, and I can earn two dollars a day in the shipyard, and I have a house lot now. Won't you be my wife? The others are coming—answer quick!"

"I'll tell you to-morrow."

"I'd got in ahead, but somehow Dan and Fred, each managed that same evening to get her ear for a similar message, and received a similar answer. Now the problem was to get in ahead to-morrow. We went home together, Dan and Fred, and I, and on the way arranged to hunt rabbits in the morning, appointing the old rye field as the meeting place. I thought I had them then sure, for while they were going to the old field I would slip across the river and get my answer. So, promptly at 9 o'clock, I was in front of her home, and just as promptly Dan and Fred, were there, too. It was the old result, obtained over and over again, each succeeded in deceiving himself, but neither could deceive the other.

"But Jeanie had promised me an answer to-day, and of

course she would give it, only I must find the opportunity, and find it first. That evening we were all on the river again prompt as the three wise men from the East, and following as patiently our star. She did not allow any one of us to be alone with her, and neither of us allowed her to be alone with the other. There was no moon, but the stars were bright, and, though not much in detail, one could see fairly well. Fred, seemed to have a good deal of trouble getting his skates to tie right, so Jeanie offered to assist him. He was willing to have her do it. When she had finished, Dan suggested that she tie his, and then, of course, she must tie mine. So she tied them all, and then, edging away without any apparent purpose until some ten yards in advance of us, she suddenly darted down stream, challenging us to follow. We followed. It was a race for more than life. We were about equally matched as skaters, and neither gaining any advantage, we simply flew over that ice, following only a dim outline of flowing dress, or now a clear view of a flying form, gaining steadily, but as one, and likely to capture her at the same time, when instantly Fred, who had shot ahead, went sprawling on the ice, and Dan, one foot skateless, followed suit, while I sped on and—caught her. No, I didn't; when my hand was sure of the prize I, too, saw a million stars flashing indescrutable rays about me, and suddenly sat down on the ice with only one skate on."

"How strange that one skate from each of your feet came off!"

"We thought so for a minute, as we tied on our skates, or tried to, but when we got home—and we went direct home from the mishap—it all stood out plain. In tightening our skates she had half cut the strings so that in any extra strain they were sure to break. She made sure of victory before she challenged us.

"I went home that night and hung up my skates in the old shed loft, and there they hang to-day.

"Why didn't I go the next day and ask her?

"Ah, that rasc was her answer to us all!"

JOSEPH WOODBURY STOUT.

The Recapture of Black Jack.

SOJOURNING for a season in the lowlands of Mississippi, I had been for days fishing in a bayou of Pearl River.

The sport was good and I had a fairly heavy string of fish, most of which had been taken early in the day, when a breeze was stirring, and the sun had not burned out enthusiasm.

By mid-afternoon the heat had driven me to shelter under the shade of overhanging cypress trees, where I lay in the boat for several hours enjoying the perfect quiet, and waiting until the air cooled sufficiently to make the walk home pleasant.

Finally getting under way while the sun was an hour or so above the horizon, I welcomed the sight of Uncle Eph's cool looking vine-covered cabin, to which I came shortly after leaving the shelter of the woods.

The old man and I had first met on the bank of the bayou where I had found him fishing on my first trip there, and the acquaintance had continued and extended to his wife, Mandy.

I now frequently stopped at their cabin for a rest or drink of water, and often carried away a bunch of sweet, old-fashioned flowers from their garden.

As I drew near the old man stepped out on to the little porch, where he stood rubbing his head with a red bandana.

"Howdy, suh!" he shouted, upon catching sight of me. "Been fishin' is you? Yas, suh, an' catchin' um, too. Dat is a right peart string of bre'ms you is got."

"Now, I know dat a gowd of cold watah ain' goin' miss de spot wid you, an' Mandy dis lit out foh de spring as I come in 'cause I been in de gyardin fi'tin' weeds evah since dinnah, an' I low you know hit none too cool settin' in de shade of a cypress tree to-day. Come in an' set down, suh, an' res' a little, an' de watah be yere in less'n no time."

A drink of fresh water was acceptable, and the comfortable chair offered a welcome rest from the hard boat seat; so dropping my fish into the cool depths of a vine, I mounted to the shady porch, thanking the old man for his proffered hospitality.

"Dat all right, suh," was his cordial response, "I is proud to see you. My wuk is done, an' it good to have sombody to talk wid."

His wife now appeared with a bucket of fresh water. "Howdy, suh; how is you? I thought I hear the old man talkin' wid sombody, but he do talk some time w'en dey ain' noboddy 'round 'tall, so I did'n know foh shuah if anybody was wid him or not."

"Des wait a minnit en I git you a glass to drink out of; dis ain' nothin' but a old gowd, an' it gittin' a little punky besides. It ain' fitten foh you to use."

Assuring her that I preferred the gourd to a glass, I persuaded her to allow me to use it, and greatly enjoyed the novelty and peculiar taste thereof. By some yet to be explained property in the gourd, when used as a drinking vessel, it has the power of making bad water fairly good, and good water better.

After the old man had twice emptied the gourd, which held something over a pint, he settled back against the post by which he sat on the steps, with a deep sigh of contentment.

"I tell you dey ain' nothin' so good as watah w'en you is needin' it—bring me my pipe an' tobacker, Mandy—an' I has seen de time w'en I would giv' all de watah millyuns, an' 'possums, an' taters dat wuz evah growed or ketched fo' dis one gowd full of watah."

"You git hongry an' dey is so much to eat dat you kin scattah yo' trouble by thinkin' of fus one and den de yudder thing, but if you is thusty it is des watah, watah, an' nuthin' else. Milk, liminade, an' even lickin' don' 'pear to make no 'pression on yo' min'; it des digs away all de time on cold watah, an' you will resk ennything to git it."

Here the old man paused to fill and light the pipe his

wife had brought him, and when it was going good he proceeded to relate an experience to illustrate the force of his observations on the moving power of a real thirst.

"When I was in de wah wid Marse Bicknell, we was of'en hongry, wet, an' ti'ed, but w'en we got in a dry country, an' could'n git watah w'en we want it to drink, den it 'pear'd like de real trouble had come. W'y, suh, a man will fight hardah, an' take moh resks fo' a drink of watah dat he is wantin' bad, den he will fo' all de money my old mewl kin tote."

"Dat time we lose Black Jack was on 'count of takin' chances fo' to git watah w'en we was mos' daid wid de thust, but I done tol' you 'bout dat befo', ain' I? I ain'?" he exclaimed in surprise, when I shook my head, "Well, I will right now wile we is restin' an' it gitten eobol 'nough foh you to walk home, if you like to heah 'bout it."

"I ain' des certain wheah we was at, whedder in Fur-ginny or No'th Ca'liny, but it was in a plum dry lan', an' de summer heat had dried de springs an' wheah de ericks an' branches had been dey wan nothin' but a 'casional mud hole."

"It suttinly was de wust of all de hawd times we had, caus' we was scoutin' an' lookin' to run on de Yankees any minnit, 'sides bein' hongry an' mos daid fo' watah."

"One mawnin' w'en we had'n had no brexfus, an' pow'ful little suppah de night befo', an' de sun was shinin' fit to blistah de skin on a nigga's heel, Marse Bicknell an' me had done gone on ahead of de yudder sojers, an' bimeby Marse Bicknell tu'n roun', an' des fahly spitten out de wuds, he say: 'Eph, put de bud to dat old mewl of you'n an' le's git 'long to some place wheah dey is shade an' watah. I is mos' daid fo' a drink'."

"Dat suit me esactly, but I ain' like de way Marse Bicknell talk 'bout my wah hoss, if hit was a mewl, an' I made my min' up to make his hoss jump w'en it come to de hurryin', 'cause I knew plum well my mewl could run. I ain' sayin' nothin' 'bout it, fo' he wan' de kin' of man you goin' talk back at much, even w'en well fed an' watahed."

"I see timbah ahead, suh, long down de road," I say, 'an' dey may be watah dah, too.' He 'low it may be so, an' we light out."

"Now, if I ain' tell you 'bout it befo', you don' know 'bout dat hoss of Marse Bicknell's w'at he rode endurin' of de wah, an' w'at he call Black Jack."

"Suh, dat was a hoss. I ain' nevah see annudder like him befo' or since. 'Bout sixteen han's high; nary a flaw on him; black as a crow wing, an' putty as a pictah was de way you would tell 'bout him, but it soun' col' talk w'en you think of de hoss as he was."

"An' go! Man, suh, he could out-run, an' out-jump any hoss in de reg'mint!"

"Marse Bicknell was fon' of me, an' he love his pa an' his ma, an' all his folks, but dat hoss, Black Jack, was w'at he love mo' den all de res' of us put togedda. He didn't nevah seem to real'y cah when he was hongry, or thusty, col' or ti'ed, des so his hoss was'n suffin' none; an' de hoss seem to know how de man love him, an' 'spond back, he did. Dey wan' nothin' dat Black Jack wouldn't do foh Marse Bicknell, dat a hoss could do, ceptin' one thing, an' dat was go clost to a beah. He was dat skeered of a beah look like he sho' die if he git clost to one, an' Marse Bicknell hatter quit ridin' him beah huntin' 'cause he 'fraid he break his neck gitten skeered an' jumpin' so. He fahly thow'd him befo' he done it though, an' he de only hoss dat evah thow'd Marse Bicknell, an' de only time he evah tried to do it."

"It hap'n dis way: We was huntin' in de canebrake, an' de dogs was clost on de beah an' me an' Marse Bicknell was ridin' hawd to git to a open place 'long 'head of dem, w'en de beah tu'n quick an' bus' out of de cane right 'long side of us, an' 'bout ten feet from Black Jack, an' you oughter see dat hoss! Ain' no wonder Marse Bicknell didn't stay on him. Ain' noboddy goin' stay on a hoss w'at doin' like he doin'. Look like he goin' git in a tree foh to git away from de beah, an' he ain' goin' clim' de tree, neider; des goin' jump up in it, an' way up high, too."

"It skeered me so, wid de beah, too, dat I did'n know des w'at happen, but w'en my hoss quit r'arin' an' de beah run off out er sight, Marse Bicknell was in de limbs of a live oak tree, his saddle was in de top of a saplin', an' his hoss plum gone out of sight an' yearin'. He ride my hoss home, an' he ain' nevah ride Black Jack beah huntin' no moah."

"W'en we 'gin to move right peart towa'ds de timbah wheah we was hopin' to fin' watah, dat mownin' w'at I was tellin' you 'bout, I see Marse Bicknell was lettin' his hoss go, an' so I grab off my hat an' go to fannin' my mewl wid it, an' de mewl sho' did 'spond. We kep' goin' little fastah, an' little fastah, 'til we was des a flyin', but de mewl was dah, too. Time or two I see Marse Bicknell lookin' 'roun' out de tail of his eye, an' fin'ly he tu'n roun' an' take a fah look, but he ain' say nothin'. I knowed it was makin' him mad to see a mewl keepin' so neah Black Jack, w'en he mos' doin' his bes'; but dat mewl could sho' run."

"We wan' long gitten to de trees, an' w'en we pull up 'long wheah dey was some fence lef', it do look like we was goin' to git watah, an' good, too. Down 'bout two hund'ed ya'ds in de woods was some big rocks, an' watah was suttinly runnin' out from somewas dah 'bout."

"Hit a spring," says Marse Bicknell. "You hol' my hoss," an' off he light, ovah de fence he jump, an' down th'ough de woods he run like he half wil'. I watch him go to wheah we 'low de spring is, an' wish I was wid him w'en he pitch down on his han's an' knees an' I see he drinkin'. He drink an' drink 'til I 'fraid he bus' hisself, an' den rais' up an' res' a minnit, an' went at it ag'in."

"He sho' goin' drink all de watah dey is, I think, wid me sittin' heah mos' daid; but 'bout dat time I heah sompin like sombody comin', an' lookin' roun' I see a sight w'at make me forgit dat I evah was thusty. Comin' long down de road, an' mos' to wheah I was settin' on my mewl, was 'bout a dozen Yankee sojers. Dey had been ridin' 'long on de grass side de road, so I ain' heah dem 'til dey got close up an' saw me lookin', an' now dey was comin' lickety-split."

"I was too skeered to move, but I sho' did holler. De fus yell I fetch snatch Marse Bicknell out dat watah like a snaik bit him. He stan' up to git a good look, an' den give his o'dahs:

"Git off dat mawl," he holler, 'git on my horse, jump de fence an' come yo' level bes,' den he lit out runnin' hisself.

"Did'n look to me like it was any time to be swoppin' hosses, if I goin' to git away f'om dem Yankees; but I mo' 'fraid of Marse Bicknell dan I was of dem, so I tu'n my mawl roun' right sudden an' grab at Black Jack's bridle, wheah I don' tied him to a bush so I be ready to go quick when my tu'n com' fo' de watah. I des grab de bridle an' giv' one juck, w'en bang! went a gun an' a bullet—look like it big as a watah bucket—wen' singin' by my head so clos' 'pear like I smell de powdah.

"Dat settle it; I des made up my min' I was wuth mo' den a hoss, an' slappin' wid my hat, poundin' wid my heels, an' hollen at my mawl loud as I kin, I put him at de fence hopin' he would jump it so I kin foller Marse Bicknell and git away.

"But co'se he wouldn't jump de fence—mawl nevah will jump w'en you want him to. He dis run 'gin de fence, bim! wid his fo' feet slidin' undah de bottom rail. He stop so sudden dat I keep goin' on, an' light 'bout twenty feet ovah in de woods on my haid. Any othah time I would a bin mos' killed, but des as I lit, look like all dem Yankees 'gin shootin' at me at once, an' de bullits fahly buzz 'roun' me lik' bees 'round a hon'y suckle, so I don' stop to fin' out I hu't, but scramble up an' light out down thru de woods aftah Marse Bicknell, ha'd as I kin run. Des long as I was in sight dem Yankees keep shootin' at me, an' I don' know why dey ain' kill me, less I run so fas' de bullits couldn' ketch up wid me. W'en I out of bref an' don' heah de Yankees no mo', I crawl unda a big log an' lay still lis'nin. Putty soon I heah Marse Bicknell call'n me, an' crope out an' go runnin' to wheah he is.

"He sho' cuss me scanlus w'en I tell him why I ain' min' him 'bout de hoss, an' say he been back to de road watchin' de Yankees, an' see dem take ouh hosses an' go wid um, an' how we got to git his hoss back som' way, caus' he don' 'low to leave Black Jack wid no Yankees, less dey got him, too. Den we wen' back up to de road, an' dey wan' noboddy in sight up ner down.

"Marse Bicknell show me w'ich way dey gone wid ouh hosses, an' he say he goin' sen' me aftah dem, soon as he study out de bes' plan, to see if de Yankee camp is anywheah clost by. Did'n 'pear to me lik' it de bes' way foh me to go foll'n dem shootin' Yankees, by myse'f, but he ain' ask my 'vice, an' I ain' sayin' nothin'. He stan' roun' studyin' a little w'ile, den he walk away right fas' up through de trees to wheah dey was a ol' stable, an' in a minit com' back wid somfin in his hat.

"Heah," he says, 'is som' aigs. Han'le dem kerful, 'cause I ain' know how long dey is been sit on. I took dem f'om a ol' hen w'at bin ovahlooked settin' in de lof. Git out'n yo' coat, an' put de aigs in yo' hat, den go down de road foh a mil' or two, an' see if you kin git any news of my hoss. 'Ten' like yo' wan' sell de aigs to any sojers you see in blue uniforms, an' if you see any of ouh men tell dem whah I is, an' w'at trouble we is in. Don't talk much if you fin's de Yankees, an' if you heah news of my hoss git back as quick as you kin, widout makin' dem 'spicious. I wait right heah foh you, in 'mongst de trees."

"I ain' honin' after dat walk, but I 'low I going' do my bes', 'caus' Marse Bicknell sho' suffer in his min' an' body if he los' dat hoss. Dey was a little rise in de road, 'bout half mile away, den a deep holler wheah it cross a dry crik bed, den it tu'n sha'p to de lef'. I got 'long all right 'til I come to de tu'n, an' ain' see noboddy, but des as I com' tippin' 'roun' de ben' a big Yankee, w'at was standin' 'hin' a tree wid a long gun on his sholdah, stepped out, an' p'intin' de gun straight at me, hollered: 'Halt! Who is you, an' wha' you goin' to?'

"If I had been 'spectin' him it would n' a skeered me so bad, but bein' so unexpected it sho' made me turn sick, an' I come nigh drappin' all de aigs right dah. I try my bes' to say w'at my name is, an' w'at I doin', but it seem like I can' think 'bout nothin' wid dat gun p'intin' at me, so I holler out, 'Stop p'intin' dat gun at me, Mistah, an' I tell you anything you wan' know."

"De man bus' out laffin, an' drap de muzzle of de gun so it p'int at de groun'. Den I sortah git my bref, an' say: 'My name Eph, an' I des com' ovah to see if I cain' sell you all som' aigs."

"'Wha' you live?' he say, right quick an' sho't.

"I tell him dat I live back off de big road 'bout a mile, an' w'ich I did down home in old Miss'ipi.

"He ask me how many aigs I got, an' is dey fresh; an' I tell him I got nine, an' dey boun' to be fresh, caus' de sojers com' roun' so frequent dat don' nothin' w'at kin be eat git a chanst to git old.

"He say how much do I want foh de aigs, an' den I hatter stop an' studdy a minit. I don' wanter sell de aigs to him, 'cause I had seen de camp on down de road, an' I had to have de aigs foh a 'scuse to go dah. 'You don' wan' buy no aigs duz you?' I say.

"'It 'pends on yo' price,' he say.

"'Aigs is mighty sca'ce an' high,' I says, an' dese is pow'ful nice. I reckon de is wuth 'bout a dollah an' six bits."

"'Dollar an' w'at?' he rip out. 'W'at you reckon I goin' do wid aigs w'at I pay dat much for? Dey ain' no good foh jewl'ry, an' ain' noboddy goin' eat um w'en dey cos' dat, erless dey stahvin'. W'at is bits, ennyhow?'

"Now w'at you think of dat? A grow'd up w'ite man an' didn't know w'at bits was! I didn't wan' to splain it to him, but he look like a man w'at would'n be ha'd to mak' mad, an' I ain' wan' stop foh no fuss, so I tell him bits is money. Two bits, a quatah; foah bits, a half dollah; an' six bits, seventy-five cents. An' he say: 'Oh, yas! Why ain' you call 'em shillin's if you mean shillin's?' An' I say, 'Ya-as, suh, like I ain' know des w'at he talkin' 'bout, an' I didn't needah, fo' I ain' nevah heah noboddy call money shillin's befo'."

"'You kin go on down to de camp, if you wanter,' he say den, 'an' I spect you kin git shet of dem aigs. Wouldn't hu't you none if you lef' one or two of dem heah wid me to pay me if I git put in gyard hous' foh lettin' you go down dah pestahin' de orsifers."

"I was so glad he goin' let me go dat I come nigh givin' him all de aigs, but des in time I 'membered w'at

a fool trick dat would be, leavin' me nothin' 't all to go to de camp wid, so I reach in de hat, an' right slow—like I hate pow'ful bad to do it—I pull out one aig an' han' it to him. He wait a minnit, an' look hawd at de hat, but w'en he see I ain' gitten out no moah, he say:

"'Go on, now, if you goin', but w'en you com' 'long back you bettah be redly to giv' me som' of dem bits you goin' git foh de res' dem aigs; caus' my gun mighty easy on trigga w'en I git mad, an' it always mak' me mad to see a nigger wid mo' money den I got."

"I try to look sca'd an' went steppin' light down de road towa'ds de camp, slippin' long 'mongst de trees on side of de road, an' w'en I peep back de man was laffin' like he bus' hisself at de way he skeer me.

"W'en I got clost to de camp, an' dey ain' see me yit, I stop behin' a big tree to see how many dey is, an' look roun' a little. I was hopin' dat dey was'n none of dem dah w'at had been shootin' at me, an' would know me ergin w'en dey see me. Didn't seem to be moh den 'bout twenty of um, an' dey was layin' 'roun' takin' it mighty easy, an' look like dey des done eatin'. De hosses was tied 'mong de trees little way beyon', an' I 'cluded to spy 'roun' des long as I kin, to see if I fin' Black Jack, an' w'en dey see me, go to sellin' aigs.

"Stoopin' low, an' 'casionaly gittin down an' crawlin', I wuk roun' to wheah I kin see de hosses, an' my mawl was de fus one I git my eyes on. 'Dat good,' I say to myself, 'I reckon I goin' see Marse Bicknell's hoss in a minnit,' an' w'en I go little furda, sho nuff, dah he was, wid ev'e'y'ing on des lik' w'en dey took him from we all little w'ile 'go; had'n so much as took de pistils out de holstahs, or Marse Bicknell's raincoat off de back of de saddle. W'en I see dat, an' de bridle des hooked ovah de eind of broken lim' of de tree, I say to myse'f dat if I kin make out to creep up clost' nuff to jump on Black Jack befo' dey kin shoot me, dat I des pintedly goin' out of de aig business, an' goin' tu'n race hoss ridah, like w'en I was a chap. Den I go to creepin' ergin, 'roun' to wheah de hosses is, but I ain' let go my aigs, 'caus' I didn't know but w'at I might need dem aigs any minnit.

"I sho' had good luck 'bout not gittin' seen, an' in a little bit was so clos' to Black Jack dat I lay my aigs down an' git ready to run foh him. Dey was'n no use to try to git plum to him, widout bein' seen, an' I made my min' up to try to git on de hoss, an' git stahted befo' dey could git to shootin', an' den git away so fas' dey couldn't hit me; but des as I rais' up to run to de hoss, heah come a man walkin' up to de tree wha' he tied, an' he reach up foh de bridle, like he goin' git on an' ride away, an' it sho' seem like I in a fix, caus' de road run right 'long wheah I at.

"Des as de man put his foot in de sturp to git on de hoss, annuder man holler at him an' ast him wheah he goin'. He say he goin' to headquatahs, an' p'int wid his han' out de road towa'ds wheah I was; an' de othah man say foh him to hol' on a minnit, an' com' up an' go to talkin' wid him, an' I sneak 'way des fas' as I kin 'til I git wheah dey was a ben' in de road, an' den I up an' run my level bes'. I ain' know w'at I goin' to do, but de fus' thing was to git away f'om de camp, an' long down de road, wheah de man comin' ridin' Black Jack, an' try to fin' som' 'scuse foh talkin' wid him, to fin' out wheah he goin' take de hoss. I run my bes' foh 'bout half mile, lis'nin' to see if I heah him comin'; but I ain' heah nothin'. I stop wheah de trees mighty thick, an' de ondah-bresh growed to de aidge of de road like a cane brak'. 'Dis look like old Mis'sippi country,' I say to myse'f, an' I got homesick in a minnit studyin' 'bout de old home an' de good times we all been havin' 'till de wah com'; but I drap dat mighty sudden w'en I 'membered dat a man was comin' 'long in a minnit wid a gun an' pistils, w'at I des hatter think up sompin to say to fo' he upan' shoot me.

"I had don' lef' my aigs an' hat, too, w'en I run, an' had'n nothin' to fight wid 'cept a old broken blade bahlow knife; an' all my close was a shut—old an' dutty—pants, mos' woh out, an' brogan shoes. I kep' studyin' an' lis'nin' fo' de soun' of de hoss, an' des as I think I heah him comin', I 'clude to mak' out like I a run'way nigger, tryin' to git tu de Yankees, an' ax de man to tell me wha' dey is at, an' dat way fin' out wheah he goin' wid Black Jack. Soon as I come to dat 'clusion, I scramble back in 'mong de thick bresh on de side of de road an' set down to pull off my shoes, 'cause run'way niggers didn' gene'ly hav' shoes on dey feet in wah times.

"'It look like beah country,' I say to myse'f, as I crawl undah de thick bushes, 'an' I wish it was, an' dat a 'ig beah would com' 'long an' 'skeer Black Jack so he th'ow dat Yankee off, like he done Marse Bicknell dat time, so I git him an' go; an' dis den it 'cur to me, why cain' I be de beah an' jump out an' skeer de hoss. I 'membah how I done skeer Marse Bicknell an' de little boys w'at com' to play wid him, many time by gitten in de bushes an' growlin' like a beah, an' I dis 'lowed I sho' try it, an' if it didn't wuk, I could run back in de woods, wheah de hoss couldn' foller me, if de man ain' shoot me. I reckon I'd chan'ce my min' 'bout doin' such a resky thing if I'd had mo' time to think 'bout it, but de plan was'n ha'dly made 'til long come de man settin' up straight, an' ridin' like he know he on de bes' hoss in de lan'. He was a big, good-lookin' man, an' had on a orsifer's nu-niform.

"I was peepin' out watchin' him, an' des as he got 'long mos' to wheah I was, I git down on my han's an' knees, tuck my haid down, an' com' bustin' out thru de bushes growlin' an' sno'tin', des as much like a beah as I kin, an' lit fahly undah wheah de hoss was going' step nex' time, but bless goodness, he don' gone!

"I sho' did fool him, an' sca'ded him putty nigh to deff, an' he do was foh a minnit den he don' de time I was tellin' you 'bout, w'en he th'owed Marse Bicknell. Yas, suh, it a fac'. I sca'ded him wus den de sho' 'nuff beah did.

"De fus jump did the business foh de Yankee orsifer, an' he lef' de hoss an' wen' sailin' thu de aih like a bu'd, an' com' down tu'nin' ovah an' ovah.

"I holler, 'Wo, Black Jack! Wo, suh!' an' he know me, an' stop in a minnit. He sho' had sense, dat hoss did.

"De man come down in de road an' lit on de back of his head, an' a good thing it was foh me, caus' it bus' him up so he was a little slow gittin' to his pistil, an' des as he re'ch it, I jump on him an' grab his th'out wid one han' an' de wris' of de han' w'at reachin' foh de pistil wid de otha, an' I sho' did twis' an' choke him.

"I ain' no beah,' I say to him, 'but I is a dange'ous man, an' I sho' will kill you if you holler or don' hol' still."

"He look at me wicked as a rattlesnake, but he hol'

still like I tell him to, an' he can' holler caus' I don' choke him mos' black in de face. I make him leggo de pistil an' tu'n ovah, an' I take his belt off, an' tie his han's behin' his back; den I drag him out de road an' take his hank-chuff an' tie it tight ovah his mouf so he can' holler ner call noboddy to he'p him. Den I run to Black Jack, who has 'gun to pick grass on de roadside like nothin' de mattah, an' in 'bout a minnit moah, we was slippin' long out in de woods by de camp, on de way back to Marse Bicknell.

"We sho' had good luck, an' didn't see noboddy nor nothin', an' got back in de big road pas' de feller w'at stop me fus, an' den we lit out.

"Marse Bicknell heah us comin' an' run out in de road, an' suh, he sho' was pleased. He pull me off de hoss an' fahly hug me, an' den he grab de hoss 'roun' de neck an' look like he sho' goin' squeeze his head plum off.

"I ain' mo' den tol' him how many Yankees dey was, an' wheah dey was at, w'en up de road com' ridin' de res' of de scoutin' pahty w'at we was wid. Dey was wil' when Marse Bicknell tol' de news, an' 'way dey all went to have a rippit wid de Yankess, Marse Bicknell tellin' me to stay dah till he come back.

"I 'low dey was goin' to be a scatterin' of Yankees, an' some might come 'long de road, so I wen' down to de spring an' sat down 'hin' a big tree. In a little whil' I heah dem at it, shootin' an' holl'in', an' sho' did wish I was 'long wid um to take cah of Marse Bicknell. I sit an' lis'en foh a whil', an' den I git so oneasy I cain set still, so I go up to de road to watch foh some signs of how de fight was goin'. Bimeby I see a hoss comin' f'om de direcshun of de fightin', an' he sho' was bu'nin' de win'. Man on him didn' have no hat, nur no gun, an' he was beatin' de hoss scan'lus wid a big stick, w'en if he had'n been skeered mos' to def, he could have seen de hoss doin' his level bes'. I drap down an watch him thru de fence till he git clost' 'nough to see plain, w'en, lan' of goodness, if it ain' my mawl he runnin' an' beaten dat way, an' I was plum mad in a minnit.

"He ain' got no gun, an' I ain' see no pistil on him, so I grab up a long stick an' jump ovah de fence, an' p'intin' it at him like a gun, I holler out loud as I kin, 'Halt!'

"De man look like he mos' sca'ded to def, w'en he see me, an' he des let go all holts an' fell off de mawl like I don' shot him sho' 'nuff. W'en he stop bouncin' an' rollin' he lay still, an' I lef' him w'ile I run ketch my mawl an' tie him to de fence. Den I wen' to see 'bout de man. He was layin' on his face, an' dey was blood on de back of his head, but he mo' skeered dan hu't, foh w'en I tu'n him ovah he soon come to, an' 'gin to beg me not to kill him, an' I say I won't if he behav' like I tell him. He say I kin take de foh dollahs he got in his pocket, 'sides his pistil, if I des spah his life, an' I sho' did hustle 'roun' aftah de pistil, foh I was needin' a weepin bad.

"I mounted gyard ovah my prisnah wid de pistil he gimme, an' in little whil' Marse Bicknell an' de yuthers com' ridin' 'long back.

"Dey had got close to de camp an' cha'ged in on de Yankees w'en dey wa'n spectin' it, killed some, run some 'way, an' took some prisnahs; 'sides some hosses an' lot of grub. 'Mongst de prisnahs was de orsifer w'at I took Black Jack from, an' w'en Marse Bicknell make me tell all about it, he say it so, an' he cuss me, an' laff at me bofe at de same time. W'en dey see I got my mawl back, too, an' heah how dat was dey all tell Marse Bicknell dat he got de smahtest nigger in de ahmy, an he say, 'Dat right, boys, an' de best one, too."

"Marse Bicknell bring me back a fine coat from de fight, all trimmed in brass buttons, an' gol' braid, but w'en I foun' out dey had let de man w'at owned it out thu a little roun' hole in de lef' side, I ain' like to weah it very much. But I sho' did feel fin' dressed up in his best pah of breeches w'at he giv' me w'en we got back to camp dat night.

"An' now you know sompin 'bout Black Jack; but dat ain't all, an' I hope you come by ag'in an' heah som' moah 'bout him, an' my young marster. We was togedda f'om de beginnin' to de eind of de wah, an' all com' home 'cept a ahm an' piece of one foot, w'at Marse Bicknell lef' at Get's'bu'g."

LEWIS HOPKINS.

David S. Libby.

Of fatalities resulting from the reckless use of firearms and shooting accidents during the past autumn, one of the saddest cases was that of David S. Libby, of Newport, Me., who was killed by a hunter who presumably mistook the man for a deer. Mr. Libby was camping with a son and grandson and others in a camp built by him about seven miles from Lincoln, a district in which he had hunted for many years. He left camp one morning to hunt, and did not return that night. The men in camp fired signal guns all night, and in the morning made a search for their missing companion. The lifeless body was found in some bushes just off from a woods road. A bullet hole through the breast showed that death must have been instantaneous. The story told by the snow showed that Mr. Libby had been about to step out into the road, and that two steps more would have taken him into plain view of the person who had fired the shot, and who at the time, as the snow also recorded, had stood not more than thirty feet away. After the firing the shooter had run to the spot where his victim had fallen, and then had taken flight. This heartless conduct aroused the greatest indignation, and it is said that while a conviction for shooting a human being by mistake for game has never yet been had in Maine, the public feeling in this case is so intense that it would go hard with the perpetrator of the deed could his identity be discovered.

Mr. Libby, who had reached the age of 76, was one of the most experienced and most skillful hunters in Maine; and one whose vast information in the field of woodcraft was most highly respected by all who were conversant with it. As a writer over the signature of Penobscot, he was for many years a valued contributor to the columns of this journal. There was perhaps in the entire State of Maine no one who in the wilderness was more cautious than he, more circumspect to avoid danger, or better fitted to take care of himself in any ordinary emergency. It is the mockery of fate that such a man should fall victim to that criminal heedlessness against which no experience, no provident forethought, nothing can avail to secure protection.

The Pot-Hunter,

Or the Strange Fate of Lonesome Sam.

BY FRANCIS MOONAN.

THE locust had ceased its drowsy sibilation in the trees, and the cricket had commenced its death song in the withered grass. Among the crisp leaves of the oak not a rustle was heard, nor yet a sigh among the tops of the pines. A belated bee droned monotonously about a bed of goldenrod, and its droning could be heard at the distance of a hundred yards. The occasional tapping of a woodpecker on the tree trunks in the forest sounded like the beating of a hammer. A light amber mist hung upon the mountains, and the lake was undisturbed by a ripple. All was peace—the peace of the beautiful Indian summer.

How often Lonesome Sam, the pot-hunter, had contemplated this scene with joy; not so much because it appealed to any æsthetic sense in him, as because it heralded the glorious season of hunting. But to-day as he sat on a ledge of rock over the lake, he contemplated it with a dull, lack-lustre eye.

Lonesome Sam, or, to give him his full name, Samuel Adams Gimble, was born of decent parents in the little village that nestled beneath the mountains at the further end of the lake. He was brought up in his father's trade, which was that of a carpenter and general handy man. From his earliest years he had, like most country boys, a taste for fishing and hunting, and as he grew older this taste developed into a positive passion. However, he continued to ply his trade as long as his father lived; but after the old man had passed away, Sam, by degrees, dropped the use of his tools and took to roaming the woods all day with his dog and gun.

Nobody in the village cared—nobody, at least, but one, and that was a bright-eyed young girl, Susan Hager, who was in love with Sam. She thought, and with reason, that the object of her affections was playing nine-pins with his chances in life; and, in fact, as she expressed it, was making a bee-line for the county jail. On the first favorable opportunity she imparted her thoughts to him, and Sam, being a few-worded, good-natured sort, listened to her in silence. Finally, as he made no reply, Susan put her apron to her eyes and began to cry. This was too much for Sam. His hang-dog air deserted him in a moment, and moving closer to Susan he threw his arm about her waist and cried:

"Don't little girl, don't!"

"You're breaking my heart," wailed Susan.

"I'll do anything you like," declared Sam, desperately, "if—if—"

"If what, Sam?" asked Susan, looking up through her tears, her lips parted in a pathetic smile.

"If you'll marry me," answered Sam, stoutly.

"Oh, Sam!"

So they were married, and Sam hung up the fiddle and the bow, and took down the shovel and the hoe, so to speak. But, alas! how often a reformation which begins with marriage is doomed to failure! Six months had hardly elapsed when Sam felt an uncontrollable desire to handle his gun one idle day while his wife was absent visiting her mother. So he sought it out in the lumber room, where it had been put away out of his sight. No sooner was the beloved weapon in his hands than his old passion awoke. He saw the vistas through the woods; heard the patter of feet or the whirr of wings; recalled passed moments of intoxicating excitement or triumph. His face flushed and his eyes shone. He raised the gun to his lips and kissed it. Then a thought of his wife and his solemn promise to her flashed across his mind, and he hung his head in shame. But he clung to the gun, and presently, having provided himself with some ammunition which had remained hidden in his trunk, he rushed from the house and was off to the woods.

When his wife came home and didn't find him, her feminine instinct told her that something was wrong. She went at once to the lumber room, and not seeing the gun, sank down on an old dusty settee and covered her face with her hands.

Sad is the lot of the reforming wife.

A year after this, Sam having served three months in the county jail, which experience only seemed to whet his appetite for pot-hunting, Mrs. Gimble abandoned her task in despair and went home to her mother.

The double disgrace of imprisonment and wife desertion which had befallen Sam turned all his neighbors against him, and he began to feel like a pariah in the village. He made a brief attempt to rehabilitate himself, but though possessed of plenty of physical courage, he lacked the moral almost completely. And as the drunkard hungers for his glass, so he hungered for his gun. The issue, therefore, was foregone, and we find Sam stealing away one night with his gun under his arm, a big bundle slung over his shoulder, and his dog Scout (a great half-breed hound) trotting at his heels.

Entering the woods he took an old unused Indian trail and traveling all night left the slumbering village far behind. At daybreak he found himself at the upper end of the lake. Here all was solitude. Selecting a little glade, Sam threw down his bundle and his gun, and there decided to pitch his tent. "I guess," he said, "I'll be quiet enough here. Leastways I'll be free from the gossips," he added, a little bitterly.

The season being summer, the ground was dry, so he lay down and had a good sleep. When he awoke he undid his bundle and had a meal of biscuit and cold pork. Then, without a moment's delay, he set to work to erect himself a dwelling, and being a carpenter by trade and provided with tools (for he had not left these behind), he made rapid progress. Within a week a very decent log cabin stood under the lee of the woods, about twenty yards back from the lake.

At first the cabin was furnished with a bed of balsam boughs merely, but as time went on a rude table and chair and several furs of wild animals were added. It will appear from this that Lonesome Sam (as he now began to be known) was not idle with his gun; but, in addition to providing for his own wants, he was able to send not a little game to the village, where he had, through an intermediary, opened communications in due course. The proceeds of the game kept him in ammunition and necessary domestic supplies.

Instead of growing tired of his mode of life, he only grew more infatuated with it. Sometimes, indeed, during

the long winter evenings he would experience a yearning for human companionship, but he never felt tempted to return to the village. No, not even on Susan's account. Yet he had not ceased to entertain a regard for her; but he felt that she was better off without him. "She'll get a divorce after a while," he used to tell himself, "and marry again."

But poor Susan didn't get a divorce—unless, indeed, that death can be considered one. She had secretly hoped that her desertion of Sam might cause him to look into himself and abandon his vagabond ways; but when she heard that he had left the village, the measure of her disappointment was full, and she pined away and died within a year. The news reached Sam through his intermediary with the game dealer, and made him feel very remorseful for a while. And being naturally of a superstitious nature, as nearly all moody, solitary men are, he rather apprehended bad luck in some shape or form.

However, the years passed and no especial bad luck befell him. He continued to dwell in his little cabin and hunt and fish with varying success. Game laws he set at defiance, and, singular to relate, he never fell into the hands of the law except that once in his callow days. His health was almost invariably good, and he felt perfectly satisfied and in a manner even happy. Certainly, as he realized, it did not seem as if Fate had any grudge against him.

But one evening he received a rude shock. Coming home at twilight, after a rather unlucky day, he found his cabin burned to the ground. He stood for a while in an attitude of extreme surprise; then walked up to the smoldering embers and surveyed them all round about. The weather was warm (it was the latter end of May), and he had left no fire burning when starting on his hunt; neither had there been a thunderstorm. Matches he never used (a flint and steel and touchwood were his means of making fire), and as it happened he had taken his last supply of ammunition in his pocket. Evidently the destruction had been malicious. But who had raised his hand against him thus? Whom had he offended? Certainly nobody since he left the village. Then he thought of his wife; but she had been dead five years, and if anyone connected with her had felt disposed to be revenged upon him he would not have waited so long. Nevertheless the idea clung to him that it was the part he had played toward poor Susan that brought this trouble upon him somehow. And a vague fear, springing from his innate superstition, took possession of him.

What to do he didn't know. At one moment he was for flying from the spot, and the next tears ran down his cheeks at the idea of severing his connection with all his beloved haunts. He was strangely moved and agitated. Night had fallen, and he finally resolved to wait until morning for direction as to his future course. So he lay down supperless near the ruins of his cabin. But not to sleep. Even if his thoughts or feelings had been of a nature to predispose him to it, the dismal whining of the dog Scout, kept up intermittently all night, would have made sleep impossible. It was in truth a lugubrious night for Lonesome Sam, and the sight of breaking day afforded him infinite relief.

One of the first things he heard was the drumming of a ruffed grouse in the woods. Seizing his gun, he made off in the direction of the sound, and returned in half an hour bearing the trophy of his skill. He lit a fire and cooked the bird, which he ate with the appetite of one who had not broken his fast for over twenty-four hours. The morning was fresh and beautiful, and what with this and his hearty meal he began to feel more serene and hopeful. What if, after all, the fire had been caused by some tramp who had wandered out of his way? He jumped at the idea, and it decided him not to move from his present location. He determined, however, that he should not be burned out a second time. Henceforth he would live in a cave, and this was ready at hand, or would be after not very much labor, beneath a ledge of rocks. He was for starting on the making of his new home at once, but recollected that he had an appointment with the game dealer's agent that very day to get ammunition and domestic supplies. This circumstance he deemed extremely fortunate, and it instilled fresh hope into him.

"Things ain't never so bad as they seem at first," he said, as he hurried off to keep his appointment.

He returned late in the afternoon well laden down and tired, so he postponed beginning his new operations until the morrow. All day his mind had been busy with the tramp idea. It was plausible, but not quite satisfactory, and the superstitious notions began again to flit, bat-like, in the recesses of his mind. However, he was decided to remain where he was at all hazards, and set to work at his cave the following morning. As we have intimated, the rocks overhung so that there was almost a natural cave, and it required only some hollowing out to make quite commodious quarters. Working steadily, therefore, Lonesome Sam was able to stand erect and measure his full length upon the ground before nightfall. But it was several days before he took formal possession of his new home, so to speak. Meanwhile he slept in the open, which was a thing that came very natural to him. His slumbers were greatly troubled with dreams, chiefly of times long gone by, and he often saw Susan's pale, anxious face watching him or gazing reproachfully at him. This, he thought, could only have one significance, and put him more and more out of conceit with the tramp explanation of the fire, and more and more upon brooding.

The summer waned slowly. He spent his days listlessly fishing in the lake or moping about the forest. Solitude had become such a habit with him that he never desired human companionship any more. Scout (now grown rather old, but still active) sufficed him for company. And it is to be noted that in these days of mental tribulation, he grew evidently fonder of the dog—used to caress and converse with him more. Indeed, it may be said that he was his only consolation.

It will be readily imagined, then, into what a state of mind he was thrown when he awoke one morning and found Scout missing. He (Lonesome Sam, that is) had slept in his cave, for the season was late September, and the nights had commenced to get chill. For nearly ten years he had been used to awake to receive Scout's caresses. When he didn't see him sitting expectantly by his pallet as usual, he received a shock, which presently turned into consternation after he had whistled and called in vain. He rushed from the cave and went scouring in this direc-

tion and that, whistling and calling like a man half distracted. But Scout appeared not. At length he threw himself flat upon the ground and gave way to his feelings in a fit of lamentation. Even if the dog had disappeared under ordinary circumstances, Lonesome Sam would have been deeply affected, but now to his grief was added an access of superstitious fear and panic. Recovering from his fit, he returned to his cave and sat there the whole afternoon, hoping, though faintly, that the dog might return. It was just barely possible that he had been lured off on some hunt during the night. Foxes, and occasionally a bear, were in the habit of prowling around, but though on these occasions Scout would give tongue, he had never, so far as Lonesome Sam knew, gone in pursuit, at least for any distance. Still, dogs, like men, do not always act in the same way, and are apt to be guided by circumstances.

However, the day passed, and the beloved friend and companion did not return. Lonesome Sam slept none that night, nor for two nights following. He went wandering around, even in the darkness, like a restless spirit. Sometimes he would put his fingers in his mouth and whistle and whistle, and then he would call Scout by name till he was hoarse. For all answer he heard the lonely sighing of the wind among the pines.

Naturally a lover of nature in his rude way, the sounds or voices of the forest were dear to him, but now they began to strike harsh and discordant on his ears. At the quavering of the owl at nightfall, he would shiver from head to foot. His whole environment, in fact, became terribly oppressive to him. Every depth or aisle of the forest, every thicket, seemed to hide some mysterious foe, and the very air seemed pregnant with impending doom. He longed to flee, and yet could not. He felt, as it were, in the clutch of an avenging fate.

The third night exhausted nature came to his aid and he slept. It was on the morning after this that we find him seated on a rock above the lake, lost in melancholy reveries. His appearance was sufficiently woeful. His tall frame was wasted away to mere skin and bone; his long hair and beard were matted and unkempt, and his brow was furrowed with premature old age. From his eyes looked out a spirit obsessed by years of solitude and now by phantom-like misfortune and superstitious dread. His clothes, for the most part, were skins of wild animals, kept in place with thongs instead of buttons. Evidently they were worn night and day. Altogether he presented a picture at once wild and pathetic in the extreme. He remained seated till well on in the afternoon, when he suddenly roused himself, clenched his hands, and broke into a bitter invective against his enemy or enemies. Then, swearing they should not down him, he picked up his gun and set off on one of his hunting trails.

But the revival of courage did not last long. Besides, he soon realized that without Scout his hunting would not amount to much. He raised nothing of more importance than a rabbit, which he missed. At length, staggering almost with weakness (for he had eaten practically nothing since the disappearance of Scout), he sat down on a sunny slope at the edge of the forest, and, reeling his head on his hand, soon fell asleep.

When he awoke it was late evening. The sun had set, and a dark bluish atmosphere enveloped the lake and mountains. Everything looked bleak and cold. The wind was rising, and withered leaves rustled about, while the big trees of the forest began to boom in that solemn, melancholy fashion of theirs. Alarmed by the approach of the storm, the bluejays and woodpeckers set up a wild distressful crying. These things impressed themselves upon the sensitive soul of the poor hermit hunter, dissipating whatever calming influence his sleep had had upon him. He yawned and stretched his arms wearily, then looked about him for his gun. But the gun was not there. With a lightning-like motion of the head he looked on the other side. Neither was what he looked for there. The gun had disappeared!

For a moment Lonesome Sam appeared as if petrified; then, clapping his hands to his head, while his eyes bulged from their sockets, he jumped to his feet, and with a cry of terror, fled into the forest.

A month later a tall, grave-looking individual was making his way through those gloomy wilds. Though he carried a rifle, it was evident from the way he kept his eyes about him—peering here and there and observing all the ground—that hunting was not his only object. Presently he came to a halt, let his rifle fall, and threw up his hands with an exclamation of pain. Before him, doubled up alongside of a fallen log, lay the body of Lonesome Sam. It was badly decomposed, and eaten in parts by birds and animals, and presented a piteous spectacle. For a while the finder stood gazing upon it with a mournful countenance and tear-dimmed eyes.

"Poor Sam!" he said at length. "I had not intended that it should end like this. I only thought to drive him from his wild, savage way of life."

He covered the body with leaves, took an observation, then walked sadly away. The following day he returned with two men and they buried decently all that remained of poor Lonesome Sam.

The Indian Shoulder-Basket.

From the Trappers' Guide.

ONE of the most satisfactory arrangements we have ever made for carrying luggage on the back is the Indian shoulder-basket. They are made nearly square, or about ten inches by twelve, at the bottom, and twelve or fourteen inches high. One side is flat, the others are rounded and drawn in toward the top, making the mouth of the basket only about half the size of the bottom. Over the mouth, and extending some distance down the sides, a cover of rubber or enamel-cloth should be fitted. On the flat side of the basket shoulder-straps are fastened, crossing each other in the form of an X. These straps should be made of two thicknesses of strong cotton cloth, sewed together and stuffed with cotton. The great advantages of this basket are, that it is light, easily managed, fits the back well, bringing the load just where it is wanted, does not get out of place, and does not heat the back like a close-fitting knapsack. Combined with the basket the trapper needs a small enamel-cloth haversack such as is worn by soldiers.

Trails of the Pathfinders.—XXIII.

The Rambler in North America.

IN the years 1832 and '33, Charles J. Latrobe, an Englishman, made extensive travels in the United States, of which he has left an account in two volumes entitled "The Rambler in North America." Latrobe was a natural traveler; observant, eager for information, appreciative of the beautiful, and sufficiently experienced to take the rough with the smooth with great good nature. He was also a thorough Englishman, critical of the people with whom he was brought in contact, inquisitive as a Yankee, yet quite unconscious of the curiosity which he himself possessed and constantly displayed, and entirely disposed to make fun of the Yankees for theirs.

He reached New York in the latter part of May, 1832, and is enthusiastic about the beauties of the bay of New York, which he describes in language that will seem curious to those who, in these days, have looked at the city from the water, and considered what is now termed New York's sky-line. He says: "You see a long line of level wharves and slips crowded by endless tiers of shipping, and tall brick warehouses peering over them; a few uninteresting church-spires rearing themselves from the central parts of the city, which rises so gradual from the water's edge, that, at a distance, it seems to be built on a dead flat. There is neither beauty nor sublimity in such an object. Then the adjacent shores of Long Island and New Jersey opposite, though well wooded, are not particularly bold; the small low islands scattered over the nearer portions of the bay, are far from being either well clothed, or dignified by handsome structures; the swelling back of Staten Island, is too distant to form a prominent object in the landscape; still, come from what quarter you may, you are struck with the air of beauty.

"Much is doubtless to be attributed to the extreme mellowness and transparency of the atmosphere, which gives color to every object on land or water. In this, the climate of New York is truly Italian. There is a freshness in the verdure that covers the sloping and gentle shores, a harmony in the outlines—and above all, there is a life in the aquatic scenery, which I never witnessed elsewhere in an equal degree. An air of gaiety and festal enjoyment which contrasts singularly with the unholiday appearance of men and things in the interior of the country, reigns on the waters of the bays and rivers, in the vicinity of the cities to a surprising degree."

Latrobe's reference to the Yankees has been mentioned; let us give his own words about them, the picture which he paints of the New Englander: "The manners and habits of this great eastern division of the American people are strikingly distinct from those of their fellow citizens to the southward. * * * They are speculative, at the same time that their caution, clearheadedness, and indomitable perseverance, generally insure success. In politics, their practical conduct is strikingly opposed to the theoretical vagaries of the south. They have often, and not without reason, been compared to the northern inhabitants of our own island: but, I think, the New Englanders have all the steadiness and prudence of the Scotch, with a yet greater degree of ingenuity. Like the Scotch, they foster education; like the Scotch, they are inclined to the more severe forms of religious discipline and worship; like the Scotch, they are fearfully long-winded; like them they are gadders abroad, loving to turn their faces southward and westward, pushing their fortunes wherever fortunes are to be pushed, and often in places and by shifts where no one ever dreamed that fortunes were to be gained. They may be found supplanting the less energetic possessor of land and property in every State of the Union. They have a finger upon the rim of every man's dish, and a toe at every man's heel. They are the peddlers and schoolmasters of the whole country; and, though careless of good living abroad, when at home and at ease, they are fond of 'creature comforts.'" From this description it may be seen that Latrobe was keen to see, and wielded a trenchant pen to describe the characteristics of our ancestors. Yet he does this universally with good nature, and one sees no phase of carping, spite or snappishness in all his volumes.

Continuing through New England, the author passed up into Concord, saw the great falls, and at Buffalo the little party, made up of the author, Washington Irving, and M. de Pourtales, was threatened with dispersal. Just as they were about to leave for Detroit—Mr. Irving having planned to leave them on the way to return to New York—word came to them that the Government was about to send a commission to negotiate with the Indians on the western frontier. This commission was to be stationed at Fort Gibson, on the Arkansas River, and it was one of the three commissioners who gave the author and his party this information. He invited Mr. Irving to attach himself to the commission, and promised a hearty welcome to the other members of the party. All accepted promptly, and in a short time they were on their way to what was then the far west. They went to Ashtabula, and thence, by way of Cleveland, Newark, Columbus and Cincinnati, to Louisville, Ky., and from there by steamboat down the Ohio to St. Louis.

By this time steamboat traffic was well established on the Ohio and lower Mississippi. It was in 1811, more than twenty years before, that the first steamboat was launched on the Ohio, at Pittsburgh. The building of this boat followed a survey of the river by a certain Mr. Roosevelt, of New York, who did the work pursuant to an agreement with Chancellor Livingston and Mr. Fulton, whose experiments with steam navigation made on the Hudson River, prior to the year 1809, had been so successful as to make them look for "other worlds to conquer." It will be remembered that the appearance of this vessel, and the great speed with which it passed along down the river, excited a feeling of mingled astonishment and terror among the settlers on its banks, most of whom had never heard of so monstrous a thing as a steamboat. It was during this voyage that the earthquake of 1811, '12 convulsed the valley of the Ohio.

The sights seen by Latrobe and his party as they passed down the river were of things that have long since passed away. Among other things, he says: "Though greatly diminished in number, you still meet many an ark, for the transport of goods, built as a broad flat-boat, with a deck of two or three feet elevation above the level of the water. They have generally a small window fore and aft, and a door in the middle, a peep into which will show you a goodly store of pots, pans, or flour barrels. A narrow ledge runs round them for the convenience of poling. A small chimney rises above; racoon and deer-skins, the produce of the hours spent on shore, are nailed on the sides to dry. The larger are generally propelled by four oars, and I have occasionally seen them surmounted by a crooked mast and topmast. Here you will meet one fitted up as a floating tin-shop, gleaning many a bright dollar from the settlers. Others again are of a still more simple construction, and have merely a temporary deck supported upon rails, through which the sheep and other live stock may be described. Hay for their consumption will be piled above, and cargoes stowed away in the compartment behind.

"Of the large barge, upon which the greater part of the valuable goods in request on the river were formerly transported, few are now seen in the lower waters. They required twenty hands to warp them up against the current at the rate of six or seven miles a day, and were frequently of one hundred tons burden."

At St. Louis the members of the commission who were bound for Fort Gibson determined to await the passage of the steamer up the Missouri, which should take them to the town of Independence, then the starting point for much of the western travel; but Mr. Irving, Mr. de Pourtales and Latrobe determined to go overland, camping on the way. For such a journey it was necessary to hire servants and purchase a camp outfit, and after this had been done, they started into the new land. Shortly before reaching Lexington they met a party of seventy trappers returning from the Rocky Mountains and Santa Fé. Latrobe speaks of them as "men worn with toil and travel, bearing in their garb and on their persons evident marks of the adventurous passage of those immense prairies which lie to the westward. Seven of their numbers had fallen in combat with the Indians on their return.

Independence reached, it was found that the steamer had not yet been heard of, and the party settled themselves down to wait for it, and in the meantime to learn what they could of the surrounding country. Latrobe paints an interesting picture of some phases of the life of the new settler in a country that was then being first cleared for the plow. Here the author was appointed by his two companions, quartermaster and commissary to the mess, and upon him fell the toil of purchasing provisions and other supplies, hiring servants and selecting horses. All this he did, and no doubt to the satisfaction of his friends, if not altogether to his own; but he tells the story of his trials in a humorous light-hearted way which is very attractive.

After the members of the commission and their companions left Independence for Fort Gibson, the author shows us the party just going into camp at the close of a long day's march. "The broken line of the cavalcade, the great intervals between the horsemen, the wagons toiling far in the rear, and the difficulty of keeping the spare horses on the track, as they seize upon every opportunity to diverge from it, to feed upon the rank grass, all betoken the propriety of making choice of our night-quarters.

"The streams and creeks, meandering among these vast prairies, are generally deeply sunk, and bordered by a belt of rich forest, of greater or less breadth, and upon such our choice always fell, as we had here wood, water, shelter and fodder for our steeds. If possible, we halt before the sun is down, that we may get everything comfortably settled before night-fall, choosing an open space among the trees, within a stone's throw of the water.

"The spot being fixed upon, we drive and ride in among the tall grass and dismount; each unsaddles his steed, hobbles it, as the term is, by tying the two forefeet close together, and sends it hopping into the forest like a kangaroo, crashing and scrambling through the gigantic and entangled brushwood which arises under the heavier timber. Here, at this season, they feed upon the pea-vine, a very nutritious plant which abounds in all the wooded alluvial grounds or, 'bottoms' of the Western Prairies. * * *

At length the Colonel's sonorous voice is heard announced supper, "and each rousing himself to the willing toil, contrives a seat around a tent cloth, and partakes of the banquet. And banquet it was; for we lived at this time like princes, as coffee, biscuit, and bread were plentiful in the camp, in addition to our other luxuries, among which I would recount that despised dish, fried pumpkins. * *

"The table withdrawn, we sit half an hour round the fire, listen to each other's tales, and, between whiles, to the distant howl of the prairie wolf, the shriek of the owl, the chirp of innumerable grasshoppers and crickets, the cry of the bustards going to sleep in the neighboring marsh, or speculate upon some odd nondescript out-of-the-way noise in the deep forest; till in fine, growing gradually sleepy, we steal off to rest.

"I cannot say that silence always held her sceptre over us, even when sound asleep, for little Prevot and the black snored so loud that the dogs would sit up and bark at the noise."

Journeying westward from Independence, the travelers for several days skirted the limit of the treeless plains, of which Latrobe wrote, they "know no settled inhabitants, and over the other extremity of which, at five or six hundred miles distance, the gigantic summit of Mount Pike serves as a land-mark to the scouting Indian or trapper."

At Harmony, a missionary establishment on the banks of the Osage River, they saw their first Indians, Piankashaws, and a few days later met some Osages, people with shaved heads, tall, straight and upright, and, in a certain degree, martial in gait and bearing; and of all the tribes which Latrobe saw during his stay in America, the Osage came nearest to his ideal of the North

American Indian. And this is but natural, since in the Osage he saw more nearly the primitive type than among any others to the east.

It had been the purpose of Latrobe and his friend Pourtales to attach themselves for a time to one of the two great bands of the Osage tribe, but this proved impracticable. However, they were invited to accompany an armed expedition to the westward, which had just been sent out, and a runner had been sent forward after the rangers, with orders to the officers to await the commissioner and his friends. They were believed to be in camp fifty or sixty miles to the westward, and, in fact, a few days later, Latrobe and his party overtook them. They were commanded by a captain, who was an experienced backwoodsman, and he had as assistant two or three lieutenants of like qualifications and credit. The men themselves numbered eighty," in the pay of the Government, enlisted for the service of the frontier, among the young backwoodsmen of Missouri and Arkansas, for a given time; each providing, however, his own horse, rifle and clothing. Food and ammunition were furnished to them; the nature of the service being of the roughest, uniforms were dispensed with, and each appeared as his fancy or finances dictated. * * * The men carried rations for a certain number of days, after which it was expected that we should come within the buffalo range, and amply provide ourselves there with the necessary food."

Marching westward, the way was full of novel experiences for our Englishman, yet he seems to have fallen in well with the ways of the country. Game was plenty enough; elk, deer and bear, with abundance of turkeys furnished the company with abundance of fresh provisions.

Except when marching, the men of the rangers had little to do, and much of their time was occupied in "swopping," or trading with one another, horses, saddles, rifles and clothes of every kind. Of course the materials for this trading were limited to what they had with them, and articles made the rounds, sometimes coming back into the possession of the original owner. The author tells of a certain man who was continually swopping his horses, and who, on the return to Fort Gibson, possessed the very animal that he had started with, and sixty dollars into the bargain.

The travelers of our party had amusement and excitement enough without swopping. At the outset of the trip they had agreed that each man should care for his own saddle horse, "unsaddling and hobbling him in the first instance, and when brought into camp on the following morning, taking off the vile hobbles, and preparing him for the start. There was no hardship in this, if I except unhobbling, as the knot with which the feet were strongly secured, during the course of a long night spent in hopping through the damp grass, became often hard as iron, and as wet as a sponge; and many a time have I begun to lose my equanimity, and been on the point of using my knife, after five minutes were thrown away with alternate applications of teeth and fingers, vainly attempting to unloose the Gordian tie. For the rest, all seemed to inspire pleasure; and when we subsequently met in the gay saloons of the eastern cities, we often recalled those days of adventure and light-heartedness. * * * Here, alone, in the midst of the great wilderness, we moved day by day; lay down at night and rose in the morning in peace and quiet. We were like a vessel moored in a sheltered haven, within the breakers, and out of the reach of the tempest raging in the open sea. Those who have never moved out of the narrow sphere in which all is artificial; where the possession of much makes the attainment of more an absolute necessity; where luxuries appear to be necessities, can hardly conceive how little is in reality essential, not only for existence, but for contentment; or what a pliant and easily moulded mind any body we possess. Get only over your prejudice and try, and there are thousands of so-called comforts that you can do without—and of things which you can do for yourselves." Indeed, Latrobe speaks with much real feeling, and at some length of the beauties of the country through which he was passing and of the charm of this independent life.

And now, the party were advancing further into the country beyond the Arkansas, and were beginning to look out for buffalo. They were also beginning to watch for signs of the Pawnees, those people of the southern central plains whose expertness in horse taking, and whose daring in war made them, to the travelers in the south, as terrible as the Blackfeet of the Saskatchewan and the Upper Missouri were to the trappers and traders of the north country. The Pawnee, according to our author, was the Arab of the West, whose hand was against every one; and they and the Comanches were alike dreaded.

As yet the buffalo were still beyond them. These, like the Indian, had been obliged to forsake their original domains, and retired into the wilderness. Sixty years before this time, the rich forests and cane-brakes of Kentucky and Tennessee had swarmed with them, but Latrobe says: "There is not one to be found east of the Mississippi: and as man has penetrated, year by year, hundreds of miles to the westward, so the bison has fled his presence, and yearly interposes a good hundred miles between its pathway and the nearest settlements. * * * A few years back and the bison might be met with and killed in the center of the Arkansas territory; but we had now advanced a hundred miles beyond its remotest limit, and had not yet met with them."

At last, however, they reached a country where buffalo sign was plenty, and with it also the sign of hostile Indians. After these tracks were seen, the company traveled a little closer together, and at night the horses were tied up, instead of being allowed to wander as usual. Now, too, wild horses were seen, and here a half-breed guide caught one with his rope, brought it into camp, and the next day it was humbly carrying a pack with the rest of the animals. Shortly after crossing the Red Fork of the Arkansas, the rangers turned southward, and while traveling along near the cross timbers, saw their first buffalo. Here they had their first Indian scare.

GEORGE BIRD GRINNELL.

[TO BE CONTINUED.]

NATURAL HISTORY

Some Life of the Alaska Peninsula.

(Concluded from page 310.)

"In September, 1902, a trading post was established at Unangashik, east of Port Moller, on the north side of the peninsula, for the express purpose of trading for caribou skins. A stock of goods representing an investment of about \$1,000 was put in, and a man placed in charge. One of the employees of the proprietor of this station informed me that the receipt of about 1,000 caribou skins was confidently expected during the following year. Since then I have learned that approximately 500 caribou were killed by the natives of Unangashik between October 1, 1902, and May 1, 1903, and the skins disposed of to the trader. These skins are not shipped out of the country, so the traffic in them is only locally known. The trader pays about \$1 in trade for a skin, which is worth to him from \$2 to \$5. The skin of the body is widely used for clothing and bedding material. The short-haired skin of the legs is especially desired for making the tops of the skin boots which are very extensively used by natives and whites alike. This traffic is carried on openly. The occasional killing of caribou out of season by natives and prospecting parties cannot be stopped, nor does it seem necessary that it should be. If the wholesale traffic in meat and hides, however, is not checked, the animals are surely doomed to a speedy extinction.

"Moose are more or less common throughout the region traversed, and are killed in considerable numbers by the natives. It is thought that their westward range is governed by the limit of the birch, which they eat. On the peninsula the birch extends westward beyond the limit of the spruce, but the limit of the birch is practically the moose's limit."

Mr. Osgood took some white sheep in the mountains between Lake Clark and Cook Inlet, and is inclined to think they do not occur further west than the vicinity of Lake Clark. The specimens here found appear to be referable to *Ovis dalli kenaiensis*.

It is in this neighborhood that bears were formerly extremely abundant. They are so no longer, nor are the bears as large as they used to be.

The Indians of Iliamna Village say that according to the tradition a few black bears were formerly found in the mountains northeast from there, but that in recent years none have been seen. As far as we could learn they do not occur elsewhere in the region. Their westward limit on the Pacific side of the peninsula is about coincident with that of the coniferous trees, which cease a short distance east of Iliamna Bay. The westernmost records of the black bear known to the writer are those of two killed at Chinitna Bay in 1901 by the party of J. H. Kidder, of Boston, Mass. Two specimens of small cubs secured by McKay from the Kokwok Indians in 1882 were questionably referred to *Ursus americanus* by True. These may, however, have been the young of the large brown bear.

The Kenai Indians call the black bear Yerdeeshlah. Of *Ursus kiddlei* Merriam, Kidder bear, and *Ursus dalli gyas* Merriam, peninsula brown bear, Mr. Osgood says:

"Brown bears were formerly abundant in much of the country through which we passed, but the persistent hunting by the natives since the introduction of modern repeating rifles has reduced their numbers greatly. They still occur in many localities, but have become extremely shy, and are seldom obtained unless a special campaign for them is conducted. In the course of our entire trip we saw remarkably few signs of bears. In fact, the only really fresh tracks seen were those of a medium-sized one which had been fishing along a small stream emptying into Lake Iliamna near the Noghelung portage. This region about Lake Iliamna was formerly a favorite hunting ground for the natives. Chief Michaluf, of the small remaining village known as Iliamna Village, enjoys the reputation of being the greatest bear hunter of his generation, having, according to local report, scores of bears to his credit. There are yet a good many bears in the vicinity of this big lake, and a few have been killed each season in recent years. Several old bear trails were found on the mountains near the head of Lake Clark. In following them we noticed a few 'bear trees' with the bark torn off and the trunks scored with claw marks. The highest scratches were found to be only 7 feet 9 inches from the nearest place where a bear might stand, indicating that no very huge individuals had passed that way. In all cases the trees marked in this manner were white spruce. Considerable old 'sign' of bears was seen along the Kakhtul and Nushagak rivers, but the fishing season was over, and the big fellows presumably retired to the mountains, though no traces of them were found during the limited trips we made away from the water courses. We saw very little 'sign' along the Ugaguk River and Becharof Lake. The natives say that this is not a good place for bears, though they are quite common about the Ugashik lakes near there.

"The following notes on the habits of the brown bears of the Alaska Peninsula are largely such as have been derived from old native hunters. Most of the statements have been corroborated to a certain degree by independent discussion of the same subjects at different times with different individuals. As to the former great abundance of these bears there can be no doubt. The records of the fur traders do not fairly indicate this, for bear skins have usually been comparatively low priced, and the natives have been urged to secure the smaller, more valuable, and more easily handled furs. Not more than fifteen years ago it was not uncommon to see from eight to fifteen bears scattered about on one mountain side. Those natives who have had an opportunity to see cattle feeding on the hills of Kodiak Island invariably compare them to the bears they saw in their younger days. Pioneer white men also say the same of the great abundance of

the animal in the not very distant past. The season of activity of the bears varies, but is usually from the latter part of March or early April to the early part of November. They are not particularly averse to snow, and their tracks are often seen in it, but the date of their retirement in the fall and of their reappearance in the spring depends upon the severity of the season, so that sometimes they may go in as early as October and not come out until April. Sometimes, when disturbed, they come out for a short while in midwinter. Their dens are chosen in rocky remote places in the mountains, to which they are sometimes tracked by the natives, both with and without the aid of dogs. The young are always born before the female comes out of her winter quarters. The date of birth is ordinarily some time in January, doubtless varying considerably in individual cases, for during the summer cubs of different sizes may be seen on the same date. At birth the young are blind, naked, and helpless; they vary in number from one to four. Two is the usual number, there is not very uncommon, while four is quite rare. They follow the mother until the end of the second summer, when they are often nearly as large as she is.

"Although numbers of the adults frequent some localities, it is generally safe to assume that three or four bears found together constitute one family. The cubs are mischievous and playful, and receive many a stern reproving cuff from their mother. The brown bears avail themselves of everything the country affords in the way of food, including fish, flesh, fruit, roots and grass, a variety that was scarcely exceeded by the natives when under aboriginal conditions. When they first come out in the spring, they eat young grass, herbage, and roots, and if they are near the coast take a little kelp. In securing and handling these, as well as their other food, they display much dexterity and a control of their foreclaws seldom accredited to their kind. In the spring they also enjoy, now and then, a meal on a ground squirrel (*Citellus*). Hunting these squirrels and digging them out seems to be a combination of business and pleasure for the bears, and the antics they go through are very interesting to the onlooker. The bear is usually so intent on the game that he himself is easily approached. Sometimes he slips along a hillside and tries to catch the squirrel by a sudden pounce, but this usually fails. When the squirrel dodges into its near-by burrow, new tactics are adopted. The bear immediately begins to dig, throwing out big turfs and clods at each stroke, using the left hand chiefly and watching the hole intently all the time. While this is going on, the squirrel sometimes runs out between the legs of the bear and makes for another hole. Possibly he is caught by a quick pounce. If he escapes, excavations begin immediately at the new hole. The bear digs for a few strokes, and then stops to poke his nose into the hole and sniff. Finally his efforts are successful, and the luckless squirrel is devoured.

As soon as the salmon begin to enter the streams, bruin makes fishing his chief business. He varies his diet somewhat, however, and occasionally leaves the stream for the mountain sides, but in a short time returns again to fish. The fish in large numbers usually ascend the streams for the entire summer, and the supply is practically unlimited. In fishing, the bears do not get all their prey in shallow water or on bars and riffles in small streams, as is generally supposed, but often go into comparatively deep water in large streams. Practically all the fishing is done at night or very early in the morning, though their habits in this respect have doubtless changed in recent decades, since they have been hunted so much. It is most interesting to watch an old she bear with cubs. The cubs do not attempt to fish, but stay on the bank and receive contributions. The old she bear stands upright and wades in water up to her neck, going very slowly with the current, watching the water and scarcely making a ripple in it. She holds her arms down at her sides with her hands spread, and when she feels a salmon coming against her, clutches it with her claws and throws it out on the bank to the expectant cubs. Often she stands perfectly motionless for a considerable time, and when she moves it is with extreme deliberation and caution. After supplying the cubs she puts the next fish in her mouth and goes ashore to eat it. If salmon are plentiful or easily obtained, the two sides of fish are all that she will eat; sometimes she even scorns these, and fastidiously crunches the head and leaves the rest. The gills are never eaten. The cubs are not so particular, but chew their portions haphazard. In case they have any difficulty among themselves in apportioning the tidbits, they are promptly cuffed by the parent.

"When fishing in shallow water the bear walks slowly on all fours as silently as possible, and when a fish appears in a riffle, deals it a sharp blow on the head. During the fishing season the bears make deep trails in the grass along the bank, where at short intervals bones and other remnants of salmon in large quantities testify to bruin's ability as a piscatorial sportsman. Occasionally by following some of the branches of these trails, one may discover the midday resting place of the nocturnal fishers. One that I saw on the Kakhtul River was an ideal retreat. A soft bed was made in the grass and moss under the thick, shelving branches of a small spruce. Around this small alders and willows formed a sort of inclosure, which opened on one side and gave an outlook upon the river. The whole place had an air of coziness which would appeal to anyone accustomed to selecting camping sites. In the fall, toward the end of the salmon run, when fishing becomes unprofitable, most of the bears retire to the hills, where they feed on berries and put on fat during the last weeks preceding hibernation. The black crowberry (*Empetrum nigrum*) is eaten in great quantities, and various species of *Vaccinium* which abound are also taken. In moving up and down the mountains the bears usually follow the ridges, as shown by their trails, which often indicate years of use. These old trails do not resemble or-

inary game trails, which are merely paths, but each consists of a succession of distinct, irregular oblong indentations in the turf, alternating from side to side, a sort of composite of the prints that have been made by many feet during many seasons. These depressions become nearly 18 inches in length by 10 inches in width and from two to four inches in depth. They are often quite conspicuous, and can be seen for a considerable distance.

"The two types of coloration commonly shown by these species of bears, the dark brown and the light brown or even creamy, do not seem to be anything more than color phases or individual variations. I have examined numbers of skins, and, in lots exceeding a half dozen, both phases, or modifications of both, were represented. Moreover, the natives tell me that they have often seen a light and a dark cub following the same mother. A certain amount of this difference in color among the adults may be seasonal, but it does not seem probable that it is entirely so, for skins of both general types are frequently seen in the same apparent condition, and are alleged to have been secured at the same season.

"The geographic distribution of the various forms of the Alaska brown bears is still imperfectly known. Even the range of the group as a whole is not thoroughly understood, owing to the impossibility of distinguishing them from grizzlies in reports which come from localities not represented by specimens. *U. dalli gyas* extends westward at least from Cook Inlet to and including Unimak Island; large bears are found also on Nunivak Island and on the coast of Behring Sea from Bristol Bay northward, and probably range over much of the northern and western part of Alaska. To what extent the group ranges into the interior of the Territory is not known, and specimens with good skulls and reliable data from any point in the interior are greatly desired."

Big-game hunters—especially those who contemplate visiting the north—may very profitably study Mr. Osgood's interesting report.

Do Birds Reason?

WILD ducks by the thousands come to feed and rest in the ponds in Middlesex Fells, a State reservation a few miles from Boston, where no gunner is allowed to disturb them, and occasionally a few wild geese are with them. Before State protection obtained they were few in numbers and very wild. On the beaches of the islands in the harbor, where State protection prevails, the shore birds that frequent them are much less timid than when no protection was afforded them. They seemed to have learned that they were safe from the gunner in these localities.

If reason is prompted by instruction, experience, and reflection, as it is said to be, while instinct is simply natural impulse, it certainly seems that their movements are governed by reason, and they have been instructed by past experience what protection means.

This State has done a great deal for the protection of fish and game in the last few years under the direction of Capt. J. W. Collins, chairman of the Fish and Game Commission, a man of rare talent and great executive ability, and one who made friends of all who were brought in contact with him. He will be sadly missed by all who knew him, and it will be hard indeed to find anyone to fill his place. Others who knew him better will write more of him, but not too much in his praise.

GEO. L. BROWN.

[As we have many times pointed out, wild animals and wild birds very soon learn whether man is a friendly or a hostile animal, and they would always rather treat him as a friend than as an enemy. Wild animals, in situations where they are never molested by man, become absurdly tame, as is shown by the actions of the wild beasts in the Yellowstone National Park, where sheep, deer, elk, bears, and other animals pay little regard to the presence of human beings. On this point it would be well to read President Roosevelt's article, "Wilderness Reserves" ("American Big Game in Its Haunts," p. 23). Similarly there are not a few wildfowl preserves where the birds are very tame; one in Florida, we believe, where the wild ducks (little blackheads) commonly feed out of the hands of certain persons whom they have learned to know, just as the bears of the Yellowstone Park will take a piece of pie from the hands of certain employees whom they know. It is experience and not instinct that makes wild animals afraid of man. That has been known ever since long before the days of Alexander Selkirk.]

The Wallows Are Still There.

Editor Forest and Stream:

A correspondent of the Chicago Inter-Ocean, writing from the west, notices the buffalo wallows that used to be familiar to every old plainsman. He says that though they have not been used by buffalo now for thirty years, and cattle do not use them, the wallows look exactly the same to-day as they did when the last buffalo left them, or as they probably did 20 years ago.

It might be supposed that by this time these depressions would have been covered with grass, but they are as bare of grass to-day as they ever were.

In the spring they stand full of water; this may account in part for the absence of grass in them; but the water would soon evaporate; a heavy rain would fill them again for a day or two, but it would not remain in them long. Something else besides water must be the cause of their remaining still bare of grass.

Another thing he notices is the buffalo bird. There are no longer any buffalo for the bird, so he has transferred his attention to the steer, which has replaced his buffalo. He picks the insects off the backs of the cattle now. As many as twenty of the birds may be seen at times on the back of a single steer, which does not seem to notice him.

CABIA BLANCO.

GAME BAG AND GUN

The Ways of Duck Shooters.

EAST WAREHAM, Mass., Dec. 10.—*Editor Forest and Stream:* Since our return from the far West we have been trying to catch up by reading the accumulated back numbers. The dusky duck lore that has lately appeared is very amusing. No man on this continent has devoted as much time and patience to the pursuit of these birds and killed so few, as the writer. He has watched them for many hours at a time, both day and night, just for the pleasure of observing them; to him, they are the duck par excellence for wildness, keenness of sight and hearing, and for the table. The mallard, pintail, widgeon and gadwall are keen ducks, but slow when compared to *Anas obscura*. Of course gourmets, epicures, and that ilk will not allow me to class him with the canvasback, but the latter is at his best in only a few localities. On the seacoast and on the Pacific, when fed on widgeon weed and shell fish, he is no better than a bluebill—rank and coarse.

The dusky duck is a fine feeder till starvation times come and drive him to catching minnows in springs and ditches that zero weather does not close. Then, and then only, does he take a back seat. Thanks to a beneficent law, we have this beautiful bird with us throughout the year. For the sportsman's interest, for human reasons, and for those who are to come after us, another month should be given this duck, and February added to the close season. By the last of January the weather is so severe they cannot get food and afford sport at the same time.

This bird is almost strictly nocturnal in its feeding, and entirely so when persistently hunted. While a man in very stormy weather may get a few shots at birds that are seeking shelter in the daytime, night is the only time to shoot with any success. Steady pursuit has taught them to lie wide off on the bays, bars and ice until it is fully dark.

Many people are strongly opposed to night shooting; they do not shoot in Barnstable county, and would not get many dusky ducks in southeastern Massachusetts. A law prohibiting night shooting would protect the ducks as effectually as a law prohibiting the digging of clams at low tide would protect the shell fish.

This duck's keenness of smell is not developed sufficiently to be of any service to it as a safeguard from harm. A smoke would be likely to alarm them, but smelling in the sense applied to deer and dogs does not obtain with them, and is imagined by hunters who do not conduct their approach quietly enough.

To screen himself from these birds, the writer has built wall enough on various rocky shores to fence quite a field, for the same purpose he has lugged and piled cakes of ice enough to fill an ice-house, and stocked up a great amount of seaweed and brush. From behind these structures he has watched the ducks for hours at a time, and when they showed alarm it was because they either saw or heard something.

The writer has repeatedly slept in a blanket beside a pond of less than half an acre in extent, upon which from three to fifty ducks disported and fed all night. He has sat in a gunning boat and had ducks swim down the creek within ten feet, feeding right along as they went by and paying no attention whatever to him. At the same time, he has had a big blue heron walk to his boat and stand on the mud within arm's reach and peer intently at him, first with one eye, then the other, turning his head in a comical manner while trying to make out what was sitting there. He has also had an Indian paddle his canoe by at six feet distance, and the red man did not suspect the white man's presence. The gunning boat was covered with a burlap coat that fitted the deck and reached into the water or down to the mud on all sides. His gunning coat and cap harmonized with the burlap in color, and being under, and against a bank, the whole outfit looked like a lump of mud.

For the benefit of those who wish proof, be it known that the writer has kept an accurate record of everything he has ever shot, a diary of all his shooting, and a daily journal since 1875. He has used a variety of firearms, some of them antiquated, and, last, but not least, he is armed with a field glass of power strong enough to see the moons of Jupiter. He is aware that this is not much, for there have been men who could see the moons with their unaided eyes. Such were competent to observe ducks, to which we will now return.

In your issue of Dec. 10, L. F. B. jumps on to some parties who shot at two sleeping ducks that were on an ice field or floe. Now it is quite likely that those ducks were approached with such difficulty, that the hunters had to assume positions in their boat so cramped that they could not swing a gun to shoot flying. He makes some remarks on shooting quail that are sunning themselves. To come upon quail sunning themselves when one has a gun, is certainly a rare event, so rare that we have never done it. To shoot quail is a transgression in the writer's opinion—and he has to plead guilty to having lately done so, but it was in California, and only six there; he would not shoot one in Massachusetts.

Having just read the "Views of a Blunt Old Man" in *FOREST AND STREAM* for Dec. 3, we do not think him a game butcher, doubt if he is, or ever was a market hunter, he may have sold some ducks; and, on a snapshot judgment, we would trust him with a gun around our premises. We agree with him that in the main ethics are a thing apart, and have but little to do with a sportsman's existence. Anyhow, at the Judgment Day we'd take our chance with him 'gainst many an ethical sportsman "who wouldn't shake hands with him." Save for a very select few, who write for the best sportsman's paper in this or any other country, and who are

the very elect, before whom the rest of us stand in awe, the men who go out to shoot ducks, let them have it as quick and often as they can. All of us know that a flying duck presents a better mark than a sitting one.

The circumstances under which game is secured should be considered before condemning the method. The writer has pushed his gun through a crevice in the stone wall which served for a blind, and then had to lie flat on his stomach until some ducks he was watching were pleased to come near enough. Before one could back out of that position, the ducks would have been far away. In the State of Virginia, we have seen a blind built on a gentleman's preserve, for the purpose of shooting dusky and other ducks in a small pond. It was really a tiny log house with tight roof, and provided with a stove for warmth; the shooting was done through a slit, made by leaving out a section of log about three feet long and four inches high. Very little wing shooting could be done, and none was intended, for the owner and proprietor well knew that firing at ducks as they rose to fly would drive them away for good. We noticed other blinds in Virginia built on the same principle, but intended for shooting ducks at baited ground.

The method was to stick a stake out in the water about thirty yards from the blind, and then drop a bushel of corn and wheat around it. A few days were allowed for the ducks to get "using," then the shooter took his stand inside and thrust his gun through a hole cut to command the stake, at the proper time he fired.

As no shots were fired at the birds while on the wing, they continued "using" until used up. The fact that fowl are more alarmed by shooting into them after they are in the air, was taught the writer more than forty years ago by old gunners who began when percussion caps were first used. The first dusky duck he ever shot was killed while with one of these old-timers. We had crawled with great care and circumspection as near as we could get behind some small cedars and a tumbled-down wall. As the old man cocked his muzzleloader, he cautioned the writer to fire only one barrel; to reserve the other for possible cripples, and on no account to shoot at them flying, for they would never come back there. As the ducks were on the broad shore the wisdom of reserving a shot in muzzleloaders was demonstrated then and there, for we stopped four, two of which had to be quickly shot over before they swam beyond our reach. Had we allowed these birds to rise in the first place, the writer would have scored a miss and the old man could not have retrieved any he might have killed. Omitting these details, the story would sound like pot-shooting.

The writer has hunted ducks for a living, when it was "root, hog, or die," and no choice, and a harder and more unsatisfactory and thankless mode of making a living he never heard of. During this period of market shooting he met a good many sportsmen, men no better and no worse than L. F. B. Some of these men were personal friends of ours, who often went on shooting trips with us; some of them were good customers, and all knew we were shooting for the market. The steward of a certain club was another good customer, and the members of that club were good judges of game; and some of them good shots at it.

A few incidents will illustrate a point. We always built our own gunning boats and made our decoys; half of the sport of gunning is in the preparation and the rest in getting near enough to the birds and rehearsing the incidents after the day is over. Killing is not the part that gives pleasure.

On a number of occasions we have had our rig stalked by sportsmen, and we have had it shot at a few times. We always put our live decoys where they could not be pot-shotted unawares. Neglect of this caution would entail the loss of our ducks, because the majority of sportsmen are after something, and very few wait for feathers to fly. It is nice to write "ethics" in *FOREST AND STREAM*, but, like Lady Bellaston's opinions of virtue, who ever heard of a lady's practicing them in the field. Of course, there are exceptions; the lady found one in Joseph Andrews, and *FOREST AND STREAM* finds some among its contributors.

Apropos of sleeping ducks, who shall decide that a duck is asleep? When we see a bird sitting with closed eyes, head turned over its shoulder and bill thrust among its feathers, we consider it asleep.

On Oct. 28, 1880, the writer's father and himself rowed out to Little Bird Island to look for ducks. This islet is very small and nearly covered at high tide. After landing without making any sound, we carefully rose to a standing position and saw two dusky ducks asleep. Understanding each other perfectly, nothing was said until after the birds had flown and fallen again. One of the charms of companionship is that intuitive knowledge of what to do, which comes with years of shooting together.

On Dec. 6, 1882, the writer was on West Island after dusky ducks. It was a cold, blustering day and the birds were seeking shelter. We could see them sitting about in unapproachable places on the open marsh; some were sleeping, and we made a tedious crawl up to five that were on a bare spot. Letting them sleep on, we fussed for more than an hour with a piece of smoked glass, trying to see a transit of Venus that was to be pulled off that day. Venus does not line up for transits very often, and we wanted to see one while our eyes were good; she did the trick all right, and will again somewhere around 2002. After the transit we tried the five ducks and could not get quite near enough to shoot, but studied them a good bit. They sat in a very exposed place, where the cold wind had full sweep. Now and then one would shift his head to take the

kink out of his neck, or pull his feet up into his feathers. There did not seem to be a sentinel, perhaps they relied on the gulls which were steadily circling about. Ducks can read the signs made by gulls and crows, as many a gunner has found to his exasperation. We could do nothing with them and went back to our boat.

The two following incidents were related to the writer many years ago. As men rarely tell of wrong doings that never happen, we may consider these stories true. The first was told us by a gentleman (long since gathered to his fathers) as a happening of his boyhood. He had a half holiday, not from school, but from farm labor, and being provided with ammunition and a single gun of the old Queen Anne style, he got a boat and rowed out to Little Bird Island. After putting his boat as much out of sight as possible, he built a blind of loose stones—repaired an old one, probably—and sat down to wait. He watched and waited through the afternoon into almost evening without getting a shot. Then he saw away up toward Long Beach three birds flying direct for the island. They swung around to leeward and came up and settled with that delightful swish we so love to hear. The ducks, in single file, came to land and prepared to rest. When it was all over, he looked, and lo! three more ducks; again the delightful swish and the unsuspecting birds land as before. After the smoke cleared away, and calm reigned again, through the approaching twilight another devoted trio came. History repeated itself, and a happy boy rowed homeward with never a thought of ethics. That we have heard the old gentleman tell this incident as luck with ducks at one time and sheldrake another, does not affect the moral. Those birds were done feeding and were coming to the island to roost.

The shooting in the second case was done by an older man, but in more recent years. A resident of Half Way Pond, he left his house one morning, intending to walk to North Sandwich—now Bourneville—and have Seth Holoway relay an ax. Putting the ax head in his pocket, he took his single-bore gun and started. He had some eight miles to walk, and when about half the way, turned aside to look into Moulton's Pond for black ducks—dusky ducks. This pond is small, grassy and not given on maps; like many others in Plymouth woods, it was usually low in the fall. He saw some ducks sleeping (?) on a sandbar; they most likely had been "using" there for some time and were unsuspecting. The old man fetched a compass around through the woods so carefully that the birds did not hear him. His shot was so well timed that five were killed and one or two winged—these got into the grass before he could reload. Not liking to leave his game in the woods, and unwilling to carry the extra weights to Holoway's and back, he returned home and postponed his trip till the next day. On the following morning he started out again, taking the gun and ax as before. On reaching the pond he repeated his previous performance and went home. The next day, having all the ducks he could use, the gun was left behind and the trip made without any incident. In extenuation, it can be truthfully said, that the old gentleman lived out his simple life without knowing (or dreaming even) that he had committed an unworthy act.

Such old-time gunners as used to gather on snowy days in Fearing's Tavern, and Daniel Weston's store, were fond of telling the remarkable shots they had made or missed. On a stormy day, back in the early '40s, we can see around the genial fire a little coterie of choice spirits, among whom might be Seth Sturtevant, Peter Holmes, Micah Gibbs, Charles Hamolin, Seth Besse and Stephen Wright. The door opens and in comes Nat. Hamblin. After stamping off the snow, loosening up his great coat and finding a seat, he tells the following story:

"I was down to Barney's Point the other day and saw a great raft of bluebills. They were out in Crab Cove, and I was wondering how I could toll them in. I got down as near the shore as I could, and all at once they began to swim right for me. I was surprised, and could not understand it, till happening to look down the bank in front of me, I saw a fox lying in the seaweed windrow. His head was pointed toward the birds, and they could see nothing except the tip of his tail, which he was waving to toll them in. I got all ready, and when the coming birds ranged with the top of the fox's head, I let her go."

"Well, how many?" said several.

"She missed fire."

This statement relieved the tension, and was better, perhaps, for the narrator's reputation for strict veracity. We think it was told of Peter Holmes, that once he was watching a bunch of five or six ducks in Red Brook, and saw an otter swimming down stream toward the birds, which were within range; timing his shot, he killed the whole business—six ducks and an otter.

What does constitute a true sportsman? "He is sitting out the hearts of men before his judgment seat." Shall we sift out all the old-timers? Hardly. The clean grain that is left would not seed the country. We have read *FOREST AND STREAM* from the very first, the cream of the shooting world. Write and subscribe for this paper; no sportsman could fail to find a jury of his peers among its correspondents.

The two most popular men in their respective countries are sportsmen.

How
Much I am like Theodore,
And Theodore like me,
I am, in fact (this might not be
A bad thing to suggest),
The Theodore of the East, and he
The Wilhelm of the West."

But customs vary so, that what is a right and proper way for the Eastern Theodore to take his stags, bears, boars, rabbits and other game would be a very distasteful way for the Wilhelm of the West. Merely a different point of view.

The late Sir Samuel Baker was a sportsman of sportsmen, and shot for sport only; he had a very proper appreciation of the right thing. So filled was he with this spirit on one occasion, that, snatching a gun from a bearer, he ran up alongside a fleeing elephant and fired a charge of snipe shot behind her ear; she got away. Another time, being out of ball, he fired a charge of shillings and sixpences at a buffalo; if that was not a refutation of shooting for money, let some one speak.

And yet, he shot lots of large game in tanks and lakes, where it had to lie and decay. Taken all in all, he was a very destructive man. It may be urged that he was clearing a country of dangerous and unnecessary animals.

As for present sportsmanship, the writer would respectfully move, that the gentleman who represents Brewer, Maine, be considered a true sportsman. In ancient times men were named for their characteristics, and we know of no one more happily christened than Mr. Hardy, or more deserving of distinction as a sportsman; to achieve success in this line, one must be manly, and to follow the chase one must be hardy.

Coming back to ethics, we have a difficult subject; what are they? To the elect, they represent the principles to which all true sportsmen subscribe, and from which, the old-time gunner (who shot for meat and fun both), the ground and sitting shot, the market hunter, the game butcher (not always a market hunter) and miscreants in general have no appeal. Where did these ethics come from? Everything had its origin at some time, but, the origin of many things is hid in obscurity. Of course there are many kinds of ethics, but we are dealing with those of hunting.

It is evident that it is useless to search outside the back tracks of civilization, for savages had none so far as we can learn, and if they did have any, they were of a different breed and not worth considering. Savages take pot shots whenever they can; yet, strange to say, savages and game exist together, the supply holding its own against a non-ethical pursuit. Pursuing our subject, we can trace ethics back along those roads all of which led to Rome, further yet we follow them to Greece, where much that is noble, good and pure had its origins. As near as we can find out, the ethical halo which surrounds the true sportsman is a remnant of the luster and glory which surrounded Diana, and was by her bequeathed to all sporting, or, more properly, hunting people of the earth, without reservation, and of late years has been arrogated to themselves by a certain class. We should like to say the mantle of Diana had fallen upon the hunters, but the contemplation of a great painting by a renowned artist, showing the goddess with all her attendants in pursuit of a stag, constrains us to the belief that mantles were unknown, or, at least, unpopular in those days.

When it comes to application, the foregoing principles are often honored in the breach. One of our correspondents would take a rising vote on a difference of opinion between himself and Blunt Old Man. Recently in one of our neighboring towns, a gentleman sought an office, the gift of which was vested in his townsmen. He canvassed the town thoroughly and got a yes or no answer from enough voters to find by comparison with the check list, that he would have a majority of sixty if all the others voted against him. He was defeated by forty votes, and when questioned about the defection among his constituents, declared he had found a hundred liars.

Some thirty-five years ago the writer was out with his father and brothers shooting partridges (ruffed grouse). The old gentleman had just made a neat double on two birds which sprang up in a swamp and took opposite directions; our dog had just brought the second bird to hand, when a genuine sportsman appeared. He had heard the shooting and hastened up. He wanted the two birds badly. It seemed that he had gone out on his own hook, and left a party of friends, who took another direction. He had seen no birds, and had a wager with Peleg Hackett, that he could and would kill a partridge. The price of a supper at Hackett's depended on his skill; two boys were richer each by fifty cents, and it was up to Hackett. This was all right, only, had Cale Loring been present he could have amended his celebrated adage to include sportsmen with fishermen.

Again, we were on Sandy Neck, our live decoys were sunning themselves on the bank by their coop near the shanty. Three sportsmen came around the point; the ducks flew off the bank, and one of the men fired both barrels at them. His companions laughed at and chaffed him considerably; he offered to pay damages, but, as we could not see that he had hit anything none were assessed.

Another time we had our rig set in the mouth of Cow Creek. Some twenty-five wooden decoys were floating so artistically, that they were mistaken for the real by a sportsman who was being propelled that way by his boatman. Our live decoys were sleeping on the bank, for it was warm and sunny, and nothing doing. Being out of possible range, we watched with interest the skill of the boatman as he slowly brought his craft up to the flock. The sportsman, well down in the bow, with his gun projecting like the bill of an immense snipe, was making ready for a ripping pot shot when the eye of the experienced guide discovered the illusion. The sportsman's disappointment was almost pathetic; but, just then he caught sight of the live decoys, and in an audible whisper, said, "There are some ducks," and brought his gun to bear on them. At this we called out that he need not shoot, as the ducks were tied. He was the Simon-pure, no meat hunter, market hunter, game hog or other outlaw, but a well-to-do, elderly good citizen, of whom no ill could be said.

Again we were sitting on our boat below the bank, at the mouth of Mission Creek; our rig was floating idly in a little pool. Of a sudden the monotony was broken by the bang of a gun and the whiz of shot over

our head and among the decoys. We lay low for the second barrel, but nothing coming, peeked over the bank, and saw a sportsman, still seventy or more yards off, making his way across the bog in our direction. He had on boots that laced on each side of the leg below the knee, and as they flared at the top, while he went over their depth at every step, each withdrawal took up an aggregation of mud and made progression almost impossible. He finally came up out of breath, puffing and blowing, and the following was said:

"You have a good gun there."

"Did I cover them well?"

"Couldn't say; but you shot an awful distance."

He complimented our stools and passed on.

Shortly after this and on the same creek, a gunner was putting out his rig and standing in his boat among the flock. It was in the morning twilight and he saw two men rowing up toward him, but did not give them any attention. One of these men caught sight of the decoys, and, snatching his gun, fired; a glancing shot struck the gunner under one eye, making a wound so painful that the others had to pick up his rig and carry him to the city.

These anecdotes prove nothing, except that on the spur of sighting game the ethical shoot quickly.

We have never had a market hunter shoot at our rig, or at ourselves; we have had an old-fashioned gunner stalk our decoys, and have had an Indian put a rifle ball through one. We once lost a shot at some dusky ducks because we could not determine whether they were the real thing, or another's rig, until they had flown off.

WALTER B. SAVARY.

Editor Forest and Stream:

True sport often needs protection from men who are offended when told they are not real sportsmen, but masked pot-hunters posing as sportsmen.

Is it not very seriously true that what some "critics" of the "blunt old age" school can do to worry and weaken the courage, hopefulness and nerve-force, and to chill and undermine the enthusiastic and future usefulness of one whose young name and fame are world-wide among naturalists and sportsmen, is evidenced by the collapse, blindness, and possibly ended career of Mr. W. J. Long? Does it not seem probable that, as a sad result of the severe strain that "critics" have placed upon him, he now sits in a dark room at Stamford, Conn., his young wife and child beside him? Worse, where are the published expressions of even slightest regret from the men who, I believe, have shortened his life through years of persistently published "criticism," urged home with their utmost power of separate and concerted ridicule and denial—attacks that I am told continue?

Of course the above will also be contradicted; but meanwhile, no doubt, guilty gentlemen will be satisfied with results; and readers here are sure to judge for themselves. I leave it with them to say whether those who have watched the course of the controversies believe that the above conclusions are the result of proper reasoning and warranted, or are far-fetched. The matter will not be mentioned again by me. Mr. Long has proved able to take care of himself, and no doubt will be again, if, happily, he shall recover. As to the persistent character of the disputes and denials, and whether the tension of them caused Mr. Long's collapse, it should be remembered that all the facts needed to really form a conclusion already exist or continue in the issues of various publications. The public will be the real judge accordingly on its own knowledge, and not by reason of merely reading published opinions or statements of any writer, or those printed by the management of any newspaper or magazine.

When, to strengthen one of his many attacks on what he has seen fit to call the "modern school" of naturalists, Mr. John Burroughs absurdly stated in *Outing* last July that his mere reaching while concealed, for a gun to shoot at "sleeping" dusky mallards on the Hudson one spring, instantly waked them "time and again" by "duck-and-man-telepathy," he was promptly admonished here that before assuming to criticize others and styling them "romancers," he should first cease "romancing" himself, and stop such unsportsmanlike conduct as shooting at dusky mallards "all sound asleep!"

This counter-attack was just and unanswerable. It has been most amusing to note how its force is sought to be broken by denials, side-tracking, and attempts by others to create other issues.

Our new national law to protect wildfowls will, I am advised, prohibit under heavy penalties, the shooting of all ducks unless they are flying when fired at. This shows how the public regards pot-hunters.

However, it is interesting to note the familiar line-up of apologists. One hails from sleepy Philadelphia, and dons the very large mask of Ocean! Another, said to be a student of bear trails, imported camels, etc., uses a Spanish quill-name while mentioning that a single red-head duck, probably asleep by himself, did not fly, and was potted and given away! If he had been starving it would have been different, but not sport.

A third unlocated, ancient coadjutor sits in some easy chair of a presumably remote room, loads a rusty fowling piece with wads, and contentedly fires from behind the triple mask not only of anonymity, but also of paraded "bluntness" and alleged experience. He claims credence, extra reverence and authority, and special consideration because he says he is "blunt," and asserts he is an "old man." He assumes that all this masking somehow confers on him what will be gladly recognized as a specially honorable jurisdiction to teach, rebuke, and instruct and order others to comply with what will meet his own very manifest wishes. Worse, he refuses to disclose his identity!

These gentlemen should not love darkness, the refuge of those afraid of light. When they give their real names and addresses, and the times, durations and locations of their actual duck shooting experiences and acquaintances for verification, and also show that they are not thinly disguised members of the sore little band of senior wranglers, some of whom have been glad, for years, to maul everything asserted here out of their own narrow spheres of sport, then it will be time enough to get some real duck shooters, and members or officers of a few actual sporting clubs on the Atlantic and Pacific Coasts

and the Great Lakes, as well as in the British Northwest and the Mississippi, Missouri and St. Lawrence valleys, to state here that to fire at dusky mallards "sound asleep" is forbidden by their club or hunting usages and rules, is never sanctioned, and is recognized as a proper cause for reprimand, admonishment, and final expulsion if persisted in. To these testimonials it will be easy to quote earnest pleadings from the real naturalists, like Elliott, for mercy to just these wildfowls.

Readers have already passed adverse judgment on shooters at sleeping ducks. Yet "of the same opinion still," no matter what may be the public verdict in favor of these beautiful and fast disappearing birds (see Elliott, "Wildfowl"), "argument" would go on forever, as apologetics would be driven from cover to cover, and final refuge found in such sophistry as claiming there were really no ducks, guns, powder, shot, water, world, sportsmen or laws, nor any publications in which to air their "views."

L. F. B.

ELMIRA, N. Y., Dec. 13.—*Editor Forest and Stream:* I thoroughly agree with M. Hardy, who writes in the December 10 *FOREST AND STREAM* about who are the true sportsmen. I am another sportsman who has shot grouse, quail and woodcock for forty years, and I have owned but two dogs. One was a cocker spaniel, which, when it got aged, would work up on a bird and then wait for me, giving me a good shot on the wing. The other a black setter, bought of Mr. Charles Haley, of Bath, N. Y., which I could not keep long. (Another shooter wanted her for more money than I could afford to wrap up in dog skin.)

My father, being an enthusiastic wing shot and trout fisherman, was to blame, I suppose, for my taking to the gun and rod. I also commenced shooting in the Adirondacks with a double muzzleloading rifle that had one bad fault of missing fire—especially if what I was trying to shoot at was a nice buck standing broadside on. My next gun was a Frank Wesson .44 R. T. tip up single shot that never missed fire. I remember one of the boys picking up one of the cartridges in the spring that had lain out all winter and it went on first trial in the gun and seemed to have all the force a fresh cartridge would have.

Mr. Hardy's friends must use poor judgment in loading their shells if they use 12 grains with $1\frac{1}{4}$ to $1\frac{1}{2}$ ounces of shot. Our shooters here use $1\frac{1}{8}$ and a number only 1 ounce of shot.

I would laugh some, I think, to see anyone try to still-hunt our wary old grouse. I haven't seen one in a tree or on the ground in ten years about here, and I shoot some. I have many friends who have dogs that I gun with, and being away from home most of the time I keep none. My friends always get the cream of the shooting, however, and most of the game; still I get a heap of satisfaction in once in a while closing up the wings of a swift-flying grouse or quail that has got away from the chap with the dog, and had not counted on the old man on the side. And, by the way, take the dog out of the question and the game would more than hold its own with all the shooters.

Did you ever nearly step on one of our cotton-tail rabbits in the high grass and see how easily he could sidestep a load from each barrel of your gun? Great work.

My idea of a true sportsman is one who can refrain from potting a bunch of quail when he runs on to them when alone; who is always willing to help out his friends with information of where to go; who does no shooting or fishing out of season or unlawfully; who, if he comes home with an empty bag, can tell his friends just what he got; who obeys the game laws, tries to get his friends to do the same, and pays 100 cents on a dollar, who is satisfied with a moderate bag, and has a good time if the bag is empty. If he is this kind of a man he can use dogs or not and I think he would suit Brother Hardy.

E. H. K.

Editor Forest and Stream:

Blunt Old Man refers to me as a (quondam) "usually intelligent" contributor. I've been thrown out of a jury box by the learned counsel because (he said) I was "unusually intelligent." I've always said our jury system needed reforming. So now where am I at?

Now, I don't worry how Blunt Old Man or any other kind of an old man "swats" his ducks. I'm not the duck, so what care I?

After Blunt Old Man downs Brown (if he does), I'm ready to take my dressing-down with humiliation and repentance for condemning the "swatting" of a bevy of quail all together asleep at the same time in a cosy fence corner enjoying the invigorating rays of the noonday sun.

But my dear old fellow-contributor, Cobia Blanco, swatting a duck sitting. *Et tu Brute! O tempora! O mores!*

CHARLES CRISTADORO.

BUFFALO, N. Y., Dec. 17.—*Editor Forest and Stream:* If I were to take sides with either the Blunt Old Man or Charles Cristadoro on the question started by Mr. L. F. Brown when he condemned Manly Hardy for shooting a duck sitting, I would have to take sides with the former to the extent that it has been, and still is, a common practice with duck hunters to shoot them sitting under certain conditions. There are many conditions under which, if a gunner were to shoot at swimming ducks, he could undoubtedly be called a pot-hunter; there are also times when people well known for their sportsmanlike qualities have shot swimming ducks and gone on record over their own signatures. For instance, Mr. Grinnell in his book on "American Duck Shooting," page 334, quotes the well-known sportsman, Mr. E. Hough, from an article he wrote for the *FOREST AND STREAM* about river shooting. Mr. Hough says: "We had learned to believe it as honorable to shoot a duck diving as one flying." The ducks in question were hard to get on the wing, so they took them the other way. But we believe Mr. Brown and Mr. Cristadoro made no distinctions, but condemned anyone who would shoot a duck other than on the wing. I think all will agree that Mr. Hough has a secure position in the sportsman's world.

Now, I think it a great deal more sportsmanlike to shoot a single duck on the water than to shoot into a thick bunch coming in to the decoys, and that at the most opportune time for bagging the greatest

number. If these ethical writers will hold up their right hand and say they pick out the single ones and do not shoot into a bunch, they are the Simon-pure article. I cannot put my finger on anyone who does do that. They shoot into a bunch, when they get the chance, to lessen the chance of a miss and to bag all they can at one shot.

See what Mr. Bishop says in the "American Sportsman's Library," in the book on "The Water Fowl Family." Speaking of the gunners on the Massachusetts coast, he says: "In Massachusetts ducks are not only permitted to alight, but are also persuaded to huddle up and get their heads together, with the result that often not a single begrudged bird escapes the fusillade—a shooting custom excused on the ground that ducks are few and far between." This is very bad, but it helps to bear out the Blunt Old Man in his remarks about duck hunters.

In this book Mr. Bishop mentions shooting at a club in Currituck Sound, and he says they wound up the day on three ducks which had swum in to the decoys, and that the shot was the sunset gun. It reads very much as though these ducks took theirs on the water. The shooting was made from a club there which he mentions. DIXMONT.

Editor Forest and Stream:

Joe W. Hutt in the current number gives his opinion as to what was the cause of the buffalo leaving us. He and I agree exactly as to the cause. Blizzards had nothing to do with it. Those buffalo had been in the country for hundreds, maybe thousands of years, and so had the blizzards; still the buffalo, or a part of them, lived through each blizzard. In our time they were only found west of the Mississippi. It may not be known by every one, but it is a fact that they once roamed clear from the Atlantic to the Rocky Mountains. I have never seen any evidence of their being west of these mountains, but they were at one time in all the eastern country south of New York State. It was no blizzard that killed them off. The Sharps buffalo gun in the hands of the skin-hunter did it.

I don't want to call Mr. Hutt down on account of his opinion in regard to the soldiers; he at least does not think that we killed off all the buffalo; we helped to do it; but the soldiers, when I was one, sometimes found other things besides their rations to destroy, and very often some of us at times did not destroy a great amount of rations, unless we drew our rations from the buffalo while we were trying to destroy hostile Indians. The want of these rations could not be blamed on the Government, though; they had plenty for us whenever we could get within striking distance of them.

Captain Kelly said in his account of how the buffalo came to be missing, that our general officers wanted them killed off; and he gave Buffalo Bill and Buffalo Jones as his authority. I would accept Mr. Jones's word on any subject; I have known both him and Cody; but I never knew of either the Generals or their subordinate officers advocating the killing off of the buffalo by us in order to exterminate them. These officers believed, as we did—those of us at least who took the trouble to give these things any thought—that as long as we had the buffalo we never could keep the Indians on a reservation; but they did not advocate the killing off of the buffalo by us. On the contrary, we were not allowed to kill one that we could not use. I have been told, time and again, not to kill them, nor let other men kill them, when we did not need them.

Captain Kelly, I think it was, made the statement that both Sheridan and Sherman had ordered guns to be given to friendly Indians to kill off buffalo. The last time I ever saw General Sherman before he retired (I saw and talked with him after that in Chicago), I acted as his orderly when he paid our post a visit. He asked me then if we still could get plenty of buffalo. They were still plentiful then. Only a short time before this I had been out with an English officer hunting them, and he had told me that probably I would live to see the last of them killed. I told General Sherman this, and his reply was, "Well, I am afraid he is right." Then, after a moment's study, he said: "And it is a pity, too, is it not? We will miss them." He would not be likely to furnish guns so that we would miss them sooner.

It took us less than twenty-five years to kill off the last of the buffalo. In May, 1866, I stood behind a butte on the Laramie plains, holding on to the heads of my team horses while a herd of buffalo that our men had estimated to contain 250,000 passed us on the run. This was the largest herd I have ever seen. In November, 1879, a Comanche chief and I killed the last one that has ever been seen on the Texas Panhandle, and the last one I have ever seen anywhere. CABIA BLANCO.

A National Game Reserve.

THE bill designated H. R. 11584, introduced by Hon. John F. Lacey, of Iowa, to authorize the setting apart of areas of the Wichita Forest Reserve as a game preserve, was passed by the House unanimously on December 13. The measure provides:

"That the President of the United States is hereby authorized to designate such areas in the Wichita Forest Reserve as should, in his opinion, be set aside for the protection of game animals and birds, and be recognized as a breeding place therefor.

"Sec. 2. That when such areas have been designated as provided for in Section 1 of this act, hunting, trapping, killing or capturing of game animals and birds upon the lands of the United States within the limits of said areas shall be unlawful, except under such regulations as may be prescribed from time to time by the Secretary of Agriculture; and any person violating such regulations or the provisions of this act shall be deemed guilty of a misdemeanor, and shall, upon conviction in any United States court of competent jurisdiction, be fined in a sum not exceeding one thousand dollars or be imprisoned for a period not exceeding one year, or shall suffer both fine and imprisonment, in the discretion of the court.

"Sec. 3. That it is the purpose of this act to protect from trespass the public lands of the United States and the game animals and birds which may be thereon, and not to interfere with the operations of the local game laws as affecting private, State, or Territorial lands."

The report of the Committee on the Public Lands to

whom the bill had been referred ran as follows:

"The Committee on the Public Lands, to whom was referred the bill (H. R. 11584) for the protection of wild animals and birds in the Wichita Forest Reserve, having had under consideration said bill, would respectfully submit the following report and recommend that said bill do pass without amendment:

"The Wichita Forest Reserve has been set apart in the Wichita Mountains in Oklahoma. This mountainous tract of land is surrounded on all sides with farming lands, and has been reserved as a permanent timber reserve. The bill proposes to permit the President of the United States to designate such part of the said reserve as in his opinion may be proper also as a game preserve for animals and birds. The President in one of his messages has asked that this authority be given as to all the forest reserves in the United States. He recommended that the Executive be permitted to designate portions thereof as havens of refuge for the small remaining portion of our game and birds. Congress thus far has not favorably acted upon any such a general law.

"This bill applies to one particular reserve, and many people in Oklahoma Territory have expressed their desire that this action be taken, and no opposition thereto has been expressed from the country affected thereby.

"Oklahoma and Indian Territory are the favorite breeding grounds for quail and grouse, and there has been a great desire expressed from all parts of the country that some suitable portion of that region be protected from hunting so as to be used as a breeding ground. The game birds from this reserve would migrate to other parts of Indian Territory and Oklahoma, and thus provide a supply for all parts of the surrounding country. This land is all public land, is now in a state of reserve, and is protected by Federal custodians. To protect the animals and birds in this forest, as well as the forest itself, would therefore not involve additional expense.

"It would be an advantage to all the people of that Territory and in no wise interfere with the use of the forest reserve. The Department of Agriculture could also obtain supplies there for purposes of propagation in other parts of the country.

"The President in his message to Congress called attention to the propriety of making some havens of refuge for the surviving wild birds, game, and fish within these reserves."

Massachusetts Quail.

BOSTON, Dec. 17.—*Editor Forest and Stream:* In reply to requests sent out by the secretary of the Massachusetts Fish and Game Protective Association, several of those who liberated quail have reported the results of their observations of the birds, and, in the main, these are similar to that of Mr. Taft, of Whitinsville, mentioned some weeks since. In several instances the reports show conclusively that the quail put out have raised good sized broods this year. So encouraging are the results of its efforts last spring that steps have already been taken by the State Association for continuing that branch of its work the coming winter and spring. There will also be systematic efforts to provide food for the remnant now left in our covers.

Our sportsmen friends in Middleboro have already renewed their efforts to feed the birds. They did a grand work in this line last winter. Among the active men of the club are two members of the State Association, Dr. W. C. Woodward and Mr. Samuel Shaw. Another name familiar to your dog-loving readers is that of Mr. George W. Lovell. The plan adopted in Stoneham at the suggestion of the well-known writer on natural history subjects, Mr. E. Harold Baynes, is an admirable one, not only for its immediate effect in saving the birds, but remotely in an educational point of view. He was able to interest the school officials and teachers in the High School, and through them induced the boys to take food out into the fields and on the borders of the wood lots, clear away the snow and deposit it in partially sheltered places where it could be found by the birds. The lad who engages in work of that kind is well started on the road to intelligent sportsmanship; and the spectacle afforded by a group of school boys loaded down with bags of grain and tramping through the snow to rescue "our feathered friends" when on the verge of starvation, cannot fail to awaken the interest of the community in general. As food for wild birds, wheat, buckwheat, cracked corn and barley are excellent, and there is nothing the quail relish more than the sweepings of hay-lofts and barn floors. In winter, when the ground is mostly bare, they will commonly find seeds of one kind and another sufficient to sustain life. But when these are buried beneath the deep snow the bird has small chance.

It is the opinion of sportsmen with whom I converse that our gunners will never again see live quail so numerous as they were in the fall of 1903, unless strenuous efforts are made to save what we now have from starvation and to plant as many as can be obtained from outside the State. By the way, I have lately seen a report that the sportsmen of the Province of Ontario are circulating a petition to the Government for an appropriation for the purchase of quail to restock their covers.

One of the newly organized clubs in our State is known as the "Sportsmen's Protective Association of Eastern Massachusetts." The first fox hunt of the club occurred on Thursday the 15th. Some 75 members in khaki and well armed followed the pack of about thirty hounds. Old hunters called it a "poor day"—too cold, and the footprints of the fox were quickly filled with the dry snow, and did not hold the scent. However, one fox was killed, the fortunate hunter being my friend Dr. A. E. Merrill, of Somerville. The scene of his triumph was the westerly part of Wilmington. Another was wounded after a two hours' chase by Mr. Sidney Buck, of Wilmington. About 3 P. M. the party rounded up at Masonic Hall, where dinner was served. Many towns of eastern Middlesex and western Essex are represented in the club, and at this meet were men from a dozen or more towns and cities. Most of the members are enthusiastic sportsmen of various types; but several are expert quail and partridge hunters. To such the destruction even of one fox was a happy occurrence.

The Fish and Game Department of Maine is constantly adding to the exhibit of trophies at Augusta. A bear caught by Warden Durgin near the forks of the Kenne-

bec is a recent acquisition. Another is a big landlocked salmon, taken at Square Lake, which weighed 18 pounds and was 32 inches in length.

Mr. C. S. Smith, of Goodwin's Mills, has shot a pure white albino deer in the eastern part of the State, said to be the only one killed in that section for many years.

Two successful women hunters recently returned from Norcross to their home in Bangor with one and two deer respectively. Another brought out one from Moosehead. Miss Mabel Winslow, of Beverly, Mass., and Miss Marion Ashley, of Wilkesbarre, Pa., each secured a moose this week. At midnight Thursday the Maine hunting season closed. Moose shipments have been 220 this year, as against 217 last year. Total of deer 4,271 this year, 4,609 last year. So far as the providing of funds for the enforcement of the game laws is concerned, the friends of the non-resident license law pronounce it a success.

A caribou was killed by Mrs. Avery Morehouse, who was hunting with her husband of Zealand Station, N. B., on the Keswick waters. Mr. Morehouse killed a monster bull moose with antlers spreading more than 50 inches.

CENTRAL.

The Shiras Pill.

OKLAHOMA, O. T., Dec. 13.—*Editor Forest and Stream:* I am strongly in favor of House Bill No. 15601 for the protection of migratory birds, as printed in issue of FOREST AND STREAM December 10. The preliminary clauses of the bill express in the best possible language the reasons why such a law is necessary, and I hope the bill may become a law. J. C. CLARK, Territorial Game and Fish Warden.

THE DELAWARE GAME PROTECTIVE ASSOCIATION. A. D. POOLE, J. DANFORTH BUSH, President. Sec'y and Treas.

WILMINGTON, Del., Dec. 14.—*Editor Forest and Stream:* I duly received your letter of the 8th inst., and I have carefully read the proposed Federal game law (House Bill No. 15601).

Doubtless the framers of this law have looked into the legal aspects of it and have satisfied themselves that the Federal Government can assume custody of migratory birds and pass laws for their protection, but this is a point upon which I fear litigation would ensue. Assuming, however, that this can be sustained, I think the law a very good one, and should be productive of much benefit if the Department of Agriculture can enforce the regulations which by the act it is authorized to adopt. In my experience it is quite useless to pass laws for the protection of game without at the same time providing for their enforcement, and if the Department can undertake to do this, then by all means let us have the law.

It would, in my opinion, be better if Section 1 were made more specific, giving the scientific names of the birds it is intended to protect, as is done in the model bill of the American Ornithologists' Union protecting non-game birds, as it is well known that the common names change in different localities; for instance, in some parts of this State woodcock are known as "snipe."

A. D. POOLE, President.

PITTSBURG, Pa., Dec. 14.—*Editor Forest and Stream:* Your favor of the 9th at hand and noted. I am heartily in accord with the bill introduced in the House by Hon. George Shiras 3d, to give Federal protection to wildfowl. I have felt for years that unless some protection was afforded migratory birds, and all spring shooting stopped, that it would be but a very short time until they were exterminated.

I will take pleasure in doing everything in my power to help this bill along. W. M. KENNEDY.

GRAND FORKS, N. D., Dec. 14.—*Editor Forest and Stream:* I have your favor of the 9th requesting my views on the proposed Shiras bill for Federal protection to migratory game birds of the United States. I am in sympathy with this or any other measure in the interest of game protection; but I think the bill in question should stipulate and absolutely prohibit spring shooting, and give each State the right and power to fix the open season during the fall, as conditions and dates of maturity of the different game birds vary materially in the different States, and those interested, being residents of a State, are in a better position to designate by law the open season than would be a Federal officer.

CLARENCE A. HALE.

BROOKLINE, Mass., Dec. 12.—*Editor Forest and Stream:* Without doubt a Federal law for the protection of migratory game birds, by prescribing uniform close seasons for certain fixed zones of territory, and containing practical regulations for its enforcement, would be a grand good thing.

My first thought is, would such a law be held to be constitutional? But that is a question for lawyers, not for laymen. If Mr. Shiras has solved the problem, he deserves the support of all sportsmen.

The next question is, Could such a law be enforced? It is not enough to say, "It shall not be lawful to shoot," etc., or to declare "penalties by fine or imprisonment." That is the common wording of many of our present State laws, a majority of which would be good enough if they were really enforced. What is needed is clear, practical provisions for the constant watch for and detection of violations, and the wherewithal to keep such machinery in constant motion. We pass laws to preserve order in the streets, to prevent thieving, murder, and other crimes, and then we put our hands in our pockets and pay our taxes to keep policemen continually on the watch that such laws shall not be broken. If we want effective game laws, we must similarly provide for their enforcement. No better provision can be made than by the imposition of a game license tax; the money so secured to be kept as a separate fund, and used for the permanent employment of efficient game wardens.

If Section 2 of the proposed bill could be thus amended, the bill would be strengthened, though I confess I do not see how a Federal bill could contain provisions for the uniform imposition of gun license taxes. Such taxation probably belongs wholly to the States. This is the

weak point of the plan. Even if Federal game legislation be constitutional, it would be of little use if the means of enforcement were left to the several States. Some would do something, some more, some less. There would be the same confusion as to means of enforcement as there now is to close seasons. To hope that Congress would appropriate money for game protection is visionary. It is doubtful if the people at large care much for game protection; they don't yet realize it pays—that it brings in money to the community; therefore they certainly will ask that sportsmen themselves furnish the money needed. There is no practical way for sportsmen to contribute the necessary funds other than gun license fees.

So I fear that even if we should get a Federal game law, it would not accomplish all we hope. The situation, though, would be better than it is now; and that would be something gained.

F. S. MEAD.

PHILADELPHIA, Pa., Dec. 13.—*Editor Forest and Stream:* I was very glad to see the other day that there are beginning to be some results from my long letter published in *FOREST AND STREAM* last summer on the subject of protecting wildfowl by Congressional legislation, which would be enforced uniformly in all the States. In that letter I expressed some doubts as to whether Congress had the constitutional power to protect wildfowl in all the States and enforce its protection by fine and imprisonment. But in your issue of last Saturday you describe a bill which has been introduced into Congress by Mr. George Shiras 3d, of Pennsylvania, to accomplish wildfowl protection and put the matter under the control of the Department of Agriculture. Mr. Shiras evidently thinks that this bill is constitutional, and the ground it takes that the migratory wildfowl are, so to speak, interstate birds, belonging to all the people and not to any one State, is very interesting, and I hope it will prove to be legally sound.

We can never accomplish very much in wildfowl protection until we have the whole force of the National Government on our side. Let us give every encouragement to Mr. Shiras and his friends in their praiseworthy efforts. A beginning has now been made, and it was some sort of beginning which I have always longed for, and which I advocated in my letter. We can now move forward, put the question through its regular stages, and feel our way to some satisfactory result. I am convinced that all that is required to bring back the wildfowl to the numbers they were sixty or seventy years ago is merely a little ordinary thrift and common sense in the protection of them, administered by laws which can be enforced without fear or favor. I feel sure that *FOREST AND STREAM* will not be behind hand in backing up Mr. Shiras.

SYDNEY G. FISHER.

From the Bay City (Mich.) Tribune.

CONGRESSMAN SHIRAS, of Pennsylvania, has introduced a bill to protect migratory game birds of the United States. The ground taken as the motive for the introduction of this bill is that it has been demonstrated by experience that laws passed in the States and Territories to protect game birds within their respective limits have proved insufficient to protect migratory birds, and the extermination of many valuable species of the same is threatened.

The measure is cordially supported by *FOREST AND STREAM*, which contends that in practice the protection of

wildfowl by the States has proved ineffectual, and if the migratory species are to be preserved from utter extermination in a short period of time they must have the protection which only the Federal Government can give.

It contends, further, that the thoughtful sportsmen of the country will indorse the bill in question as the only solution of the vexed problem of protection to migratory birds yet suggested. It calls on sportsmen, as individuals and in association as clubs and game protective societies, to declare for this bill and give it their cordial and unreserved support. It is to be borne in mind that the only species of fowl aimed at in the proposed legislation is the migratory birds which breed in districts beyond the State boundaries in the north and pass, after a temporary stay, into other districts and out of the State boundaries to the south, and being only temporarily and transiently in the limits of the State they are not properly under its jurisdiction, nor may they be efficiently protected by it.

Many of the most intelligent men of Michigan have expressed satisfaction with the Shiras bill, and promise to lend their influence in getting for it the recognition to which they believe it is to be entitled, as the only practicable method by which migratory birds can be protected

Editor Forest and Stream:

I had intended to write a few lines commendatory of the measure for national game protection, but, in lieu of same, I will inclose a clipping from the *Pioneer Press*, giving Mr. Fullerton's view upon the bill, which will certainly carry more weight than anything I might say. Who will oppose this bill when it comes up, I cannot imagine, nor can I conjure up any reasons that may be given for its "killing," unless some "Blunt Old Man" should arise in his wrath and object to any law that would prevent his killing a duck standing or waddling, asleep or awake, swimming or flying, in winter or in summer, or in spring, or in autumn.

CHARLES CRISTADORO.

S. F. Fullerton, Executive Agent of the State, Fish and Game Commission, has written to Senators Nelson and Clapp and the Minnesota Congressman, urging them to support the Federal game bill which is to come up in Congress at the short session.

The bill was introduced by Congressman Shiras, of Pennsylvania, and it is endorsed by the game wardens of the States and sportsmen throughout the country. The bill provides especially for the protection of migratory game birds.

"It is time that some such law is passed by Congress," said Mr. Fullerton. "Few of the Northwestern States have laws against spring shooting of game birds. Minnesota has such a law and some of the other States have imperfect laws, which do not protect the game bird as it should be protected. From the time the birds leave this State to winter in the south until they return in the nesting time in spring, they are 'pounded' all along the route. It ought to be a crime for any one to shoot game birds during the nesting season, and yet this is just what is done from the border to the gulf. To do this is like killing the goose that lays the golden eggs."

"I know that the bill which is to come up for discussion at this session of Congress will have the approval of every sportsman in the United States. Special laws to achieve the same end are being agitated in nearly

every State in the Union, but I think a Federal law enforced by officers especially appointed for the purpose, would be more effective than a mass of conflicting laws."

The law contains features that have been aggregated by sportsmen for many years. Advocates of the bill say that extermination of game birds is threatened. The valuable species which are destroyed by the wholesale, it is said, cannot be restored under State laws. Mr. Fullerton says that if the bill is passed this winter to go into effect next spring, by the time the game bird season opens in Minnesota in the fall, the increase will be very great.

In West Virginia.

MORGANTOWN, W. VA.—*Editor Forest and Stream:* The mountains of West Virginia still afford some sport for the gunners. Recently one of our fellow townsmen, Glenn Hunter, went up into the mountains about fifteen miles for a few days' hunt, and killed two fine wild turkey gobblers, each weighing 19 pounds. As a result a few of his favored friends were treated to a turkey dinner. I was among them, and can testify that wild turkey fattened on nuts, as in this case, is of delicious flavor. May the noble bird multiply and wax fat, and never cease to exist in our mountain State. Mr. Hunter reports them in considerable numbers, and seemingly very little hunted. Small game of all kinds is scarce this season. A letter from a friend in Randolph county says he secured a fine buck October 19. The morning he left the woods—October 21—there was a little tracking snow, and they tracked five different bears, which would indicate that they are quite plentiful.

On the 8th inst., a six-year-old child of Horace Baker, in Logan county, was attacked by a black bear while playing near the edge of a clearing 300 yards from the house. Before help could reach her she was badly crushed and bruised, and the clothing was torn from her body. Her recovery is doubtful. She was rescued by her sixteen-year-old brother, who killed the bear with his father's rifle. It weighed 300 pounds. This is unusual, but the report seems well founded. There is now a movement on foot to enact a law to protect the bear in West Virginia, and put him on the list of game animals, to be killed only at certain seasons of the year. Reports come in from time to time of deer being killed in different parts of the State.

There are prospects of a lively hustle among aspirants for the office of State Game Warden, and it is hoped that some energetic person who has the interests of game protection at heart may be appointed, for it is well known that game laws are violated without interference in some parts of the State.

EMERSON CARNEY.

A Long Memory for a Sight.

TORONTO, Canada, Dec. 9.—*Editor Forest and Stream:* I have looked over a lot of files of *FOREST AND STREAM*, but cannot find the address of the seller of the "Barger sight" for shotguns. It was advertised with a plate. Can you help me out by sending me the address, and oblige an old subscriber.

W. B. P.

[Our correspondent has a good memory. The sight in question was advertised for about six months in 1900 by Gray & Barger, 309 Broadway, New York. We have not heard of it lately, and do not know that it is still made.]

SEA AND RIVER FISHING

Fish and Fishing.

A Fifty Thousand Acre Preserve.

THE Canadian Camp of New York, which has now over five hundred members, is contemplating the purchase of a large hunting and fishing preserve in northern Canada. It is understood that the committee charged with the necessary arrangements has secured an option upon a very desirable territory of some 50,000 acres in extent, situated to the north of Lake Huron in the Province of Ontario. Through the middle of this territory runs the Mississaga River, which rises close to the height of land that separates the waters running into Hudson Bay from those falling into the great lakes. The river is navigable for about 250 miles, and I have it from one who has canoed many of its connecting waters, that its lake expansions and tributary streams afford some of the most picturesque and gorgeous landscapes of the continent. The Mississaga rises some few miles south of Biscotasing and Winnebago, which are on the main line of the Canadian Pacific Railway, between Sudbury and Chapleau, and empties into Georgian Bay near Blind River, a station on another branch of the Canadian Pacific Railway. Throughout the entire length of the river there are, running into it, from the east and west, many lakes and streams affording good fishing. These streams and many of the lakes are well stocked with speckled trout and bass, and a number of the larger lakes offer excellent muskellunge and lake trout fishing. Catches of bass ranging from three to six pounds, and of brook trout weighing from two to five pounds have been reported from some of these waters, so that the lines of the campers bid fair to fall in pleasant places, and to be cast in waters well supplied with fish.

A Charming Letter Writer.

A few days ago the mail brought me a delightful letter from that charming writer, Mr. Charles Hallock, whose sayings and doings for the last third of a century

and more, have been closely followed, not only by successive generations of American sportsmen on the south of the international boundary line, but also by a group of devoted personal, literary and angling friends in Quebec, of whom the following, among others, besides the present writer, still survive: Sir James M. LeMoine, J. U. Gregory, Geo. M. Fairchild, Dr. Geo. Stewart and William C. Hall. Sir James no longer goes a-fishing, but all the others are still in the ring. And though Mr. Hallock wrote me some time ago that he had probably killed his last salmon and sold his rods, there are anglers in Canada, including the undersigned, who still hope to be able to tempt the veteran founder of *FOREST AND STREAM* to again cast the fly for trout in some of the many beautiful lakes or streams within easy distance of the city of Quebec. And that the hope is a very moderate one after all, will be at once admitted when it is recalled how that sprightly Boston youth of over eighty summers—Mr. Walter Brackett—with the brightness of the springtime in his eyes, despite the snows of many winters upon his head, still does battle to the death with the valiant salmon of the Marguerite, sometimes, according to the stories told by his guides, insisting upon standing up in the canoe while following a well-hooked, freshly run fish through the rapids.

But the Marguerite is far away from Mr. Hallock and his letter, and I must return to the latter, from which the following is a question of interest to the readers of "Fish and Fishing":

"In your article on the sea trout in *FOREST AND STREAM*, of Nov. 19, you have summarized all that is essential in order to establish this fish's identity. I will not name the word 'species' or even 'variety,' in the same breath; for so long as bone structure is accepted by scientists as the basis for differentiation or classification, their contention that the marine and fluvial trout are the same, will stand. But as distinct types they are as different as two fishes can well be, and anglers and commercial fishers so recognize them. This is necessary, for practical purposes. Exact science is exact truth, but pseudo-philosophy is an attempt to

dislodge the truth. If we despise the truth we catch no fish."

Whether or not it be at all times true that if we despise the truth we catch no fish, there is no doubt that it has frequently been charged against anglers—though most unjustly so, no doubt—that when they catch no fish they are apt to despise the truth.

We certainly do not necessarily despise the truth when we employ, as a lure, the gay deceit of the artificial fly tyer, for all our angling skill and entomological science are drawn upon to enable us the better to deceive the fish into the erroneous belief that the bunch of feather, tinsel and silk or wool upon the shank of the hook is a fluttering insect, skipping over the surface of the water; so true to nature must we necessarily be in our dressing and in our casting of the artificial fly, in order to catch fish. This is our idea of truth. What the hooked trout thinks of it, as with hollow voice he cries

"Dear mother, had I minded you,
I need not now have died,"

is altogether another story. Nevertheless, if we had despised the truth—the true principles of the science of correct angling—we should, in all probability, as Mr. Hallock has said, have caught no fish.

It is most gratifying to those who have recognized what the ichthyologists call for as establishing the differentiation of species and varieties, to have from so eminent an authority as Mr. Hallock, the admission that the marine and fluvial trout are the same, but it is only what was to have been expected of so careful an observer, and more than thirty years ago he had declared in "The Fishing Tourist," that it is the "varying marks on the body and tints of flesh, produced by extraneous causes, that so greatly confuse the attempts to determine and classify the apparent varieties of the *Salmo* family." Hence the many distinct types of fish to be found in the same trout stream or pond. I know more than one spot in a small trout stream, and have no doubt that almost every one of my readers can think of just such another vantage ground, where it is quite possible to stand and catch two distinct types of *Salvelinus fontinalis*. On the one side is a rapid running

over bright golden sands, where the fish are as brilliant as coin fresh from the mint. On the other is deep still water under the shadow of an overhanging tree, containing fish so much darker in their markings and tints that the uninitiated would be apt to declare them a distinct variety from the first. When the differences are so marked as this in the external appearances of fish inhabiting the same water, it is surely not to be wondered at that, as Mr. Hallock points out, the marine and fluvial trout, though identical in both species and variety, should constitute two distinct types. Differences in coloring, as we all know, cannot constitute distinct varieties, and the sea and river trout are identical, not only in bone structure, but also in rays, in the number of pyloric appendages and in the arrangement of teeth upon the vomer, which are all taken into consideration by scientists, in their study of what is known as comparative zoölogy.

Mr. Samuels, and The Old Angler.

Thus far had I got, and no farther, when my New York mail arrived, bringing me the issue of FOREST AND STREAM for Dec. 10. I had terminated all that I expected to have to say about the sea trout, when upon opening my paper I was startled to find that the references of nearly a month ago, to my late experiences with the so-called sea trout of the Saguenay had drawn out length commentaries from both The Old Angler and Mr. Samuels. The latter appears to be singularly unfortunate with the printers. Immediately after having explained away one mis-statement which apparently arose from a misprint, he is made to appear responsible for another. At least this is the only explanation which seems possible for his statement that, "In FOREST AND STREAM of Nov. 19, Mr. Chambers has something in relation to the silvery beauties, which, although written in a most interesting manner, is not entirely free from error, or which will not, at any rate, excite some discussion," for that it has excited discussion requires no better proof than the very letter which Mr. Samuels was then engaged in writing. Nothing would probably be gained by a further discussion of the relative amount of truth and error to be found in the personal views expressed by the artistic author of "With Fly-Rod and Camera," for after all, who shall be the judge between us as to what constitutes truth and what is error? With due apologies to Mr. Hallock, of course, we can neither of us afford to despise the truth if we would catch any fish next summer, but in this age of bustle and hurry, and especially at this season of the year when everybody is rushing to get ready for Christmas, it would probably be idle to convince anybody what is truth and what is error concerning the sea trout. Even nearly 1,900 years ago, to quote Lord Bacon, "What is truth?" asked Pilate, and would not wait for an answer.

And after all, if there be error in the article from my pen, to which Mr. Samuels refers, apart from what I have quoted from others, he has not indicated it. On the contrary, we appear to hold very similar views. Mr. Perley's statements were unfortunately not credited to that gentleman, because, for the moment, when copying them from the memo, which I had made of them from his original report, some months ago, I was unable to recall their source. I have to thank Mr. Samuels for the generally courteous appreciation of the sketch, and have no reply to make at the present time to his criticism of some of Mr. Perley's statements, farther than to say that the contents of that gentleman's reports have usually been accepted as authoritative, and that my reason for quoting from them in regard to the waters of Prince Edward Island, is that these latter are about the only accessible ones in Eastern Canada with which I am not personally acquainted. In common with all readers of Mr. Samuels' writings, I shall look forward with no small interest to the appearance of his promised monograph on the sea trout, which may inaugurate a new era of the present discussion.

If, instead of telling a little side experience of my own with sea trout in the Saguenay, and quoting from Perley as to his in other waters, I had plunged headlong into the controversy between The Old Angler and others, taking sides, and asserting my own personal views as to the identity of the so-called sea trout, bolstering them up, moreover, with boastful recapitulation of all the waters in which I had fought and killed it, I should probably have escaped all the misrepresentation with which The Old Angler favors me in FOREST AND STREAM. How amusing will his reference to my "single season's study" of the sea trout appear to the elder Hovingtons and the other Tadoussac guides, with whom I angled for the fish in the lower Saguenay more than a quarter of a century ago, as well as to the guides and angling companions with whom I have killed the silvery beauties in various streams of Newfoundland, and in many of those flowing into the Baie des Chaleurs and through the interior of Labrador into the Gulf of St. Lawrence. And upon what has The Old Angler based his gratuitous assumption? "There is nothing," he says, "in the article to indicate that Mr. Chambers ever saw these sea trout except in the Saguenay and some of its tributaries." There is absolutely nothing in the context to lead one to conclude that "last summer was the only time" I had seen them. There is nothing in the article to show that I ever went to school, that I was ever in Europe, or ever visited New York. Then, I suppose, that I could never have been there!

Similarly, as to the scope of the article in question, The Old Angler simply assumes what he imagines that it implies, namely that these sea-run trout are denizens of the sea, etc. Now it implies nothing of the kind. I have no objection whatever to be judge and criticised for what I write. It is nothing but right that I should be. But I do strenuously object to be held responsible for what I have neither said nor implied, nor yet intended to imply. And I most sincerely regret the unwarranted assumptions which have been drawn from what I have purposely omitted to say, because I am now compelled to express opinions as to the recent controversy, which I have carefully avoided up to the present time, believing that it was not the part of modesty to intervene, and that neither my own ipse

dixit nor yet that of Mr. Hallock or Mr. Samuels, or of The Old Angler would have any weight in settling the matter, or could possibly be accepted as final or authoritative, in view of the positive findings of those who occupy the seats of the mighty in piscicultural lore and who speak with the recognized authority of science. Silence as to my own views, now, would simply mean assent to the opinions which have been gratuitously and wrongly attributed to me, and which are exactly the opposite of what I really hold.

Unlike those of Mr. Samuels, my opinions on the sea trout question, though differing but little, if at all, from his own, have never changed except to become more and more decided. Eight years ago I published what I had then held to be the truth on the subject for nearly a quarter of a century. No controversy was being publicly waged on the sea trout question at that time, so far as I can remember at present, and so my expression of opinion simply passed without comment for what little it was worth. At page 245 of "The Ouananiche and Its Canadian Environment," I wrote, in 1886: "These fish go down to the sea in great shoals, and, after seeing and fattening upon the wonders of the deep, reascend to fresh water, to spawn, most gorgeous in their freshly burnished liveries of silver and olive and purple and crimson and gold." This surely does not look as if I considered them to be denizens of the sea. And after speaking of the fabled specimens of which I had been told, but had never seen, and which, by the way, I never expect to see—described, as they are, to differ from *fontinalis* in more respects than the immaterial one of coloring—I added: "But for this, and sometimes even in spite of it, I am tempted to doubt the existence of any distinction but that of anadromy, between these gorgeous sea trout of the estuaries of rivers flowing into the gulf and the brook trout of our inland waters. In other words, are they not to these latter what the sea salmon is to the ouananiche—a fresh-water species that has acquired the sea-going habit?"

Years ago I had made simple comparative anatomical studies of the marine and fluvial types of *fontinalis*, as Mr. Hallock has happily termed them, and had become convinced myself that they were identical in structure. Last summer, I was tempted by the late controversy to pay rather closer attention to the fish and its habits of feeding and fighting than on former visits to the Saguenay, and hence the few rather unconnected notes, which have been the innocent cause of so much discussion. Into the merits of the controversy I had never any intention of entering.

E. T. D. CHAMBERS.

Labrax and Striped Bass.

NEWPORT, R. I., Dec. 7.—*Editor Forest and Stream:* In reading "Forest, Lake and River; the Fishes of New England and Eastern Canada. By Frank M. Johnson. Two volumes. Boston. Printed for subscribers, 1902," I was struck by two errors in an article on the striped bass by Dr. Heber Bishop. He says: "As far back as the days of the ancient Greeks, Archetratus speaks of this fish (the striped bass) as an 'offspring of the gods.'"

There is no such person as Archetratus. Arcestratus was a Greek poet of Sicily of the third century B. C. He is chiefly known from a poem on cookery, which has come down to us in fragments, and is quoted chiefly by Athenæus.

The passage in question is found in Athenæus VII., p. 311a. In this the poet says: "Whenever you go to Miletus, get the Labrax, the child of the gods." (*τον Δεόπαιδα λάβρανα*.) That is unimportant, the omission of the "s" being perhaps a printer's error.

The second I cannot understand. Liddell & Scott's Lexicon says that the *λάβραξ* is "a ravenous sea fish, perhaps the loup-de-mer bass." Century Dictionary gives the bass of the Greeks and Romans as *Labrax lupus*. Jordan, in his "Catalogue of the Fishes of Greece," p. 259, says that the *Labrax* is the *Dicentrarchus labrax* of the Serranidae family.

To call the fish spoken of by Arcestratus the striped bass is absolutely incorrect. The striped bass (*Roccus lineatus*, Bloch), is entirely unknown in European waters, and even the specimen described by Bloch is an American one in an ichthyological collection. To make assurance on this part doubly sure, I wrote to the United States Bureau of Fisheries in Washington on the subject, and they assured me I was entirely correct in my statement that the "striped bass was unknown in European waters."

I was astonished to see such a statement in a book published in a limited edition at a great cost, and purporting to be the latest authority on each fish described.

Having been a fisherman of the striped bass for over thirty years and a devoted admirer of his, I can not refrain from drawing attention to this misstatement of fact.

DANIEL B. FEARING.

New York Fishculture.

FIGURES from the forthcoming report of the Forest, Fish and Game Commission, which is now being compiled by the secretary, Mr. John D. Whish, show that the total output of game fish during the season of 1904 was 5,045,914. This is an increase of 583,459 over the output of the previous year, which was considered high-water mark in the hatchery work. The game fish distributed included 2,857,415 brook trout, 1,519,389 brown trout, 416,062 lake trout, and 251,922 rainbow trout. There were saved from failing waters a total of 4,450 game fish, mostly black bass, which were distributed near the localities where they were taken.

Over 34 per cent. of the game fish distributed were sent out in the fingerling stage, which is that most favored by the Commission. About 8 per cent. were distributed as yearlings, which went for the most part to the larger bodies of water. The Commission as a rule does not furnish yearling fish, as the hatchery output is taken by the fingerling applications, but the sudden coming of cold weather last fall made it necessary to carry over many of the trout until spring. Next season's output will be

almost entirely fingerling fish, and but few fry will be sent out, as additional accommodations have been provided at the hatcheries to hold the fish until the fingerling stage is reached. The capacity of the Catskill Mountain hatchery at Margaretville has been almost doubled in order to meet the requirements of that region, which is difficult to reach from other sections of the State.

The Commission hopes that another season will see the beginning of black bass culture, as rearing ponds are now being built at Constantia for this purpose. The total cost of running the State hatchery system is about \$50,000 yearly.

"Forest and Stream" Designing Competition No. IV.

Sixty-foot Waterline Cruising Power Boat.

\$225 in Prizes.

THE three designing competitions previously given by FOREST AND STREAM have been for sailing yachts. In this competition, the fourth, we are to change our subject and give the power boat men an opportunity. The competition is open to amateurs and professionals, except that the designers who received prizes in any of the three previous contests may not compete in this one.

The following prizes will be given:

First prize, \$100.

Second prize, \$60.

Third prize, \$40.

Fourth prize, \$25, offered by Mr. Charles W. Lee for the best cabin arrangement.

Mr. Henry J. Gielow, N.A., has very kindly agreed to act as judge. In addition to making the awards, Mr. Gielow will criticise each of the designs submitted; and the criticisms will be published in these columns.

The designs will be for a cruising launch propelled by either gasoline or kerosene motors, conforming to the following conditions:

I. Not over 60ft. waterline.

II. Not over 4ft. draft.

III. A signalling mast only to be shown.

IV. Cabin houses, if used at all, to be kept as low and narrow as possible.

V. Construction to be of wood, and to be strong, simple, and inexpensive. The cost of the boat complete in every detail must not exceed \$9,000.

VI. The location of tanks and engine or engines to be carefully shown. Either single or twin-screws may be adopted. The power and type of the motor must be specified.

VII. The boat must have a fuel capacity sufficient to give a cruising radius of 700 miles at a rate of 8 miles an hour. The maximum speed shall not be more than 14 miles nor less than 10 miles. The estimated maximum speed must be specified.

VIII. All weights must be carefully figured, and the results of the calculations recorded. A thousand-word description of the boat and a skeleton specification must accompany each design.

The design must be modern in every particular, without containing any extreme or abnormal features. We wish to produce an able, safe, and comfortable cruising boat, one that will have ample accommodations, so that the owner and his wife and two guests, or three or four men, can live aboard, and one that can easily be managed at all times by two or three paid hands in addition to the steward. The draft is restricted to 4ft. in order that the boat may have access to nearly all harbors, canals and rivers North and South, and may thereby widely increase the cruising field. We have in mind a boat that can be used North in the summer and South in the winter, and a craft well able to withstand outside passage along the coast in all seasons of the year.

Special attention must be given to the cabin arrangement. The interiors should be original, but devoid of any impractical features. Arrangements should be made for a direct passage forward and aft without going on deck.

Drawings Required.

I. Sheer plan. Scale, 1/2in.=1ft.

II. Half breadth plan. Scale, 1/2in.=1ft.

III. Body plan. Scale, 1/2in.=1ft.

IV. Cabin plan and inboard profile and at least one cross-section. Scale, 1/2in.=1ft.

V. Outboard profile. Scale, 1/2in.=1ft.

The drawings should be carefully made and lettered; all drawings should be preferably on tracing cloth or white paper, in black ink. No colored inks or pigments should be used.

The drawings must bear a *nom de plume* only, and no indication must be given of the identity of the designer. In a sealed envelope, however, the designer must inclose his name and address, together with his *nom de plume*.

All designs must be received at the office of the Forest and Stream Publishing Company, 346 Broadway, New York, not later than February 3, 1905. All drawings will be returned. Return postage should accompany each.

The FOREST AND STREAM reserves the right to publish any or all the designs.

YACHTING

LITTLE CRUISES AROUND BOSTON.

By William Lambert Barnard.

MOST of us are victims of circumstances, and those which controlled my goings and comings last summer prevented my taking, with one exception, anything more extended than mere "week-end" cruises. I have, however, long thought that a description of a few of the short runs open to Boston yachtsmen might prove of interest, not only to those unfamiliar with the home waters of America's greatest small boat fleet, but even (as recalling the scenes of so many of their most pleasant memories) to my fellow Bostonians. Let this idea, then, be my apology, if you conclude that one is due you, for writing of these runs, so short as to scarcely deserve the name of cruises.

Sassoon is a keel knockabout, was designed by Messrs. Stewart & Binney, built at Quincy by McIntyre & Kirk in 1894 for Mr. T. W. King, and was originally known

as Hobo. She is 20ft. 5in. on the waterline and 29ft. 6in. over all. Her extreme breadth is 7ft. 4in., and her draft but 4ft. 3in. Despite this moderate draft she goes out to windward in a sea and blow with as little leeway as any boat on which I have ever sailed. So well turned and fair is her design, that although her displacement is seven thousand pounds, she will slip along with astonishing zeal in the least chill of a breeze. Her ballast, which was originally of iron, is now lead (3,500 pounds, all outside), and keeps her on her feet long after she should, from motives of comfort, have been reefed. I must confess that she is very lively in a short sea, and would be improved were a third of her ballast well distributed inside.

Her mainsail and jib contain approximately 520 square feet of canvas. The mainsail has one objectionable feature, in that the foot is not cut up enough, the boom swinging at right angles to the mast, and as it extends some three feet over the taffrail, has to be topped up a bit when running in a seaway.

Her ends are sharp—the stern overhang surprisingly so; add to this the fact that her midship section has great deadrise, so that her garboards are low and well filled out, and you have the secret of her clever performances in the shortest and steepest seas.

I.—Cape Cod Bay Way.

Saturday, June 18.—With my wife at the tiller, Sassoon left her moorings in Hingham harbor at 2:30 P. M. under No. 1 jib and single reefed mainsail. The W.-N.W. wind was fresh and gusty, and the sky full of clouds. Hing-

wrecked steamer Kiowa well to port. She was sunk last February in a howling snowstorm by colliding with another steam vessel.

Before reaching Minot's Light, we met the steamers Cape Cod and Old Colony returning from their daily jaunts to Provincetown and Plymouth respectively. We stood beyond Minot's to the Davis Rock can buoy, and then made the course S. by E. $\frac{1}{2}$ E. for Scituate. Inshore of us was an 18ft. knockabout running along the beach with balloon jib set. She had more of a southerly air than we were getting outside, but as we drew in toward the beach we began to get the wind off the land, about W.-S.W.

Dusk was fast approaching as we ran beyond the old light tower and northerly breakwater until the entrance bore W. by N., when we stood in close-hauled against a strong ebb tide. (A red lantern is displayed from a post on the breakwater at night.) We could not fetch clean up the channel, and made several little tacks, hardly gaining a foot against the tide in a dying breeze. Finally, in a desperate attempt to cheat the current, I stood just too far, and Sassoon gently slid upon the mud on the north

ham harbor's mouth is blocked by three islands long ago named for a prominent character in the town's history, i. e., Ragged Sarah Langley. The stern realists of the United States hydrographic office have, however, charted the middle island as "Sailor." Passing between Sarah and Langley islands we could fetch Hull Gut easily, and were fairly off for our little holiday.

Tearing through the Gut with a fair tide, we eased off our sheets, and passing friends in the neat sailing dory Inch Bug, settled into our stride. Finding the wind steadier and lighter than in the harbor, we shook out our reef at 3:50, a moment or two after passing the Allerton beacon buoy. We then swung off dead before it for Harding's Ledge gas buoy, leaving the masts of the

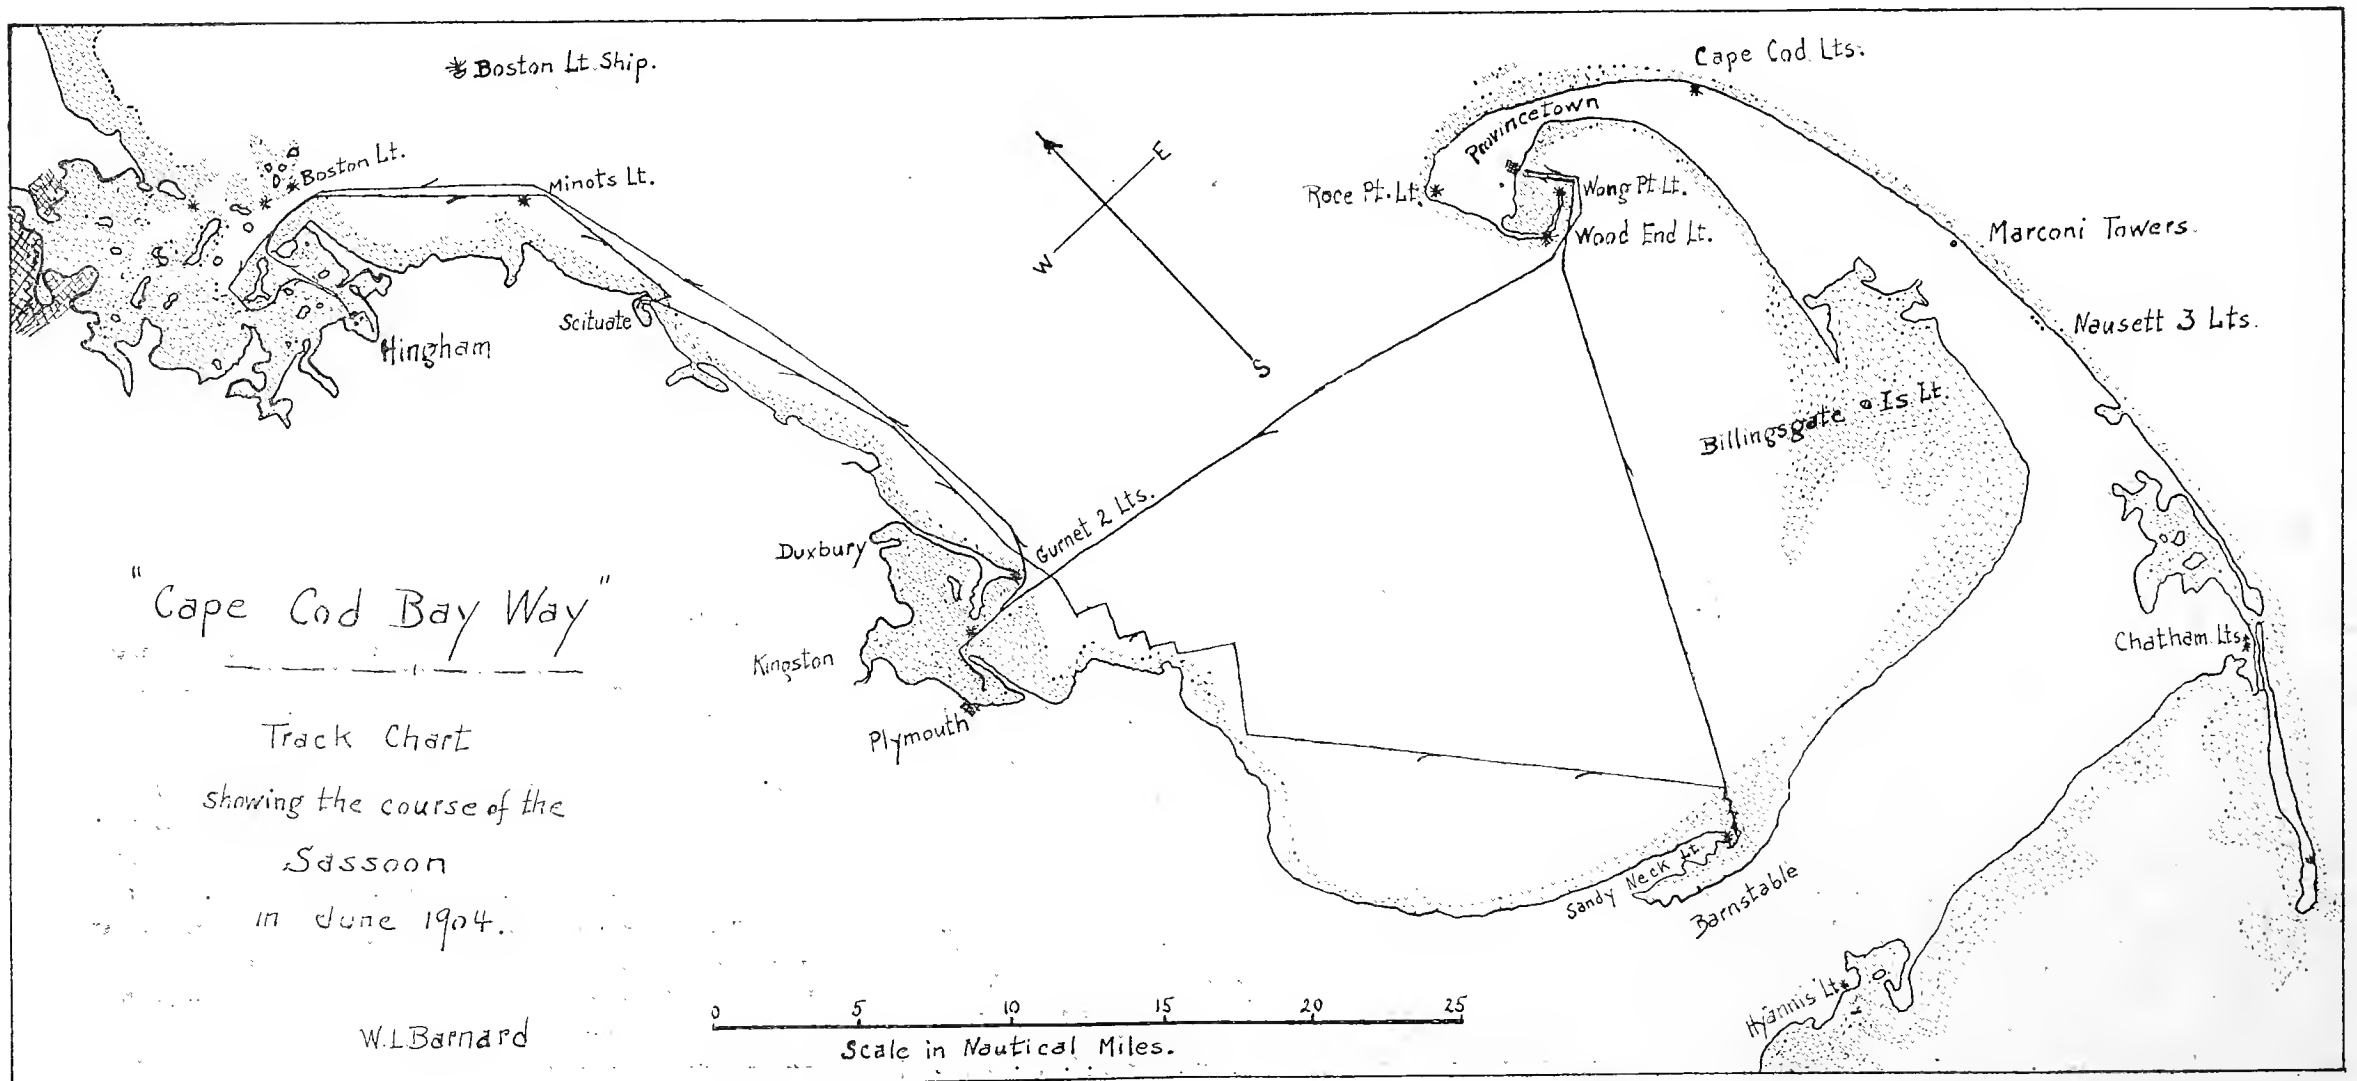

side of the channel. I tried towing and kedging without effect; I pulled the 25-pound anchor and its 30 fathoms of rope right through the mud back to the boat.

As the ebb tide had about two hours to run when we grounded, we had to compose ourselves for a long wait, so shoved the main boom (the sail was lowered) way out to starboard and listed Sassoon well over on that (the shoal) side, so that she couldn't dive into the channel deck first. Then tilted the stoves into an erect position and cooked supper, telling my better half that it was a very English situation, and so presumably fashionable. But for once I found a woman who did not care to follow the fashions.

Well, at dead low tide we were in ten inches of water (mostly grass at that), and so far laid out that our rail was two or three inches under water. A plumb-line from the port side of the companionway hatch would

Old "Bill" Smith, of Quincy, built on a cabin house some years after she was launched. It is low, with a beautifully flat top, and gives 4ft. 4in. head room—4ft. 8in. under the slide.

Her mainsail and jib contain approximately 520 square

have struck the sheathing back of the starboard transom. Mrs. B. went to sleep on the cabin sheathing while I took a series of naps in the open air on the port side (literally) of the cabin house.

I had no idea how Sassoon would behave when the tide flooded, so at the first sign of its doing so, got the mainsail as far to port as possible and put all our heavy dunnage well up "to windward." The water crept up the deck to the coaming, then Sassoon slowly and gently began to rise, the water receded, and inch by inch we assumed a more perpendicular position. At 10:45 P. M. we floated and warped out into the channel. Then I took a line and by the light of the moon began towing up the harbor. We got hung up again twice for a moment or two each time, but the flood lifted us right off, and we finally anchored at 11:30 in 9 ft. of water.

Sunday, June 19.—We were up at 4:40, and hurried through breakfast. The harbor looked very pretty, but we had nothing but black words for it, so cleared at 5:35 in a gentle N.-N.W. wind. Once outside we made the course S.-S.E., and cleaned up the devastation wrought by breakfast and its attendant dirty dishes. The wind was very light as we ran down by the Scituate Cliffs (a series of four steep bluffs known as "first," "second," etc., and numbered from Scituate toward Brant Rock). We gradually shifted our course to S. by E. as we seemed to be getting rather far offshore.

About nine o'clock the wind dropped flat, leaving a faint breeze along the beach, so I took the tender and

beach. This was to leeward of our course, but I looked to see the wind shift to its familiar S. W. quarter, which it did at 3:11, and piped up very stiff. Coming about (we were at that time between Indian Hill and Center Hill Bluff), we could just lay a course calculated to land us at the Barnstable sea buoy. Barnstable is a discouraging place to approach, as you cannot see the town from the water, it being lost among the trees of its single long street, and the lighthouse, of white on a long, white sand spit, does not show up at all. The sea buoy is two miles offshore, and the chart bears this encouraging legend: "Barnstable bar shifting, buoys unreliable." The bar has a vast expanse marked one foot while the channel is narrow and shoal.

We finally raised the buoy dead ahead, and leaving it to starboard, started a dead beat against a gusty S. W. wind and strong ebb. With my wife forward to look for shoal water, and the hand lead going constantly, we worked our way in. We found the channel exactly as given on the chart—practically a straight line from the sea buoy in to Sandy Neck Light, and then curving along the back of the neck with a sharp turn around the point. There is a black buoy about half-way between the sea buoy and the lighthouse, and that, too, was in its correct position. We concluded that the chart makers were altogether too modest.

It was a hard rub to buck the tide at the hook of the point, but after several fruitless tacks we managed to get a lay that gave us a lee bow tide, and then our troubles were over. We dropped anchor just above the inner black spar buoy at 6:45 P. M., fourteen feet of water by the lead, tide two-thirds gone. After getting snugged up, we had supper, our fourth meal for the day, and voted 13 hours and 10 minutes a good day's work.

Monday, June 20.—A beautiful day, with a light N. W.

more sail, until at 9. A. M. we had everything set. Soon after this we made out the Marconi tower, which are situated, you know, on the further side of the Cape. Last year, in writing of a trip on the Ayaya, I remarked that the location of these towers ought to be shown on the chart, and lo! this year they were. If I were a newspaper editor, I suppose I would boldly proclaim that it was all due to my "exclusive exposé."

towed Sassoon inshore to get the air, "but when she got there the cupboard was bare, and so the poor boat had none." It finally came light E. by S. at 10:10, and at 11 A. M. we were off the Gurnet's twin lights. As we stood across for Manomet, the wind hauled ahead until we were plugging away with sheets pinned in flat.

We came up with Manomet Point at 1:25 after a slow pull against the tide flooding into Plymouth. Once around the point we made a long board parallel to the

wind in the morning, hauling later to S. E., and finally settling in the S. W. After spending nearly two hours in going over Sassoon with ivory soap and water while the wife cleaned up the cabin and stowed things neatly, we started for shore at 9:50. The harbor is long and narrow, with wide flats at the edges and an intricate channel winding up through a maze of shoals. I should consider it very foolish to endeavor to take a keel boat up to the town. We started on the last of the ebb and could not find a chance to land anywhere until we reached Beale's float (the only wharf). It took me just an hour to row the 13/4 miles against the tide, and it was a hard grind all the way.

Took the train across the Cape to Hyannisport, where we lunched with relatives, returning by train in the afternoon. After filling our four-gallon water jug, we returned, covering the distance with a fair tide and wind in 20 minutes, an agreeable change.

To prevent swinging around the anchor with the tide, and so possibly dragging, I ran out our spare anchor straight astern. This afforded an opportunity to keep the tender offside in a way I had never before heard of, namely, by making it fast well out on warp, with a light line from her stern to that of Sassoon, so that she could be hauled in without touching the warp. The S.W. wind blew very fresh during the night, and raised quite a chop on the flood.

Tuesday, June 21.—Strong S.W. wind and fog, but at 5 A. M. the sun appeared and began to burn off the fog. Rain set in at 6:30, however, and things looked dismal enough. We got under way at 7 (we found it took about two hours to get breakfast, clean up, wash down decks, restow everything, and make sail). Under double reefed mainsail and small jib we ran out of the harbor very quickly on the strong ebb tide. Passing out by the sea buoy at 7:23 we made the course N.E. by N. for the buoy off Long Point Light (Provincetown).

Offshore the wind lightened, and we gradually made

Provincetown water tower was the first landmark we raised; then Wood End Light appeared almost directly under it. We had the latter abeam at 11:14 and rounded the Long Point buoy fifteen minutes later. Standing across the harbor we found that the wind had freshened materially, so that the catboats were all tying in two reefs. We anchored in my favorite locality, just north of the end of the railroad wharf at 11:45, and had a hard time to get the mainsail down, as the peak halliard would not render, but the peak vang came to the rescue and brought her down.

The wind was very fresh all day and increased at nightfall, so we ran out our 50-pound anchor, though there was no absolute need for it. The new steam yacht Visitor came in during the afternoon and lay outside of us.

Wednesday, June 22.—Lay at anchor all day. Squall in the afternoon followed by two beautiful rainbows. One large fisherman went out just before the squall made up. She had a big main topmast staysail set, and I watched her across Long Point to see her take it in, but she disappeared in the middle of the squall without starting a halliard.

During the evening we had three different squalls on at one and the same time; one in the N.W., another in the S.W., and the third and worst in the S.E. There was a magnificent display of rose-colored lightning. Ran out big anchor once more.

Thursday, June 23.—Up at five in the morning to find a strong N.E. wind and wonderfully clear sky. Under way at 7:15 with one reef tucked in the mainsail. I confess I am a great hand to put in a reef on many occasions when other people would not hear of such a thing; but I'm out for comfort and not for fast runs.

We passed Long Point Light at 7:29, and when half-way to Wood End made the course W. 3/4 N. for the Gurnet whistler, thinking the ebb from the Bay would about equalize our leeway.

Once out from under the land we found the wind due

N. and a bit gusty. Reefed sail very comfortable—rail about three inches out.

We had a beautiful sail across the Bay in a nice 3-foot sea, raising the Gurnet Lights just as we lost the Marconi towers, but half an hour before the water-tower disappeared. The tide was evidently stronger than our leeway was great, so made course west.

We reached the Gurnet whistler at 11:12, and then had a battle royal with the ebb tide as we ran up between the numerous buoys. A story is told of a man who thought red buoys should be left to port and black ones to starboard; it took him a week (fourteen high tides) to get up to the Plymouth docks. There is certainly some basis for this yarn, as at low tide the channel inside the harbor is the only water in sight. After passing the Duxbury Light at 12:06, we found that the tide set diagonally across the channel (this at two-thirds ebb) until well inside of the Plymouth beach.

After passing the last black buoy (S. No. 13), we held S. by W. $\frac{1}{2}$ W. up a narrow channel running off the steamboat channel and anchored at 1:15 P. M. in 8 ft. of water where the chart called for 13 ft. I have heard that the heavy ice of the winter of 1903-1904 in settling on the mud flats caused the mud to work out into the channel, and from what I have seen this summer at Hingham, Scituate and Plymouth, I am inclined to believe this theory. We had to have bow and stern anchors out to keep us in the channel.

Friday, June 24.—Under way at 8:11, just after high

Once up with the Allerton buoy, we made slow work bucking the ebb. We passed Hull Gut and kept on for the West Way, when we got knocked down to the cabin house by the S.W. wind which jumped to a two-reef blow without any warning whatever. We "babied" her along until well into Hingham (best known as Hull) Bay, where we anchored, tied in two reefs and shifted jibs. We then jogged up and down the Bay waiting for the tide to serve enough for us to get into Hingham, but as the breeze continued to freshen, we beat up as far as Crow Point, and anchored in three fathoms at 4:45. Put out stern anchor on account of the tide, which runs like a mill-race, but it started the stern anchor until we had swung around stern to wind. I shifted the warp forward, and there we lay, bow to tide, port quarter to a three-reef breeze, and both anchor warps trailing off aft from the bow chocks.

After supper we felt too lazy to shift, so lay there all night.

Saturday, June 25.—Under way at 8:20 on the last of the flood and under one-reef beat up to our moorings, and made fast at 8:45.

II.—To Marblehead.

Sunday, July 3.—After sleeping aboard Sassoon while at her moorings, I was up at 3:45 and hurrying through an *al fresco* breakfast, made sail at 4:20 in a light

When abreast of Egg Rock, the wind backed a bit, so that we eased our sheets slightly and made better progress in the longer sea. On reaching Marblehead we found the breeze more moderate, and running up to the head of the harbor anchored in 15 ft. by the lead at 1:01 P. M. Tide two-thirds flood.

In the afternoon we took friends out for a short spin under whole sail. On returning to the anchorage, Prescott Keyes came alongside with Scapegoat for a short talk.

Monday, July 4.—The early morning was calm and hazy. We cleared just before ten o'clock in a light S.W. air that proved to be S.E. when we got outside. The Corinthian Y. C. was starting its morning races as we passed out, and the scene was most animated.

Beating out around "the Rock," we settled down to a long tack to the southward to pass outside of "the Brewsters." The thirty-footers passed close to windward of us on this leg, with Chewink IV. leading, but to leeward. However, she crossed Sauquoit's bow soon after the accompanying photograph was taken.

We held along S. $\frac{1}{2}$ W. until noon, at which time we heard the Boston forts firing the national salute. On sighting "three and a half fathom buoy" (N. No. 2), we found we could ease off a bit, so did so, and made for the harbor entrance with a fair tide under our keel. We observed the boats inside the harbor sailing in a strong S.W. wind, while outside there was a fine little south-easter. At 12:25 we shot from one breeze into the other without slowing up, and then beat in to the Gut in long tacks.

water. Two reefs and small jib on account of a strong S.W. wind with vicious puffs. We passed the knock-about fisherman, Helen B. Thomas, at anchor in the Gurnet Roads, and photographed her; but alas! we did the same thing by another boat on the same film.

Reaching the Gurnet Rock buoy, we cut inside of the whistler and made for the High Pine buoy. After passing the latter, we set whole sail and carried it nicely, despite some rather severe puffs off Brant Rock and the Scituate Cliffs. Nearing Davis Rock buoy, we met a flying fisherman with every rag set. His main topmast staysail was a beautiful sight—it looked as though chiseled from marble.

We reached from Minot's Light to the Harding's Ledge gas buoy in 52 minutes, and had a close call from a three-masted schooner bound out in ballast. She was wallowing all over the road. I wondered why until, as she shot by, about forty feet from us, I saw one man busy on the fore-castle deck, two at the mizzen-top, and "the old man" pacing the quarter-deck with no one at the wheel.

W.-N.W. wind. On reaching Crow Point, I anchored to await the coming of "the stewardess." There was a curious little swell working straight in up the channel for which I could see no reason. Turned in at 5:30 for another hour of sleep.

Under way again at 8:45 with double reefed mainsail and small jib, the wind having hauled to the N.W. and become very fresh. Beating down the narrow channel in short tacks at low water, we were uncomfortably crowded by the Boston steamer until she drew ahead.

Passing out through the Gut at 9:30, we beat over to the Narrows, and rounding the "Bug" Light looked down through Black Rock channel against a strong flood tide. We left Half Tide Rocks buoy well to starboard—the rocks being jam up against the buoy—and Commissioners' Ledge can to port. Close-hauled on the port tack, we could just lay for Marblehead Light, and had an exhilarating sail in a steep, hollow, three-foot sea. She took it very nicely, although occasionally an over mobile crest swept aboard.

Passing in under Peddocks Island at 1:27, we had to encounter a hard series of flaws, but having a better acquaintance with our boat than earlier in the season, took them all without huffing or easing her. The rest of the way to Hingham was sailed with the lee deck well in and a smother of foam at the port shroud. Going in we followed all the devious windings of the channel up to our moorings, which were picked up at 2:12 P. M.

III.—To Rockport.

Saturday, Aug. 13.—The first mate being away, I had for crew two old college mates. They were aboard and waiting with mainsail set and clam chowder just cooked when I arrived from Boston. Breaking out the jib at once, we were off at 2:15. Wind moderate E. by S. We demolished the chowder while running out by Crow Point, and when passing Hull saw the special races in full swing.

Reaching across from the Gut to Bug Light, we swung

into Black Rock channel for a close fetch down to Half Tide Rocks. It is best to give the light a good berth and keep much nearer Lovell's Island here on account of shoal water. On an ebb tide watch your course sharply, for the current breaks across from the Narrows and out the B. R. channel with force. This Black Rock channel is very attractive, as it runs along close inside of the group of Brewster islands, and gives a good view of some charming summer places.

After passing Green Island, we found the wind E.-S.E., and started our sheets for a fast but uneventful run to Marblehead. Spatters of rain drove us into oilers. We passed in by the skeleton light at 5:20 (three hours five minutes, eighteen knots, in a moderate air), and spent an hour sailing around through the fleet, eventually anchoring off the Boston Y. C. station.

Sunday, Aug. 14.—Rain fell heavily during the early morning, and there was little wind. We got our anchor on board at 10:40, and were off in a faint S.E. air. Creeping along in a series of chills and a loup of a sea, we passed Monomoy, Chicadee, and all the boats near us, finally meeting a nice little S.-S.W. wind when nearly over to Cat Island. Taking the outside course, we left Cat and Baker's islands to port, and made for the buoy inside of Half-Way Rock. When up with that buoy, we squared away for the Eastern Point whistler, and had hot coffee, with apple sauce and gingerbread, as we ran down the wind.

Passing the whistler at 1:15 P. M. in a good whole sail breeze, we held on for "the Londoner," a spindle off Thatcher's Island, and gybed around that at 2:28. Here we encountered a steep bobble, caused by the weather-bound tide, that necessitated topping up the boom and giving the tender's painter more scope. We ran down between the Dry Salvages and Straitsmouth Light, then beat up Sandy Bay into the small stone harbor at Rockport. The big Government breakwater at Sandy Bay is still incomplete—being awash at low tide. It is marked by several spar buoys. You would not expect to find a lot of ugly rocks inside of an artificial harbor, but there are many of them there, and it is well to keep toward the port side of the harbor in going in. We anchored at 3:25 P. M. in the center of the outer basin, where there are 11ft. at mean low water. It is a charming little "old world" spot, but no place to be caught in a N.E. gale, despite the excellent holding ground.

Monday, Aug. 15.—Up at 4:30 to find an ideal morning. Before we got under way two large schooners kedged out. They took their anchors down to the harbor's very mouth, then started their steam winches, tripped the anchors as they passed over them, and got enough way on to shoot nearly a half mile across the placid waters. We drifted down to the light on the ebb, and then caught a gentle N.W. breeze. We cut inside of "the Londoner," rounding Thatcher's Island close in under the two towering lights, and then met the 25ft. sloop *Hermes*. She was a beautiful sight, with a big balloonier drawing like the wing of an enormous gull. I pulled out the camera, but just as I got it she lowered away the jib. Hard luck! Having the camera out, I jumped into the tender and had Sassoon sailed past me a few times so that I could take a couple of photographs of her under sail.

The wind now swept offshore in fresh gusts, and we held along close in to get the full benefit of it. Hauled on the wind at the Eastern Point whistler at 8:10, and stood across under the Magnolia shore as the wind looked light offshore. We got some rattling puffs. "Fine!" Loping along by Kettle Island, we passed in between House and Misery islands. On the latter was the wreck of the old steamer *Monohansett*, which broke her back last July in a sporty attempt, one foggy afternoon, to leap across the lower portion of the island.

We beat well up the river in toward West Manchester to have a look at the elegant estates located there on the waterfront, then ran out again, taking a good squint at the Binney-designed schooner *Savarona*, the handsomest auxiliary on our coast. Holding along the shore up to Beverly, we then squared off for Cat Island. As we ran along we heard sounds like the whirring of forty thousand mowing machines all in one field, and the motor boats *Autowin* and *Naughty Girl* sped by us, five feet to our one, and we doing a good four knots. They were having a match race, which was about as exciting to watch as a game of cricket.

We sailed into the Marblehead harbor and jogged up and down it until the light began to fade, when we anchored as before off the Boston Y. C. That was at 12:30 P. M., and the rest of the day there was a flat calm.

After dinner we took the mainsail ashore for repairs, the bolt rope having parted on each side of the throat.

Tuesday, Aug. 16.—The sailmakers had the sail ready at the promised hour, but we could not get away until 11:06, when a light S.E. wind sprang up. Secretary of the Navy Morton was then leaving the dispatch boat *Dolphin* amid the racket of eighteen guns. After passing buoy No. 3, the wind was very light, so I took a try at a white ash breeze in the tender. Half-way to Tinker's Island we connected with a delightful easterly which hauled to S.E. and pricked on so hard as to nearly ruin a fine fish chowder that was brewing.

After passing the bell buoy, we began to think of reefing, but pondered on it longer than the breeze lasted. Reaching Broad Sound, we encountered a faint S.W. air and stood up to Deer Island Light against the first of the ebb. Then beat through Long Island gut and went through Nantasket roads to Hull Gut. Two attempts to stem the tide in a sickly breeze were enough, and we started a drift up the back of Peddock's in a series of little showers. Passed through the West Way at 6:30. Then another calm. Then another light east wind which dropped to nothing when we reached Bumpkin Island. Set our side lights for the first time and drifted backward for awhile, but finally beat up the channel in a S.-S.W. chill (the course was S. $\frac{1}{2}$ E.), with the lead going constantly. The channel shoals quickly from three fathoms to four feet, so the use of the lead was essential. We finally anchored at dead low water (9:20 P. M.) in $3\frac{1}{2}$ fathoms just south of the Crow Point wharf.

Wednesday, Aug. 17.—Under way at 5:05 A. M. with light W. wind and ebb tide. Picked up moorings at 5:28, and gave the ship a good cleaning up before going ashore.

IV.—To Gloucester.

Saturday, Sept. 3.—After having slept aboard, I got under way at 6:13 A. M. in a moderate S.W. breeze, and running out between Ragged and Sailor islands was soon at Hull, where I picked up a mooring off the Boston Y. C. station at 7:03.

Under way again at 2:05 P. M. with my wife and our friends, Mr. and Mrs. B., on board. In a strong S.-S.W. wind that was all we could swing whole sail to, we ran out the old familiar Black Rock Channel against the flood tide. After passing the huge tower, nearly completed, on the Graves, we met with quite a rolling sea, but swung along at a good pace in the usual large Saturday afternoon Marblehead-bound fleet. One small craft of about 18ft. waterline length with full cutter rig crossed our bow near Tinker's Island, and, as we overhauled her, crowded into our course. She would not give way, and as I would not either a scant five feet separated the two hulls (the booms were on opposite sides) as we shot by. It was evident from the remarks of her crew that they thought they could frighten the feminine members of our party, but they did not succeed.

Once inside the harbor, we sailed about through the fleet to give our guests a good view of the various craft, and then anchored off Tucker's ferry at 6:05.

Sunday, Sept. 4, was calm and hot after a few showers and some fog, so that we did not start until 10:12, although our guests had hurried off from their hotel in time to breakfast on board.

We took the inside passage to Gloucester, leaving Cat Island, Bowditch's Ledge and Baker Island to starboard. Once out by Baker's Island Lights, which, by the way, so confused two of the contestants in the Sandy Hook to Marblehead race last July, we made slow work of it in a long roll, very faint following breeze and hot sun. The 50ft. schooner yacht *Monataka* passed us off Manchester, and I took two beautiful pictures of her, both on one film, a pet mistake of mine. Then a fine little puff sent us ahead, much to the chagrin and mystification of her sailing master.

We had thought of trying for Rockport, but the breeze was so light we slowly ran into Gloucester, where we anchored under Ten-Pound Light. Here our guests left us.

Monday, Sept. 5.—Another calm morning. The *Hersheff* 15-footer *Little Robin* had come in during the night, so we rowed over and had a look at her. She is a beautiful little ship, beautifully kept up.

Getting under way soon after nine o'clock, we beat out of the harbor on the ebb tide. Off Norman's Woe we were overtaken and easily passed by the *Little Robin*. I had had quite a conversation with her owner while we were within talking distance. It was Mrs. B.'s first glimpse into the free masonry of the sea, and she was very much surprised at my talking to an utter stranger.

We retraced our steps of the day before, passing inside of Baker's Island. The two lighthouses are of different height, which is one means of distinguishing them from those on Thatcher's Island.

The wind was very paltry, and when we reached Cat Island we saw no signs of improvement, so went into Marblehead harbor and anchored at 2:05, well up toward the head of the harbor.

Tuesday, Sept. 6.—There was a splendid breeze from the N.W. in the early morning, but we delayed our departure until 10:10 in order to take a friend along with us. By the time we started the wind had hauled to N.-N.E. Beating out of the harbor with one reef tied down in the mainsail, we had a very lively time in the puffs from the town shore. Once outside we squared away for a delightful run. We did not make very fast time, however, because after reaching Nahant we had to fight the ebb sweeping out from Boston. Shook out our reef, as the wind had taken off a bit.

At the entrance to the Sound we found a very steep sea, about four to five feet high, which caused our skiff to go mad. She would shoot up alongside of us, then sheer around broadside to the sea and then straighten out with a wild jerk when her painter came taut. The old, old story!

Once in by Half Tide Rocks, however, we found the sea smooth enough, and boiled away up the old Black Rock channel, across the Narrows, and up to the Gut. Hauling on the wind we stood in to Hull Bay and picked up a mooring off the Boston Y. C. station at 2:05, the third successive day that we had quit at that hour and minute.

After luncheon we put our guest ashore and sailed about in the Bay until the tide had flooded enough for us to get up to our home mooring, to which we made fast at quarter after five o'clock. And so to shore and dinner.

PAVONIA Y. C. OFFICERS.—The Pavonia Y. C. held its annual meeting a few days ago at Jersey City, and the following officers were elected: Com., E. H. Moore; Vice-Com., W. E. Throne; Fleet Captain, D. C. N. Collins; Finan. Sec'y, W. F. Tobin; Cor. Sec'y, H. Smith; Treas., Charles F. Crane; Meas., R. S. Morton; Fleet Surgeon, W. J. Parker, M.D.

The club has sold its Atlantic Highlands property to advantage. The club's annual dinner will take place on New Year's Day.

STEAM YACHT RIVIERA SOLD.—Mr. Frederic Gallatin has purchased through Messrs. Tames, Lemoine & Crane the steam yacht *Riviera*, ex-Katoomba, from Mr. Pliny Fish.

YAWL NERINE SOLD.—Mr. Stanley M. Seaman has made the following sales through his agency: 30ft. yawl *Nerine*, by Mr. F. W. Etherington, to Mr. George A. Enell; knockabout *Cyma*, by Mr. W. M. Bieling, to Mr. David Raib, Jr.; and the cruising launch *Roma*, by Mr. James Golden, to Dr. Horace J. Parker.

GEORGE G. TYSON DIES.—George G. Tyson, commodore of the *Riverside Y. C.*, died at his home in Greenwich, Conn., on December 13, from a hemorrhage of the lungs. He was forty years old and had been in poor health for some time.

Iceboating on North Shrewsbury.

RED BANK, N. J., Dec. 12.—*Editor Forest and Stream:* The early coming of cold weather has hastened the preparations for iceboating on the North Shrewsbury River. The third class, which includes most of the racing boats, will this winter number sixteen. New third class boats, under 350 sq. ft. of sail area, are being made ready by several members of the ice yacht club.

R. D. Chandler has built a sloop-rigged boat for Raymond Hoagland; William White is building a new *Mistral*, jib and mainsail; Edward Asay and Ivins Hance have altered their boats, *Daisy* and *Northwest*, from lateen to jib and mainsail rig. Dr. Brewster has rebuilt the steel boat and will sail her as a sloop this season. Edward Willis and Charles Burd, professional yachtsmen, have joined forces, and are turning out a jib and mainsail boat of the third class for their winter's amusement.

There has been a drift away from the lateen rig, and there will consequently be comparatively few of them in the racing class. *Wizard*, owned by George Gillig; *Georgic II.*, by Chas. P. Irwin; *Tyro*, by Grant & Morford, and *Torment*, by Charles Burd, are the fastest lateens that will be out. It remains to be seen whether they will be as decisively beaten by the sloops as they were last season.

January and February, 1904, furnished more iceboating than has been seen in years. The North Shrewsbury Ice Yacht Club went over to Branchport and captured the challenge pennant of the North and South Shrewsbury rivers from the South River Club. They successfully defended the pennant of America against the *Pleasure Bay Club*, and lost it to the Branchport Club. They also held

the first mentioned pennant against the Branchport Club on the river at Red Bank. All of these matches were best two in three, two boats to a club, over a 20-mile course in a fast time limit.

There were also special races for cups and trophies, and an interesting series of point races for the season's performance. *Georgie I.* proved to be the fastest. *Atalanta*, also a sloop, was second, and *Tyro* earned the third place.

Irwin's *Georgie*, a little boat of 13ft. spread and some 320ft. of sail, supplied the sensational sailing of the season in light and medium winds. *Atalanta* did best in heavy weather. The problem for the other owners is to produce something to displace them.

An interesting feature of the coming season is the restoration of *Wizard*, champion in 1902 and 1903, to her old trim and first-class condition. Sailed by her most successful skipper, it is a matter of speculation as to her performance this winter compared with some of the newer jib and mainsail ice yachts.

It had been the opinion here until last winter that the lateen rig gave the best results to windward, but the contrary proved to be the case. *Georgie* outpointed and out-footed everything. The rougher the ice became, the more she beat the lateens and the heavy jib and mainsail boats.

A feature of last season's racing was the large amount of lead carried, amounting in some cases to 600 pounds, in addition to two men. The boats track from 13ft. to 18ft. in third class, there being no limit except sail area.

Besides the above mentioned boats there are here at Red Bank a full dozen of first, second, and fourth class boats, and probably fifty or more of lesser size. When there is good ice-yachting the river presents a scene of life and animation that would well repay one for making a trip out from New York to see. There are comfortable hotels here, and the ice yachtsmen are usually attentive to visitors if they make themselves known. S. W. Morford is the commodore, and Charles Foxwell the secretary of the club.

T. H. GRANT.

DEATH OF WELL-KNOWN YACHT SKIPPER.—Charles H. Wells, well known in yachting circles as a crack boat sailor, died at Greenport, L. I., on December 14. He was 73 years old. Captain Wells commanded upward of twenty-five different vessels with great success. He was a cautious man, and never met with any accident. In 1876 he was in charge of the schooner *Madeline* when she defeated *Countess of Dufferin*. For fifteen years Captain Wells was employed by John S. Dickerson as sailing master of his yacht. The last yacht in which he was in command was the famous *Wizard*.

All communications for FOREST AND STREAM must be directed to Forest and Stream Pub. Co., New York, to receive attention. We have no other office.

SIXTY-FOOT CRUISING LAUNCH—DESIGNED AND BUILT BY THE GAS ENGINE & POWER CO. & CHAS. L. SEABURY & CO., CONSOLIDATED.

Gas Engine Experts.

BY A. E. POTTER.

THERE is no doubt but that valuable marine gasoline engines have been all but ruined in some cases, and too often has their efficiency been impaired by a certain class of people with no mechanical training whatever, and an extremely limited amount of actual experience in operating this class of motors. As for design, manufacture and repair they know nothing; yet on the very first sign of trouble they "get busy," usually with disastrous results.

Were they to confine their operations to their own property there would be no great harm done, except what they ought to make good themselves instead of expecting the manufacturer to replace broken or ruined parts.

There is another class of men who are continually offering their services to owners of power boats usually gratis, and whose memory frequently lingers with the ignorant and unsuspecting owner after he realizes the harm that has been done.

I maintain that anyone who owns a marine gasoline engine has a perfect right to do with it as he likes, so long as he does not jeopardize the lives of others; but no one should be allowed to tinker with a marine gasoline engine belonging to someone else unless he thoroughly understands the function of the engine and the mechanism on which he is to work.

One day last summer at Canarsie I saw two men in a launch trying in vain to start their engine. The usual crowd of interested spectators gathered, and among them was one extremely "previous" chap who vouchsafed some startling suggestions. His apparent knowledge of gasoline engines seemed to appeal to the owners of the craft, and he was invited to take a hand. Oh, yes! He could start it all right! Loosening a nut here, tightening one there, making several false passes, he turned the flywheel several times, but the engine did not start.

Intuitively, perhaps, suspecting that the engine was "flooded," he opened the relief cock, closed the gasoline valve, and proceeded to "work the gasoline out of her," as he expressed it. At about the twentieth revolution he got an explosion. Closing the relief, he attempted to turn the flywheel over, but the compression was good, and he could not quite do the trick, when something happened. At the time he thought the engine hit him, as, rubbing his arm, he picked himself up from under the seat. With a sickly laugh he remarked that was just what he expected. It might have been at that.

The observing crowd offered its encouragement. He informed the owners in tones loud enough and with all the sincerity he could command, that the ignition had occurred too early and then he screwed the firing-pin down about three threads, turned the engine over once, broke off the end of the rocker shaft, suddenly realized an important engagement, and taking his coat, vest, and collar, hot, dirty, disgusted, but not discouraged, he disappeared while the owners sadly tied the boat back at her moorings and spent the afternoon no doubt in endeavoring to frame a request reasonable enough to get a new rocker shaft from the manufacturer without charge to replace an "imperfect" part.

This is the much-despised, so-called gas engine expert, who hangs about looking for trouble. He can be found around the wharves, on club house floats, and in similar places. Owners of motor boats, after their patience has been severely tried and pocket-books flattened, begin to suspect that there is no one who can repair or adjust their engines unless he comes from the particular factory where the engine was built. He finds this an expensive matter, and the result is he studies his engine, follows up all the publications bearing on motor boats and engines, makes his own repairs, enjoys it, becomes independent, and if he is wise, does not offer his services and knowledge to strangers.

But then you may ask whether or not there are any gas engine experts. To be sure there are, but they cannot be engaged to do slight repairs for the usual wages engine owners think they can afford to pay. They will

be found frequently engaged in selling engines, in the designing and mechanical departments of manufacturing establishments, where they get salaries frequently surprisingly high, but seldom on the lookout for an hour or two's work on repairs for 40 to 50 cents an hour or less.

The more true gas experts we have the less gas engine troubles will be experienced from the development of the art of design and perfected construction, but the faking imposter posing as a gas engine expert, possibly unknowingly or unconsciously, is decidedly too much in evidence.

Queries on Marine Motors.

J. M. M., Montreal.—What advantage, if any, would there be in putting a standpipe in the gasoline piping from the tank to the engine, outside of collecting light particles of dirt, which might get into the tank?

Ans.—A stand-pipe such as you describe could only have one advantage that we can see. It might make the flow a little more regular, providing you were using two or three different vaporizers on a multi-cylinder two-cycle engine. We don't see how any particles lighter than water would be likely to get to the bottom of a tank and get into the piping, as they usually float on top.

J. H. B., Philadelphia, Pa.—1. What is the maximum power possible with an eight-cylinder, four-cycle 3½ in. diameter, 4 in. stroke engine at 720 r. p. m.? 2. Do you consider it possible to develop 40 B. H. P.?

Ans.—Basing the mean effective pressure at 66 pounds to the square inch, with the usual formula

$$\text{PLAN} \\ \text{I.H.P.} = \frac{\text{PLAN}}{33,000} \text{ where}$$

P=Mean effective pressure.

L=Length of stroke in feet.

A=Area of piston.

N=Number of explosions,

the horsepower would figure but 18.47. With P. at 75 pounds, a very high rating, the engine would figure 20.99.

2. In order for this engine to develop 40 B.H.P., it would have to show an unheard of M.E.P. of nearly 143 pounds. We do not consider it possible or even probable.

C. E. H., Crisfield, Md.—What makes so much blowing back in my four-cycle engine at the air inlet in the float feed carburetor?

Inlet valve is perfectly ground into its casing, which is removable and held by a clamp. Inlet valve is located above the exhaust valve.

Ans.—Blowing back of pressure could only occur through leaky inlet valve, too weak inlet valve spring, or leak under the valve caging. In that particular construction it is a very hard problem to machine the two surfaces where the joint is made without "grinding" them together. Sometimes gaskets are used, and in some cases even copper gaskets will not stand. In that case, the surfaces will have to be remachined and ground until they are true with each other.

B. J. M., Patchogue, N. Y.—1. How many different causes are there for an engine using make-and-break to occasionally miss explosions? 2. Are there any more causes for such irregularity in jump spark ignition?

Ans.—Missed explosions in make-and-break ignition could be caused by any of the following: Loose battery or wire connections, oxydization of engine, battery or switch terminals; insufficient battery, wet spark coil, sticking of the rocker shaft, too short contact, failure to trip, insufficient pressure of electrodes, too rich or too poor a mixture, loose insulation, water on the electrodes or in the mica, carbon on the mica insulation, imperfect ground connection, too much cylinder oil, a drop of water or dirt in the needle valve of the vaporizer or carburetor, broken wires with ends occasionally separating, igniter set too late, or probably a few dozen others.

2. In jump spark, causes would probably be less, as some of the above could not be present. Broken porcelain, too much opening at the plug, wet, secondary wiring, insufficient secondary insulation, poor trembler or vibrator contacts, perforated tin-foil in the condenser, broken or weak spring in commutator, etc. Usually jump spark troubles can be more easily located than make-and-break.

B. B. B., Bernardsville, N. J.—I have a double opposed four-cycle automobile engine, set horizontally in a launch. Water-jackets are of copper. I am bothered with water in one cylinder. How can it get in if not at the upper end of the cylinder beneath the copper jacket?

Ans.—Examine carefully the relief cock on the underside of the cylinder. It probably does not fit into the cylinder as it ought, or you may possibly have a blow-hole in the cylinder. Be sure the water does not come in from the exhaust-pipe. To prove whether or not there is a leak under the copper jacket, draw off all the water and start the engine, after disconnecting the water pipe from the jacket. If at each explosion steam or smoke puffs out of the water discharge at the cylinder, you can be quite sure that there is a leak under the copper jacket.

Sixty-Foot Cruising Launch.

THE Gas Engine and Power Company and Chas. L. Seabury & Co., Consolidated, have begun the construction of a day launch for Mr. H. L. Terrell, of New York city. We reproduce this week both the cabin plans and outboard profile of the boat.

Her construction is of the most approved type, and, like every boat turned out by this firm, shows novelty in many respects in keeping with their reputation for modern design and detail. She is 60 ft. over all, bent oak frame, spaced 9 in. centers in the wake of the engines, and 12 in. elsewhere. Long tapered keelsons also add materially to her strength. Planking is of 1 in. southern cedar. She is built carvel style, with butt blocks copper fastened throughout. Standing roof is of light construction canvas-covered. Interior finish is of paneled mahogany. All outside hard wood is bright finished. Hand rails and outside fittings are finished either bright or oxidized. A canvas awning covers the after part of the cockpit; floors are covered with linoleum and Wilton carpets. For lighting provision has been made for cylinders to hold 200 ft. compressed acetylene gas. Whistle is operated from cylinder compression. The power equipment is to consist of two four-cylinder 6 in. by 6 in. Speedway model A motors, giving an estimated speed of 12 miles with a fuel capacity sufficient for 30 to 40 hours' running. Speed of the engine will not exceed 600 revolutions per minute, and this comparatively low speed ought to materially increase the life of the engine. In the tank compartment forward below and underneath the tank, the space is filled with cork flooded with asphaltum to reduce the weight and space usually occupied by water when a free circulation about the tank is permitted for reason of safety. This launch will be used extensively on the Shrewsbury and in the lower bay.

Ocean Race for German Emperor's Cup.

THE race across the Atlantic Ocean for the German Emperor's Cup has been discussed for over two years. The matter has now taken definite shape, and the race will be held next May, provided three vessels start.

Commander Hebbinghaus, naval attaché of the German Embassy at Washington, has acted for Emperor William, and this gentleman has conferred with Mr. Allison V. Armour and Mr. C. L. F. Robinson—two members of the New York Y. C. who are greatly interested in the project. These gentlemen have taken part in regattas held in German waters, and are members of the Kaiserlicher Y. C.

As a result of the conferences between the German representative and the New York Y. C., all arrangements have been made, and the following conditions, governing the contest, have been given out:

Kaiserlicher Y. C., 1905.—The ocean cup presented by H. I. M. the German Emperor.

The race in detail to be arranged by the Imperial Y. C. at Kiel. Open to cruising yachts of all nations and enrolled in recognized yacht clubs.

Yachts must be of 100 tons, American Custom House measurement, or of 200 tons, Thames yacht measurement, and upward. Auxiliary vessels are eligible, but before starting must remove their propellers from the shafts.

The race to be sailed on May 15, 1905, and to be from Sandy

Hook Lightship to the Lizard lighthouse. The start will be at 2 o'clock on the afternoon of that date.

Three yachts to start or no race. The race will be sailed according to the international rules of the road at sea.

The owner, or his representative, to be a member of a recognized yacht club, and must be on board.

Entries will close at midnight of April 1, 1905, and must be addressed to the sub-committee of the Imperial Y. C., Naval Attaché, German Embassy, Washington, D. C.

The sub-committee will decide if the vessels entered are of the cruising type, as required, and from its decision there shall be no appeal.

No entrance fee is required, and there will be no time allowance. The ocean cup will be given by H. I. M. the German Emperor, personally, to the owner of the winning yacht at Kiel at the beginning of the Kiel week.

His Imperial Majesty will give additional prizes on the basis of one prize for every three starters.

The race will be left entirely in the hands of the Kaiserlicher Y. C. Commander Hebbinghaus and Messrs. Allison V. Armour and C. L. F. Robinson will look after all matters relating to the race on this side, and they will also start the boats.

The Race Committee of the Kaiserlicher Y. C. will be assisted by a committee selected from members of the Kiel Y. C.

Boston Letter.

Boston, Dec. 19.—Mr. B. B. Crowninshield has received an order for an automobile boat, which is expected to compete in all of the prominent American events next season. The boat is to be built for a Boston man, whose name is withheld for the present. It may be said that he is a very enthusiastic automobilist, having had three cars during the present year. That he will race the boat to the limit is not doubted. At this time also it is impossible to give the name of the motor to be used. The firm manufacturing the motor has long been prominently identified with automobile motors, and while it has experimented with marine engines, this will be its first great effort. The boat will probably be about 40ft. long, and while nothing definite has yet been drawn, it is likely that her beam will be about one-tenth of the length. The matter of horsepower is another one that has not yet been settled, but Mr. Crowninshield is of the opinion that at least 100 horsepower will be used. The power may be even greater than that, but this will depend upon the amount of weight that a boat of naturally small displacement and buoyancy will stand. Mr. Crowninshield makes no estimate of the speed he hopes to get out of his model, but he will get all he can out of the amount of horsepower available.

Mr. Crowninshield has designed a yacht for Mr. P. Pavloff, of St. Petersburg, Russia, under a rating rule that figures up about the same as the proposed new rating rule for American yachts. This yacht is 42ft. 6in. over all, 28ft. 6in. waterline, 10ft. beam and 6ft. 4in. draft. Her rating figures out the same as her waterline length. The plans show a very nicely lined craft, with a clean, rather slim entrance and a fair amount of breadth at the quarters. She has a beautiful sheer, from which nothing is taken by the cabin trunk of normal height. Her sail plan is moderate and is well proportioned, and it is thought that she will prove a very dangerous competitor in light to moderate breezes with a lump of a sea. Another craft by the same designer is for a yachtsman of Hamburg, Germany. She is designed under the German cruising restrictions, and will rate in the same class as Uncle Sam, which Mr. Crowninshield designed two years ago. This boat will be 34ft. over all, 21ft. waterline and 7ft. 6in. beam. She will be built by Graves, of Marblehead.

Mr. F. B. Chesbro, of Bay City, Mich., visited Boston last week to inspect the preliminary plans of his 75ft. twin-screw gasoline yacht, just completed by Messrs. Swasey, Raymond & Page. He was very much pleased with the plans of the boat, and left an order with the same designers for an open launch.

A very severe test of a gasoline engine was shown in the 25ft. open launch, Minnie T., owned by Mrs. J. N. Taylor, of Dorchester, in a trip from City Point to Hallowell, Me., last season. The boat, which was equipped with a brand new 5-horsepower Murray & Tregurtha engine, left the yard of the builders one Saturday afternoon at 5 o'clock, and reached Hallowell at 8 o'clock the next evening, having covered the 165 miles in 27 hours, or at the rate of 6.11 knots an hour. Throughout the trip, which was made without a stop, a dinghy, which contained extra dunnage, was towed astern, and this dinghy was half full of water from the entrance to the Kennebec to Hallowell, by reason of a nasty sea off Seguin Island. The only trouble experienced was off Boone Island, when the magneto wheel did not make a good contact; but this was because of no fault of the machinery, but on account of the gathering of oil, in which the engine had been packed, upon the flywheel. The engine was run along on the batteries, while the flywheel and the magneto wheel were cleaned, and when the switch was thrown over again, there was no trouble during the rest of the trip.

Mr. E. A. Boardman has designed a 30-footer for Mr. H. H. Walker, who owns the 22-footer Athlon. This yacht will not conform to the restrictions of the 30ft. class which was formed last spring, but will undoubtedly race with the boats of that class in races next season. The lines show a beautifully turned craft, much more wholesome to look upon than the 30-footers of the past season. She is much heavier than those yachts which raced in the restricted class last season, having about 20,000 to 22,000 pounds displacement, but Mr. Boardman feels confident that she will give any of the yachts of her length a good rub, especially in rough water. The boat will be fitted up luxuriously below decks, with every accommodation for cruising.

JOHN B. KILLEEN.

INDEPENDENT Y. C. INCORPORATED.—Articles of incorporation have been filed by the directors of the newly formed Independent Y. C. with the Secretary of New York State. The club will make its headquarters on Jamaica Bay, and it will hold its races off Sandy Bay Point, Canarsie. The directors are Messrs. Arthur G. Morris, George S. Harvey, Charles S. Frampton, George Vincent, Paul J. Honer, William F. Wagner, and Frederick Frampton, all of Brooklyn.

New Auxiliary Cruising Yawl.

WE are publishing herewith a sketch of an auxiliary cruising yawl, recently ordered from Messrs. MacConnell & Cook by Mr. H. A. LaChicotte, of Brooklyn.

The design is developed to give a roomy, comfortable cruiser, with draft suitable for southern waters. The sail plan is moderate and can be handled on long cruises by the owner and one paid hand. The 18-horsepower engine is exceptionally large for a boat of this size, and almost places the sails in the position of the auxiliary; in fact, the owner has expressed his intention of handling the yacht the greater part of the time under power alone, and using the sails when necessary on long runs down the coast.

The yawl is 46ft. over all, 31ft. waterline, 12ft. breadth, and 22,000 pounds displacement on a draft of 3ft. 6in. The overhangs are of moderate length, sufficient to give a pleasing appearance, but so moulded to avoid pound-

ing in a seaway. The freeboard is quite high, and the rounded sheer gives a distinct individuality and deep sea appearance to the whole.

The accommodations consist of a main cabin with two berths, extension transoms, folding table, lockers, and buffet; aft of the cabin on the starboard side is a large wardrobe, and on the port side an inclosed berth with standing room. On the starboard side forward of cabin is a large stateroom with double berth, locker, mirror and medicine case. On the port side is toilet room with folding lavatory, and forward of this the galley with ice-box, sink, racks and stove. In the fore-castle are accommodations for man, together with locker and storage space.

The construction is developed along the lines required by Lloyds Register with such deviations as the careful analysis, by the designers, of the conditions warranted. The keel, stem, stern, and framing are of selected white oak; the planking, clamps, stringers, etc., of selected Georgia pine, and the decking of white pine. The interior finish is in chamfered mahogany staving throughout, and all fixtures in bronze. The curtains, carpets, upholstery, etc., are in a harmonious shade of hunter green, and the effect of the whole is so pleasing that the craft promises to be of the most attractive of her size.

The Launch Anita.

THE accompanying half-tone shows the 51ft. cruising launch Anita on a flat car, the first step of her journey to Florida via the Mississippi River, where she will be used for cruising by her owner, Mr. D. Fleming, Jr., of

Philadelphia. The boat was built by the Matthews Boat Company, Bascom, Ohio. She is equipped with a 25 horsepower Globe engine, which drives her at a speed of 12 miles. Anita has accommodations for eight guests and the owner.

Naphtha vs. Kerosene.

THE English M. M. A. are still struggling with the rating of engines using gasoline and kerosene. While the past season with us did not develop much in the line of high powered kerosene propelled boats, the A. P. B. Association were not called upon to decide upon the relative power of the two fuels. Something may be gained from the results of their deliberations from which we may be better enabled to make intelligent rules when the necessity arises.

YACHTING NEWS NOTES.

For advertising relating to this department see pages ii and iii.

NEW YORK Y. C. MEETING.—The sixth general meeting of the New York Y. C. was held on Thursday evening, December 15, and Commodore Frederick G. Bourne presided. The meeting was a large one, there being forty-

one yacht owners and upward of 150 non-yacht owners present.

The several committees reported, and in each case progress had been made since the last meeting.

The committee in charge of the new one-design 30ft. class reported that sixteen members had agreed to build and that four or five others are still undecided.

At the next meeting, to be held on January 1, the committee appointed to revise the racing rules, etc., will submit their report.

A committee was appointed to revise the club's routine and signal code. The following officers and committees were elected:

Com., Frederick G. Bourne, steamer Delaware; Vice-Com., Henry Walters, steamer Narada; Rear-Com., Cornelius Vanderbilt, steamer North Star; Sec'y, G. A. Cormack; Treas., Tarrant Putnam; Regatta Committee—Oliver E. Cromwell, H. De B. Parsons, C. L. F. Robinson; Meas., Francis Wykoff Belknap; Committee on Admissions—Henry C. Ward, Frederic Gallatin, Cornelius Vanderbilt, Tracy Dows, John Jacob Astor; House Committee—Thomas A. Bronson, John M. Goetchius, W. H. H. Beebe; Library Committee—T. O'Connor Sloane, Charles Soosmith, John H. Cole; Model Committee—Theodore C. Zerega, Robert Golet, John Rutherford Buchan; Committee on Club Stations—No. 1, William H. Thomas; No. 2, Henry H. Rogers; No. 3, Cord Meyer; No. 4, Augustus C. Tyler; No. 5, Charles Lane Poor; No. 6, Maximilian Agassiz; No. 7, W. Frazier Harrison; No. 8, Henry C. Ward; No. 9, William Lanman Bull; No. 10, Edward R. Ladew.

The flag officers remain unchanged, but some important changes take place on some of the committees. Commodore Kane, who has served the club in various capacities for the past thirty years, retires as chairman of the Regatta Committee, and his place is taken by one of his old associates, Oliver E. Cromwell. Mr. N. D. Lawton also retires from the Race Committee. Mr. Francis Wykoff Belknap succeeds Mr. Charles D. Mower as measurer. Minor changes were made on some of the other committees.

A new committee has been established, known as the Model Committee. These gentlemen will be in charge of the club's collection of yacht models, which is the finest in the world. Mr. Buchan is particularly well equipped to serve on this committee, as he has given the subject great study, and was in charge of all the models shown by the United States at the Paris Exposition. Mr. Zerega, who has served on various committees, will also prove of help in this undertaking.

The annual meeting has in previous years been held in February, but the by-laws were changed making it regular to hold the meeting in December. The new officers will take office on January 1.

Canoeing.

Officers of A. C. A., 1905.

Commodore—C. F. Wolters, 14 Main St., East Rochester, N. Y.
Secretary—H. M. Stewart, 85 Main St., East Rochester, N. Y.
Treasurer—F. G. Mather, 30 Elk St., Albany, N. Y.

ATLANTIC DIVISION.

Vice-Commodore—W. A. Furman, 846 Berkeley Ave., Trenton, N. J.
Rear-Commodore—F. C. Hoyt, 57 Broadway, New York.
Purser—C. W. Stark, 118 N. Montgomery St., Trenton, N. J.
Executive Committee—J. C. Macclister, U. G. I. Building, Philadelphia, Pa.; L. C. Kretzmer, L. C. Schepp Building, New York; E. M. Underhill, Box 262, Yonkers, N. Y.
Board of Governors—R. J. Wilkin, 26 Court St., Brooklyn, N. Y.
Racing Board—H. L. Quick, Yonkers, N. Y.

CENTRAL DIVISION.

Vice-Commodore—Lyman T. Coppins, 691 Main St., Buffalo, N. Y.
Rear-Commodore—Frank C. Denmler, 526 Smithfield St., Pittsburgh.
Purser—J. C. Milsom, 736 Mooney Brisbane Bldg., Buffalo, N. Y.
Executive Committee—F. G. Mather, 30 Elk St., Albany, N. Y.; H. W. Breitenstein, 511 Market St., Pittsburgh, Pa.; Jesse J. Armstrong, Rome, N. Y.
Board of Governors—C. P. Forbush, Buffalo, N. Y.
Racing Board—Harry M. Stewart, 85 Main St., East Rochester, N. Y.

EASTERN DIVISION.

Vice-Commodore—D. S. Pratt, Jr., 178 Devonshire St., Boston, Mass.
Rear-Commodore—Wm. W. Crosby, 8 Court St., Woburn, Mass.
Purser—W. S. Stanwood, Wellesley, Mass.
Executive Committee—Wm. J. Ladd, 18 Glen Road, Winchester, Mass.; F. W. Notman, Box 2344, Boston, Mass.; O. C. Cunningham, care E. Teel & Co., Medford, Mass.; Edw. B. Stearns, Box 63, Manchester, N. H.
Racing Board—Paul Butler, U. S. Cartridge Co., Lowell, Mass.; H. D. Murphy, alternate.

NORTHERN DIVISION.

Vice-Commodore—Chas. W. McLean, 303 James St., Montreal, Can.
Rear-Commodore—J. W. Sparrow, Toronto, Canada.
Purser—J. V. Nutter, Montreal, Canada.
Executive Committee—C. E. Britton, Gananoque, Ont.; Harry Page, Toronto, Ont.
Board of Governors—J. N. MacKendrick, Galt, Ont.
Racing Board—E. J. Minett, Montreal, Canada.

WESTERN DIVISION.

Vice-Commodore—Burton D. Munhall, care of Brooks Household Art Co., Cleveland, Ohio.
Rear-Commodore—Charles J. Stedman, National Lafayette Bank, Cincinnati, Ohio.
Purser—George A. Hall, care of Bank of Commerce, Cleveland, O.
Executive Committee—Thomas P. Eckert, 31 West Court St., Cincinnati, O.; Dr. H. L. Frost, 10 Howard St., Cleveland, O.
Board of Governors—Henry C. Morse, Peoria, Ill.

Rifle Range and Gallery.

Fixtures.

Jan. 16-20.—Pittsburg, Pa.—First annual tournament of the Iroquois Rifle Club.

Rifle in the Netherlands.

AN interesting statement has been received by the National Board for the Promotion of Rifle Practice concerning rifle practice in the Netherlands. Considerable interest is taken in this subject by the Government of the Netherlands, and much encouragement is given to the formation of the clubs and to the practice with the military weapon of that country. The Government takes the ground that the object of such rifle practice is to awaken an interest in the subject; to promote skill in the handling of the rifle among soldiers on furlough and the reserve; for the training of

serviceable riflemen from persons outside the military service, and to enable good riflemen to keep themselves in form. In every garrison, opportunity is afforded for practice, and in all communities in which there are serviceable and available shooting ranges, and wherever there are private shooting ranges in the vicinity of any garrison, endeavors are made to obtain the use of the same. To those communities and associations for the voluntary use of arms, whose regulations have been recognized by the royal decree, a subsidy is accorded toward the erection, maintenance, and for the improvement of the shooting ranges; under the direction of the Minister of War. To obtain such subsidy the community or association must lay out or improve its shooting ranges, and bind themselves to utilize the same in the interest of the defense of their country. The amount of the subsidy is determined by the Minister of War.

Rifle practice is carried on under the superintendence of military men. The Government provides the rifles and ammunition. The course of practice is the same as that prescribed for the army corps. The distances at which the practice takes place vary from one hundred to seven hundred meters. Whenever, either because of the great distances at which the shooting ranges are situated or on account of any special circumstances, as, for instance, bad weather, it may be deemed best that the practice be made with cartridges adapted to the short distances, such a change is allowed. Every rifleman is permitted to fire five cartridges each drill day, with this proviso, that in the case of a limited number of participants in proportion to the number of ranges and the time available, more cartridges may be used, provided the number does not exceed fifteen.

The practice takes place every year between the first of May and the first of December, and on at least one afternoon each week in those places where there are ten riflemen to practice. The Government directs that the numbers of ranges placed at their disposal must be, as far as possible, in accordance with the demand, and that participation shall be promoted as much as possible, both by proper announcement and by the regulation of the practice itself. Prizes are offered, and in the year of 1902 the Crown gave a medal of an elaborate description to be awarded to such persons as became eligible in accordance with the regulations of the Minister of War, and the granting was made by royal order. There are other prizes or badges for those distinguished in communal, provincial and national competitions, of medals of silver, silver gilt, and gold. The communal competitions are held annually, and the provincial and national every three years.

Providence (R. I.) Revolver Club.

STILL alive and growing slowly. We have graduated from the shooting gallery 15yd. range, hired an old drill hall for one night a week, and increasing the shooting interests about here. Our pistol team is still resting on past laurels, and the men have not taken up much practice as yet; but we hope to wake them up eventually.

W. H. Freeman, our top-notch man, has done no shooting since the last match with the Miles Standish Club.

Capt. Bowen left off pistol shooting to practice for the State team work in connection with the Fort Riley match. Sergt. Bulard also kept at the Krag all summer, disposed of his pistol and revolver, and is now interested in the match rifle. In fact, many of the regulars of last winter have done very little work of late; but, under the club's new plan and place for practice, they will no doubt get the fever again and take up the work.

The facilities for small-bore rifle shooting at 25yds. has created quite a little interest among a number of shooters here, and most of our new members are composed of that class. There is quite a variety of weapons brought down for practice.

Albert Coulters, with his .22 target rifle, is kingpin in that line in this locality at present, and W. Bert Gardiner holds him a close second.

Mr. L. A. Jordan, of Saylesville, has just commenced practice, using a .22 repeater with Lyman sights, and considering the disadvantages under which he labors in indoor work, puts up some very good scores.

Down in Portsmouth and Newport there are quite a number of shooters, both of rifle, pistol and revolver, and plans are being made for the reorganization of the revolver club, combining such of those men as care to come in under a satisfactory arrangement.

Mr. William Almy, one of the old Portsmouth Rifle Club pushers, is doing fine work with the pistol, and the general revival in shooting matters will no doubt bring about some good scoring this coming season out of doors.

Following are the scores made at our shoot, Dec. 15, 20yds., Standard American target; revolver practice: A. C. Hurlburt, 88, 77, 80; Arno Argus, 83, 73, 79, 79; W. Bosworth, at 12yds., on 20yd. target, with .38 pocket arm, 73, 70; D. L. Craig, .38, on Creedmoor count, 36, 33, 38—possible 50.

Twenty-five yard German ring, rifle practice: A. B. Coulters, 231, 235, 231; W. Bert Gardiner, 222, 223, 235; L. A. Jordan, 220, 234; Wm. T. Bullard, 218, 223.

Our old friends, the Portland boys, have suggested a rifle match in order that they may get even for our success of last winter, and we are going to let them shoot out their revenge if we can scrape up the necessary men.

All things considered, we believe "business is looking up," and feel rather encouraged at the prospects here, even though it seems like pulling teeth to get the shooters into line.

A. C. HURLBURT, Sec'y.

Zettler Rifle Club.

At the weekly shoot of this club only eleven members were on hand to take part in the competition for high scores. The approach of the holidays, apparently, is the only reason for this lapse in the attendance, which usually increases steadily after the new year has begun. Scores: R. Gute 1219, O. Smith 1211, C. Zettler, Jr., 1210, L. Maurer 1201, G. Schlicht 1196, C. G. Zettler 1193, A. Begerow 1192, F. J. Herpers 1183, B. Zettler 1183, H. C. Zettler 1179, George Bernius 1144.

Lady Zettler Rifle Club.

SATURDAY evening was ladies' night on the Zettler ranges. Scores follow: Miss Zimmerman, 246, 248; Miss M. Zimmerman 245, 248; Mrs. H. Fenwirth, 245, 243; Miss Eusner, 242, 246; Miss Ludwig, 244, 243; Miss B. Ludwig, 244, 239; Mrs. H. Turbett 241, 235; Mrs. F. Liegibel, 231, 245; Miss Stoltz, 234, 236; Mrs. F. Watson 227, 231; Mrs. B. Zettler 226, 225.

Italian Rifle Club.

APPENDED are the scores for the practice shoot held Monday, Dec. 12: Selvaggi 239, De Felice 237, Muzio 235, Borrour 228, Bianchi 227, Orsenigo 221, Mandelle 217, Clemente 211, Gaglione 210, Biancorosso 209, Lampagnaur 207, Moglion 206, Cassetti 203, D. Amato 191, Scognamoglio 175.

New York Schuetzen Corps.

SCORES follow for the regular practice shoot of Dec. 15:

Ring target: R. Busse, 246, 246; A. Kronsberg, 239, 246; O. Schwaneman, 239, 236; C. G. Zettler, 232, 234; H. Radloff, 232, 233; G. Schroeter, 221, 233; H. Metzger, 211, 217; J. Keller, 209, 219; W. Heil, 200, 216; A. Wiltz, 190, 192.

Bullseye target: C. G. Zettler, 35 degrees, O. Schwaneman 37½, J. Facklam 55, A. Kronsberg (9), R. Busse 133, A. Wiltz 135, C. Wagner 136, W. Heil 140, J. Metzger 194.

Rifle Notes.

The Iroquois Rifle Club, of Pittsburg, have about completed the programme for the large shoot to be held on its ranges, Jan. 16 to 20, inclusive. In the championship match there will be twenty prizes, starting at \$100 for first, \$75, \$60, \$50, and so on down the line. A medal, valued at \$50, will also go to high man, in addition to the \$109 cash. On the ring target thirty-two prizes will be distributed, ranging from \$75 for first, \$60 to second, \$5 to third, etc. About thirty prizes in merchandise will be placed on the bullseye target, in value from \$50 down. The conditions: Any .22cal. rifle, any sights; entrance fees: 100 shot championship match, \$10; ring target, 50 cents per ticket, and bullseye tickets, 35 cents, or three for \$1. The amount of cash placed on the different targets should insure a goodly attendance of the New York crack shots. The official programme will be issued shortly.

Gus Nowak, the veteran marksman, died of pneumonia Wednesday, Dec. 14, at Throgg's Neck, Westchester, N. Y., after a brief illness. Mr. Nowak at one time was a member of that famous group of experts, the Zettler Rifle Club, New York, acting for several years in the capacity of secretary.

The St. Louis Central Sharpshooters' Association held its annual election of officers recently, with the following results: E. H. Kessler, President; August Fick, Vice-President; Adam Felhauer, Secretary; Capt. E. P. Creacy, Financial Secretary; J. Green, Treasurer; N. Matheis, Trustee, and J. Stumpf, Captain.

A number of army officers from Fort Thomas, Ky., visited Middletown, O., last week to inspect the proposed site for a Government rifle range for the use of troops at Columbus and Ft. Thomas. The range will also be used by the Ohio National Guard.

The Jackson Township Rifle Club held their December shoot on the 10th. The medal was won by Jesse Johnson, with a score of 46 out of a possible 48. Four shots, 100yds., offhand.

June 8-9.—Dalton, O., Gun Club annual tournament. Ernest F. Scott, Capt.

DRIVERS AND TWISTERS.

The Gloucester City gun clubs have arranged special programmes for Christmas trapshooting competition.

An all-day shoot of the Mullerite Gun Club will be held on the grounds of the Orange County Gun Club, at Middletown, N. Y., on Jan. 20, 1905. The managers are Albert A. Schoverling, 2 Murray street, New York city, and O. H. Brown, Middletown, N. Y. Programmes later.

In the Philadelphia Trapshooters' League contests last Saturday, the Florists defeated the Highlands by a score of 186 to 122; S. S. White defeated Camden by a score of 206 to 196; Hillsides defeated Narberth by a score of 123 to 107; Meadow Spring lost to Clearview; scores 206 to 207. There were ten men to a team, 25 targets per man.

The Carteret resumed shooting last Saturday at their old Long Island grounds. The club house has been moved across the railroad, where no annoyance will be caused to the neighborhood residents. The opening day cup, at 15 targets, was won by W. P. Norton. W. S. Hoyt presented a cup, to be shot for on alternate Saturdays, and each contestant is to shoot at 25 targets. The first leg on this trophy was won yesterday by George S. McAlpin. Three wins are essential to ownership. The Garden City cup, a handicap at 15 targets, was won by D. I. Bradley. The amateur championship will this year be decided on the grounds of the Philadelphia Gun Club some time in January.

Capt. C. G. Blandford writes us that the next shoot of the Ossining, N. Y. Gun Club will be held on Christmas afternoon, Monday, 26th inst. Shooting will start at 1:30 sharp. The programme will consist of ten 10-target events for ten prizes offered by the president of the club, Col. Franklin Brandreth. The events will be distance handicaps, and no shooter may win more than one prize, though all can shoot along in the optional sweeps. After the winners of all the events are decided, they will draw for first choice of prizes. This is a club shoot, and members should turn out in good numbers. Any member may invite one friend to compete.

Mr. Edward F. Markley, Chairman of the Tournament Committee, writes us as follows: "The Alert Gun Club, of Phillipsburg, N. J., opposite Easton, Pa., will hold their first annual target tournament on their grounds, Feb. 11. The programme will consist of 180 targets and eleven events. The programme in full will be mailed to you later."

Mr. W. T. Irwin, commonly and endearingly known among his familiars as "Tramp" Irwin, is now a traveling representative of the U. M. C. Co., and at present is visiting tournaments in Illinois. He is a hard worker, can fill any position in connection with trapshooting interests, whether as contestant, manager, reporter, cashier, etc. His experience is measured by trapshooting from its beginning to the present time. As showing that he was a valiant opponent, it may be mentioned that he contested a series of matches with the renowned Bogardus, and won nearly all of them. Our recollection is that he won five out of seven contests. Mr. Irwin is popular with the members of the trapshooting fraternity, and is a valuable addition to the U. M. C. force.

The London Field mentions that the shooting season began on Dec. 12 at Monte Carlo, and closes on April 8. After the first week in January there will be shooting on Mondays, Wednesdays and Fridays for sweepstakes, after which date there will be no prize with less than £40 added on Mondays, Tuesdays, Thursdays and Saturdays up to the end of January. The Grand Prix du Casino will begin on Monday, Feb. 6, and three following days, so that there is no risk of the delay which occurred last year through insufficient time. The Grand Prix is to be followed by the Monte Carlo Handicap of £160 on Feb. 10, and there will be shooting on Mondays, Wednesdays and Fridays for prizes of £40 and £120 throughout March, the Grand Prix du Littoral of £400 being shot for on March 27-29.

The North Branch, N. J., Gun Club announces the programme of their first annual midwinter shoot. The date fixed upon is Dec. 29. Twelve events are provided, of which ten are at 15 and two at 25 targets; entrance 80 cents and \$1. Totals, 200 targets, \$10. "Fifteen dollars for amateur's average shooting, entire programme 50, 30, 20. Class shooting, three moneys; twelve or over, four moneys; prize for high professional or paid representatives. Loaded shells for sale on the ground. No postponement on account of weather, as shooters are fully protected. Take main line of N. J. C. R. R. direct to North Branch. Two cents will be charged for targets, included in entrance. Guns and shells sent prepaid to M. H. Rupell will be delivered on the grounds free of charge. Goose dinner at hotel, 12 o'clock. H. B. Ten Eyck, Sec'y; M. H. Rupell, Capt."

BERNARD WATERS.

Florists Gun Club.

ON Monday, Dec. 19, the two teams of experts were given an all-day shoot by the Florists' Gun Club, of Philadelphia at Wisnoming, the home club entering a team out of courtesy to the visitors. The scores were:

Targets:	10	15	20	10	15	20	15	20	Total.

WESTERN TRAP.

Cincinnati Gun Club.

OWING to the weather, the attendance on Dec. 17 was small. The day was very disagreeable, with snow and rain, and shooting conditions were hard. In the cash prize shoot there were nine entries, Don Minto being high with 45 out of 50; Gambell second with 42; Block and Williams third with 41 each, and Maynard fourth with 40.

Only seven men did any practice shooting, the best score being made by Maynard, who broke 63 out of 75. Williams also did some good work, breaking 24 out of 25 in one event.

Captain has not been at the club for some time. Owing to poor health, he was obliged to go to Florida, where he is enjoying some good shooting and getting better.

Ackley is slightly more comfortable than last week. Peters and Barker went to Dayton to-day to show the boys there how to shoot. If they do as well as they know how, they will lead the Daytonians a chase.

Del Gross has recovered from his recent illness, and was in the city this week, preparatory to a trip on the road. We may expect to read of some big scores when he gets the hang of his new gun.

Arthur Gambell and H. Osterfeldt have got their grips packed, and are only awaiting a telegram from Dick Porter, of Chattanooga, Tenn., to start for Grace, near Vicksburg, Miss., for a few days' hunting. Mr. Porter writes that wild turkeys, quail and other game are abundant, and he is only waiting for the flight of ducks to begin. No cup races have been shot for some time. It looks like Faran would get the trophy.

Cash prize shoot: Don Minto (16) 45, Gambell (16) 42, Block (19) 41, Williams (19) 41, Maynard (19) 40, Falk (16) 38, Herman (19) 35, Roll (20) 32, Pohlar (19) 28.

Springfield (O.) Gun Club.

The members of the Springfield (O.) Gun Club held a shoot on Dec. 10, which was well attended, sixteen men taking part in the various events. Twelve events were shot; one at 25, one at 20, three at 5 and seven at 10 targets. In each of events 3, 5, 6, 7 and 8 a duck was offered to the winner. In No. 4 a turkey, and in each of events 9, 10 and 11, a chicken. In the shooting for the day Foley was high man with 96 out of 105. Poole and Young tied for second on 88, the former shooting at 105 and the latter at 95. Henderson, third with 83 out of 95. The only straight score in the first event, at 25 targets, was made by Ernest, who defeated Young by 1 target and finished fourth for the day, with 68 out of 75. Other scores were: Snyder (80) 66, Rex (65) 56, Oats (50) 39, Hensell and Halbert each 33 out of 60, Thompson (65) 31, F. Henderson (35) 24, Musselman (30) 23, Morningston (25) 13, Swigert (15) 11, Geo. Oats (10) 7. The prize winners were Foley, a duck, in event 3, after shooting off a tie on 10 straight with Snyder. In event 4, Foley, Snyder, Henderson and Ernest tied on 9 out of 10, and the former won the shoot-off and turkey. Young shot for targets in this event and broke 9. Rex and Foley tied on 10 straight in No. 5, and the former won the duck in the shoot-off. Young also broke 10, but was shooting for targets. In event 6, Foley and Ernest tied on 10 straight, the former winning the duck in the shoot-off. In event 7, Henderson, Snyder and Foley tied on 9 out of 10, and the latter won in the shoot-off and got the duck. In event 8, Geo. Oats, F. Oats and F. Henderson each broke 7 out of 10, the duck being won by Geo. Oats in the shoot-off. Event 9 was at 5 targets, and Oats won the chicken with 4 breaks. In event 10 Oats and Swigert tied on 4 out of 5, and the former won the chicken in the shoot-off. In event 11, Oats, F. Henderson and Swigert tied on 5 straight, the latter winning the chicken in the shoot-off.

Greenville Gun Club.

Seven members of the Greenville, O., Gun Club took advantage of a pleasant afternoon the other day and spent the time in smashing a few clay birds over the traps. H. A. McCaughey was high man with 83 out of 100. Baker shot at 105 and broke 77. Fouts third with 50 out of 100. Ross fourth, 35 out of 80. Lockwood fifth, 30 out of 60. Jenkinson sixth, 16 out of 30, and Brawley, seventh, 14 out of 50.

Palestine Club.

A new gun club was organized this week at Palestine, O., with the following officers: Norman Teaford, President; Joe Ross, Vice-President; Hershel Jeffries, Secretary; I. von Saylor, Treasurer. The club will hold a turkey shoot during the holiday season, and propose to let the shooters of this vicinity know they're alive when the season opens next spring.

A new gun club has been organized at Bradford, O., with fifteen members. Regular shoots will be held during the coming

season. At the first shoot on Dec. 10, A. R. Zimmerman made high score, 19 out of 21, H. Q. Kitmer 18, J. Miller 14.

Ohio Notes.

All trapshooters are invited to attend an all-day shoot on the Dayton Gun Club grounds on Thursday, Dec. 29. Turkeys, ducks and chickens will be offered as prizes.

At the turkey shoot held at Salem on Dec. 15, Harry Oswald was high gun with 89 out of 100, Rike 84, Kette 80, Schwind 79. Oswald won six turkeys and a chicken; Rike five turkeys; Mack three turkeys; Staup two turkeys and a chicken; Schwind two turkeys and a chicken; Barnes two turkeys; Craig one turkey and a duck; Teddy one turkey and a duck; Ike a duck; Miller, Clark, Hook and Evans, one turkey each.

Mallory—DuPont.

THE following interesting recountal of a team shoot held on Dec. 10, is taken from the Morning News, Wilmington, Del.:

The weather on Saturday afternoon was fierce enough to lower the scores made over the Country Club traps, but could not keep the shooters from carrying out the programme of a team race between the well known "Mallory Squad," of Parkersburg, W. Va., and Bradford, Pa., and the equally well known "duPont Squad," of this city. The Mallory squad was as follows: Messrs. F. E. and S. T. and J. F. Mallory, of Parkersburg, and L. E., Sr., and L. E. Mallory, Jr., of Bradford, Pa. They were accompanied by Mr. Standcliff, of Parkersburg, and Pringle, of Bradford, this party of seven being on their way to their club house and shooting preserve at Revels Island, Accomac county, Virginia. The duPont Squad was, as usual, Eugene, Alexis I., Eugene E., Victor, Jr., and Victor 3d, all of Wilmington. Drifts of snow had to be waded in order to get to the shooting house and platform, while a blinding snowstorm and a biting 20-mile-an-hour nor'wester made target shooting a strenuous sport. So cold was it that referee and scorer had to be changed many times during the progress of the team race, Elmer E. Shaner, of Pittsburg, Pa., secretary and manager of the Interstate Association, the official referee, being assisted by Luther J. Squier and other local shooters.

Seldom, if ever, was a target team race shot off under more severe conditions, yet J. F. Mallory and L. E. Mallory, Jr., scored 48 and 45 out of 50 respectively, scores which were really phenomenal under the conditions, and which undoubtedly won the match for their team. It will be a long time before Messrs. F. E. and S. T. Mallory forget their scores of 30 out of 50, for both of them are under ordinary circumstances good for 47 or 48. While the duPont Squad was beaten, it was by no means disgraced, as the score given below will show, for to be defeated by only 15 targets out of 250 shot at by each team is but a small margin, particularly when the high class form of their opponents is taken into consideration. The race was shot in three events of 15, 15 and 20 targets each respectively, and the scores were as follows:

Mallory Squad—J. F. Mallory 48, L. E. Mallory, Jr., 45, L. E. Mallory, Sr., 31, F. E. Mallory 30, S. T. Mallory 30; total 184.

duPont Squad—Eugene duPont 36, Alexis I. duPont, Jr., 36, Eugene E. duPont 35, Victor duPont, Jr., 32, Victor duPont 3d, 30; total 169.

Prior to the shoot Messrs. Mallory and Messrs. Pringle and Standcliff were entertained at lunch at the Wilmington Club, and were later driven out to the Country Club's grounds, where the shoot was held. After the shoot a dinner was given at the club house by the duPont Squad in honor of their guests, covers being laid for sixteen, there being present, in addition to the party of seven from Parkersburg and Bradford mentioned above, the following: Elmer E. Shaner, of Pittsburg, Pa.; Messrs. Eugene and Alexis I. duPont, and Messrs. J. T. Skelly, W. M. Foord, Luther J. Squier, Duncan Bruce, Edward Banks and Lieut. Jere G. Ewing, the latter most capably filling the difficult position of toastmaster. After dinner the party returned to the city in a sleigh carryall, the Messrs. Mallory and party, accompanied by Messrs. Eugene duPont, Skelly and Squier, leaving on the 11:50 P. M. train for Keller station on the N. Y., P. & N. R. R., the station from which they reach their club house on Revels Island. As geese, brant and ducks are reported to be very plentiful on the club's waters, and as each member of the party is a skilled wild-fowl shooter, a thoroughly good time is assured.

In connection with the visit of the Mallory Squad to the Country Club's grounds, the members of the duPont Squad presented a handsome stein to be competed for by members of the Mallory Squad under handicap conditions, the Messrs. Mallory to handicap themselves. J. F. Mallory's magnificent total of 48 out of 50, made under such extremely hard conditions, deservedly won for him the souvenir of his first visit to Wilmington, but L. E. Mallory, Jr., was a very close second, owing to his almost equally great total of 45.

Fairbury Tournament.

FAIRBURY, Ill.—On Wednesday and Thursday, Dec. 14 and 15, there was a two-day tournament held by the Fairbury, Ill., Gun Club, on their grounds, which are situated south of the city, in the well appointed fair grounds.

The visitor arriving at the club house is well pleased with the surroundings. Though the club is small, it is active and enterprising, as shown by the neat club house, in which was found a red-hot stove. After a deposit of shells and guns, for which racks are provided, a look outside revealed a new trap house, in which a brand new trap was set up ready oiled and conditional to please all with its regular delivery of a 45yd. target. The grounds are level and face southeast. This was hard on the shooters on this particular day, as the sun's reflection on the snow was rather severe; yet most all made fairly good scores.

The weather was cold in the early mornings, yet warmed up during the day; especially was this the case on the second day, when a large delegation of townspeople were out on pleasure bent to enjoy the sport of seeing targets busted while flying in the air.

Dr. D. Brewer, the president, was present part of the time. Though he is a game shooter, and claims to be, like some other "has beens," so far as the target game goes, yet he takes his annual game hunt with the same energetic spirit as of old.

T. D. Karnes, the secretary, handled the cash and kept the inside work in the best of order, using the Shrogen score sheet, which was hung on the wall, where all could see their scores, total misses, money won in each event, and total money coming, as each event was added together as fast as shot.

I. C. Harris, one of Illinois' well-known shooters, was doing all he could to entertain his friends. A. Brown was the man with the "heagle eye," who attended faithfully to the refereeing. When he called "Broke" or "Lost," there was no disputing the same, as he wore a suit of blue and on his coat a large star was conspicuous. F. J. Moran is another active member, though he did not shoot in all the events.

The attendance was disappointing to the management, who had provided a good programme. There were 200 targets each day, with seven events of 10 each, to suit the amateur. They were also catered to by a provision for a handicap from 15 to 18yds. The best shot was provided for by high average money for each day, and also for both days. Good lunch was provided and served in a tent, where the hot coffee was a sure enough "foot warmer."

The weather was cold, with an inch of snow on the ground, and that caused some to stay away. Another "good bunch" came late the second day, having got mixed in the dates, hence the town made famous by Ide Harris, did not come up to expectations, as to numbers. Yet those present had a good time, and will be glad to return when the weather is more favorable.

The profession were out in force. H. H. Vietmeyer's score of 180 was very fine, considering the snow handicap. Fred Lord was driving 'em out very consistently. Our old friend "Cad" was having some trouble with an excessive load of powder in his new shells, and, besides, he had a very bad cold. He is handicapped in his shotgun shooting by the amount of expert rifle shooting that he is constantly doing. Chris. Keck was going a great clip when he won out the high expert average on the first day, so that his employers have reason to be pleased with his work. His "one arm only" does not hinder him being a good fellow among the "boys." The young man, Standish, was especially invited, and named in the programme as the cashier, but he had business elsewhere. In his stead there appeared on the ground another "feller." While it was his maiden effort as a representative, he is well known to every shooter in Illinois, or the United States, for that matter. You will be surprised to read herein his name, as was the writer and all present, for he was the well-known Tramp Irwin, whom you all know. "Nuff said."

For the first day the one-armed gun pointer was the top man for the experts, with Lord second and Vietmeyer third. For the amateurs it was Blumershire, of Washington, Ill., first; Fagot, of Benson, second, and Ferris, of Chatsworth, third.

The second day was a fine one, though cold in morning. While some of the shooters present first day did not return, there were others who came in, and there were more present on the second than on the first day—a rare thing in the shooting line. There was a reversal of form on this day, as Vietmeyer and Lord had a hot time of it, and they finally tied on 180. Ide Harris was high for amateurs, with the low score of 166. Fagot, second, 158, and Toss third, with 157.

During the day the target throwing question was discussed, and it was the general opinion that targets should never be thrown over 45yds.

Those present as traveling representatives, were Fred Lord, Chris Keck and W. H. Vietmeyer, of Chicago. Amateurs: Ide Harris, Fairbury; P. J. Fagot, Benson; D. J. Moran, Fairbury; H. Blumershire, Washington; A. Ferris, Chatsworth; Clark Harris, Fairbury; E. P. Beebes, El Paso; De Moss Boyd, Fairbury; H. Rosalus, Gilman; W. S. Holmes, Pontiac; George Reits,

Walter Snyder and R. M. Frisby, Gilman; Dr. De Brewer, T. D. Karnes and A. Brown, Fairbury, Ill. The scores:

Philadelphia Trapshooters' League.

Meadow Springs—Clearview.

On the grounds of the Meadow Springs Gun Club, Dec. 17, the home team was defeated as follows:

Meadow Springs—Roberts 23, G. Smith 23, Pepper 19, Mardin 21, W. Hansell 18, Franklin 20, Henry 19, Bush 20, Coyle 23, Hall 21; total 206.

Clearview—Light 22, W. Charlton 23, Davison 19, M. Smith 19, Ludwig 22, Springer 21, Bivens 16, Fisher 22, Downs 21, Huber 22; total 207.

Meadow Springs weekly club shoot, 25 targets: Chandler 1, Christ 6, Heathcote 19, Martin 19, Woodward 4, E. Hansell 13, Hall 22, Coyle 21, Frey 17, Garrett 21.

Sweepstake event No. 1, 10 targets: Coyle 9, Bush 7, Meyers 4, Jackson 7, Snyder 8, Martin 7.

Event No. 2, 15 targets: Bush 10, Coyle 12, Martin 12, Jackson 10, Schneider 12.

Event No. 3, 10 targets: Roberts 9, Leicht 10, Coyle 9, G. Smith 10, Henry 8, Hunt 2, W. Hansell 9, Harvey 9, M. Smith 10, Hall 8.

Event No. 4, 15 targets: Ludwig 11, Fisher 11, Springer 11, Charlton 13, Hall 8, Roberts 13, Myers 13, Bivens 13, Martin 12, Golthart 10, Huber 13, Frey 14.

Florists—Highlands.

At Gorgas Station, Dec. 17, the visiting team won, as follows:

Florists—Sanford 20, Westcott 11, E. Coleman 21, Park 19, Huttenlock 21, Massey 15, Bell 14, Landis 19, Anderson 23, F. Coleman 23; total 186.

Highland—M. Wentz 21, Ringgold 4, Denham 12, Dalton 11, A. Ballentine 23, Meehan 9, T. Ballentine 10, Everett 11, J. Burns 11, E. Wentz 10; total 122.

Sweepstake event No. 1, 10 targets: Sanford 10, Landis 9, Bell 8, Shew 6, Ringgold 5, Nixon 4.

Event No. 2, 10 targets: Parker 8, Westcott 8, Huttenlock 5, Everett 3, Hammil 2, Pinkerton 1.

Event No. 3, 10 targets: Whitaker 7, Massey 6, Crooks 5, Sheeler 4, Ringgold 4.

Event No. 4, 25 targets: Buckwalter 23, Sheeler 20, Whitaker 19, Shew 17, Nixon 11, Green 8.

Event No. 5, 15 targets: E. Coleman 12, Landis 12, Dalton 10, Anderson 9, Nixon 3.

Event No. 6, 15 targets: Huttenlock 14, Anderson 13, Parker 12, E. Coleman 11, Park 10, Hammil 7.

Event No. 7, 15 targets: W. Wentz 12, A. Ballentine 12, Whitaker 10, Massey 8, Crooks 8, Sheeler 7.

Event No. 8, 20 targets: Nixon 19, Buckwalter 18, Anderson 18, Crooks 14, Huttenlock 11.

Event No. 9, 25 targets: Buckwalter 23, Sheeler 20, Whitaker 19, Shew 18, Nixon 11, Green 8.

S. S. White—Camden.

Dec. 17 on the grounds of the Camden Gun Club, the S. S. White team was victorious by a score of 206 to 196. Watson Harper scored 25 straight, notwithstanding the snowstorm, which interfered with high scores.

S. S. White—Harper 25, Dr. Cotting 23, H. Stahr 23, Hand 22, Fountain 20, Parry 20, Reade 19, St. Clair 18, Hinkson 18, Brenizer 18; total 206.

North Camden—Bryan 23, Tilton 22, H. White 20, Stratton 20, Bray 20, Cavalier 20, Bateman 20, A. Sharp 19, Garrigues 18, Grant 14; total 196.

Special prize shoot, 10 targets, 50 cents entrance: Dr. Cotting 10, Bryan 9, H. White 8, L. White 8, Tilton 8, Fountain 7, Sharp 7, Hand 7.

The open sweepstake events were at 10 targets, and scores were as follows:

First event: St. Clair 9, Brenizer 8, Hinkson 8, Hand 7, Stahr 7, White 6, Tilton 6, Cavalier 6.

Second event: St. Clair 10, Hand 9, Stahr 8, Bray 8, Reade 8, Brenizer 7, Harper 7, Heite 6, Fleming 5.

Third event: Harper 9, Parry 8, Fountain 7, Garrigues 7, Reade 6, Heite 6, Hinkson 5, Stratton 5.

Fourth event: Silver 9, Dr. Cotting 9, Hand 9, Stratton 8, Fountain 8, Wilkes 7, Brenizer 7, Heite 6, Hinkson 6.

Hillside—Narberth.

At Narberth, Dec. 17, the Hillside team defeated Narberth. Hillside had only five members present, and according to the rule, were allowed a score of 12 breaks for the absentees.

Hillside—Laurent 14, M. Bisbing 15, Clark 9, Haywood 14, Parsons 11, and five absentees at 12 each; total 123.

Narberth—Davis 12, Halberstadt 8, Sharp 11, Duffield 13, Appleton 10, Dill 7, Alker 10, Fryer 7, Barker 16, Humphries 13; total 107.

Sweepstake, 10 targets: Davis 7, Haywood 6, Halberstadt 5, Dill 5, Alker 4, Humphries 4, Fryer 4, Laurent 3.

Sweepstake, 10 targets: Titlow, 7, Duffield 7, Alker 7, Dill 6, Sharp 5, Fryer 4, Laurent 4, Halberstadt 4, Emerson 2, Dill 2.

Sweepstake, 10 targets: Appleton 5, Parson 4, Laurent 4, Halberstadt 3, Laurent 2.

Crescent Athletic Club.

BAY RIDGE, L. I., Dec. 17.—There was a good attendance of members, notwithstanding the heavy snowstorm. The chief feature of interest was the trapshooting competition of the trade experts, who were the club guests. The experts were of the highest skill, and each had records indicative of valiant doings in tournaments everywhere. They were Messrs. J. A. R. Elliott, R. O. Heikes, Alexis duPont, Hood Waters, Fred Gilbert, Jack Fanning, James T. Skelly, T. A. Marshall, G. W. Huff and Luther J. Squier. The first contest was a team match, 100 targets per man, six men on a team. A sterling silver trophy rewarded the expert who made the highest score. Gilbert proved to be the winner, with the excellent snowstorm score of 91.

Marshall's Team.

Cincinnati Rifle Association.

THE following scores were made in regular competition by members of the Cincinnati Rifle Association at Four-Mile House, Reading road, Dec. 4. Conditions: 200yds., offhand, at the 25-ring target. Payne was declared champion for the day with the good score of 230. Nestler was high on the honor target with 70 points. Mr. John W. Coleman, whose application was formally announced in our previous report, was duly elected to active membership, and we wish him many good scores. The scores:

Payne	230	221	217	216	215
Nestler	225	219	217	216	213
Odell	221	212	212	209	175
Hasenzahl	220	217	209	207	...
Bruns	220	215	205	204	204

Hofman	197	196
Coleman	191	174	167	157	...

Bergen Beach Gun Club.

THE Bergen Beach Gun Club will hold a shoot at targets on New Year's Day, Monday, Jan. 2, 1905, beginning at 10 A. M., on their grounds, situated at Avenue N and Seventy-first street.

The programme will consist of 170 targets, 120 of which will be at eight 15-bird sweeps. Entrance \$1.25 each, including targets; sliding distance handicap; four moneys, divided Rose system, 5, 3, 2, 1. A contestant getting into first money will shoot at 20yds. rise; one getting second money at 19yds., third money 18yds., fourth money 17yds., out of the money 16yds. in the successive event.

The main event will be at 50 targets, distance handicap, 16 to 21yds. rise for at least twelve merchandise prizes of value to shooters. Entrance, \$2.50, including targets. Highest score, first choice; second high or ties, next choice, and so on until all the prizes are distributed in this event. Entries close approximately 3 o'clock P. M. Handicaps by Harry Bergen, Capt. Dreyer and the manager.

Shooters may shoot for targets in the 15-bird events at a price of 25 cents for the 15 targets.

Two dollars for two highest averages in entire programme; \$2 each for two lowest averages in entire programme of 170 targets.

Paid experts may shoot for targets only. Lunch and refreshments for shooters and their friends by the courtesy of the club.

Flatbush avenue Bergen Beach trolley from New York City Hall, Brooklyn Bridge entrance, direct to the grounds, for 5 cents.

L. H. SCHORTEMEIER, Mgr.

Trap at Point Breeze.

PHILADELPHIA, Dec. 17.—The snowstorm was a hindrance to good scoring at the live-bird shoot held on the Point Breeze grounds to-day. Two matches were shot. In the first, S. C. Aiman scored 9 to J. McShane's 7, each shooting at 10. Aiman stood at 31yds., McShane at 28.

In the second contest the principals of which were A. J. Miller and A. A. Felix, 25 live birds each; Miller won by a score of 22 to 18.

Match shoot, 10 live birds, \$25 a side:

S C Aiman, 31....2222222222—9 J McShane, 28.....122200*12—7

Match shoot, 25 birds, \$50 a side:

A J Miller.....*2222222222*202222222222—22

A A Felix.....2*22222220*222202020222222—18

Open sweepstake, 5 birds, \$3 entrance: Aiman 5, Murphy 5, Felix 4, Harrison 4, Rivel 4, Talbot 3, Martin 3, McShane 2.

Open sweepstake, 5 live birds, \$3 entrance: Harrison 4, Murphy 4, Shettsline 4, Miller 3, Talbot 2, Felix 2, Martin 2, McShane 0.

Match shoot, 5 live birds, \$10 a side—Martin 5, McShane 4.

Pennsylvania State Sportsmen's Association.

PITTSBURG, Pa., Dec. 15.—Kindly announce to the readers of the FOREST AND STREAM that the Pennsylvania State Sportsmen's Association tournament for 1905 will be held at Pittsburgh, Pa., May 2, 3, 4 and 5, under the auspices of the Herron Hill Gun Club. One thousand or more in cash will be added to the purses. The committee that will have immediate charge of the tournament is composed of Messrs. Louis Lautenslager, Chas. G. Grubb and Elmer E. Shaner. The personnel of this committee is sufficient guarantee that the tournament

A WELL OF THE DESERT.

THOSE of us who were brought up on the literature provided by Mayne Reid, no doubt remember that some of his heroes, when traveling over the desert, were saved from death by thirst by opening the stems or fruit of the cactus and drinking the water which they contained. For many years this has been regarded as a mere traveler's tale; yet those who live in the desert know well that the story is true. Only the white man who goes around with his eyes shut has been ignorant of this. There is water in the desert, and those who dwell there know how to find it.

Some years ago, in his interesting article entitled, "The Gulf of Cortez," published in one of the Boone and Crockett books, Mr. Geo. H. Gould described how, on a barren mountain side in Lower California, he found the stems of cactus with the hard rind broken in and the moist interior gnawed away. His Cocopah Indian guide told him that this was done by the wild sheep, which broke the hard spiny rinds with their horns and ate the soft contents.

It is well known that animals inhabiting the desert often go a long time without water, and there are people who maintain that they never drink at all. The camel has long been famous for the length of time during which he could abstain from water, and has been credited with carrying around with him an extra supply, on which he may draw if ever he really becomes thirsty. An extraordinary statement concerning this beast is that made by D. W. Carnegie, who tells that, while traveling in the desert of Southwestern Australia, his nine camels went without water for a period of twelve days, at the end of this time drinking each about seventeen gallons. Again, a little later, two camels traveled for thirty-seven days on thirteen gallons of water each, distributed in three drinks.

But our own animals, such as peccaries, deer, various mice and other rodents, appear to get along without water, and in a recent paper on this topic, Mr. F. V. Coville has brought together a number of interesting facts on this general subject. Some of these rodents do not appear to know what water is, certainly as it is offered them; but it will be remembered that nearly 100 years ago Audubon the naturalist, when making experiments to learn whether a prairie chicken would drink or not, discovered that while the bird would not notice water offered to it in a dish, it eagerly sipped from the bars of its cage drops of water that had been spilt and clung to them.

As we have said, the Indians and the animals of the desert recognize very well that some of the great cactuses which grow in their home contain water and in abundance. Chief among these are certain plants—locally called bisnaga—belonging to the genus *Echinocactus*, the juice of which is sweet and pleasant. The plants stand up three or four feet high and 18 or 20 inches thick, looking at a distance like tremendously stout posts. If the top be sliced off horizontally, the white soft flesh of the interior of the plant is seen, but water will not flow from it of itself; there is merely a moist surface. If, however, a club or pestle be used to crush this white flesh lying within the outer rind, a bowl will be formed in the top of the cactus, partly filled with wet pulp, and from this pulp water may be squeezed back into the bowl. In a case witnessed by Mr. Coville, the crushing proceeded until a bowl had been made about 8 inches deep, and in this bowl were about three quarts of very pleasant water. It was slightly salty to the taste, but good enough water for any thirsty man.

There is another form of bisnaga, approximately spherical in form, which is said by the Indians to furnish a better water than the upright one. This, if we recollect

aright, is the sort described by Mayne Reid in those stories of many years ago.

This water is commonly drunk by the Indians, is used to mix with flour to make bread, and is commonly devoted to any camp use.

There are other very large cactuses—those, for example, known as the saguaro, the pitahaya and the sina—which do not provide good drinking water because their juice is very bitter and even nauseating; and it is interesting to note that these cactuses, so unpleasant to the taste, are but slightly protected by spines, while on the other hand the visnaga and their agreeable tasting allies possess an almost impenetrable armor of hooked and rigid spines.

A NATIONAL AUDUBON SOCIETY.

AS EARLIER stated in the FOREST AND STREAM, it is proposed immediately to incorporate a National Association of Audubon Societies, the purpose of which is to do work similar to, but broader than, that undertaken by the State Audubon societies, and whose membership shall cover the whole country.

It is nearly twenty years since the Audubon idea was first formulated by FOREST AND STREAM, and the first Audubon work undertaken and for several years carried on at its own expense by the Forest and Stream Publishing Company. Of recent years that work in other hands has grown and strengthened, and largely through the energy of Mr. William Dutcher, of this city, with the co-operation of the American Ornithologists' Union, has done great good. The time has now come to extend the Audubon work so as to make it cover more than the protection of birds. Moreover it is time, we believe, that more emphasis should be given to the economic importance of the work while the sentimental side should have less prominence. If the management of the National Association of Audubon Societies should share this view, the new association would have as a part of its work the protection of birds, the protection of mammals, the protection of forests, and generally, so far as possible, the protection of the natural things of the land.

The proposed association will be incorporated in such form that it may hold property, and may legally receive gifts and bequests for carrying on its work. Large sums annually are already contributed to the purposes of the various Audubon societies, and we have recently been told that a New York man, whose name is not given, has made a bequest of \$100,000 for the uses of such a National Association. With this as a nucleus, efforts will be made to raise from people interested the sum of \$1,000,000, the income of which should be used for wild bird and animal protection in North America.

It is understood that the management of the prospective association has made arrangements to secure the services of Mr. T. Gilbert Pearson, of North Carolina, to explain by talk and public discussion the objects of the new society. Mr. Pearson, in his work in North Carolina, has shown great enthusiasm and capacity, and the selection made seems a very wise one.

MONOLOGUES OF KIAH.

THE sun glowed in gorgeous colors through the soft haze, and the air was in a state of perfect calm. The day was Sunday, and the hour was late morning. The morning meal had been leisurely eaten, after which the dishes had been hurriedly and scantily washed after the peculiar manner of men who, without wetting or soiling their fingers, assume to be expert cooks and scullions. Each had breakfasted according to his best judgment or his cubic capacity, therefore repose and contentment pervaded the camp. All was inaction in observance of the day. The impressive mellow peals of a far away church bell could be faintly heard carrying its message through the still air to a militant people. The expression of each camper's face indicated that the mind of each was far away in other associations, or dwelling on retrospections. Impressed by the spirit of the moment, Ruben gently remarked: "A good man, in good luck and striving for the public weal can confer inestimable benisons upon a people by heart-to-heart—" "Just the idea I had in mind this very moment," KIAH exclaimed eagerly, "and if all people would but recognize that fact more patiently and responsively, with a devout purpose to humanely know themselves and their fellows, a only heart-to-

heart talks will reveal, they would discover inexhaustible mines of goodness and nobility of which they now are in profound ignorance. You, Ruben, find everyone repellant because you meet them in a saturnine way, while I, on the contrary, sunny and cheery, treat them so sweetly that their hearts then beat with pleasure if they were ever so heavy and sombre. You attribute much to luck when it is not luck at all. It is a clear case of cause and effect in nine cases out of ten whether we hunt or fish, or work or play. Now, I can catch more fish than you can, and I can shoot birds better and in greater quantity than you can, or than you can reasonably hope ever to equal. You always urge that it's pure luck. I make friends right and left wherever I go, and you say I am lucky. Luck is a term more misused and abused than any other of the language. Even in our sports it holds a conspicuous place. You prow around all day with rod and gun and return empty-handed many times. When I can break away from the popular assignment to do the camp work while my good friends enjoy themselves, I sally forth and return with game in plenty. That, too, is a case of cause and effect. It is not luck at all. The results are consequent to industry and intelligence. When seeking, I am constantly alert. I note every little sign which may be appropriated to my advantage. Within my field of vision, every object is scrutinized carefully. You, Ruben, poke along with about the same alertness that you would display if you were really made of wood. You always have a crop of excuses. All these things are consequent to your taciturn disposition. I know that you say a lecture is not a heart-to-heart talk, but I judge you charitably in the many things which you do not understand. No man should be derided because some ideas are beyond his mental grasp. If you would engage in heart-to-heart talks oftener, the results would be much to your advantage. I am sure you will agree with me in this, will you not? Hey, Ruben, I said you would agree with me in that, will you not?" "Agree with you in what?" queried Ruben, sleepily. "Why, in what I just said," KIAH replied wonderingly. "Excuse me," Ruben answered, "I have not been listening. Would you mind repeating it again?"

THE SHIRAS BILL.

WE have printed letters from almost all the game commissioners of the United States in comment on the measure introduced in Congress by Hon. George Shiras 3d to put wildfowl under Federal control in so far as the shooting season is concerned. The plan has been received with approval which is practically unanimous. No one reading these communications can doubt that Mr. Shiras has with him the support of the game protectors of the country. We believe that individual sportsmen are alike a unit in the indorsement of the bill. As we have said, there are details in the several sections of the measure which may be subject to suggested change, but the general proposition, that the Federal authorities shall prescribe the close season and enforce the law, is a step of such advantage that criticism of it must be restricted only to a consideration of the technical principles involved; that is to say, as to the jurisdiction of Congress in the matter. This is the one point which in the past has restrained action at Washington; but it is a point which Mr. Shiras has considered, and which, he has said, is not an insuperable obstacle in the way of attaining the law, provided only, and provided always, that the sportsmen of the country want such a law.

We are convinced that they do; and we shall watch with very earnest interest the progress of the Shiras bill in the House.

THE pros and cons of the merits of shooting sitting ducks have had more extended consideration than was anticipated when the subject was first brought up. It has given a new illustration of the many-mindedness of those who call themselves sportsmen, and who profess to practice only such methods as are sanctioned by the approval of sportsmen in general. However diverse may be the views held, and however earnest the expression of opinion and belief and disbelief, so long as good nature prevails the discussion cannot be otherwise than entertaining and more or less profitable. It would perhaps be unreasonable to expect all men to agree on such subjects, when it is a common thing for disagreements to be on points far weightier.

THE SPORTSMAN TOURIST

Seth Muzzy's Pluck.

BY GEORGE STORY HUDSON.

"ARE the doughnuts aboard, dad?" asked Seth, doubtfully, poisoning the uplifted oars.

"That they are," replied Deacon Obed, "safe and snug in the earthen crock, with ma's blueberry cake and pies."

And the deacon, sitting in the stern of the leaky skiff, hunched up his knees to draw his feet above the sloshing pool.

Seth resumed rowing. They passed down the narrow channel between level, oozy flats toward the harbor, where a schooner swung at anchor.

"Bound to risk it, be ye?" piped a venerable acquaintance who leaned on his scythe at the edge of the thatchy bank.

"We're off next tide, weather willing," was the deacon's curt reply.

The schooner wallowed deep under a ponderous deckload of lumber. She was decrepit, weather-beaten and untidy. Dingy sails, patched and pinholed, lay unfurled. Ropes and other gear littered her cabin top in lubberly disorder.

She was a typical down-easter of ancient vintage and uncertain mould. Emblazoned on her squat stern was "Success" in rusty white letters. Beneath the name appeared a mystic square and compass.

Deacon Obed Muzzy was a typical farmer who knew little of the sea. He had taken the vessel for debt and claimed she was eating her head off lying idle. So he conceived a scheme to make her pay and had brought it into action, totally disregarding the warnings of his neighbors and the pleadings of his wife.

The deacon was noted for his stubborn characteristics, and when he declared he would load the Success with lumber from his wood-lot and freight it to market with the aid of his sixteen-year-old son, Seth, the wiser ones said, simply, "Wait and we'll see."

The Success was ready, so far as cargo was concerned. Her hold was jammed full of spruce boards, and a monster pile of 60-foot logs lay upon her deck, reaching from a point just forward of her cabin house to the windlass in her apple-shaped bows.

On the cabin roof was stowed a crate or pen. Within the slats was a flock of garrulous hens, perhaps fifty of them, destined as a present for the deacon's married daughter just settled in a faraway home.

Tall and spare was Deacon Obed. His grizzled head, set on a gaunt, bandanna-swathed neck, was topped with a battered straw hat of generous brim. Climbing up the seamy side of the old Success, he fell to work at the clanking, spluttering pump.

Seth was supremely happy. Boy-fashion he skipped about the deckload, whirled the creaking wheel and strutted to and fro along the counter. He looked forward to the outing as a bright spot in his life. He had sailed a punt in the river, and why couldn't he steer the schooner and mind the sails? he thought.

A tearful mother watched the boy from the vine-shaded porch on the hill. The tide soon began to make, and the bar across the harbor mouth disappeared; the low monotone of the surf against the flinty barrier was stilled.

"Up with the anchor, Seth boy," cried the deacon, and they bended to the work with zeal.

"We'll show 'em how to go coasting in the lumber trade," he continued, cheerily, as the mud-hood was at last made secure.

Then he let her go, all sail set, bound down Boston way. The breeze was fair, and there was nothing to do save steer and jiggle the pumps.

Presently the wind shifted and came in, puffy, from the eastward, dead ahead. They flattened in the sails and hammered away for Crooked Point, expecting to find smooth water beyond.

A thin haze crept above the wavering sea-line. Between the point and the schooner were strewn rocky ledges, where the surf foamed like milk. The coast line, to leeward, loomed solid granite without beach enough for a gull to find decent foothold.

Home Harbor, entered by a dangerous channed, and a little more than a bottle-shaped cove was eight miles away behind the frowning cliff. It proved tiresome work bucking into the rising sea. The Success never was much of a sailer to windward. She sagged and sulked and would not fetch where Deacon Obed pointed her.

The outer rock on Crooked Point gradually faded from view as fog enshrouded the horizon. In a short time the ashy pall, dense and dank, swept over the laboring vessel. Foaming along an unseen course, the Success was utterly lost.

Deacon Obed heard the breakers boom against the cruel ledges close under his lee. He gripped the wheel anew and sought a rift in the great gray blanket. It had now freshened in hardening squalls to a whole gale. The schooner rolled and pitched and groaned in every fibre. There was no time to shorten sail, and she needed every rag to fetch her clear. The old man, hatless and drenched, crouched over the wheel to ease her in the furious blasts that tortured masts and sails. Rain swished across the desolate waste. Seth—poor little chap—clung to the forward rigging, where the sting of driving spume was keenest.

Suddenly a fog horn bellowed close aboard. The dismal note came from a steamer fleeing the deadly coast. It boomed again, louder, nearer. Deacon Obed determined to take no chances. Peril was imminent. He threw the schooner into the eye of the wind. The Success, obedient to the helm, climbed over the heaving ridges and settled into the yawning valleys, her headway deadened. Then father and son waited, nerves keyed to bursting tension, to catch the position of the unseen stranger.

Up! up! a black hull rose upon a mass of foam, towering high above them, and not 100 feet off their starboard beam. Straight for the laboring vessel the mass of metal rushed. The Success, unmanageable, lay athwart her course.

Bells jangled from the lofty bridge! Steam roared out of deep-throated pipes. The steamer had reversed. Men, somewhere in the foggy distance, shouted orders in frenzied haste.

"Shift your helm," shrieked Deacon Obed. "You'll run us down, you heartless bully. We're here by right of way," he yelled in terror-stricken rage.

Crash! the ship catapulted into the Success with awful impact. Logs pitched and leaped into the hissing sea as the sharp stem cleft its path through stubborn wood and metal. The ship passed on; the dismal minor melody of her siren seemed to say she'd stand by and lower boats to aid.

Seth was hurled into the mainsail as it burst from its roping and blew in swelling folds against the mast. Grasping a halliard he clung there; then dropped to the deckload, dazed and bruised. Out of the shattered hen-coop flew a bunch of cackling fowl. Out into the bewildering fog they slowly winged. The boisterous wind beat them down in scattering flight. A few just cleared the seething crests.

Deacon Obed emerged from the cabin, where he had sought shelter from the shock. He was unhurt, yet severely shaken in nerve. A hen hurtled past his head. He forgot the peril of the situation and, with wildly swinging arms, tried to keep the remaining fowl within the slatted crate, though the schooner, almost submerged, maintained a frightful list.

A breaching wave poured tons of water upon the helpless craft. The coop, wrenched free, overturned and fell upon the deacon. A shifting log wedged the contrivance firmly and held him fast. Still unhurt, yet frenzied with rage at the peculiar predicament, the old man might have been mistaken for a wild man in captivity.

The sea sluiced through a yawning wound in the schooner's side. Had the Success been loaded with almost any other cargo, she would have sunk like lead. But the lumber within her hull kept her afloat.

"Roll the coop off me, Seth boy," implored the deacon. "She's settling fast and I'll drown like a rat," he cried.

Grasping an ax, Seth tried to jettison the deckload. The binding stakes, once severed, would permit the unwieldy log to roll into the sea. With one hand clinging to a crevice, his feet touching the slippery rail, the boy fought to the last ounce of his strength for his father's life. At last the stakes were cut; they creaked and threatened to give way and hurl the great log down upon him. A timber yielded, spun around and plunged overboard, barely missing Seth's head. The lad regained the deck. With a crow-bar he pried and wrenched at the logs across the coop.

"Hurry, hurry, Seth, I'm drowning!" cried the deacon despairingly.

Seth, horrified, saw water sluicing almost level with his father's pallid face.

"Why don't the steamer come back and help me," moaned the boy. "They can't have left my father to die out here like this."

Foam spurted up through the crevices in the upheaving deck. A foam-capped comber thundered over the vessel's stern and well-nigh buried her. It seemed she must founder.

Seth's active brain now seized on a forlorn chance to cheat the riotous ocean of its prey. He knew another toppling sea might crush out his father's life. Could he steer her against such odds? Hope leaped into his heart as he laboriously trimmed the flaunting remnant of canvas to swing the vessel before the wind, and so lessen the battering power of the seas.

Gradually the Success gained headway. Seth crawled back across the charging logs and grasped the wheel to hold her steady before the gale. A pursuing comber reared its hoary front and fell short. The schooner was now outrunning the sea, and the deck began to free itself of water.

Deacon Obed drew himself to a sitting posture and wrenched feebly at the slats of the pen. His thin lips quivered with cold and fright. "Keep her going, sonny," was the old man's encouraging cry; "you may save the vessel and us. I'm too weak to bear a hand just now."

The sky brightened, and Seth's manly heart quickened with joy. A ray of sunshine touched dashing sprays in rainbow beauty. The murky sea changed to dazzling blue and lost its destroying power. A foaming reef was cleared with nothing to spare as the Success fled on. She touched the shelving surface of a rock, careened, then grated over the jagged fangs and slid

to freedom. A section of her keel washed up under the stern and sped astern in the frothy wake.

A swaying buoy emerged from the dissolving mist. Seth saw it and shifted his course to fetch the welcome beacon.

"It's the Home Harbor mark!" he cried exultingly. The pursuing billows flattened as he swung the schooner head to wind behind a sheltering head land and let her drift. Seth, exhausted, cold and sobbing, dropped to the slippery deck. He had swooned.

Fishermen ran down to the beach from their huts, put off to the Success and let go her anchor. Deacon Obed was soon released. Father and plucky little son were lowered into the rescuer's boat and taken ashore, where they soon completely recovered from the dreadful experience.

Yet the deacon's neighbors continue to wink and say: "I told you so."

Trails of the Pathfinders.—XXIV.

The Rambler in North America.

(Concluded from page 329.)

Here, too, they found bears very plenty and very fat, feeding full upon the acorns. Latrobe complains, however, that "they were a cowardly set, and never waited to be killed, but slunk away among the entangled brush-wood till out of sight, and then shambled off with their ungainly gallop, so that we had no chance of another feast of bear's venison." Extraordinary bears!

Late in October they began to be among the buffalo, and it was now that Latrobe had his first chase. He was mounted on a good horse, and seems to have had little difficulty in overtaking his bull, but he very honestly explains that "there was something in the immense shaggy head, mane and beard of my game—the deep eye that gleamed like a coal of fire from beneath the curls, and his unwieldy bulk, that made me rein in, and rather follow than hunt him—nay, as often as, shambling on, he turned his head and glanced revengefully on me, I thought it might be more convenient to be off, lest he might take it into that capacious head of his to hunt me. However, my blood was excited and I followed him, to watch the effect on the horse, who, in fact, showed that he entered into the chase with all his heart; till the bison tumbled head over heels into a deep, red, muddy creek, and waddled through; when I thought I might leave him without compromising my valor."

The second chase was equally successful; and after a headlong ride "up one swell and down another, over broken ground, and through hollows filled with water and deep red clay, into which my unwieldy quarry precipitately plunged with such unhesitating goodwill, that I could not but imitate his example, however little I should have fancied it at another moment—he led me into a deep marsh, where, spent and breathless, he was brought to bay, and turned upon me. Here we bothered one another a good deal by our several maneuvers for attack and defense, and though I did my best to kill him, I failed to do so. Two of my balls had struck him on the hind-quarters as he ran, but seemed only to act as a spur, for he merely gave his tail a flourish, glanced around at me, and scampered on. Unless you strike the animal at a given spot, below the hump and behind the shoulder, or on the spine, such is the toughness of the skin and the elasticity of the muscles, that the ball seems to be thrown away; and so all mine appeared to be. I was annoyed with my non-success thus far, and with the idea of the clumsy piece of butchery I was attempting; and in fine, extricating myself from the marsh, left him to his fate."

A little later another buffalo chase was had, when Mr. Irving and Mr. Latrobe brought down each a bull, and halted, Mr. Pourtales continuing the chase with unabated perseverance. The author alighted, to take the tongue from his bull. "To the trample and rush a dead silence had succeeded, and I was occupied in my labors, when a slight yelp drew my attention, and, raising my eyes, I saw at a few hundred feet distance, the head of a gray wolf pushing cautiously upward through the grass. This apparition was followed in the course of a quarter of an hour by as many as half a dozen of similar character, appearing, as though by magic, on the verge of a circle which they formed around me; till, having secured my trophy, and being convinced that assistance from the camp was out of the question, and that I must leave my prey where it had fallen, I rode off. I then could see them stealing forward cautiously to their meal. The hunter is the wolf's and vulture's provider on these great plains; and they know it, and follow his trail on the buffalo range, with the certainty of having their share of the spoil."

There was much hunting that day, and plenty of meat had been brought into the camp; but Mr. Pourtales did not come in. The next day they sent out scouts for him, and met him on his way back to camp. He had followed the buffalo so far that he was unable to find his way back again, and when night came, had hobbled his horse, and climbing into the forks of a tree had spent the night there; sleeping peacefully, he declined, notwithstanding the cold and the howling of the wolves. It was soon after that that they turned about and re-

traced their steps to Fort Gibson, where the commissioners remained, while Latrobe and Pourtales returned to the Osage agency.

A little later, in November, Latrobe notes the interesting packing of the prairie fowl. Indian summer had set in. The squirrels were at work among the dead leaves at the foot of the hickory and pecan trees; and the "countless bands of water-fowl and flights of pigeons, which had been constantly observed passing to the southward during the prevalence of the cold wind, ceased to attract the attention.

"The prairie-fowls had now completely thrown aside their summer habits. Instead of keeping apart in distinct families scattered over a vast extent of country, like our grouse at an earlier season, they now appeared congregated in immense flocks in the immediate vicinity of the farms. I had plenty of opportunity of studying their habits, but to shoot a few brace, as they were extremely wild, required frequently hours of patient and wary exertion; whereas, at an earlier season, a sportsman, if aided by a dog, might bag any quantity, from the pertinacity with which they will lie close till forced to fly."

"It appeared that at this time of the year all the birds within an area of three or four miles square, congregated together by consent at sundown on a given spot in the rank dry grass of the unburnt prairie, to sleep. Many a time have I seen them coming at sunset from every point of the compass, with their remarkably level and even flight over the swells of the prairie, toward the place of rendezvous, which a few days' observation enabled me to determine upon within a quarter of a mile, and twice I was on the prairie early enough to hear and see them rise, and the sight was such as might make an English sportsman's mouth water. The number must have amounted to many thousands, and the sound of their wings might be heard at a very great distance. After rising, for about half an hour, they crowd the scattered trees on the edge of the prairie by hundreds at a time, after which they disperse. Their wariness at this time is extreme; and the slightest indication of the approach of man, even at a great distance, is noticed by the cock, who, perched on the topmost twig, elongates his neck, and peeps first on one side, and then on another, with the most provoking caution. How often have I been foiled, when, after the most cautious approach, either in serpent-fashion, like the Indian, dragging myself through the grass inch by inch, or in an upright position, striving to counterfeit a tree stump; never stirring till the sentinel looked another way, and then by imperceptible approaches, and five more feet and five more minutes would have brought the tree within range—the careful bird began to grow more and more doubtful and restless, and finally set up that clear tremulous crow, which said: 'There's a rogue with a gun almost within shot!' as plainly as though he had spoken English. The instant and complete dispersion of the whole covey to a great distance would be the immediate consequence."

After much pleasant loitering about Fort Gibson, waiting in vain for a steamboat, which should enable them to follow Mr. Irving, who had already gone, the travelers determined to go down the river by canoe. This was purchased, and two discharged soldiers were hired, to make the trip with them.

The journey was not long, and with paddles and poles they glided down the river. Sometimes they camped upon the bank, sometimes stopped at the farm of some half-breed or Frenchman, passing through a region which Latrobe compares to the "back parts" of Kentucky some fifty years ago, and "the Mexican province of Texas," at the time when he wrote. He tells of the curious mixture of population seen along the stream; of the gradually more numerous settlements through which they passed, until they reached Little Rock.

Here ended, for the time, their travels in the far West, for at Little Rock they took a steamer bound for New Orleans, leaving it again, however, at Point Montgomery, to await one going up the river. This came along a little later, and two weeks after this they landed at Wheeling, Va., and continued their way over the Alleghanies to Baltimore by land.

GEORGE BIRD GRINNELL.

Floating Down the Mississippi.

A Journey Through the Swamps.

THE interior of Robertson's model-hull boat was all a-tangle. There were two single beds, a cook stove and a table that loomed up amid piles of tents, boards, bed springs, poles and fire wood. Under the table where he ate was a pile of food remnants six inches high, kept there in order that the cat might always have food handy. Robertson swept frequently, always toward this pile; and when the pile became too high, he carefully poked out the bones and eatables in order to shovel up the dust, or mud, depending on the weather. Judging from what was on and under the table, the old man had fresh meat, cake, biscuit and light bread at frequent intervals. He also had jellies and apples and jams, besides, condensed milk for his coffee—"plenty to eat for sartin."

Night came down out of the clouds in layers, closing in like the sides of the room in Poe's tale, the rain sheeting along the roof and the wind swishing. We sat by the stove, Robertson discoursing on his horse: "Proudest, gaudiest horse you ever saw, stranger. Holds his head up gay. Just as fat as butter, round and slick, too. Of course he don't look very well now, in this rain; but when he gets dried off and you look at him from the left side, he's as pretty as a picture—yessir, as handsome as a drawing—"

"Why the left side?" I asked.

"Well—um—you see he ain't got but one eye.

"I s'pose it's because I come of a good family that they takes to me so round here. But 'tain't that alone. I asked Mr. Horton one day how come it was he took to me so, me not being much account since my legs got crippled up. 'Well,' says he, 'I'll tell you. It's cause you're 'bout the oldest citizen we has round here, and we plumb like your ways.' One time there was two

men come down here from St. Louis with the finest guns you ever saw, yessir, and they had me with them for quite a time; and I never did know their names rightly, but one called hisself the Unknown, and t'other was Knowing Jack. Rich, they must of been, and they did like me for sartin—seemed plumb interested in me. They was hunting, too.

"I s'pose you've hearn of Barney Mitchell, ain't you? Well, I cooked for him once for nine months, when he was scouting. I seen him kill a man at Neeley's Ferry. He wasn't a desperader, but was just evading the officers of the laws, so's they wouldn't hang him. He just hated the name of killing anybody, and used to cry when anybody spoke of his shooting anybody. I seen him cry lots of times when I'd talk to him kind and Christian-like. The only time he ever cussed me, was at Neeley's Ferry. Barney—his real name was Martin—was shooting at Thomas Ball, who was in a skiff, and Charley Brison was shooting at Mitchell, and I was into the way of Mitchell, who was about seventy yards away and couldn't shoot Brison without hitting me, and he cussed me for that; and Brison cussed me for not telling where Mitchell was at, and Ball, he just riz up and fell out of his skiff, and Mitchell, he—"

Bang! Thunder and lightning came ripping through the gray clouds that had been hanging over the boat all day. There was a swish of the wind, and a chill blast swept through the boat, while limbs from the big deadened trees on the bank clattered down on the tarred roof of the boat loud and startling, after the hours of wearying rain patter.

In the morning it was clear and middling cold, but such a day as makes river traveling delightful. I pulled out and headed along the Crawley's Ridge on my way toward Madison. It was Sunday, quiet, pleasant and as many miles before me as I could make—nine miles to Madison, so I was told. But miles in the Bottoms are of the more-or-less type, and mostly more.

It was about noon when I came to the town, with its church-bell silence—big sawmills without steam, smoke or sound, a couple or three cabin boats, a big dark railroad drawbridge, rolling banks of dark red sawdust, caving into the water, and a trim little Government boat, laid up by low water, and a fish dock with a tawny-colored man—skin, hair, clothes—was in hailing distance of me.

By and by I came to a forest which closed around me, the river not showing its course far ahead at any time. I said howdy to some men on the bank in a couple hours or so, and then rowed on for hours and miles and stopped at a lumber camp—tents. A familiar face greeted me: "Why yes, you saw me over here a mile and a quarter. Yes, you come eight or ten miles round getting here. Won't you spend the night with me? Be glad to have you—like enough you never was in a log camp."

The invitation was from the camp boss, Crippen, and to any one passing through the Mississippi Bottoms, a look at the lumber camps is a matter of prime importance. The lumbering in the Mississippi Bottoms is being carried on in a fashion that means much to the future of that region. The forests, which formerly stood in the way of the settler because of the difficulty of getting rid of the gigantic trunks, now are a profit and encouragement to the man who wishes to make a home in the Bottoms. Casen, the yellow-man, of whom Robertson told, and countless others are dependent on the sawmills at Helena, Memphis, above New Orleans, etc., for their start in life.

The foreman of the camp was not a large man—fair, reddish mustache, agile. Only a malarial headache had him, and that takes the tucker out of the best, for the time at least. He was different from the typical boss of a woods crew. Undoubtedly he was "a bad man when you git him going," but the fact was not written on his features, save in a kind of set of his jaw that drew a deep line clear across his chin. The type of the lumber-camp boss is medium height, broad-shouldered, heavy-featured with a jaw that reaches from ear to ear, a big wrinkled forehead with the fact that he's the best man thereabouts, showing in his tone of voice and his movements—a trifle of the bully in him, that is to say. Doubtless Crippen knew his job as well, if not better, than the typical boss, but he did not grow impatient when asked to explain things "anybody ought to know." The new hand under the type gets his knowledge hammered into him, while under Crippen matters are patiently explained. It's a question among handlers of negroes, whether, in lumber, or log, or levee camps, the explaining or the thumping process brings about the best results. If Crippen carries a gun, I didn't learn of it; but Marshall, a boss I met down in Mississippi, jerked a Forty-five out of his pocket at the question, "Do your hands ever bother you?" It was sufficient answer.

"This yere is plumb amusement for you, ain't it?" a ducky said to me, as I looked around the camp of which Crippen was foreman. There were half a dozen tents, staked amid tall green cane, with big trees standing thickly in a forest, where the vines grow up over the low brush in hummocks like haycocks, and almost as dense. One walked along the road, as if between two walls in those places where the vines were thickest. High overhead were the treetops—little tufts of gnarly, brittle branches, seemingly small in proportion to the magnificent columns that supported them.

The work in the camps begins in September and ends by the first of May, usually. From late April to early September "worms" eat up the logs on the dumps and render them useless for lumber in so short a time that summer operations are impossible.

Crippen was cutting gum mostly; but the woods contained elm, ash, oak and cottonwoods, to be cut later. One man had eight or ten thousand feet of persimmon logs—one big one, thirty-four inches in diameter—which he was selling in Memphis to become golf sticks. But Crippen's job was getting out "export lumber." "Export" is the highest grade, and it is sent in barges to the seaport, thence transferred to an ocean-goer's hold, for a sea trip to Liverpool, to be used there in veneering, and other fancy work.

The contract called for 800,000 timber feet, and 200,000 more if both parties desired, at \$5 a thousand—a dollar more than usual—but it was selected timber in

time of booming market, and the scaler for the buyer could throw out any logs he saw fit—"goose-egg it." In the Adirondacks it is alleged ten inches is the minimum size for spruce pulp logs, butt measure at that. Here twenty-four inches was the least, and measured at the top of the butt piece. "A perfect gum" log measures from the center, fifteen inches "heart" and three and one-half inches sap—thirty-seven inches in all—at the small end, and from twelve to fourteen feet long. It is called a gum tree, Crippen thought, because when the tree is "belted," "girdled" or "deadened" a sap oozes out, which is hard enough to chew in six or eight months. "It tastes like—well, you know how cherry tastes? Well, this is just like that, only it has the gum flavor, instead of the cherry."

Swamp loggers hunt up sections of land to cut over; camps are located, tents put up, crews and mules brought in and work goes on with much the same regularity of an Adirondack camp, but, of course, the heavy timber, the level lands and the nature of the region makes every operation different in some, or all particulars. The large trees are more apt to have "wind shakes" or splits, and rot, than the small ones in the northern and healthier wilderness.

Half a hundred trees are first felled, then logged off and toted to the dump, where they are made into rafts or hoisted on barges. The negroes use a teetering stroke, much different from the straight drive of most white sawyers, and when they put in the 3½-pound ozark stave wedges to keep the saw from binding, the ducky hits a hard drive, then a little tap, with his ro-pound sledge, getting much satisfaction out of the little useless stroke. As they saw, the negroes wail, sometimes without words, again: "Oh-h-h—w-o-e—oh-h-o-h!"

"Sweet Georgia Lee-e-e
Shot a light on me-e-e,
But the Katie won't land-d-d
A-around Flower Lake,
Not until next pa-a-y-d-a-a-y—
Oh-h-h—w-o-o-e-e—oh-h-h!"

Singing that sounds for all the world as if the men at it were suffering from a soul or stomach ache—only there is music in it, a kind of rhythm, which jibes with the whizz of wind through the treetops, or the wash of the river current along the caving bank.

I timed two crews; one sent the saw back and forth across the middle of the log—32-inch gum—at the rate of eighty double strokes in 110 seconds, while the other sawyers cut thirty strokes in thirty seconds—about 35-inch strokes—seventy inches of fist thrust and recover a second; but it was the rocking stroke, which is probably best for such large logs, and not the level drive of the eastern woodsmen which cuts with every tooth inside the bark. Thirty-five logs is a crew's day's work, as against 150 to 200 a day in the softer and smaller timber in the northeast.

These logs were to be taken out on barges when the water comes up in the spring, so it was unnecessary that they should float. Only one of twelve gums will float, running about thirteen pounds to the lumber foot, board measure, as a rule. The average log contains 700 feet, hence a weight of 9,100 pounds, and the transportation of such logs from the stump to the river bank involves methods not found in hillside spruce timber with several feet of snow, sprinkled and icy, and sleds to travel on.

Where there is no underbrush it is delightful walking under the trees of the Bottoms—soft, still and moist, but with a little too much moisture. One's heel goes down through the brittle leaves and comes up mud-laden. The transportation of 5,000 tons of logs over half a mile or so of level, gummy soil requires different sets of ideas from the steep sidehills of Pennsylvania, where hemlock grows, or the hummocks of an Adirondack spruce chopping. There is no question of setting the brakes—no rolling the logs half way, or clear down a mountain, no slides or whoop hurrah of logs jumping end over end as they whirl down sidehills. The wagon bolsters are four feet above the ground, and there are four tons in a chunk to load—a dead lift.

They say in the camps, that they serve one meal a day and two at night. We were up, through with our hominy and pork and hot bread before dawn, and then warmed by the heat of a fire which one of the men built in the boss's tent for him. When a haze of daylight appeared, Crippen went through the tent-flap, calling, "All out!" It was a command, not the "Let's turn out" of an Adirondack boss.

The crew appeared. There were four sawyers, to log off, and their marker—the one who measures logs, files saws, cleans away the brush so the sawyers can get at the logs, and leads the way particularly. The yellow cook looked out, the boss looked over the gang, speaking to the white swamper—road maker—in regard to the work to be done. Then five mules appeared, each harnessed, but each free to take his own gait to the wagon—that was the "team," two wheelers and three leaders. The driver was a very black, hanging-lip negro, who bossed the mules around into place, except one. This mule went on the run around back of the wagon and eight or ten rods into the cane.

"Come back heah, Juke!" the driver yelled. "Back hay-hay! Who-hoo, hoo high! I'll just kill yo' this mohnin!"

Juke wiggled all over, turned around and trotted back, stopping on the way to kick both hind hoofs far out in the cane, then ran into his proper place on the off-wheel side and looked around at the driver, tilting his nose up till it was nearly horizontal, the long ears coming together at the tips and sawing back and forth, a cheerful, well-fed mule.

To go over the soft soil, the wagon had a wide tread—five inches—and the wheels were "boxed in." Two-inch boards were bolted on the sides of the wheels, so that the tread was increased to nine inches. The boxing was worn on the edge from the tire, till it was rounded. When the weight came down on the dirt, it did not cut in like a shear blade, but bent the matting of dead leaves, vines and surface rootlets. Where the sharp tire would have cut through the dry surface soil to the muck a few inches beneath, this bending would save much hard hauling—would keep the road good even in damp weather.

The five mules, with the driver in a saddle on the

nigh wheeler, started away along the road soon after the sawyers had gone to their work. It was a fine woods' road—level, dry, and there had been little cutting of roots and small trees necessary, for it was easy to drive, winding and dodging among the trees.

The mules were fast walkers, and were guided by bridles and the voice. If anything was in the way the wheels hit it with a crash and climbed over the top, or slid off to one side in a fashion that would have racked an Adirondack wagon from axle to tongue. The swamper followed after with an ax and a swamp hook. There quarters of a mile back the wagon turned into some cane, and here was a tree, cut into three logs, and opposite the butt piece, ten feet from it, the wagon was stopped.

It was a five-ton log, flat on the ground; but five tons was only a circumstance to the swamp woodsman. The swamper had an iron hook, which he hooked low on the big log on the side from the wagon. The mule driver unhooked his three leaders and drew them up opposite the log on the far side of the wagon. With a "cross-haul chain" the log was started up two big skids, running at a steep angle from the nigh side of the log to the wagon bolsters. The bed chains, one to each bolster, were drawn under the log by the swamper, and then the log was allowed to roll back on them to the ground. Sometimes the swamp hook slips when the swamper is reaching for the bed chains, and his arm and shoulder are crushed into the ground. A pulley block was then hooked to the crossed bed chains, and the mules were hitched to one end of the 1¼-inch rope with which the block was threaded.

"Gee up, Juke—gee yup!" the darkey said. And in ten seconds the mules had rolled the log up the skids to the middle of the bolsters and made fast. An Adirondack woodsman would have built a skidway four rods long and rolled the log up on the wagon by hand, till he learned, or contrived better. On the other hand, the swamp woodsman loads a ten-inch persimmon log with his three mules, though an Adirondack hick would lift the log in his arms before going to that trouble.

The logs were got together at the river bank, in order to load them on a barge reputed to carry 400,000 feet of logs—say 20,000 tons. Had the logs been destined for rafts, it would have been necessary to skid them clear of the ground, otherwise they would sink from the weight of the moisture acquired by contact with the ground, which would exceed the evaporation. One tree in twelve of gum floats, the others sink, unless dried from thirty to sixty days. The logs are loaded on the barge with a derrick.

They have a fashion of logging in the Bottoms during the overflow that has no analogy with logging in the deep snow. It leaves high stumps, according to the stage of the water when the logging is done, but here the resemblance ceases. Instead of going to the trees on snowshoes, dugout canoes are used, and one can't stamp a hard place in the water, as in the snow, for standing on. The dugout is what the chopper stands in. He runs the canoe among the trees, sinking his ax blade into the likely ones, sounding them for shakes and cutting out chips, which, if they float, indicate that the tree will float, too. He fells the tree and cuts it up into long logs. These are run to a "right of way" or "float road," twelve feet wide, cut through from the section to be lumbered to the bayou or river, where the raft is to be made. The right of way is similar to a winter road, in that it is made in fall or summer for another season of the year. In the bottoms water covers the ground as snow does in the mountains. The right of way is straight, with stumps carefully cleared away on the cane ridges, lest the overflow happens to be a low one. The logs are poled into the right of way and there spliced four abreast and run end on along the right of way, other logs being hitched to them till perhaps a mile of logs are "cribbed and tailed"—cross binders and sticks being spiked to logs to hold them end to end, and fenders outside if the float road is crooked, or pretty narrow.

The tiers are poled and run out to the rafting place and the tiers cut loose from each other and laid side by side till a block of fifty logs is formed. On the St. Francis these blocks are turned loose with the current and picked up at the sawmills as they come along by little gasoline boats. Some rafts are taken down with sweeps on them—some small logger having a bunch to sell—and then sweeps are used to steer it through.

Wooden pins, fitting loose in the sapling-tree splice and tight in the log, are used to bind the logs together, unless iron spikes or chain dogs are used—the latter methods being modern and quicker.

When the mud gets deep, and there is no water to float the logs, a lizard is used to drag the logs out—a Y-fork of a tree, nine feet long, with a cross-bar on the V part to hold the log. A yoke of cattle are hitched to the tail, a log rolled on the lizard and chained there, and away it goes. The way the lizard plunges down into mud holes, following the oxen, "the log plumb under sometimes," would be a sight for those drivers who think they know mud from an axle-deep experience. The lizard is the last resort of bad weather. In between are mud-sleds—bob-sleds, hewed out of bent sticks. Most remarkable of all, however, were the "carry-logs"—sulkies with wheels twelve feet in diameter—which were backed over the stump to get to the log, if that was handiest; and standing astride the log, chains were rigged and a lever applied, by which one end of the log was lifted clear of the ground, whereupon the ten or twelve oxen walked away with it—a spectacle growing more and more rare, and very seldom seen now in the bottoms.

I went out to see the sawyers at work, the boss indicating the direction so well, by means of a fence corner, a path and a "neighborhood road," that I found them without difficulty, and watched them at work. I noted, among other things, that they carried a wooden water keg, from which they drank from the side through a little hole that was corked, and an air-hole also corked till the thirsty came around, as indicated by the washed place three inches across the center of the bung.

It was about three-quarters of a mile from the sawyers to the camp, and I left them about 11 o'clock to return. "The path yonder is the way to camp," one of the

sawyers indicated, and I found a path which led in the direction that it seemed right to go.

It was an interesting chopping to me—the smallest stumps were larger than the largest I had ever seen in the Adirondacks. The new wood, log-ends and stumps-tops could be seen far among the trees. The trees still standing were monsters, with black hollows in them, and branches two feet through, broken off and lying on the ground. I looked up and looked down—saw a red squirrel big as a small dog, and half a hundred hogs rooting around. A great bird, standing lengthwise on a sapling that sagged beneath its weight—curved bill, white head and dark mottled plumage, underneath light-colored, an eagle—attracted my attention, and I sneaked around in an effort to get its picture.

I came to where logs had been hauled, noted that the wide wagon tires make but faint impression on the ground and left the road where the path did and directly came to a canebrake, with cane twelve feet high, into which the path led. In time I came to a bayou that was dry, and crossed it into another canebrake, finding a narrow-tired wagon track at the far side of the bayou, and this was going the wrong way from my direction, and so I left it and followed a cow-path, having missed my path just a little way back, right where I knew it was. Directly my cow-path forked, and I took the biggest one, and this forked, and the one I took landed me in a canebrake, so I turned and went back and took the other one, which disintegrated in some nice open woods. I had the sun and my watch to go by, so I started east, being on the west side of the river, and went a few hundred yards, coming to low ground, which must be the river of course. It didn't look quite right. I hadn't seen any such place as I came down the river, so probably I was below camp; but I would go over and take a look at the river anyhow, to make sure. I went and took the look, first traveling a hundred yards through some cypress undergrowth and the peculiar root-growths, called cypress "knees."

They were from thumb-high to waist-high; but I finally got to a place where I could look beyond. I didn't see the river. It was a lake with a shore on the other side much further away than the length of a still-water. I took a careless look at the features, and examined the ground to see if I had left a visible back-track. I hadn't. I had started in time for dinner. It was now considerably after dinner time—12:30 o'clock.

I concluded I'd better go back. I went west, according to the sun, and found some browsing mules. I sat down and looked at them, and wondered how long it would be before they'd make up their minds to go home.

They looked at me, wiggled their ears and looked at each other. I had seen cows go home when yelled at. I started to yell, but changed my mind. They don't use the same sounds in driving mules that they do cows, or even horses. Mules are knowing, and I wouldn't make myself ridiculous trying to drive ten or fifteen mules toward somewhere I didn't know where. I walked around the mules, found a little path which they'd evidently followed through some cane.

Cane grows tall like grass. It is from the size of pipe stems, for which switch cane is used, to the size of a linen thread spool. I felt like a mouse in a hay-field. Never had I been in such a thicket. The mule tracks left the trail I was trying to follow, and soon I came to a place where there wasn't any trail. The mules had come into the cane to browse on the switches. But I kept on straight ahead, for that seemed the right direction to go, only to find myself in taller cane—cane that was so high as to cast a deep, well-like shadow around me. When I finally turned to go back, I found that the cane had closed in around me, and go which way I would. A glance skyward showed a circular hole, round which the cane gathered in long-leaved stems; when I walked, the opening moved hither with me.

Then, curiously enough, a kind of panic struck me. There was something awful in being closed in by yielding green bars. I tried to bull through—anyway to get out of that cell. For a time I made fair progress, and then little green, briared vines coiled around my legs and seized my coat with a spiny clutch. I tripped, plunged headlong, but did not fall. The masses of cane would neither let me stand up or fall down. A few yards of travel sapped my strength, and for a little while I wondered how long it would take me to get out of that brake.

It was a needless fear which I experienced in the cane. The sun was shining, and I was enough of a swampman by this time to recognize that this wasn't a large canebrake from the look of the forest. It was only a few hundred yards long and a hundred wide at the most, but it was quite large enough to be satisfactory to one who didn't know where he would be even if out of the cane. There was one especially bad place in the brake, where the wind had full sweep at it along the back of the ridge. Here the cane was laid like a wheat field. It was utterly impossible to force my way across the leaning stalks. I turned back, took a course by the sun, and in a few minutes came into switch cane, where I could see over the tops of the stalk heads.

For the first time I was in strange woods without my compass, so it was necessary to put into practice some of the hints in regard to finding directions by means of my watch. Somewhere to the west was a faint wagon track, and toward this I made my way through the open forest, careful to not overrun the track. I found it, and with some difficulty followed it to the left, for I was hopelessly confused as to the direction of camp. I had gone perhaps half a mile, when I heard the tread of a heavy animal behind me. It proved to be a youth on muleback. The youth and mule looked at me with undisguised interest, and I at them gratefully.

"Howdy?" the youth asked. "Feeling bad," I answered. "I lost a lumber camp somewhere—Wheeler's camp. Which way is it from here?"

The rider turned half way round in his saddle, and looked along his back trail for a full half minute, and then turned to look at me again. Then, settled in his saddle once more, he said:

"You say you lost Wheeler's camp? Well, paw and me hauled two logs right to it this mornin'. We had a narrow-tired wagon—see these tracks?"

"I see them—had my eye on them for 'most a mile." "So-o! Had yo' eye on them, eh? Well, you was piking the wrong way, strange, yassah. Yo' follow them back. They cross a byoo yonway, and there's big wagon tracks theh. Yo' want to keep the narrow ones, though. They'll take yo' right to camp."

"You say they will?" "Yassah, they shore will."

"I'm a heap obliged to you. Reckon I won't lose them tracks—no sir!"

"I reckon not."

"Good-by."

"Good-by."

Beyond the dry bayou I found the wide-tired tracks, but didn't lose the narrow ones. I came into the camp late in the afternoon, and made a handsome meal from the biscuits, hominy, coffee, etc., of the cold dinner. I split some wood for the tent stove, and as it grew dark listened to one of the darkies who was coming with a song on his lips as he walked along the camp trail. The very best thing that can be said of a negro is that he sings at the end of a hard day's work.

RAYMOND S. SPEARS.

An Historic Letter.

A MUCH-TRAVELED sportsman and engineer on the Trans-Baikal, at the village of Bolcherinskoe, named Kpylekebich, received me very kindly one black Sunday night in August—so black that my white costume appeared ghost-like as I walked down the middle of the solitary straggling village street, and the leading horses of a passing caravan shied at the sight, and completely overturned his telega and its half ton of freight. It is said that some human eyes can see in the dark—after getting accustomed to it—as in the day, but this is fiction. A rapidly approaching storm-cloud was, a minute later, moving through the sky directly over the village, and this made things oh, so black! My eyes—habituated already to the dark for a couple of hours—could not penetrate that. Still, I continued cautiously along for fear of walking into the ditch lining each side of the roadway. All the village shutters were closed, so not a light was visible. I thought I heard on one side a low whispering, and approached a couple of paces toward whence the sound proceeded to inquire for a friend's house, when suddenly there was a sound as of the sudden flight of a startled covey—a score of boys had leaped up and darted helter-skelter away, paying no heed to the question I sent after them. I shall never forget that humorous incident.

Next moment a blizzard seemed to strike the village; I closed my eyes instinctively during a few steps to keep out the whirlwind of blinding—as I thought—dust; opened them, when lo! all was light (comparatively). I could, for the rest of the walk, see everything, even to, in the distance, the two-storied log-house of my host—the only one in the place. What do you suppose had happened? That swiftly-moving cloud had shed a thin layer of snow over the village, and the reflection rendered all visible. The utility of snow! Never in my life did I realize so much the illuminative effects of snow. For, though this was late August, you occasionally get snow this early in Cibiria—with ice an inch thick by the morning. More to the north you will even have, sometimes, quickly-melting snow in July.

Arrived at the house of Kpylekebich, I presented my circular letter, which was scarcely necessary, as a Polak is the hospitality of the Slav race; and, on the morrow, received from him an introductory letter for his cousin at Warszawa—about 8,000 verst (over 5,000 miles) distant. This was a Pan Shrynecki. It took me eighteen months to deliver that letter! And yet it was traveling to its destination little by little almost every day, as the survey slowly proceeded with its work from the Pacific to the Atlantic. That little historic letter went through one Cibirian and one Russian winter, crossed three mountain ranges, journeyed over 3,000 miles of snow-covered step, crossed rivers "too numerous to mention," and all the time snugly maintained at about even temperature in my pocketbook.

The carriage was with it! When finally it was delivered, one and one-half years after date, its recipient had to think out about a letter he had received from his cousin, by post, nearly eighteen months previously, notifying him the missive was en route. He had almost forgotten the incident, having about concluded it would never reach reach him. However, that billet secured for me a cordial reception and a platonic friendship which has been a consolation ever since.

Another letter I had from the Ycypi River, beyond the Amur, to Peterburg, took 19 months to deliver; but it did not go through the travel vicissitudes of the Kpylekebich-Shrynecki letter. One introductory missive I carried from Gospodin Hikolaef, of Telma, near Ipkytck, to Kniaz (Prince) Tpybitckoi, of Tomck, about 1,000 miles, was a disappointment. I had arrived in Tomck on a Saturday; made purchases while all the places were open, and on Sunday morning left the hotel to deliver the letter to the Kniaz. It was an icy January morning, and I walked five verst over the snowed roads on the hunt for the Tpybitckoi domicile. He received me, "alright." We had a little chat, asked what he could do for me, to which I replied in the negative, and offered me—a glass of cold water! And I had to ask for that, even! For the intensely dry winter climate of Cibiria (like the drying-up winter weather of Manhattan) sometimes gives one an acute thirst.

Of course a letter of introduction gives you no right to expect it means table hospitality. It would be preposterous to put such a construction on it. But, as a matter of usage in isolated country regions, it is generally supposed to mean a little "warmer" reception than can be got out of a glass of cold water on a 20-below-zero wintry morning. However, as a philosopher, I have no fault to find with the Kniaz. All these actions are interesting traits of human character.

So I hied me back to the hotel, had the steaming samovar brought in, and put in the rest of the day going

through three months' of accumulated mail. This had been piling up at the Tomck post-office, and required a sledge to haul it to the hotel. There were over a hundred letters and about 300 journals, catalogues, etc. Most of the printed matter my time was too limited even to glance at. It must have proved a good waste-paper perquisite for some one of the hotel help—for paper has a value in remote Asiatic regions unknown to the American townsman.

There is a well-known outing periodical published in Paris which has a unique feature, in that it publishes a list of professional sportsmen always on long-distance touring, the regions they are covering, and addresses for mail matter. The result is the enterprising French tourist supplies depots keep these parties supplied with their catalogues; and my name somehow having got into that list, I found myself well supplied with sporting goods catalogues and circulars. But all this is a mistake. The true sportsman needs to know not what to buy, but what to be able to do without. The secret is, to know how to be able to take too little and yet enough. Any fool can "take plenty." True woodcraftness consists in knowing how to be able to make use of the things around you,

and not to lug around a 20-pound cooking stove when a hole in the ground and a few stripped boughs will do as a makeshift.

L. LODIAN.

A Dinner to Mr. Lee.

WHILE not an invited guest, yet I sincerely regret that the Morris-Brown-Kelly-Seaton Metropolitan Club dinner has been abandoned. And this reminds me of a dinner that was not eaten (although prepared) and the guests all assembled, which took place over thirty years ago in New York.

Mr. Lee, a noted English clubman, and husband of the much lamented artiste, Adelaide Neilson, was on a visit to New York. It was his first visit. In a spirit of mischief, Dan Bryant, the minstrel, conceived the idea of inviting Mr. Lee to dinner, there to meet some of the most prominent Americans of the day. And the invitation was sent to Mr. Lee, and until the day of the dinner he flattered himself that he was to meet such prominent men as William Cullen Bryant, Horatio (actually Nelse) Seymour, and a number of other minstrels carrying

names, stage or otherwise, of some of our most celebrated citizens.

The evening arrived, and Mr. Lee, monocled and expectant, was in turn gravely introduced to William Cullen Bryant, Honorable Horatio Seymour, and others of note, when dinner was announced and the guests filed in to their seats, Dan Bryant taking the seat of honor with Mr. Lee on his right.

The practical joke was one that would not stand much drawing out. So the moment they were seated Dan Bryant raised his plate of Blue Points to his nose, and, giving a whew! of disgust, passed it across the table and grabbed that of Nelse Seymour. Instantly Seymour, kicking his chair back, arose to his full length, drawing at the same time an immense old-fashioned Colt's revolver from his hip pocket. Dan Bryant retaliated by drawing an old-time bowie knife from his waistband, and the rest taking the cue, turmoil resulted, and Mr. Lee made his way from the dining room with all speed, undoubtedly with some queer ideas of American men and customs.

So what might have happened at the Morris-Kelly-Brown-Seaton banquet the writer does not pretend to foretell or imagine.

CHARLES CRISTADORO.

NATURAL HISTORY

Save the American Bison.

THE "passing" of a great and noble animal is a calamity which every intelligent person should seek to avert. It is a loss to the world which can never be repaired, since an animal once extinct has gone forever. At this time we are called upon to prevent a loss of this kind; I refer to the threatened extinction of the American bison. I cannot think of this magnificent creature which for untold thousands of years nature has gradually been molding until it is one of the grandest on the earth—I cannot watch its fast-approaching end without making another earnest appeal to the people of the United States to take their last chance to save it.

The importance of an immediate and active movement to preserve the last remaining buffaloes is recognized, not only by the press, which is devoting all necessary space to the subject, but by every natural history society, every institution of learning, every individual to whom I have written on the matter.

President Roosevelt, in his annual message, says:

"I desire again to urge upon Congress the importance of authorizing the President to set aside certain portions of the reserves or other public lands as game refuges for the preservation of the bison, the wapiti, and other large beasts once so abundant in our woods and mountains and on our great plains, and now tending toward extinction."

And a little further on he says:

"We owe it to future generations to keep alive the noble and beautiful creatures which by their presence add such distinctive character to the American wilderness."

And surely no other animal appeals to the American people from so many points of view as this one does. An adult buffalo bull is a creature of imposing grandeur. If you are an American, no doubt you take some pride in the fact that one of the grandest animals of all time is a native of this country; I urge you to let your pride in this matter prompt you to do some act, however small, tending to save this animal for future generations of Americans. If you have no time to do more, will you not write me ever so brief a note expressing approval of a definite plan to preserve the buffalo, and I will see that your views are brought to the attention of the Government. Your letter will be in good company, and will be filed with letters from many of the leading men in the United States, including President Roosevelt himself.

If you are a lover of animals, then you must be doubly interested in the fate of the bison—sufficiently interested, I feel sure, to raise a hand to help in a reasonable movement for his preservation. It is a good thing to be in favor of having desirable ends accomplished, but it is not quite enough. The desirable ends are never accomplished until somebody actually does something toward their accomplishment, and where all are interested, all should help, at least a little. If you desire a thing, surely it should not be too much trouble to ask for it.

If you are a naturalist, no argument is necessary; you know only too well that the passing of the bison would be an irreparable loss to the fauna of this country. Your assistance in this movement is most earnestly solicited, for it is to you and your brethren that the country looks for advice in matters of this kind. Perchance you are a member of some natural history society; if so can you not bring this matter before the members at some meeting in the near future, and if possible urge them to pass a set of resolutions setting forth the necessity of saving the bison, and expressing their sympathy with the present movement to save him. If you are a writer, do not fail to write some letters or articles in favor of the preservation of the buffalo, and if you need illustrations, come to me, and for this purpose I will give you what I can spare. If you lecture, you can help by giving, at the end, a five-minute talk in favor of the preservation of the bison, and if you need a few lantern slides, perhaps I can put you in the way of getting them.

If you are interested in educational matters, take the first opportunity to see a fine specimen of a living buffalo, give him five minutes' thoughtful attention, and then ask yourself if he is worth saving. As you look upon his mighty frame, you will read intelligently long chapters from the early history of our country. Perhaps for the first time you will get the real flavor of the life of the Indian—a life inseparable from the life of the great creature before you. This was the animal he hunted on his wild little pony; this is the animal which supplied his every want. That grim, burly head was the mask he used in the "buffalo" dance; that splendid hide served him as a robe, as a blanket, as a covering for his tepee, and for

a score of other purposes. That flesh, dried or cooked, served him for food; from those sinews he made strings for his bows and thread to sew his clothing. From the long hair on the fore part of the body he made ropes and halters and lariats; in fact, there was no part of the buffalo for which the Indian did not find some very good use. Shall the teachers of the future and the children they teach, be deprived of this striking object-lesson in American history, or will you do your little share toward his permanent preservation?

If you look at the matter from a purely utilitarian point of view, you will at least admit that for many purposes a buffalo skin has no equal. To-day a buffalo robe can scarcely be bought for money; yet within a comparatively few years this article might again be on the market at a reasonable price, if the buffaloes now living were taken up by the Government and maintained in suitable reservations. By the experiments carried on at Corbin Park and elsewhere, it has been proved that buffaloes multiply rapidly under proper conditions, and that they are easy and inexpensive to rear. But they should no longer be left in the hands of private individuals, who are liable at any time to sell the last survivors for their hides and heads.

ERNEST HAROLD BAYNES.

Some Bird Names.

I.—The Song Birds.

AN entertaining side-study in ornithology is into the history of birds' names. It teaches us how the same little creatures in which we delight presented themselves to our forefathers or to other races; and it reveals many an accurate observation as well as many a queer old error, preserved by the single symbol of a name—sometimes so disguised as to be unintelligible to modern ears.

We say "we call a spade a spade." We can trace that word back in history and find that the early Englishmen, the Romans, perhaps the people who talked Sanscrit, all uttered a sound something like it when they meant the implement in question; but why that particular sound, rather than some other, should stand for spade, is left wholly to conjecture. It is not so in most cases with the names of animals, and hence there is the satisfaction, in this department of etymology, of arriving somewhere at last. No one who has heard the shrill scream of a shrike, for an instance, needs speculate over the origin of that name-word.

The popular designations of the great majority of birds are either descriptive* (1) of their voice, (2) of their appearance (color), (3) of some striking habit, (4) of the favorite food, (5) of some customary haunt, or else they are words indicating a human sympathy or affectionate regard, or some fanciful attribute, frequently of a mythological kind. I am speaking now of generic terms—names of classes of birds—to which the specific appellations attach themselves as sub-titles embodying some individually distinctive point.

This may seem a very rudimentary and matter-of-course kind of information, which nobody is disposed to dispute about; but how circumstantially the law is supported would scarcely be suspected by one who has not studied the matter and looked behind the disguises that the progress of changeable time and spelling have thrown over the original vocal expression in the case of most of our modern bird names. Take, for example, the word "crow." That does not seem onomatopoeic, nor is it in its present form; but we know it to be a change (by transposition of the "r" and "o," according to Grimm's law) from the Latin *corvus* (Sanskrit *kara-va*, Greek *korax*); and if you will take the trouble to pronounce that slowly, you will see at once that it contains the familiar *kaw* of this bird, quite as well as does the *kah-kah* of the Iroquois tongue.

Although this one is hardly an instance in point, it is a fact worthy of note that the outcome of this process has fortunately resulted in a series of words that are, upon the whole, singularly euphonious, and thus add to the delight with which we regard these most lovely and lovable

*The learned compilers of The New English Dictionary (Dr. Murray's) say that the word bird is English alone—no corresponding form appearing in any other Teutonic language, and that its etymology is unknown; the earlier spellings put the r before, instead of after, the vowel, and the primitive application seems to have been as a general name for the young of the feathered tribes. Skeat (Etym. Dict.) hints that *bird* is allied to "brood," and hence is finely descriptive—the creature that broods; or, to go a little deeper into the analysis, both of word and fact, the creature that brings forth its young by means of warmth.

of animals. The mere sound of such words as bobolink, blackbird, orchard oriole, petrel, killdeer, whippoorwill, robin redbreast, meadowlark, goldfinch, longspur, che-wink, song-sparrow, vireo, summer warbler, brown thrasher, winter wren, tufted tit, wood-thrush, chickadee, bluebird, and others, is pleasing in itself, as well as delightfully suggestive of the green fields and murmuring woods and breezy waters where these gentle and beautiful little creatures disport themselves. They are all—or nearly all—good Saxon words, too, and positively enrich our language to the ear as well as in the written vocabulary.

Let us glance over a catalogue of our North American birds and see what curiosities of this kind are hidden in their common names, which in most cases have been imported from the old world, though often with a different application.

The word "thrush" is very old, appearing in substantially the same shape—the *u* sound having superseded an older *y* or *ö*—in the Icelandic and early English speech. I believe that the original word had a reference to the throat, which swells and moves visibly when the bird is singing; or, in other words, to the singing powers of this family, whose musical voice is probably its most notable trait. The thrushes are, par excellence, the singing birds of Europe and America. This view is strengthened when one recalls that the old German word *drossa*, coming from the same root as our English word "throat," gives *drossel* in modern German as the word for "throat" or "throttle," and also for "thrush" (a disease of this organ is still known as thrush). In England the finest songster of the family is the thrush or threstel (old spelling), and a similar bird of our own is the "thrasher" or "thrasher" (*H. rufus*). In the dialect of the Germans of Pennsylvania this species is called the *omshel*, which is their rendering of the German *amsel*, the parent of another old English word for "thrush" preserved among us in the name of the water ouzel of the Pacific slope.

"Bluebird" requires no further space than merely to mention that it is "blue robin" in Rhode Island, which is much nearer the European original than when that name (which means Little Robert) was given to our migratory thrush by the Massachusetts colonists, simply because he had a red breast.

Next come the Paridae. "Tit" originally signified something small; we have it in such expressions as "tit-for-tat," and in the word tittle. A kind of pony used to be called a tit; and so did a kind of woman—small, but vicious. Among birds it appears in *titling* for sparrow (Iceland), in *titlark* and *titmouse*. Of the former we have one representative, and of the latter several; but though the titmouses are partly gray in plumage, the latter half of the word has nothing to do with "mouse," the name of an animal, which is traced back to the Sanskrit root *mus*, "to steal." On the contrary, it comes from an ancient English name, *mase*, which belonged to several kinds of diminutive birds, and refers to their small size. The plural, therefore, in spite of our dictionaries, should not be *titnice*, but *titmouses*.

The local names of the American titmouses call for only brief mention. "Tom-tit" is alliterative. The crested southern species is the "peto" or "peterbird" on account of its note; a Texan variety has won the name "fat-eater" by its yellow-daubed head, while the Mexicans seek to imitate its voice in *pétachoché*. No explanation is required for chickadee, belonging to several species, after one has heard its

"Saucy note

Out of sound heart and merry throat."

The nuthatch is the nut-"hacker," and "ovenbird" refers to the domed nest of the *Seiurus*. "Wren" descends from an ancient *wrin*, whence, we are told, came many words in the old Teutonic languages, meaning to neigh (as a stallion), squeal (as a boar), or chirp (as a cock-sparrow). So far "wren" is an imitative word, and it is still used in the Scandinavian tongues to express a whine or squeal; but a further notion of masculinity was carried, so that the wren's name implies that, in the opinion of our ancestors, he had wanton manners—was a bold, bad little bird. This does not seem to me so much deserved by our American species, at least, as by our sparrows.

"The Frenchmen in Louisiana," as I once wrote in the Nuttall Ornithological Club's Bulletin (viii, 1883, p. 77), "in the early days gave to their familiar wren (probably the great Carolina or mocking wren) the name 'roitelet,' or little king. This was a direct importation from Europe, and perpetuated a bit of folk-lore, which tells that

the wren is the superior of the eagle, and hence king of birds, but a diminutive king—hence kinglet or *roitelet*. This supremacy was attained by the trial of the birds, in congress assembled, as to which had the greatest powers of flight. The eagle, soaring above all the rest, thought himself *facile princeps*, when an impudent little beggar of a wren that had slyly perched upon the eagle's broad back, rose gayly over his head, repeating the maneuver as often as the baffled 'king' attempted to get above him. Ever afterward the eagle was properly respectful in the presence of the mite of a wren that had outwitted his majesty. Many forms of this myth appear, and sometimes the statements are given as facts. Thus it is hard to tell whether or not Du Pratz believes the story he tells in his 'History of Louisiana' (1763) to account for the kingship of Le Roitelet in Louisiana. In America we do not regard the wren with special kindness; but in Great Britain it is scarcely ever spoken of without some gentle, loving epithet; and the adjective poor, little, tiny or dear, is constantly joined to the prefix Jenny, Kitty, Titty (*cf. anté Tit*), Jintie or Chitty, when naming it."

"He that hurts robin or wren,
Will never prosper, boy nor man."

says an old English proverb.

The different "kinglets" (*Regulus*) of the northern half of this continent are so called, however, because of the scarlet and golden coronet of feathers worn on the crown of the head; yet it is also a fact that they steal a ride now and then as they go to and from their semi-arctic breeding places on the backs of the swans and geese.

"Lark" is a condensation of two ancient words in Anglo-Saxon (*lær*, "craft," and *werca*, "a worker"), which meant a worker of guile; and the etymologists tell us "the name points to some superstition which regarded the bird as of ill-omen." The well-known cunning of the mother bird, in trying to distract attention from its nest, and other evidences of wisdom, such as are celebrated in Esop's fables, seem to me a more natural rendering of the fact, however. In the Scotch form *laverock* (the skylark an Icelandic-like variant is seen. Our "titlark" is copied from England, as also is our "shylark" (of the upper Missouri); while our icterine "meadowlark" is not a lark at all, but takes the name from being the only one of our eastern field birds which sings while soaring, except the bobolink, whose characteristics are far more noticeable.

"Warbler" explains itself, as does "chat," to anyone who has heard the voluble chatter of this ecstatic songster. The latter was the "ghost-bird" of the Delaware Indians, due to its singing a great deal during the night, and often in a mournful way. The name of a more widely familiar warbler, "redstart," is German for "red-tail." "Tanager" is the Anglicized form of the name for this kind of bird in French Guiana, whence the first specimens were introduced to European notice; ours differ only generically from the South American.

"Swallow" has no relation to the similar verb—or at best an exceedingly remote one—but, according to Dr. Skeat, signifies "the tosser," which moves to and fro in its undulatory flight like the swell of the sea. The bird is a *svala* all around the Baltic, and in Bowden's "Naturalist in Norway" is related a Swedish legend in

point: "When our Saviour was crucified, a little bird came and perched upon the cross, peered sorrowfully down upon the sufferer, and twitted 'Hugsvala, svala, svala, Honom,' that is, 'Console, console, console Him,' and hence it obtained the name of swallow." This is pretty, but hardly scientific. A number of species, of which our large "purple martin" and the "sand martins" are American examples, were named by the French after St. Martin, presumably on account of their nesting in holes. St. Martin was the holy grave digger of old legends, and the kingfisher, several woodpeckers, and some other birds that burrow out their homes, are dedicated to him, as well as the funeral crow and the robin-rebreasts (European), who brought leaves to bury the Babes in the Woods. In his "Fur-Bearing Animals," pp. 23-24, and in his "Birds of the Colorado Valley," p. 369, Dr. Elliott Coues has compiled much curious information on the names swallow and martin.

"Waxwing" refers to the cereous tips of the quills borne by the great northern waxwing, and by our more common *Ampelis cedrorum*. My long lists of American local names of birds show a great variety of appellatives belonging to the latter, none obscure except "coppie-crown" (Rhode Island), which indicates the bird's pretty crest, and is also the name of a prominent hill near the southern end of Lake Winnepesaukee. Here we have preserved an old derivative from that fertile root which gives us cap, cope, and so on. In old English the verb "to coppie" meant to rise into a conical but not very high form. Thus a "coppie-crown" means a top-knot of feathers; but I doubt that it is heard anywhere else in America, except as applied to the hill I have mentioned, unless it is when a farmer's wife addresses her crested hen as Toppy.

Vireo was the Latin name for the greenfinch, but has been applied to our "greenlets" on account of their color. In the West Indies they receive note-names, like "whip-tom-kelly" and "sewy-sewy." One rather rare species was named by Cassin *Vireo philadelphia*; this referred to the city, but is generally written in the books as "brotherly-love vireo," which is absurd. All of them sometimes share the name "hangnest" with the orioles, on account of their suspended, hammock-like homes, and become, in the tropics, "ficedulas," or fig-tree birds.

ERNEST INGERSOLL.

[TO BE CONTINUED.]

How Should Bedsteads be Placed in Reference to Compass?

PARIS MUSEUM OF NATURAL HISTORY, Dec. 13.—Some persons think, or think they think, that they sleep better if their bed is so placed that the head points to the north and the feet to the south. Others say that the head should be east and the feet west. And others still—the majority, I suppose—do not trouble themselves about the direction of their bed, being only thankful to have one wherein to retire and repose when the day's work is over. Readers having opinions on the matter, and having observations to adduce, might perhaps help to solve the problem by giving the result of their experience. It might be interesting also to know whether animals seem to have any preference for one direction or another during their sleep.

HENRY DE VARIGNY.

Suspended Animation.

THE question raised recently in the columns of FOREST AND STREAM concerning the possibility for frozen fish "coming to"—of recovering when slowly thawed out—have been often discussed by biologists. The recovery was thought possible by the well-known John Hunter, who went so far as to imagine that some degree of immortality was thus rendered accessible to mankind. If a man can be frozen, and after some years thawed out, he can live some thousand years easily; granted, of course, that he spends by far the largest part of the time in the lethargy of cold. Thus reasoned John Hunter. But before proceeding to experiment on his congeners, he tried the process with a carp. And the result disgusted him, as the carp obstinately refused to "come to." Others succeeded better. Isidore Geoffroy Saint Hilaire, the pioneer of modern biology, says that toads may be entirely frozen, so entirely as to become brittle; but if slowly thawed they may come back to life. Sir John Franklin and Lerry Coste testify to having seen frozen fish revive. And in recent experiments, a German biologist, Karl Knauth, who is not in favor of the general opinion (he says that his frozen fishes "crepirten alle," that is, died) observes, however, that he has seen the heart of thawed fishes begin to beat anew.

It is very difficult to obtain a conclusion on the matter. Certain it is, however, that much depends upon the way in which the fish is frozen. If you freeze it when dead, no thawing can revive it, of course. But then, how must one manage to freeze the animal during life? Should the fish be kept in the water, or should it be taken out of it? The matter needs an investigation. Observers may be easily mistaken if not attentive enough. Some years ago some tadpoles got imbedded in the ice which was the result of a cold snap. I cut some of the ice out and noticed the tadpoles. There was an opportunity for an observation. I made the most of it, and the result was that, upon close examination, the tadpoles were found to be quite living, and not at all frozen. In fact, each tadpole was in a sort of little cavity in the ice full of water, and exactly of the form of the animal. At first sight the tadpoles could be supposed to be frozen in the solid ice; on careful examination they were found to be included in small water cavities in the ice, their movements, no doubt, and the slight heat produced by them having been enough to prevent the water immediately surrounding them from freezing. Of course the tadpoles were not very lively on coming out of the ice, but in a short time, being put in water at some 8 or 10 degrees above zero, they became quite normal, and acted very tadpole-ly.

To conclude, it does not seem that the question has been definitely settled. Further experiments are required. I am sorry I cannot give more precise information in answer to Mr. Charles Cristadoro's interesting question. But some other reader of FOREST AND STREAM may be better posted, and I shall have pleasure in hearing what he has to say.

GAME BAG AND GUN

North Carolina Shooting.

RALEIGH, NORTH CAROLINA.—Beyond any question the most striking sportsman in North Carolina is Rev. Dr. R. T. Vann, who is the President of the Baptist University for Women at Raleigh. When he was under ten years of age he lost both arms in one of the wooden mills which used to be used in squeezing the juice from the sorghum cane. He was feeding a cane into the mill, when one hand was caught between the rollers, and in his agony he reached out with the other hand, this also being caught. He was a wonderfully smart boy, and his bravery and his determination to make a man of himself brought to him the most generous sympathy and aid. He made his way through school, and then through Wake Forest College, where he graduated with very high honors. He had from his boyhood a great love of field sports, and determined to enjoy shooting in spite of the loss of his arms, one of which was cut off several inches above the elbow, while the other was cut off two inches below the elbow. His ingenuity came to his aid, and he rigged up an ordinary double-barrel shotgun in such a way that he became, if not an expert shot, one who could count upon getting an average of a partridge for every two shots, which is by no means bad. The way he rigged his gun was by fixing a strap around his neck in such a way that he could sling the gun and steady the breech against his shoulder. To each trigger he attached a leather strap, at the ends of these straps being a little button of wood. When hunting birds, as soon as the dogs made a point, he arranged his gun, with a remarkable quickness, and then cocked the piece with the stump of the right arm. The leather straps lay handy to his mouth, and on the rise of the birds he never failed to get in his work on them with both barrels, firing with great quickness. Dr. Vann has never lost his love for shooting, and this winter killed three turkeys one morning. He was in a blind and showed his skill as a shot by waiting until the turkeys crossed, when he fired and brought down two, knocking over the third as it was in the act of springing from the ground to fly, these birds having to make a little run before rising. Rev. Dr. Vann has shot in many parts of this State, sometimes with prominent sportsmen, and every one with whom he has been in the field admires his shooting and also his fine

instincts as a sportsman. He is the president of one of the largest institutions in this State, and is always a very busy man; yet he finds time to get out in the field several times each season. His chief delight is partridge shooting. He uses an ordinary gun, and not one built for him, and keeps it always rigged ready for use. An effort has been made to obtain a picture of him in the hunting field, but so far has failed, though later in the year the writer expects to get out with him and take an artist friend along to get some snap-shots, as these are really worthy of preservation to show what a practically armless man can do with the gun. Dr. Vann is a remarkable man anyway. For example, he plays croquet and a number of other games—tennis, for example—and plays them well. He can do so many things, in fact, that a lot of people believe he can do almost anything. Last year his young son Harvey was terribly injured while hunting, his gun having been accidentally discharged, the load passing through his chin from underneath. He has undergone several operations in a hospital, and is at present under treatment in one.

The writer has told the story about the hunt with the pack of hounds from this county owned by Mr. Otho K. Holding, which was taken over to Chase City, Virginia, and which pursued a deer which crossed a fox trail. Some of the dogs, as was stated, returned, but eight failed to do so. These dogs were out several days, but all except one have been found and brought home. They chased the deer about 75 miles, as nearly as can be estimated, the animal having crossed the Roanoke River into North Carolina, and having then recrossed and gone back into Virginia. It seems that after all the dogs caught this deer. It was the second deer they had ever seen. They caught the first one after a chase of only about an hour. Deer are certainly unusually abundant just across the Virginia border.

There has been snow during the past few days over a good deal of North Carolina, the depth in the central section of the State being from 3 to 7 inches, and the weather has been quite cold for this climate, the ground being frozen every night for nearly a week. The snow does not seem to have injured partridges at all, as there is a very large food supply for the birds everywhere, this being one of the things which has made the country people say this would be a severe winter.

Great numbers of rabbits have been caught during the snow. It is said that Siler City, a little station in Chatham county, is the leading place in the United States in the rabbit trade. From that village no less than 3,000 to 5,000 rabbits are shipped daily during the season. They go to all parts of this State, and also to the north in great numbers. It seems that there is a large demand for rabbits in New York, Boston, Philadelphia, Washington and other places. The skins are sold to the furriers. In nearly all cases the rabbits are shipped dressed. One day the sales reached 8,000 from Siler City, this shipment about filling a car. Chatham county is simply a storehouse for rabbits. Some years ago the writer was hunting partridges there with a friend, and as the rabbits popped up we began to shoot them. A native of the county who was with us laughed and said we would not keep that up long, and he certainly told the truth, for we had half a large bag full in less than an hour. They were given to a darkey, and after that we left them alone. I believe I have mentioned the fact that up in Chatham the rabbit is known as the "sand horse" because he plays in the sandy places.

Sportsmen from the North are beginning to show up at Pinehurst, and are enjoying a shooting in that very open country, where there are only scattered pines, the remnants of a once vast forest, these trees rising from a regular mat of grass, which in the cold weather is brown and stringy, almost like pine needles, scrubby bushes standing here and there, and there being runs of water at the foot of the hills, the country being very rolling. It is a very singular country to shoot in, and of this land the Pinehurst people have no less than 60,000 acres leased. They have planted cornfield peas in about sixty localities, besides getting the use of pea fields planted by farmers, and they have turned loose about 4,000 birds during the past twelve months. The soil is pure sand. It is, in fact, a vast sand region. There is all sorts of trap-shooting at Pinehurst, and there is one of the few tower traps in the country. It was built by a man who had seen one in southern France. There is a good deal of pistol shooting going on. In fact, Pinehurst is a great place for sport, and between the hunting, pistol matches, golf, etc., there isn't a dull day at the place, unless it be a rainy one, and even then there is always something doing indoors.

FRED. A. OLDS.

The Shiras Bill.

STATE GAME COMMISSIONER,
STATE OF ILLINOIS.

SPRINGFIELD, Ill., Dec. 17.—*Editor Forest and Stream:* I am pleased to acknowledge receipt of a copy of House Bill No. 15601, introduced December 5 by Honorable George Shiras, of Pennsylvania, entitled, "An Act to Protect Migratory Game Birds of the United States." I also note with pleasure the editorial comment of the FOREST AND STREAM under date of December 10, and a number of letters from various sections of the country published in your issue of the 17th, all of which meet with my unqualified approval and hearty co-operation. The sportsmen of Illinois have long been anxious to find a solution of this question, and to assist in a movement to protect migratory wildfowl by the Federal Government.

The real sportsmen of the country will not raise the difficulty of State rights or constitutionality if the bill is passed and rigidly enforced and the game protected. I think, however, they will insist that they should be consulted, or permitted to have a representative in the committee created by the Department of Agriculture for the purpose of establishing the open and closed seasons in the different zones covered by the flight of ducks, geese, brant, and other migratory game birds; which open and closed seasons can only be properly fixed by practical sportsmen, and those personally interested in the protection of the game for legitimate sport and home consumption, and Congress should specify this in the passing of the bill.

There is now such a wide difference in the game laws of the States through which wildfowl travel from north to south in the fall, and from south to north in the spring, and so many States have failed to provide the funds and system of paid wardens with which to enforce their laws, while others have used the department almost entirely for political purposes, and not for game protection, as their Legislatures intended, that it is time the Federal Government was stepping in, as it did in the passage of the Lacey law, and make a provision for better protection of such game, and more rigid enforcement of the act.

I have taken the trouble to write the twenty-three Congressmen of the State of Illinois and the two United States Senators, urging their co-operation in the passage of this bill, and if the sportsmen of the country think best, shall be glad to send a representative or go personally to a meeting of the game commissioners and sportsmen of the various States, which could be held at Washington for the purpose of united action in this matter.

I trust you will not lose sight of the importance of asking the Department of Agriculture, should the bill be passed, to consult fully with the various game commissioners and representative sportsmen of all the States as to the open and closed seasons, as stated above, for this is of vital importance to the different territories within the flight of the waterfowl. As, for instance, Illinois sportsmen are entirely satisfied with the open season on water fowl in this State, which is from September 1 to April 15, although they would be willing to have it from September 15 to April 1, and are not willing to give up spring shooting; yet you will find them not unreasonable, and they will submit cheerfully to the will of a majority. Other States have prohibited spring shooting, while others still believe in the marketing of game, and the Southern States are extremely slow to pass any kind of a bill for the protection of water fowl, and very few of them provide any money or organization to enforce the law, and I believe that only the sportsmen and men personally interested can solve this problem.

JOHN A. WHEELER,
State Game Commissioner.

DENVER, Colo., Dec. 16.—*Editor Forest and Stream:* In your issue of December 10, you print and comment favorably on a bill recently introduced in Congress by Hon. George Shiras, of Pennsylvania, by which it is proposed to extend Federal jurisdiction to the protection of migratory game birds.

The question of Federal protection of game has been much discussed for several years, mostly by laymen, and such protection urged as the only hope for the game.

Lawyers generally are of the opinion that it cannot be done, except through a constitutional amendment to which the consent of Congress cannot be obtained, and that the validity of such an amendment, even if secured, would be doubtful.

The Shiras bill, by a number of whereases reciting facts showing the inefficiency of State laws, undertakes to construct a foundation for Federal control.

It seems obvious that such a foundation is of sand, and that further inquiry into its merits is scarcely necessary.

But the bill in Section 1 provides that all wild geese * * * and other migratory game birds, "which in their northern and southern migrations pass through or do not remain permanently the entire year within the borders of any State or Territory," shall be under the protection of the Federal Government.

The words above quoted, which were no doubt intended as a definition of the word "migratory," are not only unnecessary, but weaken the whole section, in that their effect is to limit its application to such individual birds as do not, in fact, remain the entire year in any State or Territory. This is not the meaning of the word, as used there, or as ordinarily used. It applies to a class and includes every bird of the class, regardless of whether such bird remains permanently in one region or State, or migrates as his fellows ordinarily do. It is well known that here, and in many other States, some ducks do remain the entire year and breed in the same region.

Under the rule requiring criminal laws to be strictly construed, the prosecution under this act would be bound to prove that the particular bird or birds, the killing of which was charged, did not remain during the year in the State or Territory where they were killed.

The bill further provides that the "Department of Agriculture" shall make regulations as to closed seasons, etc., and provide fines and imprisonment for their violation.

The "Department of Agriculture" consists of a secretary, assistant secretary, a chief clerk, superintendents,

chemists, etc., down to a carpenter. The bill in question attempts to confer the proposed power on these persons—some twenty in all—to make these regulations.

This doubtless was not intended. What probably was intended was to give the power to the Secretary of Agriculture. But that would not cure the principal vice in the bill in this respect.

Congress has no power to confer authority on a department of its secretary to enact rules, the violation of which shall constitute crimes, and also prescribe penalties of fine and imprisonment for such violation. U. S. vs. Eaton, 144 U. S., 677. Dent vs. U. S. (Arizona), 71 Pac., 920, and cases cited.

There are other minor objections to the bill, and I venture the prediction that it will be shot full of holes before it gets out of the committee room, if it ever does.

I do not believe that any law can be devised for protection by the Federal Government of game on private lands; but I do believe it can be done on public lands, and this would, in the West, embrace substantially all the big game.

There is no doubt of the power of the Federal Government to control the occupancy and use of its public lands wherever situated, and hence little, if any, doubt of the power of Congress to prohibit by law hunting upon the public lands at any time or in any manner except as permitted by the laws of the States in which such lands lie.

I do not intend to give here the proper form of such a law, but the idea merely.

It is possible that it may also be extended to birds on public waters, but that question I have not examined.

D. C. BEAMAN.

STATE OF WISCONSIN,
DEPARTMENT FOR THE PROTECTION
OF FISH AND GAME.

MADISON, Wis., Dec. 19.—*Editor Forest and Stream:* I am in receipt of your favor of December 9, inclosing copy of bill introduced in the House by Hon. George Shiras 3d to give Federal protection to wildfowl, and asking for an expression of opinion on the bill.

In my opinion it is the only effective way to protect migratory birds, as there is always a clash of interests between adjoining States. In this State, for instance, spring shooting was prohibited for a few years, but at the last session of the Legislature repeal of the law was made possible because some of our neighboring States allowed shooting of ducks in the spring.

I think the bill should pass in spite of possible clash of State and Federal jurisdiction, as with such a Federal law as a guide, it would unquestionably be enacted into statute law in every State interested in the protection of wildfowl. I sincerely hope the bill will pass.

HENRY OVERBECK, JR., State Warden.

STATE OF RHODE ISLAND,
COMMISSIONERS OF BIRDS.

WESTERLY, R. I., Dec. 22.—*Editor Forest and Stream:* I believe that if the Shiras bill can be passed, it will afford our migratory game birds such protection as cannot be obtained by State legislation. I cannot see how any fair-minded person can oppose so worthy a measure.

EDWIN R. LEWIS.

TERRITORY OF NEW MEXICO,
DEPARTMENT OF GAME AND FISH.

SANTE FE, N. M., Dec. 20.—*Editor Forest and Stream:* Yours of the 12th inst. duly received. I have read with a great deal of interest text of the bill to protect migratory game birds and consider it a most wise measure. Its effect on our Territory may or may not be felt, as there are no breeding grounds here, and the birds are not killed to any great amount during their migrations. Our Territory has for the past seven years been laboring under its first game law, with a means of enforcing same, and there is no provision whatever for the protection of water fowl. However, in my last report to the Executive (December 15, 1904), I have strongly recommended such an amendment to the present law, and should I be in position to do so, will see that the law is enforced. We consider it best to prohibit the sale of all such birds, at least for a time.

STATE OF TENNESSEE,
DEPARTMENT OF GAME.

NASHVILLE, Tenn., Dec. 18.—*Editor Forest and Stream:* I beg to acknowledge receipt of your letter of December 9 inclosing a bill introduced by Hon. George Shiras to protect migratory game birds, etc.

I heartily approve the idea of this measure; though, to be entirely frank, I fear the courts will not hold it to be constitutional.

J. H. ACKLEN,
State Game Warden.

OFFICE OF J. W. BAKER,
STATE GAME AND FOREST WARDEN.

COTTAGE GROVE, Ore., Dec. 15.—*Editor Forest and Stream:* The bill introduced in Congress by Hon. George Shiras, of Pennsylvania, entitled, "An Act for the protection of migratory game birds of the United States" is, in my opinion, a good act. It should have the support of all true sportsmen. This is the first time my attention has been called to the question. I am strongly in favor of a measure of that nature.

J. W. BAKER,
State Game Warden for Oregon.

OFFICE OF JOHN SHARP,
STATE FISH AND GAME COMMISSIONER.

SALT LAKE CITY, Utah, Dec. 14.—*Editor Forest and Stream:* I joyfully acknowledge receipt of yours of the 9th inst. inclosing draft of House Bill No. 15601 for the Federal protection of wildfowl and other migratory game birds, introduced by Hon. George Shiras 3d, of Pennsylvania, and requesting an expression on it for publication. I will say frankly that nothing has given me more pleasure for some time than this knowledge that your letter brings of steps to be taken by the Federal Government for the preservation of our wild water fowl. The measure has my most warm indorsement and unqualified approval and support, and I sincerely hope that the measure will soon become a law, and that the Department of Agriculture will be "wise in its generation" and speedily make regulations to abolish the barbarous

practice of spring shooting, limit the bag to a reasonable kill per day, and forever kill the commercial traffic and sale of wild game, which is, and always has been, the bane and wrecking stone of our once limitless supply of wild game and birds. I look upon the wild game and birds of our country as a natural resource and product that belongs to all the people alike now living, as well as generations to come, which should be reserved and protected for the people to take and kill for food, pleasure, and recreation under or subject to reasonable and equitable laws and regulations, but not to be made a source of traffic for money-getting to the market-hunter and dealer to supply the endless demands of the opulent.

I trust that before long all the other game birds and game animals will come under the same national wing of protection. I have advocated Federal protection for our game animals and birds for some years, and which is the only salvation from complete extinction that I can see. The big game animals especially require immediate and thorough care before they are all gone the way of the bison and wild pigeon.

JOHN SHARP, Commissioner.

THE STATE OF WYOMING,
Office of
STATE GAME WARDEN.

LANDER, Wyo., Dec. 14.—*Editor Forest and Stream:* I have your favor of 7th inst. inclosing a copy of Mr. Shiras' bill for the protection of migratory birds. Some such legislation is certainly necessary; and a careful examination of the bill referred to, convinces me that it is a meritorious measure, and ought to become a law.

D. C. NOWLIN,
State Game Warden.

BOSTON, Dec. 10.—In view of the benefits that have resulted from previous conferences of sportsmen and others interested in the propagation and protection of fish and game in Massachusetts, the State Association has instructed the secretary to extend an invitation to all sportsmen's clubs and organizations throughout the State to send delegates to a conference to be held at the Copley Square Hotel, Boston, at 2 P. M., on Thursday, December 29. Dinner at 6 P. M. Delegates and others (not members of the Association) invited will be welcome at dinner as guests of the Association. Every one will be free to speak upon existing conditions, and suggest means for their improvement.

NATIONAL ASSOCIATION OF AUDUBON SOCIETIES
FOR PROTECTION OF BIRDS.

NEW YORK CITY, Dec. 22.—*Editor Forest and Stream:* I inclose you herewith a series of preambles and resolutions which were unanimously carried at the last meeting of the Board of Directors of the Audubon Society of the State of New York, which was held on the 15th inst.

You will note that the Society not only approves the Shiras bill, but also suggests most emphatically that the bill be amended so as to include all of the migratory birds of the country.

WM. DUTCHER,
Chairman Law Com. N. Y. Aud. Soc.

WHEREAS, The Board of Directors of the Audubon Society of the State of New York approves most heartily the important legislation proposed by the Hon. George Shiras 3d, of Pennsylvania, in H. B. No. 15601, lately introduced in Congress, and

WHEREAS, This board earnestly believes that the absence of uniform and effective State laws and regulations for the protection of migratory game birds is a great evil, and

WHEREAS, It also believes that the present tangle of contradictory State statutes covering the migratory game birds will be effectually remedied by the passage of H. B. No. 15601, therefore be it

Resolved, That the Honorable Members of Congress from the State of New York are earnestly requested to give their support to this important economic but non-political measure; and be it further

Resolved, That this board believes that the said beneficial legislation should be extended to cover all the migratory birds of the country, inasmuch as eighty per cent. of the said birds do not belong to the class known as game birds, but are largely insectivorous, and as such they are of the greatest economic value in their relation to the agricultural interests of the country, and therefore they should also be placed under the care of the Federal Government.

STATE OF VERMONT
DEPARTMENT OF FISHERIES AND GAME.

STOWE, Vt., Dec. 19.—*Editor Forest and Stream:* In answer to your communication of the 9th, in regard to giving my opinion in relation to Federal protection of migratory game birds of the United States, I have carefully looked over the synopsis of the same, and it seems to me that such a law enacted by Congress would be of greater value than our present State laws, if the Federal Government will be to the expense of seeing them enforced. Under our system of wardenship in Vermont, it is absolutely impossible to enforce the laws in killing game birds, especially in the waters of Lake Champlain. During the open season the limit for taking ducks is twenty in any one day for each person or hunter. You readily understand that three persons in a boat will take sixty ducks, and the chances are that one or two persons get the majority of them.

Parties owning certain sections of territory on the borders of Lake Champlain, where ducks breed numerously, have made these grounds private preserves. I do not see their rights in closing certain large territories and preventing others from hunting on these grounds for migratory birds, and there should be such a law enacted by the Federal Government to prevent this, and perhaps Mr. Shiras' bill covers the ground.

I do not think any party can lawfully, even if he owns the grounds, assume the only and whole privilege of taking migratory birds, even if they do breed on his grounds.

However, any wholesome law that will regulate the taking of these birds and preserve them from becoming extinct, will certainly improve present conditions and be a blessing to mankind.

H. G. THOMAS,
Commissioner.

Wisconsin.

HERE we are once more domesticated in the old Badger State, after an absence of some forty-six years. And what a change has come over the landscape in those years! Where are the heavily wooded groves, the home of the deer? The swales full of mallard and teal? The coveys alive with Bob White, not to mention enough of the pinnated grouse to satisfy any genuine sportsman? Now the large timber is all cut off, and fields of grain for miles and miles in extent take their place, and the game, at least in this the lower part of the State, is gone never to return. There are no prairie chickens, very few quail, and but a small amount of ducks compared with what there "used to be." We have to put up now with the fox and gray squirrel and the Mollie cotton-tails. The upper part of the State, I am told, still holds its paradise for the sportsman. Many deer have been brought down to market thus far this season. I was fortunate in the years '56 and '57 to be employed as one of the examiners of the Fox and Wisconsin Land Improvement Company, who owned land (some 7,000,000 acres) scattered in twenty-eight of the counties of the State, and roamed with pick and gun throughout its wide domain, some of the northern part densely wooded, and I found a large variety of fur, fin and feather. The glory of the sportsman has departed from this section; but the fishing near-by at Rock Lake and Mud Lake is often quite good; bass of 4 to 5 pounds, and pickerel of 12 pounds are quite common. Mud Lake used to be a grand place for ducks, especially in the fall, as its shores were lined with acres of wild rice and the fowl tarried in large varieties to fatten on the luscious seed. But some scoundrel—or more like egregious lunatic—put a quantity of the detestable carp in the lakes, and they multiplied exceedingly, and of course tore up and destroyed the roots of rice and other plants so dear to the ducks, and now not a spear of any kind is to be seen in all the surrounding acres—nothing but mud, mud. It is too bad, and the miserable soft "poor man's food," as they were first called, cannot now be eradicated.

In this pleasant village—or city, as they like to denominate it—of some 2,000 inhabitants, I have found some congenial souls, disciples of the steel tubes and bamboo joints, to whom we "cottoned" at once. Among the first of these is Julius Wolfed, one of the business men of the community, one of the right kind, a reliable companion, a good shot, and a most indefatigable tramp. I have had several days with him, and always with renewed pleasure, if not at all times with as full bag as we might wish, of snipe (they call them jacks here) or squirrels (both fox and gray), and the everywhere plentiful Mollie cotton-tails. Quail are protected until 1905. But last week we had a new experience in the way of hunting the longears. Mr. W. has two beagle hounds, little, short-legged fellows, and especially the bitch, black and tan, is a daisy. She will not weigh over 15 or 20 pounds, but is staunch and true, runs the game slowly but surely, and, unless it be holed, will bring it around to the starting point. But there are a good many holes around the country, supposed at some time to have been the residences of badgers, woodchucks or skunks. Into these receptacles Mollie will dive when she takes a notion—and she often takes the notion—and the hunter must seek another track. We were out last week and had some luck, having potted three or four Mollies and quite a number having disappeared in the earth. We were joined by Mr. Laskax, a successful veterinary surgeon of the county, a genial and enthusiastic sportsman. He had no gun, but carried a small box under his arm. He was warmly welcomed by Mr. W. and the other hunters. "Now, Judge," said W. to the undersigned, "you will see some fun, and if you can kill the first one you will do remarkably well."

I did not understand what he meant, and the following occurred. The next time Mollie went to earth, the Doctor took from his box a long, brown little thing with bright, beady eyes and a sharp peaked nose. Just back of its forelegs was attached a strong strap. Now, there are always two holes opening to the same earthly domicile. Mr. W. stationed us near one of them, and told us to keep our eyes peeled. The Doctor carefully put the animal (bird they call it) head first down in the ground. Almost instantly there shot out a streak of fur lightning with a white knob on end, and was forty yards away before your humble servants could gather our wits about us or our guns to our shoulders. Of course we shot behind him; and the next one also, for that matter.

Now I am aware that there may be a big cry against Jacobstaff for this very unsportsmanlike way of bagging game; and he was at first rather ashamed of it; but they claim here that it is no more unsportsmanlike to shoot Mollie (they always shoot her) jumping like the wind from the earth as to do so when on the track.

In Jersey there is a law in regard to the use of the ferret, as the dagoes come over from New York carrying no gun, but instead a bag, and silently get away with innumerable of the little hares. There a sportsman will likely shoot the Italian meat-hunter and the ferret before they will the rabbit.

While we stood around a couple of holes debating the existence of a hare being therein, we happened to glance upward, and saw a bunch of leaves that resembled a squirrel's nest. Knowing the propensity of these little animals to take their siesta as they feel so disposed, we casually let drive at it, and, rather to our astonishment, out popped a big gray, which was at once added to our bag. Now, six or eight full-grown rabbits in one's game pocket make quite a load to carry around very far; and some of our high-toned sportsmen friends will sneer, and say it is small business for such an old hunter as Jacobstaff claims to have been. Let them laugh. There is some fun in it in lieu of better, and threescore and twelve years is not as strenuous as he was; he cannot "follow the stag to his slippery crag," nor climb the rough mountain side for the lordly grouse; but may perchance renew his boyhood days with the innocent bunnies—and they do make good pies.

What a lot of talk you are having about the sleeping dusky duck. Of course they sleep; not perhaps whole flocks at a time, but, like crows, some are always on the watch. And a grouse does not strike the log or hole or even breast with its wings when drumming, no more than the hummingbird when it hums or the woodcock

when it whistles. That is done with the rapid oscillation of the wings in each instance. So much for so much.

JACOBSTAFF.

Duck Shooting.

PORT RICHMOND, N. Y.—*Editor Forest and Stream:* Write me down in italics as siding with that Blunt Old Man in the duck argument that's called into more prominent notice some of FOREST AND STREAM's "fine old educational mastodons." And I've killed some ducks, too, although I'm quite a fresh young man.

"Ducks is ducks," and it's lawful and moral to take them flying, sitting, swimming or sleeping, high, low, jack and the game.

To my olfactories Charles Cristadoro smells of law-calf, buckram and mucilage, but he should use a better brand of logic in his business than the sample offered last week by the application of which he steps easily from sitting duck slaughter to fish dynamiting.

In the words of the lamented Artemus Ward, "This is 2 mutch."

There's an awful lot of good space goes to waste in your columns (maybe some is going now). Too many of these sea-lawyers arguing over ghosts that will not lay.

Instance: FOREST AND STREAM comes by the post, and I hurry to open it for an evening's unalloyed pleasure, when what to my horrified eye doth appear but "How does a drumming grouse do his drumming? On the log, over the log, on his breast, on his back?" and so on.

Or another inquiry: "I killed a 7-point buck yesterday. Is each point a year or two years or six months, or twenty days or \$10?"

Never mind the rest—let sleeping ducks lie.

Then after the inquiries—bedlam! Fossilized Nimrods, whose ideas no Presto could change, rattle into the fray, other wiseacres rally to the war-cry, and then to pot go three or four columns of the best sportsman's paper in our U-nited States.

Let me modestly suggest a remedy: Have an "Anxious Inquirers' Column." Subordinate everything to it, even the editorial notes, and in this column print the latest accepted conclusions regarding these mooted questions, and have the grouse business first and last also for fear "Anxious" overlooks it.

I hope you get my point. I'm for enlightenment and progress, but I am opposed to the sort of argument that rather seeks the conservation of opinions than the saving of truth. There are too many quidnuncs, closet-observers, semi-amateur naturalists on the ink-path. Mixed up with the mouse trails there may be the track of some larger deer; but one gets so irritated by the petty meanderings that he leaves the hunt in disgust.

None of this refers to men like Cabia Blanco, whose writings bear the stamp "Genuine."

I look for his contributions at once. There is a charm about his unaffected style that pleases me, and if he has ever published a book or a collection of stories, I want to know it, so that I can get it. SIDNEY EDWARDS.

EAST WAREHAM, MASS., Dec. 22.—*Editor Forest and Stream:* In your current issue I seem to have fallen into a pit of my own digging, and unless something is quickly done will be buried by the indignant sportswomen. For I am made to say that ladies do not practice ethics in the field. I intended nothing of the kind; their ethics are all right. The allusion to Lady Bellaston and her vigorous expression was to make a parallel illustration. Her footman, finding himself on slippery ground, took refuge behind his virtue, whereat the lady scornfully exclaimed: "A man's virtue! Ministers preach of virtue, but who ever heard of one's practicing it?" Likewise sportsmen preach of "ethics," but whoever caught one putting them into practice?

Personally I have no doubt that many readers of FOREST AND STREAM, and correspondents also, are all that they pretend to be, and would not shoot anything sitting or sleeping. But in forty years with a gun north and south on both sides of the continent, I have never met one of them. I have known some fine men, too. One of these, a gentleman by name of Piercy, who lived on the west side of Elk River in Maryland, told me of a shot which he always regretted. He was walking with gun in hand down to a pasture to drive up some cattle at evening. At their watering place he saw a quail run to the spring and stop; he fired quickly, without any consideration, and picked up nine birds that were all drinking at the sunken barrel. He shamefully related the facts to his father, and was reprimanded. On the other side of the river lived a man named Davis. I was up to his place one day in the bitter December of '76, and he related a partridge shooting without any compunction; he "nursed" them through the snow till they were under a cedar; the result was greater even than Piercy's. Though they did practically the same thing, there was a difference greater than a river between the two men.

In another place your types make me say, "We have read the FOREST AND STREAM from the very first, the cream of the shooting world." "Write and subscribe," etc., should be in the same sentence. I meant the cream of the shooting wrote for, etc. WALTER B. SAVARY.

AITKEN, MINN.—*Editor Forest and Stream:* If some of the critics who have spoken so harshly of Manly Hardy and a Blunt Old Man for shooting birds sitting, would examine the subject a little, they might find something out that would throw some light on it. There are always two sides.

I once had experience with a man who prided himself on being a true sportsman, and who scorned to shoot at anything sitting. Time and again I have seen him order a bird flushed, and then, after his three to five shots with a repeater, I have seen the bird go wabbling off with broken legs or otherwise maimed, to die by inches in an unknown spot. After a few hundred such exhibitions I remonstrated and pointed out the evil results. It did not mend the matter in any degree; but I lost a good deal of prestige. It would be no sport whatever to hunt squirrels or rabbits with a shotgun, for mostly they must be shot sitting, hence we use a rifle. When we hunt birds, we use the shotgun because their natural means of escape is by flying; yet if the birds are scarce and wild, we should shoot them on the ground, in a tree, or

wherever an opportunity offers, for the reason that the distance the bird would fly while the shooter is taking aim would likely take it into debatable range, and a crippled bird would be the result. If the bird be at close range and in the open, one may as well flush it, as the shot is equally sure by the ordinary shooter; but don't make any virtue of giving the bird a chance, as it weakens the standard of sport. We want the bird, rather than simply to gamble with it for its life. If one be a poor shot, there is all the more reason for shooting on the ground. The origin of hunting was the desire to possess the game. If we do not want the game, it is pure wantonness to hunt it. The manliest set of men I have ever met was among sportsmen on the field at a trap-shooting contest, or by the camp-fire. There was never any bickering among them as to who was the true sportsman. The best man among them was the one who won the big prize or brought in the big buck. Whenever I hear or read of disputes as to what is the standard, I can't help but think it is caused by the introduction of alien elements.

The Kelly-Seton controversy going on of late, puts me in mind of an incident that happened on a tenting trip two or three weeks ago. One day I found the fragments of an old gun in the woods. I was quite busy just then with a covey of partridges and laid the fragments across the portage trail between two lakes. Diverted by the chase, I continued on to camp. On the way I fell to speculating on the romance that might be connected with that old gun. That evening in camp I started twenty-seven different times to tell about the gun; but each time some other member broke in with something that just came to his mind, and I was silenced. After that the gun incident passed out of my mind for the evening. The next day, coming in over the portage trail, one of the boys picked up the gun, and the way he rung the changes on the gun and its possibilities kept us all in a fever all evening. I had found the gun, but the other fellow got in all the "guff," and did reap all the glory. The man who can talk loudest and fastest wins the argument regardless of any right of discovery or merit in the text. E. P. JAKUES.

Editor Forest and Stream:

I am only a blunt old man, something of a duck shooter (if I do say it myself), but no arguer. I have no controversial equipment which fits me to debate with Mr. Brown, nor indeed have I entertained any purpose of carrying on a controversy with him over this question of shooting ducks on the sit. That, and that only, is the point under discussion, though I confess that when reading Mr. Brown's letter in your current issue I forgot for the moment just what it was we were arguing about. Mr. Brown has a lot to say about how John Burroughs telepathized a sleeping duck (which J. B. hadn't ought to have done), and how the harsh criticisms of a writer of animal stories have brought blindness upon him (which I believe they did not do), and how the Shiras bill was going to forbid the shooting of sitting ducks (which of course it is not going to do), and how I am old (which I am) and sit back in an easy chair (which I do do), and how I wouldn't give my name (which I won't do), and how therefore he wouldn't give us those club names (which I think he should do). It was all good reading, and I enjoyed it; but, as I said before, I am no arguer, and shall not attempt to take up these extraneous considerations. One thing I will say—I can see a point when the point is there. And another thing I will say—I can stick to the point when it is there, and can hang to it through thick and thin, sink or swim, live or die, survive or perish. (P. Henry.) A third thing I will say—if we are ever to get anywhere in this discussion, Mr. Brown ought to stick to the point, too. I mean that he shall; or at least I mean not to let him forget or evade the point. And the one sole, solitary, single, particular individual and only point now before the meeting is this, namely:

Mr. Brown has said that for shooting a duck on the water, a member of a ducking club would for the first offense be reprimanded and expelled for a repetition.

I questioned this statement, and called upon Mr. Brown to name the clubs where such a course of procedure could possibly happen. I said that it was up to him to prove his extraordinary assertion by adducing some corroborative proof, and that the names of clubs which would expel members for killing ducks on the water would supply the proof.

Mr. Brown refuses to do this. I believe that his refusal is due to his inability to name the clubs. I think I am perfectly safe in saying that he will not give us any names of clubs which would expel their members for shooting ducks on the water, for the simple reason that he cannot. I don't believe that there are any such clubs.

However, I may be mistaken. I am not always dead right. I don't know it all; and a certain woman is fond of saying to me, "There is no fool like an old fool." On the other hand, old as I am, I am not beyond learning something from those who know more than I do, and I would be grateful if any of the readers of FOREST AND STREAM would tell me the names of ducking clubs which would expel a member for having shot ducks on the water. We are none of us too old to learn, not even

A BLUNT OLD MAN.

Wildfowl at Currituck Sound.

POPLAR BRANCH, Currituck Co., N. C., Dec. 23.—*Editor Forest and Stream:* For the past two months the duck shooting here has been very "spotty." There have been multitudes of fowl, but, on the other hand, we have had much mild and pleasant weather during which ducks do not fly, and of course offer no shooting. Southerly breezes have piled up the water in the upper end of the Sound, and perhaps this has something to do with the absence of birds. Last week there were a good many ducks here, the weather was rough, and there was some good shooting, and two men shooting together for five days averaged about thirty birds daily or fifteen to the gun.

There are great quantities of geese here, and many swans; but as yet no canvasback have been shot, for the weather has not been cold or rough enough to bring them to the decoys. A little later we hope for better weather.

SNOWDEN.

Muskrat Hunting.

BY HENRY THACKER.
From "The Trappers' Guide."

In the winter of 1844-5, I made two or three excursions from the city of Chicago into the neighboring wild regions for the purpose of spearing and trapping muskrats. At this distance of time I shall hardly be able to give from memory a very accurate account of those excursions; but I enjoyed them so well, and they made such vivid impressions on my mind, that I can at least give an outline of them, and shall recall as I proceed many interesting incidents.

The first thing I did, by way of preparation for the campaign, was to procure a suitable spear, which was simply a rod of round steel, three-eighths of an inch in diameter, and three feet long, nicely pointed and polished at one end, and at the other driven firmly into a ferruled wooden handle, also about three feet long. The next thing (and a very important one) was to provide a pair of muffers, made of old carpeting, to be drawn on over my boots. Lastly I harnessed myself into a knapsack suitable for carrying provisions, game, etc. Thus equipped, I put on my skates one morning, as soon as I found the ice strong enough to bear me, and started up the north branch of the Chicago River for Mud Lake, a small sheet of water about twelve miles distant, surrounded by extensive marshes, a noted place, not only for the habitation of the muskrat and mink, but for the gathering in the spring and fall of the year of multitudes of almost every variety of wild ducks, geese, and other water fowl.

Here let me describe the character and situation of this marsh and lake. The lake proper is a narrow sheet of water, from ten to twenty-five rods wide, and two or three miles in length. The water is from three to ten feet deep, and the soft mud at the bottom probably a great deal deeper. This lake seems to have two outlets flowing in opposite directions; one toward Chicago being the principal headwaters of the south branch of the river which forms the harbor of Chicago; the other in the opposite direction, emptying into the Auxplains River, which is among the headwaters of the Illinois River. I was told that at the time of the high water in June of that year (1844), schooners from Lake Michigan could easily have passed through this lake and marsh into the Auxplains, and so down the Illinois River to the Mississippi.

But to return to my story. On arriving at the marsh, I found the ice strong enough to bear my weight, and quite transparent. A sight was here presented that I had never seen before. I cannot describe the view better than by likening it to a large meadow covered with hay-cocks, so thickly was the marsh before me studded with muskrat houses.

These structures are built up of flag-tops, roots, mud, and sea-weed or water grass, to the height and size of a hay-cock; and in them the muskrats live through the winter and spring. They generally commence their houses on a place where the water is one or two feet deep, and build it up entirely solid, to the height of three, to five feet above the water, cutting out channels diverging in different directions from the house, and using the materials thus displaced in strengthening the foundation of the house. These channels are used as runways by the rats in going back and forth between the house and their feeding beds during winter. After the superstructure is finished a hole is cut from underneath up into the center of the house, forming a nest just above the water, leaving ample room for a second story in case of a flood.

I now made preparation to enter upon the business of my excursion, that of spearing muskrats. I was not long in putting on my muffers and getting ready for the onslaught; and, as this was my first attempt at spearing, I was full of enthusiasm. With feelings of interest and excitement, I marched up to a large house very cautiously (for, with the least jar or crack of the ice, away goes your game), and, with uplifted spear, made ready for a thrust. I hesitated. There was a difficulty I had not taken into account—I knew not where to strike. The chances of missing the game were apparent, but there was no time to be lost; so bang! went the spear into a hard, frozen mass, penetrating it not more than three or four inches, and away went the game in every direction. With feelings of some chagrin I withdrew my spear, and began feeling about for a more vulnerable spot, which I was not long in detecting. It being a cold, freezing day, I discovered an accumulation of white frost on a certain spot of the house, and putting my spear on the place I found it readily entered. The mystery was solved at once; this frost on the outside of the house was caused by the breath and heat of the animals immediately beneath it, and it was generally on the southeast side of the center of the house, this being the warmest side. Acting on these discoveries, I made another trial, and was successful; and now the sport began in good earnest. Whenever I made a successful thrust, I would cut a hole through the wall of the house with my hatchet and take out the game, close up the hole, and start for another house. The remaining members of the family would soon return and immediately set about repairing the breach. I sometimes succeeded in pinning two rats at one thrust. I also became quite expert in taking game in another way, as follows: Whenever I made an unsuccessful thrust into a house, the rats would dive into the water through their paths or runways, and disappear in all directions. I now found I could easily drive my one-tined spear through the ice two inches thick and pin a rat with considerable certainty, which very much increased the sport, and I was not long in securing a pile of fifteen or twenty rats.

Here I made a discovery of what, until now, had been a mystery to me, namely, how a muskrat managed to remain so long a time in the water under the ice without drowning. The muskrat, I perceived, on leaving his house inhaled a full breath, and would then stay under water as long as he could without breathing; when he would rise up with his nose against the ice and breathe out his breath, which seemed to displace the water, forming a bubble. I could distinctly see him breathe this bubble in and out several times, and then dive again. In this way I have chased them about under the ice for some time before capturing them. I do not know how long the muskrat could live under the ice, but I have

heard of their having been seen crossing large bays and rivers under the ice five miles from shore. I saw a man in Illinois who told me he chased two otters under the ice for three-quarters of an hour, trying to kill them with his ax, and finally lost them; which goes to show that these animals, as well as the muskrat, can live under the ice a long time.

As I frequently speared the muskrat on his feeding bed, and subsequently found it to be the best and surest place to set a trap for him, I will, for the benefit of the novice, undertake to describe one as found in the marshes. A feeding bed is a place where the muskrat goes to feed, generally at night, and is frequently many rods from his house. Here he selects a place where his food is convenient, and by the aid of the refuse material of the roots, etc., which he carries here for food, he elevates himself partly out of water, in a sort of hut. Here he sits and eats his food, and at the slightest noise, or least appearance of danger, disappears in an instant under water. In the winter these feeding places are readily discovered by a bunch of wadded grass, flag, or some other material about the size of a man's hat protruding above the ice. This little mound is hollow, and is only large enough for a single rat, where he sits and eats his food, with his lower parts in the water. When the rats were disturbed in their house, I found they generally fled to these feeding huts, where they were almost a certain mark for the spearman.

Finding I had taken as many rats as I could conveniently strip before they became frozen, I set about the work of skinning, and after an hour and a half of pretty cold work I bagged my skins, put on my skates, and started for the city, well satisfied with my first day's excursion.

In my next excursion, not many days after, to the same place, I had still better success. As the ice had now become too thick to be easily penetrated by my spear, I adopted, in part, a different mode of taking the game. This time I carried with me, in addition to my spear, two dozen steel traps and a bundle of willow sticks (cut on the way) about three feet long. On arriving at the hunting grounds I prepared myself for the day's sport by putting on my muffers, and with traps and willow sticks slung upon my back began the work by driving my spear into the first house I came to. I could not now see the rats as they fled from the house on account of the thickness of the ice and a slight snow that lay upon it. Consequently the sport of spearing them through the ice was cut off. But as often as I had occasion to cut through the walls of the house to take out my game, I set a steel trap in the nest, slipped a willow stick through the ring of the chain, laid it across the hole, slightly stopped it up, and then passed on to the next house; and so on, until my traps were all gone. I then started back to the place of beginning, driving my spear into every feeding hut in my course, and killing many rats. Finally I began going over the ground again, first driving my spear into a house, then examining the trap, taking out the game, and re-setting the trap. In this course I was quite successful. I found by setting the trap in the right place, near the edge, and a little under the water, I was almost certain to take the first rat that returned. In making two or three rounds in this way, I found the rats became somewhat disturbed, and sought temporary shelter elsewhere; when I would move to a new place, giving them time to recover from their fright.

I think this a very profitable method of trapping the muskrat, especially in an open winter. It very much lengthens the season of trapping, which is quite an important consideration with the trapper. Another consideration is, the trapper may set his traps and allow them to remain many days, if not convenient to go to them, and be sure his fur will take no harm; as the rat on being caught in the trap dives into the water, and is soon drowned, and will not spoil for a long time at this season of the year, and is also secure from frost.

I will here state that I found a muskrat house to contain from four to nine rats. I have caught as many as nine from one house. Possibly some may contain a greater number than this. I concluded that these colonies must be the progeny of a single rat in one season, or, for aught I know, at a single litter.

In these winter excursions I sometimes captured several minks, which I found somewhat different from the mink of the Eastern States, being much larger, and of a lighter brown color and coarser fur. I sometimes found them occupying muskrat houses, from which they had driven or destroyed the muskrats, of the flesh of which they are very fond. They are a gross feeding, carnivorous animal. I have found stored up in muskrat houses which they inhabited, from a peck to half a bushel of fish in all stages of decay, and some freshly caught and alive; which is good evidence that they are not only gross feeders, but good fishers also. I was most successful in taking the mink in steel traps, baiting with muskrat flesh or fish, and setting my traps about the marshes and along the banks of streams and rivers. A mink will seldom pass a bait without taking or smelling at it; and by placing the bait a little beyond the trap, in such a position that he must pass over the trap in order to reach it, you are pretty sure of him. I also caught them by setting the trap in the mouth of their dens and in hollow logs, and sometimes enjoyed the sport of digging them out of the river bank.

In setting my traps for mink and raccoon, I was somewhat annoyed by the prairie wolf taking the bait, but still more by the skunks getting into the traps. The country at this time abounded with these animals. They seemed to be nearly as plenty as the minks. I have sometimes found as many as two or three in my traps on a morning. It was an easy matter enough to dispatch one, but to do it and not get my trap scented was not so easy. (Here let me say I never knew one caught in a trap to discharge at all until disturbed by the approach of man.) After trying several unsuccessful plans, I hit upon one that I thought would do the business. Putting a tremendous charge of powder and ball into my rifle, I approached my antagonist as near as I could without drawing his fire, and placing the muzzle of my rifle within three feet of his head, blazed away, and blew his head clean off. I approached the carcass for the purpose of taking off my trap (congratulating myself on my good

success), when he made a sudden convulsive movement, and oh, horror! such a discharge of the genuine article no man ever saw or smelt! However, by a quick movement I escaped the charge myself, but my trap, as usual, was thoroughly perfumed. I soon had an opportunity to try again, and this time I succeeded, by the following device: Watching my opportunity when the skunk turned his eyes from me, I dealt him a heavy blow across the back with a long club, and immediately loosened the trap from off his leg. In this way I ever after managed to keep clear from scent, with a single exception, which occurred as follows:

In one of my excursions, accompanied by another person, the dog scented something under the floor of an old shanty, which we concluded must be a mink; so at it we went, tearing up the floor to give the dog a chance to get at the animal. Up came one plank after another in quick succession, when all at once the dog made a tremendous lunge right into the midst of a nest of seven nearly full grown skunks. In less than a minute the atmosphere was blue with the most horrible stench ever encountered by human olfactories. The dog was soon nearly choked and blinded by the showers of stifling spray that met him at every charge, and, for the time being, all were obliged to beat a hasty retreat into the open air. But as we were all now fairly in for it, we concluded to make another charge and finish up the work we had so enthusiastically begun; and, armed each with a long club, we returned to the fray, and, with the help of the dog, soon despatched the foe, and retreated to the windward to get clear of the stench. But it was of no use. I seemed to be scented through and through; my very breath seemed to be hot with the terrible miasma, and for several days I could scarcely taste or smell anything but skunk. This was my most serious encounter with the skunk family, though I continued to be annoyed by their getting into my traps; and once, at the suggestion of a fur dealer that their skins were worth fifty cents apiece, undertook the job of saving a lot; but after skinning five, gave up the business in disgust.

My next excursion was a short but rather exciting one. In consequence of a slight thaw a day or two previous to my setting out, the skating on the river was nearly spoiled. I was therefore obliged to travel most of the way on land, and on foot, taking nearly all day to get to my place of destination. I put up for the night at a tavern a mile or two from the part of marsh where I intended to trap, which was at the end opposite to the theatre of my previous excursions, and near the Auxplains River. The next morning after breakfast I started out for the hunt, and, on arriving at the marsh, to my surprise not a muskrat house could be seen, with the exception of the very tops of three or four. The rest were all under water and the water frozen over. At first I was unable to divine the cause of this unusual rise in the water; but subsequently ascertained that an ice dam had formed in the river three-fourths of a mile below, in consequence of the breaking up of the ice above, and had set the water back over this part of the marsh to the depth of nearly four feet. The muskrats were completely drowned out, and I now saw them huddled together in numerous squads upon the newly formed ice all over the marsh, having already brought up portions of their submerged dwellings, with which they had built up slight walls to shelter themselves from the cold northwest wind.

This was an exciting scene to the trapper—a multitude of his game in full view! I became almost nervous with excitement. But how to get at them was the question. On going down to the water, I found it scarcely frozen along the shore, though it looked firmer further out. To be sure, I could reach many of the muskrats with my rifle; but what was the use if I could not get them after I had killed them? However, something must be done. I couldn't stand this sight anyhow. I set about devising some plan by which I might reach the game in person. A half dozen plans were presented to my mind in as many minutes. One plan was to place a board on the ice, get on it, and shove myself along by placing the point of my sharp spear on the ice; but, on further consideration, I concluded this would be too slow an operation. If I succeeded in getting out on the ice, the rats could easily keep out of my way, as I should not be able to leave my board. Another plan was to fasten a piece of board a foot square to each foot; but, on further thought, this plan was also abandoned as being unsafe. Although the water did not exceed four feet in depth down to the old ice, yet, in case I broke through, the boards might operate to keep my heels up and my head down. I now determined to test the real strength of the ice; and, procuring a piece of slab twelve or fourteen feet long, I shoved it off on the ice. Leaving one end resting on the shore and walking on this, I stepped off upon the ice. It barely held my weight, and soon began to settle, so that the water came upon the ice. However, I came to the conclusion that if I could get upon the ice with my skates on, and keep constantly under pretty good headway, it would hold me up. Stripping off all extra clothing, and laying aside every unnecessary weight, I strapped on my skates, and, with spear in hand, launched forth in pursuit of the game. The ice bent and waved before me, but I glided swiftly on, and in less than a minute was among the muskrats.

I now discovered that the rats kept a hole open through the ice, right above their house, and before I got within striking distance they dove into the water and disappeared. I could hear them snuffing up against the ice, but could not see them on account of a slight sprinkling of snow which covered the ice. As soon as I left for another place, they would come up again through the holes on the ice. I saw that, in order to get a chance to strike them, I must wait at the holes for them to return for a fresh supply of air. This I found rather tedious, as I was obliged to keep constantly in motion, running in a circuit around the hole, on account of the weakness of the ice. In this way I would have to wait several minutes, and, when one did return to breathe, he was so very quick I found it difficult to hit him; and I also found, where the holes were not a great way apart, that when I went to one hole the rats would dive and swim to another. This would not do. I must try another expedient; and, returning to the shore, I took from my knapsack a dozen steel traps and a handful of willow sticks, threw them on the ice, and then started back. Picking up in

my course as many traps and sticks as I could carry without increasing my weight too much, I distributed them around the holes. And now lively work commenced. Taking a trap and stick in my hand, while under headway, I set the trap, slipped the willow stick through the ring of the chain, dropped it on the ice, placed the trap in the little cuddly where the rats huddled together, and passed on to the next, scarcely making a stop. This plan was a successful one. Frequently, before I reached the next hole, a rat would be caught in the trap I had just left, and, diving into the water, would be brought up at the length of the chain by the stick sliding across the hole, and in this condition would soon drown himself. I now had as much business as I could attend to, taking out the game, re-setting my dozen traps, carrying the game to the land, etc. You may be sure I played back and forth in a lively manner. I, however, discovered that the ice became much weakened by passing over it several times. Consequently I was under the necessity of moving to new places occasionally, to avoid breaking through. In fact, I found there was only a small part of the marsh where the ice was sufficiently strong to hold me up at all; and the weather, moderating after the middle of the day, weakened the ice so much that I fell through several times, getting my clothes wet and boots full of water; which so much increased my weight that I was soon obliged to abandon the field altogether. I had, however, by this time secured a good pile of rats, and, on the whole, had had one of the most exciting day's sport I ever enjoyed.

The weather now continued to moderate, and there were evident signs of the breaking up of winter, and the opening of spring. In two or three days from this time, wild ducks and geese began to gather about the marshes. I now began active preparations for a spring's campaign of trapping. During the winter two small trapping boats had been made, and a tent, camp kettles, and other "fixings" had been got in readiness; and on about the twentieth of February, in company with E., I set out. We launched our little crafts and commenced the campaign by scattering over the marsh one hundred and ten steel traps, with open jaws, ready for the fur-clad inhabitants. The weather being favorable and the water steady, we made havoc among the muskrats and minks; and as this was a noted place for game, especially for muskrat, mink, and raccoon, we soon had competition in the business. In the course of three or four days three other trappers stopped in the same vicinity, and commenced operations. But as they were strangers from a distance, we had decidedly the advantage, as we understood the ground, having previously pretty thoroughly reconnoitered the marshes in this section. The game being plenty, we found work enough to keep us busy, and for several succeeding days caught more rats than we could find time through the day to skin.

However, our good success was of comparatively short duration. In the course of ten or fifteen days we found ourselves confronted by a pretty serious difficulty in the way of successful operations. As the previous summer had been remarkable for its long continuous rains and great flood, we now had the opposite state of things—continuous dry weather; and having had scarcely any rain the fall previous, nor snow during the winter, spring found the water in the rivers and marshes unusually low. As the weather continued fair, the March winds dried up the marshes so fast that we soon found it difficult to get around with our boats, and finally were obliged to leave them altogether and take to the rivers in order to continue our sport. We now found our chance for sport much reduced. The high water the previous spring and summer, overflowing the river banks for so long a time, either prevented the rats breeding, or drowned their young, so that we found the game rather scarce. We, however, ascended the Auxplains River some twenty or thirty miles. Our way was to string our traps along the banks, three or four miles at a setting, and then return to camp. The next day we would overhaul and re-set, if we found the game plenty enough to warrant it. If not, we would take up the traps and make another stretch, and so on.

On returning several days subsequently to our old hunting grounds, we found the muskrats had somewhat recovered from the fright we had given them by our sudden and terrible onslaught, and had returned from the inaccessible parts of the marsh to which they had fled for refuge, and we made several more successful sets.

The weather had now become mild, and the marshes literally swarmed with ducks and geese and other water fowl. Anyone not familiar with this section of country can have no idea of the numbers of water fowl that gather about these lakes and marshes in the spring and fall of the year. As we moved about in our little boats

among the tall reeds and flags of the marsh, our firearms were always at hand, ready to bring down a duck or a goose that happened to pass within reach. We fared sumptuously every day. Our daily bill of fare consisted of roast goose, roast duck, prairie chicken, plover, pike, bass, catfish, bullheads, etc., together with coffee, hard biscuit, butter, and occasionally a meal of duck and goose eggs. This was what we called high living; and as we seldom found time for more than two meals a day, we were prepared to dispatch them with a relish that no one but a trapper can realize.

E. did not seem to enter into the business with as much enthusiasm as myself, and having a family in the city, frequently found occasion to go home, and sometimes stayed away two or three days. This made the work not quite so pleasant for me, as I enjoyed the sport much better when we were together. However, I got along very well; and the croaking of frogs, the peeping of lizards, quacking of ducks and geese, crowing of prairie chickens, the loud cries of the great sandhill cranes, and the almost incessant howling and yelping of prairie wolves, were all music to my ears. On the whole, I enjoyed the situation exceedingly.

One day as I was pushing my little boat along through the tall reeds, I saw at a distance something unusual on the top of a muskrat house. As it was lying flat, almost hidden from view, I at first sight took it to be an otter, as we had killed one some time previous near the same place. As usual at the sight of game, my rifle was quick as thought brought to bear, and away sped the bullet, and over tumbled a large wild goose, making a great splashing as she fell into the water. On examination I found she had a nest of seven eggs, all fresh. The goose weighed fourteen pounds and a half. The same day I found another nest with several eggs, and took them to a farmer who was anxious to get them to hatch "at the halves." He placed the eggs under a hen; but a few days before they were ready to hatch, my ever-present enemy, the skunk, ate up the hen, eggs and all, to the great sorrow and indignation of the farmer. He said the young geese would have been worth five dollars a pair.

The weather still continued dry, and as we did not find game very plenty in the rivers, we concluded to wind up the trapping business, after having spent about six weeks in steady employment. We now collected our furs, and found we had caught seven hundred muskrats, sixty minks, a number of raccoons, and one otter; for which we found a ready market at good prices. Thus ended my first and most interesting trapping campaign.

Sir Walter Raleigh.

NEW GLASGOW, N. J., Dec. 17.—*Editor Forest and Stream:* In your issue of last week a correspondent wrote:

"Long years ago," as far back as the days of Sir Walter Raleigh, that noble gentleman (if I remember correctly) came with a colony and settled upon Roanoke Island. There they found a race of friendly Indians, with whom they lived on amicable terms. After a bit, however, Sir Walter sailed away again, leaving about a hundred settlers and the friendly Indians, and promising soon to return. But all things did not turn out as Sir Walter anticipated, and he was prevented from returning by some slight inconvenience in the way of having his head chopped off or some other little difference of opinion between himself and the good Queen Bess.

"Queen Bess" did not chop the head off Sir Walter Raleigh. The brutal deed was ordered by one of the Stuarts who succeeded her. Raleigh was long kept a prisoner, and during that time daily taught one of the King's sons, a very bright lad, who unfortunately died young, the science of navigation and war. The boy exclaimed to an associate one day: "No man but my father would keep such a man as Sir Walter in a cage." It was done, and Sir Walter executed at the behest of Spain; and I can assure you that British subjects everywhere rejoiced when your country kicked her off this continent forever. JAMES A. FRASER.

Codd's Curious Defenses.

AN interesting book might be written on the subject of "Curious Defenses."

One excellent instance is supplied here in what was known as "Codd's Puzzle." Codd was defending a client accused of stealing a duck. He set up seven defenses: (1) The accused bought the duck and paid for it; (2) he found it; (3) it was given to him; (4) it flew into his garden; (5) it was put in his pocket while he slept; (6) and (7) are not recorded; but an *amicus curiae* suggested that there never was any duck at all. The accused was acquitted, not "because they choose any particular defense, but because they did not know which to choose, and so gave the prisoner the benefit of the doubt."—Spectator.

Maryland Ducking Waters.

STOCKTON, Md., Dec. 17.—*Editor Forest and Stream:* The wildfowl shooting at this point has been somewhat disappointing this season. The shooting on the early birds in November was very fair, but the weather has been extremely mild, the birds keeping further north. Lately we have had an extreme change in the shape of a blizzard, and the inland waters are all frozen, making it difficult to get out; however, the large bay is open, and the shoals are covered with myriads of geese, brant, red-heads, broadbills, etc., and the outlook is very good. The redhead shooting is very fine here at times. We have enough geese to furnish shooting for half the United States, but the old fellows are very wary, and few are brought to bag. Mr. O. D. Foulks, who is the only one here who is taking gunners this year, has been booked up full all season, his people meeting with varying success. There has been very little weather suitable for battery work, but both his batteries are in constant demand. Among the prominent sportsmen visiting here this season are Messrs. Nelson, Cantrell, Woolman, Bailey, Laurent, Caie, Clarke, and Dr. Sherbourne Dougherty, of Philadelphia; Mr. Barker, of Milford, Delaware; Messrs. Anderson and Stout, of New York; Col. Ripley, Rutland, Vt.; Mr. Flaccus, Pittsburg, Pa.; Granville Leeds and Mr. Wells, Rancocas, N. J.; Mr. Buzby, Vincentown, N. J.; Mr. Jones, Morristown, N. J. Gentlemen sportsman all, and I think a fair example of the class of men from which the ranks of the sportsmen of America are recruited. We read much about pot-hunting and would-be sportsmen, but our experience here has been more fortunate, and I can safely say, after years of experience, that the average sportsman is a good citizen, an upright gentleman, and a representative American. Long may he live to enjoy the sport that is due him.

W. H. OCKER.

The Okapi.

SOME interesting notes have recently been published in the geographical journals of Europe on the explorations of Dr. David in the Congo forests and on the western slope of the Ruwenzori Mountains.

Dr. David appears to have been the first European to have had a good view of the okapi in life, and to have secured one with his own gun. Heretofore our only knowledge of this strange animal has been from specimens brought in by the natives; but Dr. David saw it in life, and we have thus a clear description of its physical characters and general appearance. It is not strange, then, that, according to Dr. David, the specimens of the okapi which have been mounted in Belgium and Great Britain have been incorrectly set up. The effort, if we may judge from the illustration, appears to have been to make them as horse-like as possible, since the stripes suggest the zebra, or else to model them so as to look like antelope.

According to Dr. David, the okapi, although it is a ruminant, resembles in its carriage and manner of walk a tapir, rather than an antelope. The stripes are much narrower than those of the zebra, and are almost all double, the black lying within the white. The back is reddish, the mane erect, and the ears very long. The animal stands as tall as a small horse, say four or five feet. Some specimens of both sexes bear horns, while others are entirely without them, and it is therefore suspected that there are two species.

Tanawadeh Outing Club.

THE ninth annual meeting of the Tanawadeh Outing Club was held at their club house at Pelham Bay Park, New York, December 18. The following officers were elected for the year 1905: President, J. Frank Case; Vice-President, F. James Reilly; Secretary, Harry V. Radford; Treasurer, Joseph B. Hanf. The club during the past two years covered by the able administration of the retiring president, Mr. F. James Reilly, has made the most rapid progress in its history; the most notable event being the erection of a substantial and commodious club house on the shore of the beautiful Pelham Bay. For nine years the members of this organization have encamped each summer in the Adirondacks or some other forested region, and in addition to the summer outings have engaged in numerous side trips exclusively for hunting and fishing. Besides the sports of the wilderness, the club also patronizes canoeing, yachting, snow-shoeing, trapshooting, rifle and pistol practice, and cross-country riding and walking.

SEA AND RIVER FISHING

Fish Chat.

BY EDWARD A. SAMUELS.

Gamy Salt Water Fish.

FOREST AND STREAM for December 10 has just come to hand, and I find it, like all its predecessors, replete with all the good things that sportsmen delight in. In the communications, which are more than ordinarily interesting to me, is that from C. H. Mallory; brief as it is—much too brief, I am sorry to say—it contains in a condensed form fruits of the Captain's experiences in salt-water fishing which would furnish a text for more than one elaborate article for the entertainment of his brother anglers. What a pity it is that Mr. Mallory's business responsibilities are so great that they prevent him from putting on paper stories of the thrilling encounters he

has had with his prime favorite the striped bass or rock-fish. There is hardly another angler living who has followed that fish as long and perseveringly as has the Captain, and no one could write more understandingly and from actual experience than he can; and the barracouta or barracuta! If Mr. Mallory would furnish to the readers of FOREST AND STREAM as entertaining an account of this splendid game fish as he gave me one afternoon last summer, I have no doubt there are many anglers who would "on with a new love," betake themselves to the tackle stores for a suitable outfit, pack their grips, and start for the regions where barracouta abound. And the kingfish also; the Captain can tell us more of that indomitable fighter than any other angler with whom I am acquainted, and I wish very much he would, with pen and ink, tell his fellow-sportsmen such stories as he can, for they would interest them one and all.

More Literature Desired.

Mr. Mallory's complaint that our salt-water game fish do not receive a fair proportion of attention from writers on fish and fishing is, perhaps, well founded. Strong, vigorous and gamy as they are, they have, in a measure, failed to arouse the inspiration which is felt in following the meanderings of the beautiful trout streams through woodlands and meadows, or in casting the fly on the pools of the picturesque mountain rivers in quest of the princely salmon. 'Tis true, 'tis pity, and pity 'tis 'tis true' our salt-water game fish have not received the degree of attention from writers they deserve, and I hope that, in these "piping times of peace," when rods, reels and flies are packed away for the winter, our brothers of the angle will fill to overflowing the columns of this paper, and that the Captain will lead them off

with something about the royal fighters he takes such keen delight in encountering.

Strength of Salt Water Game Fish.

The Captain is quite right in his statement concerning the stubborn gaminess and strength of many of the salt water species compared with those qualities in fresh-water fish, such as trout, black bass, etc.; for, taking them pound for pound, there is a vast difference between them, and the illustration he uses of the capture of an 8-pound trout with the fly in the Rangeleys, using tackle so light that it would be instantly destroyed by the mad rush of the bluefish, is an apt one; and he is right, also, in his statement that "This question of game in fish depends a good deal on tackle," as I have proved on many occasions. Of these an incident comes fresh to memory which will serve as a good example. I was fishing for trout in a small lake on Prince Edward Island; the fish were so abundant that at almost every cast I rose and hooked a pair. An interesting fact about that lake is that the trout in the upper end, which is surrounded mostly by a cedar swamp, are dark colored, with dirty gray abdomens, and the inside of their mouths is almost invariably black or very dark. I have always found those fish sluggish to a degree, coming to the fly in the most indolent manner conceivable, and offering no play whatever when they felt the barb of the hook, and coming to the landing-net with hardly a struggle. But at the other end of the lake the fish were bright and full of life, and when they came to the fly they sometimes, in their eagerness, jumped above the surface of the water. In fishing for those spotted beauties, which averaged nearly a pound in weight, I have always used the lightest tackle available, for I hold that the lighter the tackle the keener the sport the angler enjoys. Now as I rose and hooked those beautiful fish and played them with my supple rod, they were as gamy and as plucky fighters as any trout of similar size I ever landed. My rod was so light that for a short time they darted about almost as if the thin casting line was no restraint to them, and sometimes several minutes elapsed before they were encompassed by the landing-net. With this tackle they were in every sense game fish; but mark the difference. Within a very few rods from the point from which I was casting there were two lads of perhaps a dozen years of age who, armed with huge sapling poles, coarse lines and hooks, baited with a bunch of angleworms, were fishing for the trout which were giving me such great sport. At every cast of the bait they made the poles splash in the water, but that did not appear to frighten the fish, for they seized the bait as soon as it touched the surface. But when the lads lifted those heavy poles by an effort that taxed their whole strength, they did not dally with the trout to give them play, but jerked them high in the air and into the bushes behind them as ignominiously as if they were bull pout or suckers. If those trout had any gaminess, the lads jerked it out of them in the most summary manner possible. But even with the same tackle the degree of gaminess in trout varies with the condition of the water. It is possible that the 8-pound trout that Captain Mallory mentions may have been hooked in still, deep water, in which case it would not have put up as stubborn a fight as it would have in the quick water below the Upper Dam, for example. With light tackle in that water so large a fish would give the angler all he would want to attend to; his struggle would not be a brilliant one, measured by the electric energy of a grilse or bluefish, nor leap above the water like a black bass, but he would fight doggedly and with the strength of a trout of his size must possess, and the skill of the angler and fidelity of his tackle would be thoroughly tested before the fish would be saved. I never had the pleasure of killing an 8-pound trout in that pool, which is full of whirling eddies and tortuous currents; but I once hooked and landed a beauty there that weighed 7½ pounds, and when the fight was ended I felt as if I had conquered a game fish such as any angler might be proud to possess.

Yes, the lighter the tackle the more intense the enjoyment the angler feels. In former days an 8-ounce rod was considered a mere wand, but that weight was cut down to six ounces, and it has descended to four ounces and even lighter, and when large fish are hooked it requires no small degree of skill on the part of the angler who uses such delicate tackle to land his prize.

Degrees of Gaminess in Fish.

Now, while Mr. Mallory's statement is true that "game in fish depends a good deal upon the tackle," it may be somewhat qualified, for a great deal depends on the fish themselves. For example, the so-called "sea trout" which in May and early June hover about the estuaries of the rivers on the Canadian coast in pursuit of the myriads of smelts which ascend those streams for the purpose of spawning, in the bright, sparkling water of the bay they rise to the fly or bait with avidity, and when hooked they put up a fight such as only fish which has sojourned in salt water can wage. They are strong and vigorous, make runs of considerable length, and sometimes leap clear of the water; they are then game fish, and in every sense gamy.

Trout Lose their Gaminess.

But in a month or two after they have ascended the rivers and remained in the pools, the water of which has become low and heated, they come to the fly in the most perfunctory way, and no matter how large the pool may be, they make no long runs when hooked, and never rise to the surface until they are drawn to it by the tension of the rod, and when they are landed they almost have the appearance of being glad to "come in out of the wet," so insignificant is the struggle they make, and that on precisely the same tackle as that used with them in the salt water.

Characteristics of the Salmon Vary.

The salmon, fresh-run from the ocean, clad in his silvery armor, if hooked in one of the lower pools of the river, is the grandest fighter with such tackle as is ordinarily used in angling for this superb fish, that can be named. With few exceptions there is no comparison in that respect between it and other fish that is taken with rod and reel. The wild, fierce runs he makes are like those of no other species, and so great is the celerity of his movements, he seems to be in a dozen places in the

pool at once, and in the air almost as much as in the water. He puts up the best fight that can be made in the narrow confines of the pool in which he is obliged to struggle; give him the breadth and depth of water such as the striped bass inhabits, and how would the struggles of the two fish compare?

Yes, it is a glorious battle the salmon wages in that lower pool, but allow him to ascend the river and remain until midsummer in one of the upper pools and then rise, hook, and play him, and that with precisely the same tackle that would be employed with him at the beginning of the season, and what a change has come over him! The fiery dash, the wild rushes and wonderful leaping powers have left him, and he has become a slow-moving, indolent creature with apparently very little of the vigor left that he possessed when just in from the sea, and if you succeed in rising him, something of much more difficult performance than it was in the early season, and play him with the same tackle you would then have used, you will find he is far from being the gamy fish you expected to take. Of course, he is always a stubborn, dogged fighter, but the natural vivacity of his spirits seems to leave him after a long residence in fresh water, and, although reluctantly, he comes to the gaff in much less time than he would have done when clad in the silvery sheen of the salt water sojourner. So that the game qualities of fish do not always depend on the strength of the tackle.

Bluefish with Rod and Reel.

There are some fish, particularly those which live permanently in salt water, which are always gamy, no matter what the tackle may be. The bluefish, for example, is a hard fighter, and an exceedingly powerful one, too; more powerful, pound for pound, than are almost any other species that can be named. Those who have stood on the seashore whirling in the air above their heads the heavy leaded hook which was covered with an eel skin for bait, until sufficient momentum was obtained, and then cast the lure far out into the sea, and then hauling the strong line in rapidly, hand over hand, until it was seized by one of the most voracious fishes that swims, can certify whether or not it is a strong and plucky fighter. Sinewy arms and hard, tough hands are required to land a 15-pounder, and there is sometimes a doubt in the fisherman's mind whether the bluefish will come ashore or he will be pulled into the water. One can conceive of hardly any more primitive or rough tackle than that which is thus used in this method of fishing. With the same tackle trolled behind a sailboat in a fair breeze, one also finds great and exhilarating sport, an eight or ten-pound fish being about as much as the ordinary man, unless his hands are covered with woolen mittens or gloves, cares to haul in. Both these methods of fishing are in no sense scientific, but the fish are as gamy as they would be if the most elaborate outfit were employed. But with rod and reel, as Captain Mallory truly states, the bluefish is one of the most gamy of the finny tribe.

My first experience in this method of angling occurred in the early sixties, when I was invited by Mr. Charles Lovett, who was for a great many years chief clerk in the office of the Secretary of State, Massachusetts, to join him in an outing, with bait-rod, line and reel, among the bluefish at Marion, Mass. I had taken many a good fish long before that time by trolling, and was anxious to enjoy the new sensation which my friend described in glowing terms, and very gladly accepted his invitation. We left Boston for Marion on the afternoon of the next day, and spent the night at the residence of a friend of Mr. Lovett, who had entertained the genial old gentleman on other similar occasions. After breakfast on the following morning our boatman appeared carrying in his hand a minnow pail well filled with large "mum-mychugs," some of them being over four inches in length, and soon we were aboard our boat and speeding with a fair wind to a submerged bar about two miles from the shore, from the edge of which the water deepened rapidly, and when a flood tide was running there was a current of considerable speed swirling by the edge of the shoal. When the anchor was dropped and the sail furled, our hooks, which were strong ones, similar to those now used in fishing for tautog, were baited, each with a good sized minnow, and we "threw in" and awaited the coming of the bluefish.

Our rods were strong lancewood affairs; our lines, which were of heavy linen, braided, were about one hundred yards in length, and our leaders, to which the hooks were affixed, were made of piano wire, the powerful jaws and sharp-cutting teeth of the bluefish rendering the use of any other gaging entirely futile.

A Grand Old Angler.

Mr. Lovett, who was a man of large physique, his weight being about three hundred pounds, occupied the middle seat of our boat. I took a position in the stern, and the boatman, who had his hand-line along with the expectation of pulling up a porgie, or "scup," as it is called in those waters, took his place in the bow.

What a glorious morning that was in early July! There was just breeze enough to make a light ripple on the water, such as all anglers delight to see, and the pure ozone of the sea air, the blue sky and interesting fish stories that my friend regaled me with—he was distinguished as a brilliant conversationalist and raconteur—all combined to make that occasion a most enjoyable one.

Early in the season the bluefish is a bottom feeder seeking its prey low down in the water, but in July it changes its habits and becomes a surface feeder, preying upon menhaden, herring, mackerel, in fact, upon most species inferior to it in size which range near the surface of the water. With this fact in mind, we attached a float to our lines so that the bait might be kept up near the surface, and enough length of line was drawn from our reels to permit the bait and float to be carried by the tide several rods from the boat. The minnows were hooked through the back just below the dorsal fin, which method of impaling is not fatal, but permits them to swim about almost as freely as if they were unencumbered. Ever and anon our rods were lifted, and the line recovered or drawn in, in order that the bait might be kept in motion, for your predatory bluefish always comes quickest to, or darts in pursuit of, the moving lure.

An hour elapsed before either Mr. Lovett or myself got

"a strike," but our colored boatman, who was a well-known character to anglers in those waters, had in his tub near the bow a dozen or more floundering, jumping, flapping scup, which he had inveigled out of the depths with his hand-line and bait of clams.

Slicks.

"Ah, they're coming now!" exclaimed my friend, pointing to several patches of oily scum floating on the water a few rods from the boat. "There's half a dozen 'slicks,' at least, that shows the bluefish are feeding close at hand."

"Slicks," I would say here *en passant*, are composed of an oily fluid which the bluefish occasionally emits when it is gorging its prey.

"Keep your bait well in motion," he added, moving his rod vigorously, "and my word for it you will feel a—"

He did not finish the sentence, for at that moment his reel gave a loud, discordant scream, and at the same time I felt a tug at my own line which was almost strong enough to pull the tip of my rod beneath the surface of the water.

The predatory marine fishes, be they bluefish, striped bass, or the squeteague, have a rushing method of seizing the bait quite different from that of the trout, black bass, and others that live in fresh water. They seize the bait, particularly the bluefish, in a most savage manner, and when old Temnodon takes hold, you receive notice at once that he "means business."

Mr. Lovett's fish was darting about in close proximity to mine, and I began to fear that the two would come together and foul our lines; but, fortunately for me, my fish took a quick and savage run away from the boat on the port side, and I forced every ounce of strain I dared to put on my rod to keep him there.

The runs of the bluefish, which are sometimes quite lengthy, thirty or more yards of line being taken from the reel in a single run, are made as rapidly as are those of the grilse, but the fish is stronger, even, than is a salmon of its own weight. In fact, there are few salt-water game fishes that possess his strength and stubbornness. The striped bass is as quick as he and will take out as long a line in one of his mad runs, but his form is not as robust, and his spread of fins is not as broad as is those of the bluefish, and he, therefore, cannot wage as fierce a battle as can the other.

The tautog has a more robust form than either, but his fight against the rod lacks all the brilliancy of the others'; strong and stubborn he is, and full of crafty expedients to free himself from the hook. He is a powerful but not a lively fighter.

Mr. Lovett's fish was evidently a large one, for it seemed as if it would shake his rod to tatters, so wildly did it dart about.

"Hi, but he's a good one!" exclaimed the old gentleman, rising to his feet and bracing his back against the mast. "He's a good one, and I'm in luck if he does not carry away my line!"

I glanced at his reel and saw that the spool was becoming alarmingly small, and knew that unless the fish changed its course the whole line would soon be exhausted. I was busily engaged with my own fish, which, although it had been hooked nearly ten minutes, showed no signs of yielding, but kept up its wild runs in every direction. But now and then I had an opportunity to glance at my friend, and I was glad to see that he was rapidly making his big multiplying reel perform its allotted work, the bluefish had turned and was coming toward the boat, and the line was saved.

My rod was a heavy one, and I dare say that I put the most severe strain on it that it would stand, much more, probably, than I would nowadays; but at that time I had learned to play my fish only with the rod, instead of on the reel, as I have done in later years. But notwithstanding my most strenuous efforts it was fully a quarter of an hour before the huge dip-net which our boatman had brought along encompassed the glistening prize, and as he was lifted into the boat and killed, I confess I was not sorry the struggle was ended, for the strain on my wrists had been a continuous one without any let up, and it was as severe as it was prolonged.

A few minutes later my friend's fish was lifted into the boat, when the portly old gentleman, uttering a sigh of relief, resumed his seat, and wiping the perspiration from his forehead, exclaimed: "That's a grand fish, and he gave me all I wanted to attend to." Our prizes were weighed, and we found that the fish Mr. Lovett had taken weighed seven and a half pounds, and mine was a pound lighter than his.

"Mr. Samuels," he exclaimed, reaching to the luncheon hamper that was just behind him, "that's the kind of fishing I like! But you remember what the Governor of North Carolina said to the Governor of South Carolina?"

"I do," I replied, and we participated.

A High Average.

Our score that day was eleven bluefish, of which one of us took four and the other seven. The combined weight of our catch, exclusive of the "scup" the boatman had hauled up, was fifty-two pounds.

One may find such sport nowadays with rod and reel among the bluefish, which are always gamy in the highest degree, no matter what tackle you use with them; but I doubt very much if you will take eleven fish that will score as high an average as did those which fell to us on that beautiful summer day.

Old Arms.

Boston, Mass., Dec. 14.—*Editor Forest and Stream:* In the illustrated article, page 274, issue October 1, I would suggest a correction or two.

No. 13 is not the first breechloader used by the United States Army. It never was made at Harper's Ferry Arsenal. In fact, no arms ever were manufactured in the arsenal. The arms made by the Government were fabricated in the armory. This gun, the "Hall," was not manufactured by the United States Government, but for them on an island up the river. The date of the patent is not 1838, but May 26, 1811. The caliber was never .55; was .535.

We all make mistakes in describing arms, but there are too many in this particular case to pass unnoticed.

EDWARD N. BATES.

Obadiah the Fisherman.

OLD man Mooney lived near the school house; his house was the last in the settlement before the road ran into the woods. A tall lank man he could walk faster than any man with whom I have ever tramped. His fame as a bear hunter had traveled far through the country of the East Branch. In fact there is but little doubt that this reputation brought to him the office of Justice of the Peace. He did not hesitate to admit that he knew more about bears than he did about the ways of courts; but he was honest, and that means a good deal in a judge.

Obadiah Mooney, as can be readily guessed, was old man Mooney's son; and if he was not old enough to follow in his father's long strides after bears, he, too, had a bloated reputation. Looking back at this repute from the fair vantage of some years, I can now see that the father's laudation was an important factor in the son's fame. Be this as it may, Obadiah was known all over the valley as a remarkable trout fisher.

We first heard of this youthful prodigy at the time the good Dominie joined us for two weeks of angling. On that trip we boarded with the Miller family, who lived not far from Obadiah's home.

Three constituted our party, and leaving myself out of account—it is proper for an angler to be modest—my friends were certainly very good fishermen. But somehow our luck was poor. The water was low, and this in a measure was the reason for our lack of success; but taking this into account, we could hardly claim to be doing even decent work. Day after day we cast our flies with praiseworthy industry, but the results were meagre and far from satisfactory.

It was certainly hard enough to have such luck, but to come home with but a few smallish fish and hear tales of monsters caught by another, and that other a little, thin-legged boy, was really too much to be patiently borne. Our host would placidly remark after supper, on the porch, where we fishers were resting in a row of disgruntled failure: "Mooney says Obadiah got a big one in the mill-pond to-day;" or, "Obadiah caught a pailful of big trout last night, so Mooney tells me;" or, perhaps, "That big fish Obadiah got on chub bait, his pa says, was thirteen inches long." Was Obadiah a virtuoso with the rod, or were these tales somewhat legendary?

At last my friend confided to me, in the narrow bed we jointly occupied at the top of the Miller farmhouse, "This Obadiah business is getting stale and unprofitable, and I for one am heartily sick of him and his trout."

"What are you going to do about it?" asked I, from under the offside of "Marm" Miller's lumpy comfortable.

"Just this much—I am going to blast that overgrown fame; I am going to shoot an arrow into that bubble of a reputation. We will offer Obadiah, or Obie, as his pa calls him, fair compensation to take us fishing. We will let him choose the day, and I will be near him and see once and for all if he is the wonderful fisherman we have been told or if his pa—" "Don't say it," interrupted I. "All fathers are inclined to exalt the virtues and the abilities of their sons, and I doubt not that when the day comes, we, including the Dominie, will go way back and sit down among the willows."

"I don't believe it," said my bed-fellow. "Rather Obadiah himself will hang his fish-pole on a tree, and hang his head in disgrace below the willows."

The following morning proved to be bright and clear; and strange enough, before breakfast, Obadiah was seen with a boy companion before the house. Fate had sent him fairly into our hands. My friend conducted the negotiations.

"Good morning, Obadiah," said he. "What brings you so early in this direction?"

"Wal, Mister Palmer, you see that pesky old heifer is strollin'; pa allows she ain't below."

"I hear you are catching some big trout, Obie, and that must mean you are an almighty good little fisherman."

"Wal, you see, Mister Palmer, we here fellers livin' along the creek knows where they be."

"Yes, I see, and my friends have been wondering if you would take us fishing; we have not had very good luck this trip; of course we will be glad to pay you for your trouble."

I had been watching the bright-faced little fellow, and did not fail to note the keen look that passed over his face.

"Wal, Mr. Palmer, it's like this: some days trout bite, and some days they don't; to-day is awful poor."

"You shall choose your own day, Obie, and we shall be here until the end of the week."

Again I saw that conscious look on his face: He seemed embarrassed, and turned his bare toes over one another as he directed his eyes to the ground.

"Wal, p'haps I might, and p'haps I mightn't; pa's kinder busy just now." He looked down for a moment and then continued. "It's kinder hard to get chub bait."

"I will ask your father, Obie, and we will provide worms and chub, too, if you wish them."

After Obadiah had made his somewhat troubled departure, I asked my friend if he thought the boy would go with us.

"Not if he can get out of it," he answered. "He is in no hurry to blight his shining reputation."

Old man Mooney, like most of us, needed money, and when it was told him that we would pay what in that country was a liberal price for his boy's services, we saw that he was willing to barter Obadiah's fame for ready cash.

Toward the end of the week a day came with every sign of a good fishing day. Fleecy clouds hanging low over Moon Hill; soft southern breezes snowing the stream with the pollen of the willows, and lifting mists in the valley, all gave token that if you could catch trout you should be at the river side.

My friend ate his breakfast hastily and left us, saying that he was "going below to capture Obie, and would meet us at the bridge."

I was almost willing to wager odds that Obie would evade him, but when Dominie and I arrived at the bridge, Palmer and Obadiah were already there.

From personal observation, I cannot tell much of Obadiah's methods; I let my friend attend the young fisherman, and left them to use my best skill, that Obadiah should have at least one rival.

Fishing up stream, and using small flies, I was fortunate enough to have a fairly successful morning.

An old pine tree down the stream had been fixed as our place of meeting at noontime. As I approached this place I heard excited voices, and the thought passed through my mind, "Obadiah has hold of a big one." But when I came out on the bank of the stream, my friend was guiding a fine fish into the landing-net held by Obie. When the big trout had been landed, and Obadiah did not show over much skill, I asked my friend the result of the morning's experiment.

"Do not say anything to Obie," said he, "he is feeling a little uncomfortable. No, he has not done much, and I fear that his reputation is much blasted."

When I had an opportunity to look into the boy's creel, I saw a few little fingerlings; fish such as we always returned to the water.

The Dominie had gone alone down the stream that morning, not being very much interested in the efforts of the prodigy. When he approached, he showed some fine trout. In fact, when we compared notes, all of us, with the exception of Obadiah, had done very well indeed.

Obadiah ate luncheon with us, but it was with an injured bearing. He partook of some of the best fish, baked under the coals, after the recipe of Thaddeus Norris, but he showed somehow that they were not appreciated. Nor did he seem particularly interested in hearing about the big fellow the Dominie caught on a ginger hackle, nor of my 10-incher that swam under a log. He was a subdued, disgusted, almost morose, little boy.

After his luncheon, he said: "Pa's goin' to mend the chicken yard—maybe he needs me." We paid his fee for showing us how to fish.

As his bare legs disappeared around the bend of the road, my friend remarked: "There goes the youthful wonder; and I tell you now that although old man Mooney is Justice of the Peace; although, doubtless, he is a great bear hunter; although, likely enough, as you say, he can walk faster than a horse can trot; yet with all these honors and excellences he is a colossal old—" "Don't say it," interposed the Dominie. "Surely it is victory enough to know that with only flies we can catch more and much larger trout than the country boy, who has his torn hat, bare feet, freckled face, sapling pole, cotton line, pin hook, and angleworm. Just think of it, man!" continued he, "this morning we have exploded a theory which has been accepted from the time when the first country editor—was he Cicero?—wanted more copy, and threw the now rank old tale into his gaping column. Why, I tell you," shouted he with enthusiasm, "you little know what service we have rendered to fly-fishermen yet in their cradles. As for Obadiah," and here he stopped for a moment to change his dropper fly for a blue dun, "we shall hear on our future visits little enough about his exploits with the rod."

The words of the Dominie proved prophetic. It is many years since the youthful Hector of the East Branch was of necessity made to bow down to the bamboo rod, silken line, and mimic fly. When I last visited that spot, a young country belle informed my wife that old man Mooney said "Obie was the best b'ar hunter on the creek—unless it be I." Later I bought a wildcat skin said to have been shot by Obadiah's rifle. On my fishing trips to that country I hear no more stories of Obie's wonderful skill with the sapling-pole.

But I do hear, occasionally, tales of other little boys and their exploits with the cotton string and angleworm. It is hard to down a pleasing fiction, and the skillful in any art have always their detractors. So I suppose the alleged superiority of the bare-foot country boy and the pin hook will continue to interest the ignorant and delight the critical. But I have done my little to show the matter in its true colors. If I have felt obliged to make public that which Obadiah would have preferred to remain secret, I hope he will excuse me. At all events his reputation is now that of a "b'ar hunter," and he no longer seems to care for fishing.

GARDNER LADD PLUMLEY.

Landlocked Smolts and Restigouche Salmon.

Editor Forest and Stream:

In your issue of December 10, your contributor, E. T. D. Chambers, has an *olla podrida* of landlocked smolts, Restigouche salmon and fishculture in Canada, made up of extracts from the Reports of Prof. Prince and the managers of several hatching houses. When Mr. Chambers discourses of matters he understands, there is no more interesting or instructive contributor to your magazine; but when he deals with matters of mere hearsay and incredible fish stories, adopts them as truths, and proceeds to theorize on them, he not only loses his own way, but leads his readers as far astray as he generally gets himself.

The present writer has been familiar with all the lakes around Sussex for over fifty years; for the last fifteen years he has resided within a few miles of them. There is not one that contains trout he has not fished many times. The group of lakes into one of which the salmon fry were dumped by Mr. Sheasgreen, is the source of Big Salmon River, debouching into the Bay of Fundy at St. Martin's. This was, in the writer's youth, the best salmon river east of St. John, and it is yet the resort of a considerable number which spawn in the upper reaches of its waters. Ever since the writer first fished these lakes in 1852, he has caught parr in the streams connecting them, just as they are still caught every season in Trout Brook and Smith's Creek, considerable streams flowing into the Kennebecais, formerly the best salmon river in King's county.

In all his long experience as an angler, the writer never caught a salmon parr or smolt confined in a lake teeming with trout running from half a pound to two pounds in weight, and it is most surprising news to him that in Pleasant Lake, where 25,000 salmon fry are said to have been confined by "an arrangement made to prevent the fish from escaping," the water is so "alive with them" that "one rod caught fifty in a day." For the last five years the writer has been seeking to get a specimen of these young salmon "ten inches in length," but he has not yet succeeded, though he is on intimate terms with

several of the club controlling the waters. Until he sees a smolt taken from this lake, he is forced to believe that Mr. Chambers swallowed a fish story that confutes itself.

Respecting the steady decrease in the stock of Restigouche salmon, which the hatchery men and guardians stoutly deny, and which Mr. Chambers disposes of by saying "that there is no present reason to fear for the future welfare of the salmon fisheries of the Restigouche," the writer would refer to official Reports of the Fisheries Department at Ottawa. That for 1874, the year the hatchery was started, gives the catch in the Restigouche district below and above Dalhousie—that is, on the coast and in the river—as 678,500 pounds; the report for 1903 gives the catch in the same district as 304,000 pounds, considerably less than half. In the interim, 39,486,000 young salmon had been planted in the waters of the district.

Were the decrease confined to the Restigouche alone we might still hope; but the Miramichi, the greatest salmon river in New Brunswick, shows a still more serious falling off in the catch. In 1874, the year the hatchery was started, the catch of salmon in Northumberland county was 1,311,798 pounds; in 1902 it was 373,000 pounds. In the interim 30,390,000 young salmon had been planted in the rivers of the county. In St. John and the counties through which the river runs, the catch in 1874 was 539,200 pounds; in 1902 it was 336,025 pounds. In the interim 59,410,200 young salmon had been planted from the hatchery.

The catch in the whole Province in 1874 was 3,214,182 pounds; in 1902 it was 1,456,175 pounds. In the interim 129,286,200 young salmon had been planted from the three Provincial hatcheries. I will spare Mr. Chambers any comments on these facts and figures; he and your readers will be able to draw their own conclusions.

THE OLD ANGLER.

Fiddlers for Bait.

SPEAKING of fiddler crabs as bait for blackfish or tautog, a well-informed correspondent writes: "There are chinabacks in multitudes. I believe it would be no trouble to catch a bushel in half an hour by making two boards into a V-shaped plow like those used to break rows in the country, put a bag over the small end, and drive them in. They go in armies down there. I have my man catch a lot in early summer and keep them in the boat house, and they breed like rabbits; and such fishing! Why, Japan and Russia are not in it for slaughter, and still the tribe increases. They can clean raw meat from bones better than dogs, and polish them as with an emery cloth. Sure they are the bait for blackfish. The cunner is a nuisance, but must be of some use or there would not be so many of them. Fairly good eating, and have seen them weighing over two pounds each caught on the fishing banks outside Sandy Hook. One thing is sure, they tend to develop patience, for they can steal bait to beat the band, though while developing patience they provoke strenuous expletives."

The same writer says:

"You should take a trip in the early spring on the Harlem branch of the N. Y. N. H. & H. R. R. in the evening. A train comes down just after dark, and one car is about filled with fishermen, who have been after fluke or flat fish, and as everything is fish that bites, they have a great assortment in bags, baskets, nets, etc., and as all are smoking, after a liberal allowance of beer, you can judge something is doing. All try, and do, talk at once. Fish, eels, etc., get out of the overturned baskets or through the nets and slide along the floor; and, take it all in all, it is a great experience. Sunday night is usually the star performance, and it is well worth seeing. This train has been noticed by the daily papers, but I have never seen an article that did it full justice, and it must be seen to be appreciated."

A Wonderful Woman.

THE appearance of a woman competitor in a plowing match in Derbyshire reminds the Sheffield Telegraph of one Phoebe Bown, who died just half a century ago, aged eighty. This extraordinary woman, who lived with her mother in a cottage nearly opposite the High Tor, at Matlock Bath, could walk nearly forty miles a day when young, could lift a hundredweight in each hand, and carry fourteen score. She undertook any kind of manual labor, as holding the plow, driving the team, threshing wheat with the flail, and thatching the stacks. Her chief avocation was breaking horses at a guinea a week. She always rode without saddles, and was considered the best judge of horses and cows in the Peak.

But Phoebe had also a liking for sport and for art. She was a good shot, and carried her gun on her shoulder. She was fond of Milton, Pope, and Shakespeare, and performed on several instruments, including the flute, violin, and harpsichord, and played the bass viol in Matlock Church. She was a carpenter, mason, and smith, and mainly by her own hand labor built another room to the cottage for the reception of a harpsichord which a lady presented to her. At her own request a local clergyman wrote her epitaph, and here it is:

Here lies romantic Phoebe,
Half Ganymede, half Hebe;
A maid of mutable condition,
A jockey, cowherd and musician.

Luminous Eyes.

THE luminous eyes of animals are susceptible of a very simple explanation. The whole secret is reflection. People who have lived years among domestic animals and have never seen their eyes shining may well believe it is only the eyes of panther, bear, or lion that ever shine; but, as a matter of fact, the eyes of a sheep or cow will blaze with just as much intensity as that of the most ferocious of wild beasts. One experiment will prove the statement. When in the presence of domestic animals at night with a lantern, let the experimenter raise it to his shoulder, turning his head to one side to allow the rays of light to pass as near in line with his own eyes as possible, and the eyes of every animal within sight of the lantern will blaze, some of them with the intensity of white-hot coals of fire. The eyes of deer, sheep, dogs, cats, and cattle are of a bluish-white, while those of moose, rabbits, and horses have a reddish glow.—Land and Water.

YACHTING

History of Yachting, 1600 to 1815.*

THIS is easily one of the important books of the year; by which we mean that it will in all probability survive and become widely known as a standard work upon the subject to which it relates, partly on account of the admirable manner in which the publishers have produced the volume, and chiefly by reason of the conscientious research and literary ability of the author, who appears to possess in a marked degree the qualities of a historian—conciseness, impartiality, and freedom from egotism. The book deals with an era of yachting history of which, hitherto, very little has been known or written, and it will doubtless surprise most people to learn that yachts were introduced and built in America by the Dutch some fifty years before they were known in Great Britain; also that the first British yacht to cross the Atlantic was the *Industry*, owned by the eminent Quaker, George Fox, who made this cruise during the reign of King Charles II. There are many other new and equally interesting facts related; beginning with the origin of yachts in Holland and following their history for more than two hundred years, until the yacht club, now the Royal Yacht Squadron, was founded in 1815.

There is very little left to the imagination in this book; dates, dimensions of yachts, their builders' and owners' names are all clearly recorded, also interesting particulars of celebrated vessels of war and commerce. Captain Clark has made clear several matters about which there has been much doubt and question; among others, the definition of the word "yacht" at various periods since the term came into use, also the exact period when science was first applied to shipbuilding; likewise the origin and development of various rigs—all handled by the firm hand of an expert.

The author remarks in the opening chapter: "I wish to trace as clearly and completely as possible the early history of yachting, illustrated by the portraits of famous yachts executed by artists no less famous when these

his hands until it was delivered in completed form, Mr. Sparkman took every care that the book should be a per-

fect piece of the printing art of the day. As a member of the New York Yacht Club, and one who has long been prominently identified with yachting affairs, he took

NEW YORK, Dec. 22.—*Editor Forest and Stream:* Captain Clark, in the preface to his book, remarks on the singularity of the fact, that with so much that has been written on yachting, nothing previous to his effort has appeared which made any attempt to give its history. A very moderate acquaintance with the matter and a little reflection are sufficient to dissipate any apparent strangeness in this lack, and to embrace the value of Captain Clark's undertaking. In this age of systematic design, of professional and amateur designers, of technical literature, popular magazines, organized yacht clubs, blue prints and snap-shot cameras, everything worth preserving is recorded and perpetuated in print; but when none of these existed, or existed only in very small degree, and when the painter or other artist was the means relied upon for delineation and illustration, it is not at all remarkable that little has been commemorated.

That under these conditions Captain Clark has furnished his book with forty-nine pages of illustration and so much of fact, detail, incident and measurements is abundant evidence that the work has not been done in a hurry. On the contrary, it is clear that the work is the result of enthusiasm working with concentrated effort through many years, and seeking its material from many and widely scattered sources. While Captain Clark knows full well and acknowledges that boats of various kinds usually, in part at least, propelled by oars have been used in different parts of the world, from very early periods for State, official, or for purposes of purely personal convenience and pleasure, he apparently, with good warrant, claims a Dutch origin for the favor given to yachting in England, and for the introduction of the chief features of the sloop and cutter rigs there and in this country.

Readers will find in this book the known facts in regard to some questions in yachting history, often recurring, but not so far as I know ever be-

THE SOVEREIGN OF THE SEAS.

vessels were in the zenith of their renown. At various periods I shall notice briefly some of the celebrated vessels of war and commerce, in order to trace more clearly the evolution of the yacht, for she has developed side by side with her more industrious sisters, and at times, especially during the early days of her existence, has shared in the laborious undertakings of both."

This may be taken as the scope of this interesting work, and one is impressed throughout, in reading it, by the enormous amount of labor and research which has been bestowed upon the subject. There are many fine passages in which the author displays his excellent command of language, and nowhere in the book do we find any indication that he permits language to take possession of him; there is also a very refreshing absence of the personal pronoun—worthy of imitation. The book is superbly illustrated throughout in photogravure reproductions of rare and valuable engravings and original portraits of yachts; also of men-of-war and merchant ships; most, in fact we may say very nearly all, of which have never before been published. We have much pleasure in reproducing a number of the illustrations, by permission of the author.

As most yachtsmen are aware, Captain Clark followed the sea for many years, beginning on board the *China* and *California* clippers, and retiring while in command of an *Atlantic Mail Steamship*. This is a rather remarkable instance of a sailor whose love for the sea has converted him into a yachtsman. The introduction is appropriately dated on board of his yacht, the famous *Minerva*. The book is published under the auspices of the New York Y. C., and reflects much credit, not only upon the author, but upon all who have been concerned in its production. Our only regret, in which we think most yachtsmen will share, is that the author has not extended this history to a later date, and we hope that he may be induced to publish a second volume.

It remains only to say that the volume is an example of beautiful book making, and for this the credit is due to the loving care bestowed upon the work by Mr. James D. Sparkman, of Messrs. G. P. Putnam's Sons. From the time the manuscript reached

fore discussed in the same volume. Of this class are the origin of the centerboard, the introduction of common use of leeboards on vessels sailing the Hudson River in the early part of last century. Accounts are given of the early contests between yachts antedating the institution of yacht clubs, and of the earliest formation of these, and the subsequent early races.

The book contains much that has no very close relation to yachting, but rather to those interested in it, to marine development, and in a sketchy way to spicy scraps of history, but these chiefly serve to lend

28-FOOT OPEN LAUNCH DESIGNED BY BURGESS & PACKARD FOR HENRY L. HERBERT.

interest to the volume and are charged with incident interspersed occasionally with amusing anecdote. We find (page 142) that Captain Slocum's lone voyage in the *Spray* was anticipated in 1786 by Captain Shackford in a 15-ton vessel.

The book is printed on good paper, in large type (pica) with wide margins, is well illustrated and has a handsome and durable binding.

It is the only work of the kind that I know of, and supplies easy and entertaining reading. I may be allowed perhaps to express the opinion that any yachtsman's library is incomplete without it.

JOHN HYSLOP.

A Twenty-Eight Foot Open Launch.

WE reproduce herewith the plans of a 28ft. open launch that was designed by Messrs. Burgess & Packard for Mr. Henry L. Herbert. The boat has been used on Lake Winnepesaukee for two seasons, and has proven a very desirable all-around craft. Sudden squalls occur frequently which kick up a lumpy sea, and a boat designed for use on this lake must be a weatherly craft. With a 5-horsepower engine the boat develops over eight miles an hour. The engine is well forward, and can be protected from the weather with a canvas cover.

Amidships there is a space left the full width of the boat for arm chairs. For fishing, it enables one to stand against the side of the boat. There are the usual transom seats aft. A tiller is fitted as an emergency or for use when steering aft in rough weather, with a canvas hood over the forward end of the cockpit. There is also a steering wheel just aft of the engine. The ice-box was built under the after transom, and an awning was fitted the whole length of the cockpit, which could be easily taken down in rough weather or on cold days.

Powerboat Clubs.

BY A. E. POTTER.

THE season of 1905 will undoubtedly see the formation, here and abroad, of clubs devoted exclusively to the especial requirements of motorboats and their owners, whose needs and wants are not at present quite met at the various boat and yacht clubs.

Conversation with owners of cruising and pleasure launches elicits the undisputed fact that what they want is a place to store their boats and fittings during the winter, and good sheltered moorings during the open season; a well appointed stock of gasoline batteries lubricating oil standard accessories, etc., at a reasonable price is a necessity. Cheap railway facilities for slight repairs, a small repair shop, a capable man in charge with a force of assistants who are able

to make installations economically, intelligently and safely, would go a long way toward making the enterprise a success. Repairs ought to be made expeditiously of course, and by people who know how, and the saving to the owner in this matter alone, to say nothing of the removal of danger of injury to the engine by some one who is unfamiliar with gasoline engines, would inspire confidence in the boat owner, and be a large and important factor in the development of the project.

There is nothing that the average motorboat owner desires any more than information and instruction. For speed he is not so particular. For pleasure and recreation his vote will ever be cast. He would much rather witness competitive tests for brake horsepower made in a building especially prepared for it, and note the resulting horsepower at different speeds. A thorough competitive test of the quantity of fuel necessary to produce one horsepower in different engines under different conditions would awaken in him a desire for further information. He may have some questions or ideas that he would like answered or worked out, and here would be an excellent opportunity. The matter of lubrication could be thoroughly sifted out and he could see with his own eyes the results obtained from different lubricants, learn their structure, use and abuse.

Various carbureting devices could be exhibited and tested practically and intelligently. Safety devices and changes looking to a safer use of gasoline could be discussed and threshed out. Construction of the boat itself would come in for comment and criticism.

Propeller wheel problems could be worked out. Various wheels could be easily and cheaply tested, and for this purpose would be furnished in all probability by the manufacturer for the purpose. Wheels taken from boats that did not develop the expected speed or power could be tested, measured and changed to better suit requirements.

Engines could be tested to prove whether or not the manufacturers were selling them on honest rating or on misrepresentation. These tests could be made with the engines in the boat, or they could be easily removed for the purpose.

Batteries could be tested out and the amount of their electrical energy be accurately determined.

The result of all this would be that the member of the club would get much more valuable information than he could in any other way, except at the expending of an immense amount of time and money proportionately. He might otherwise not go at the matter in a way to get the best results. He would be able to tell whether his troubles were the result of his own faults or the manufacturer's shortcomings.

Such a club would tend to uplift the motorboat itself, stimulate designers and manufacturers to improve their product, and help the motorboat owner in selecting his power, to get the equipment best suited to his requirements, his pocketbook, and a successful and satisfactory season. There would be the elimination of the trade element and contingent. This would not be an immense exhibition, having for its object the sale of articles from descriptive matter emblazoned with misstatements and incongruities, but a kindergarten and advanced school of instruction for the motorboat owners, which the average manufacturer would do well to carefully follow, if he would perfect his product and cater to the wishes of this, so far as I have learned, first outline of a practical motorboat club.

The cost of such an outfit would not be high, and the dues would not need to be any more than membership in small yacht and boat clubs. In proportion to the length and size of the boats a regular charge could be made for use of railways, storage, etc., and in that way the owner of a small boat would not have to pay so much as his neighbor with a 60-footer. The information and instruction would be equally free for all, and

after the first season there would be no trouble to swell the membership to goodly proportions. Here is a proposition for thinking motorboat enthusiasts, not alone in the vicinity of New York, but where a sufficient number of followers and devotees of the sport could be gathered together. The larger the club, the more prolific in results.

Queries on Marine Motors.

J. H. J., New York.—In an English publication of recent date I note the following results from a test of a 30ft. Cockerill built launch. Can you tell me how the deduction of 11.5 per cent. "slip" is made? Mean speed, 31.77 kw.; mean engine speed, 906 r. p. m.; pitch of propeller, 660 mm.; diameter of propeller, 550 mm.

Ans.—By slip is meant the difference between the actual speed of the boat and the total cutting ahead of the propeller. This is found by multiplying the pitch by the number of revolutions per minute and that product by 60. The result is 35.8776 kw. per hour; the difference between this and the actual speed is 4.1076 kw., which is 11.45 per cent. of the total cutting ahead, or the percentage of slip.

H. O. R., Osterville, Mass.—My two-cycle engine connecting rod shows great wear at both the crank and wrist pin ends. Have had two new ones the past year. The upper end does not seem loose until I disconnect the crank pin end. Can you tell me anything to help me?

It looks as though the axis of your crank-shaft was not exactly at right angles to that of your cylinder, or that the connecting rod did not "line" exactly. In other words, a perpendicular projected from the center of the wrist-pin would not coincide with one projected toward it from the center of the crank-pin. The crank-shaft may not extend far enough, or too far, into the crank case. If your wear on both ends of the connecting rod shows to be more on the ends than in the middle, or worn "bell-mouthed," you may be reasonably sure that you have located the trouble. Several similar cases have come under the writer's observation. The remedy would be to have someone familiar with the lining up of steam engines examine the engine carefully for this defect, and make the crank and wrist-pin line up as they should.

A. B. H., New Rochelle, N. Y.—Which reversing gears are most in use, and which give the best results, planetary or bevel gearing?

Ans.—Where the bevel gearing is locked together into the caging so that the thrust from the bevels is taken from the crank-shaft and the drive going ahead is not on the teeth of the gears, they usually give good results when properly built and proportioned. Spur gears in planetary form are largely an adaptation from automobile practice. With a thrust bearing abaft the reverse gear, they have one great advantage in common with internal geared reverses, they do not thrust upon the crank-shaft. Internal gearing reduces the number of revolutions of the propeller shaft. This construction costs more than all spur gears.

W. F. G., Palm Beach, Fla.—How can I prevent my two-cycle engine from "flooding"? 2. What is the best cylinder oil to use? 3. Could I use 86° gasoline and get better results than with store gasoline? 4. What is the difference between 74° and 76° naphtha?

Ans.—If you would prevent your engine from "flooding," don't use too much gasoline. Your vaporizer must be kept tight, must be reground very often, and must be renewed after a few weeks' use. A check valve has a tendency to pound the seat down out of round, the wear occurring on the two sides in line with the discharge into the crank case. For this reason it would seem best to have the gasoline enter at the side rather than at the back of the vaporizer. When you have so far progressed in gas engine operation as to be able to overcome this trouble, you will need little else but confidence to operate your engine satisfactorily. 2. The best cylinder oil to use in marine gasoline engines is one not too thick, about equal parts light cylinder stock and high viscosity paraff-

SAINTE CLAIRE—21-FOOT CABIN SLOOP.
Designed by Tams, Lemoine & Crane, for F. H. Walker, Detroit C. C.—Built by B. F. Wood, City Island, 1904.

fine oil for summer use, and in winter one-third high cold test cylinder stock and two-thirds zero cold test paraffine oil. 3. Nothing to be gained by using 86-degree gasoline. It is much more volatile, more dangerous, has an unpleasant odor, and costs much more than 74 or 76 degree naphtha. 4. Store gasoline and 74 degree naphtha is usually of a gravity by the Beaumé scale used for measuring liquids lighter than water from 69 to 73 degrees, while what is known as 76 degree runs sometimes as low as 74 degrees.

Sainte Claire.

ONE day last spring there was launched from Wood's yard, City Island, a likely looking little craft. This boat was the 21-footer Sainte Claire, and as she was rather different in some respects from the cabin racing yacht of that size used on Long Island Sound, she attracted some attention, even the workmen of the big shipyard close by remarked her long forward overhang. At that time few realized that this boat was destined to accomplish great things on fresh water later in the season.

Sainte Claire was designed by M1. Clinton H. Crame, of Messrs. Tams, Lemoine & Crane, for Mr. F. H. Walker, of the Detroit Country Club. She was one of five boats built by members of the Detroit C. C. to compete in the races for the Lipton Cup and the Walker Cup.

In the Lipton Cup races, held on Lake Michigan Aug. 13, 15 and 16, she won two out of three races. There were nine starters. The Lipton Cup is a per-

SAINTE CLAIRE.

petual challenge trophy, and Sainte Claire's owner had the pleasure of bringing this prize to his home club.

In the Walker Cup races, held on Sept. 6, 7 and 8, off Detroit, Sainte Claire was quite as successful as she had been in the earlier event. Again she won the series, taking two first prizes.

Sainte Claire's owner will enter the boat in the coming season's races, and the chances are that she will do better than she did her first season.

Her dimensions are as follows:

Length—	
Over all	35ft. 11in.
L.W.L.	21ft.
Overhang—	
Forward	9ft. 9in.
Aft	5ft. 2in.
Breadth—

Aft	1ft. 9in.
Sail Area—	
Mainsail	678 sq. ft.
Jib	169 sq. ft.
Total	847 sq. ft.

The cockpit is 6ft. long, and the cabin house is 8ft. 6in. long. There is a 2ft. waterway around the cockpit and house. The center of the mast is 3ft. 4in. from the waterline forward.

Riverton Y. C.

BY T. HARRY WALNUT, SECRETARY RIVERTON Y. C.

THE Riverton Y. C. is situated just nine and a half miles above Walnut Street Wharf, Philadelphia, upon the Jersey shore of the Delaware, at a point where the river has eaten a deep cove into the land and widens to a breadth of nearly a mile, thereby affording the best expanse of water for sailing to be found anywhere on the upper Delaware. It is in the middle of this cove, about a mile and a half from either point, that the club house has been built. It stands upon the end of a pier which projects out to the edge of the channel.

Although the club has never been a large one—not having numbered at any time over a hundred members—it will always be of interest as marking the spread of the yachting spirit in America, as it stands among the first nine veterans and is patriarch of the organizations of the Delaware valley. It was founded in the summer of 1865, shortly after the close of the Civil War and the assassination of President Lincoln, at a time when patriotism and loyalty to the stars and stripes were at white heat. The committee appointed to select a club emblem chose as most appropriate a design, marked with thirteen stripes and with a blue center set with thirteen stars. The first meeting was held at the home of Edward H. Ogden. Caspar W. Morris was elected Commodore; Jacob G. Morris, Vice-Commodore, and Edward H. Ogden, Secretary and Treasurer. Mr. Ogden was elected Commodore in 1875, which office he held for twenty years, until his resignation in 1895, when Wm. R. Ellison, the present Commodore, was chosen to succeed him.

In 1880 the club house was erected, and a charter from the State Legislature was obtained before the opening of the following season. The second floor of the house is taken up by the assembly room, while the lower floor is given over to members for lockers and as a dressing room. Owing to lack of accommodations, the club has been compelled to depend almost wholly upon local support, and at various times plans have been advanced for the construction of a large building, which should have suitable sleeping apartments for visiting members, but thus far they have all failed of execution.

The club has been exceptionally fortunate in maintaining its activity, and there has never been a season when interest has not been keen in racing. New men and new fleets have always been ready to take the places of the old, and at present the club is more vigorous and the yachting enthusiasm sharper than it has been since the time of organization.

From the point of view of many yachtsmen accustomed to open water sailing, the Delaware, off Riverton, would seem to offer tame sport. At its widest it is a scant mile across, and on the Jersey shore the bank climbs high from the water and is topped with tall trees, which play strange antics with the fragments of southerly and easterly breezes that succeed in working their way through them. For a broad space out from the shore the wind comes in fitful puffs and eddies that keep the sailors on the edge of vigilance, and they appreciate a stiff southwester blowing freely up the river, or a northeaster blowing down. It is not a good place for large craft, although the club has numbered among its fleet several schooners of 60ft. in length and over, but for anything under 25ft., and particularly for little two-men boats 15ft. or 16ft. over all, there is treachery enough in the breezes to give the sharpest sailor excitement and effectually to prevent the limited sea-room from growing monotonous. Sailing is a simpler task on many of the bays and harbors along the coast than it is on this river; and more than one craft that has been looked upon elsewhere as safe and stiff as a church, has been bewildered by the antics of the wind and lost reputation along with its skipper by capsizing. With the breeze likely to shift a quarter of the compass between puffs, it is risky business cleating a sheet rope, for no amount of luffing can save the luckless mariner whose ropes have not full play and are not ready to run.

I remember seeing one of the smaller boats, on a day when the wind was blowing hard out of the south, coming close-hauled from the middle of the river when the breeze was steadier, for the finish, which brought her within the influence of the trees. She was a few yards from the line when a sharp puff struck her full and square, and with three heavy men hanging out to windward, she knocked down till her leeward deck was buried. In a moment the flaw was gone, and with a backward lurch she was over to windward, and her crew were floundering in the water.

The dominant type of craft in the club has always been the catboat, ranging in size from 18ft. to 28ft. over all. The original fleet was of this rig, and the older members tell how they used to rave when there were no restrictions as to canvas or crew, and ten or fifteen men were wedged elbow to elbow, like crackers in a box, along the gunwales of a knife-like craft that could not stand alone under the weight of its heavy spars, and, how, when the wind flattened, the crew slipped one by one into the water, until there was left only enough to bring the racer home. But broader boats with their greater power and stability gradually pushed the first models out of existence, and for ten or fifteen years these round-bodied plum-stemmed craft held sway and successfully defeated all comers. In fact, they have proved to be a hard proposition for the modern boats to dispose of. Some years ago an up-to-date craft of the skimming-dish variety was brought from Boston to win the championship. She won, but not without a very close contest. Sea Gull, the former champion, hung on with bull-dog persistency, and in the last race of the year, scored an easy victory. Since then the older models have practically disappeared; but Sea Gull, last of the old-timers, is still in commission and can win her share of races. In 1902 she recovered the championship pennant, but during 1903 a boat, built on the dead rise plan, at Atlantic City, carried off the championship by winning nearly every race in which she was entered, and her consistent performances in all weather has made her popular.

For a number of years much interest has centered in a one-design class of mosquito boats, sixteen of which

were imported from Atlantic City in 1893. The boats are 15ft. over all, 5ft. breadth and are rigged with a 23ft. mast, carrying a leg-a-mutton sail with a club at the base. The height of the sail makes them tender on the wind, but, handled well, they will go through a blow that drives the other classes to double reefs, and they will point and foot in a way to bring them home on the heels of the larger boats. Although these craft are strictly one-design, the fleet championship has been held continuously for eleven years by one man. He has won nine of every ten races sailed, and the ambition to beat him has held the fleet almost intact for eleven seasons. This admirable record of consistent interest has led to the building of another one-design class of the dead rise type—modeled after the present champion of the catboat fleet—at Atlantic City. They are 25ft. over all, 18ft. on the waterline, and are rigged with a jib and mainsail. If anticipations are realized, the newcomers will make 1905 the most exciting year in the club's history.

The club members are almost without exception eager for one-design racing. Many of them have at one time sailed in the mosquito fleet and are thoroughly convinced that for maintained interest, mixed class racing is not to be compared with the one-design.

It takes a long while to convince a man that he is not a good enough sailor to lead the procession. He will come to the line for race after race, primed with schemes for outsailing and outwitting the others, and full of the idea that he cannot make the mistake again which lost him the previous race. And nothing can be much better sport than to be in the midst of a fleet of a dozen one-design boats all working every nook and cranny of the shore as they beat against the tide. It is man for man, and he who is most alert to what is going on about him, watches closest the effect of every tack and is quickest to take advantage of each puff of wind and eddy in the water, is the one who works into the lead. The difference which handling makes in the speed is remarkably apparent, for at times with a steady wind blowing and no possibility of

HOME OF THE RIVERTON Y. C.

"flukes," a gap of a mile and more will be opened up between the first and last boats in a 9-mile race.

The selection of the jib and mainsail rig for the new class is largely due to the interest aroused in the last few years by a fleet of that description, which has grown to be very popular. For several years a freak craft, Isit by name, built almost on the lines of a perfect scow, carried off everything in sight with ridiculous ease; but the passage of a new rule, further limiting the number of men to be carried, handicapped her badly, and a little half-rater, named Tadpole, captured first prize in 1903.

The club's racing season opens on May 30 with a Decoration Day regatta, which is followed by races on alternate Saturday afternoons. But the greatest day in the yachting season is Fourth of July, and it has been so for the thirty-eight years of the club's history. The town depends upon the yacht club to provide the patriotism for the occasion.

The racing programmes are made up in four-page booklets, and are cut in triangular shape with a cover designed after the club pennant. They are distributed widely through the town, and a number are kept for distribution in the club house on the morning of the Fourth. It is a misfortune that winds and weather to suit the day cannot always be provided. It is a sad reality that Fourth of July mornings are proverbially with us as hot as the Sahara and as still as death. The picture shows the condition of affairs in 1902. There was just enough wind at times to tempt the committee to start the races, but far from enough to allow the boats finishing them. The course was a triangular one, a mile to a leg, and called for three times around. The faint catspaws carried the fleet round the first buoy and the tide took them up to the second mark, but here the puffs wholly disappeared and the boats started drifting further up stream. The gun from the flagship finally signaled the race off and brought the crews home for dinner. But for launches it was a famous day, and their event quite overshadowed, in interest, the sailing races.

Last year we were more fortunate. A fluky northerly wind, stiff in spots, which shaded off into nothingness as the day wore on, gave the fleet an excellent chance to finish well within the time limit, and left the river in the afternoon as smooth as a mirror to accommodate the canoeists and the swimmers. It fitted the schedule as though cut to order. The crowd that gathers on these occasions throngs the bank and crowds the wharf from rail to rail, and the committee is possessed with the laudable ambition to provide something novel in the way of aquatic sports each year. For two years canoe tournaments or tilting matches were the great feature, and then obstacle swimming races, walking a slippery pole, barrel races and mixed canoe races were the most interesting events. Water carnivals were at one time the rage, but they have not been seen on the programme for several years. The last great performance was when the shad fishermen's long boat was

metamorphosed into the floating image of Cleopatra's barge. From the mast amidships were strung numbers of colored lanterns, and beside each of the twenty rowers was a blazing red-light. On a high throne in the stern sat Cleopatra with Mark Antony at her side. The effect was striking, and in conjunction with the smaller boats fancifully decorated with lanterns, made an interesting spectacle. But after this effort the carnival spirit died out and the fireworks on the pier have since had no rival.

The season closes with Labor Day, when the whole fleet goes up the river to race as the guests of the Beverly Y. C.—a new organization dating from 1900. The feeling between the two clubs is very cordial, and a large proportion of the owners of racing boats at the two places are members of each club, which assures them weekly races, as the schedules are so arranged that the events fall upon alternate Saturdays.

Early in the morning of Labor Day the first detachments of the fleet can be seen working up stream, the boats racing fiercely among themselves, until they disappear from sight behind a heavily wooded point that cuts off the view of the upper river. Toward noon the second detachment, strung out in lines like an uneven picket fence, goes up in two of the various launches—a more expeditious but less interesting method of conveyance. And last of all the commodious steam yacht, loaded with the friends and relatives of the members, leaves the wharf, to arrive in time for the races. The fleet is welcomed by the commodore of the Beverly Y. C. and a lunch served on his lawn is heartily enjoyed. The river bank at Beverly rises almost perpendicularly from the water's edge, which makes the winds even more uncertain and treacherous than at Riverton, but sight-seers can look down on the fleet and follow its movements readily over the whole course. From their point of view the arrangement is ideal. The two fleets make a great showing in the cove, and there is keen rivalry for the honor of carrying off first place. And after the races are over, not the least enjoyable part of the day is the trip down the placid river, in the growing darkness, behind the launches.

This custom originated six years ago, and in that time we had never had a rainy day, and, until 1903, had never been forced to postpone a race for lack of wind.

A return race for the Beverly yachtsmen was inaugurated two years ago, which is held some time in July. The weather helped us the first year, by furnishing a stiff breeze and a clear sky, which induced almost the whole up-river fleet to venture down. In 1903, however, all hopes of good sport were discounted, when the morning opened with a gray sky and a glassy river. The prospect discouraged the invited guests and only a few of their boats appeared. In the afternoon the wind arrived bringing with it plenty of rain, and the races were run off in double quick time among the home fleet.

Before the founding of the Beverly Y. C., Riverton occasionally joined forces with the Corinthian Y. C., which is located at Essington, nearly as far below Philadelphia on the Pennsylvania shore as Riverton is above on the Jersey shore. It was a difficult trip past the city and across the lines of the ferries plying between Philadelphia and Camden, but it gave variety to the season's racing, and there is some talk of renewing the custom this coming season, which, without this feature, however, promises to be one of unequalled activity. The new fleet will insure keen rivalry, and from the 30th of May to the 15th of September there will be, in conjunction with the Beverly Y. C., regular weekly races. Our members are always eager for an opportunity to try out their skill and the speed of their boats, and a visiting yachtsman with a craft that can, by any possibility, fit into a class will be welcomed and given a chance to show what his boat can do in narrow river waters and fluky river winds.

YACHTING NEWS NOTES.

For advertising relating to this department see pages ii and iii.

KETCH SITARAH SOLD.—The ketch Sitarah, built by the Geo. Lawley Corp., 1903, for Mr. John H. Cromwell, Atlantic Y. C., has been sold to Mr. Russell A. Alger, Jr., of Detroit, Mich., through the agency of Stanley M. Seaman, New York. She is 76ft. over all, 50ft. 6in. waterline, 17ft. beam, 5ft. 7in. draft.

A NEW RACING LAUNCH.—Mr. Alexander Stein, of the Indian Harbor Y. C., expects to have ready for the Memorial Day races and the season of 1905 following, a high speed motor-driven launch, designed with a hope of securing 30 miles per hour. Mr. Henry J. Gielow, who designed the Onontio, has completed the plans, and the Greenwich Yacht Yard, of Greenwich, Conn., has been awarded the contract. She will be modeled something after the Onontio, Com. Harrison B. Moore's 28.36-mile launch, but will have improvements following some original ideas evolved by Mr. Gielow from his previous designs. We are very glad to learn that at least two boats are to be ready for next season's racing which will be in a class by themselves, as it is hardly to be supposed that the A. P. B. Association rules could be so construed as to give Onontio, Challenger, XPDNC, and similar boats time allowances equitable and fair to all. The new boat is to be 56ft. 8in. over all, 7ft. beam, and 3ft. draft, and, like Onontio, will have an 8-cylinder Craig gasoline engine.

AUTOBOAT RACING AT DAYTONA AND HAVANA.—Inquiry from autoboot owners elicits the information that it is hardly likely that there will be much, if any, autoboot racing following or in connection with the automobile meets at Daytona and Cuba. Owners do not take kindly to transportation and risk of injury in transit, but seem perfectly willing to confine their racing and speed trials to northern waters during the summer time.

All communications for FOREST AND STREAM must be directed to Forest and Stream Pub. Co., New York, to receive attention. We have no other office.

Rifle Range and Gallery.

Fixtures.

Jan. 16-20.—Pittsburg, Pa.—First annual tournament of the Iroquois Rifle Club.

New York Schuetzen Corps.

THE approach of Christmas did not seem in any way to interfere with the attendance at the practice shoot held Friday, Dec. 23, seventy men facing the targets in the race for high scores:

Ring target: R. Gute 242, 245; J. C. Bonn 242, 237; C. Meyer 239, 237; H. Lohden 237, 233; F. V. Roun 233, 235; O. Schwane-man 231, 237; J. Facklamm 240, 226; G. Ludwig 230, 235; F. Facompre 227, 234; J. H. Hainhorst 232, 226; A. W. Lemcke 220, 233; P. Heidelberger 227, 229; N. C. L. Beverstein 225, 229; C. Sievers 227, 227; J. G. Tholke 223, 226; D. Peper 218, 231; H. Mes-loh 227, 229; H. D. Meyn 230, 226; A. B. Michaelson 229, 215; G. W. Offermann 221, 223; C. Schmetz 217, 226; F. W. Dierks 197, 216; F. Schultz 189, 218; H. Hoenisch 204, 200; Aug. Beekman 192, 211; D. Ficken 202, 198; J. H. Grote, Jr., 207, 192; H. Quaal 210, 188; M. J. Then 201, 196; C. Koenig 189, 206; G. H. Fixsen 208, 184; H. Martin 187, 203; A. Giebelhaus 194, 196; L. Goldstein 200, 180; C. Roffman 198, 183; F. Gobber 193, 187; R. Ohms 179, 200; W. J. Behrens 158, 217; F. J. Hetzel 198, 175; N. Jantzen 187, 177; J. F. R. Ernst 180, 159; F. Ehlen 163, 154; H. Beckman 214, 227; C. Grosch 210, 237; W. Dahl 220, 220; H. C. Hainhorst 220, 220; A. J. F. Sibbers 220, 219; C. Mann 215, 222; J. H. Kroeger 213, 223; J. N. Hermann 214, 221; H. Nordbruch 216, 218; L. A. Hagenah 219, 213; A. Backman 217, 215; J. H. Meyer 219, 213; J. Paradies 210, 220; H. Koster 210, 220; H. Haase 209, 221; D. von der Leith 215, 213; H. Decker 217, 210; H. Offerman 212, 212; J. Jantzen 211, 212; G. H. Wehrenberg 219, 204; C. J. Brinkama 219 203; G. Thomas 206, 216; H. Meyn 203, 218; H. Kahrs 211, 208; W. Grell 200 217; H. Hesse 200, 215; D. Dede 200, 214; A. Evers 214, 199.

Bullseye target: M. Johnson 38½, J. C. Bonn 39½, Geo. Lud-wig 49, S. Meyn 55, R. Gute 75, J. H. Hainhorst 75½, G. Fixsen 77½, C. Grosch 81, H. Quaal 87½, O. Schwane-man 89, F. Von Roun 95, J. H. Meyer 97½.

Providence (R. I.) Revolver Club.

At our shoot, Dec. 22, four of our rifle shooters tried their hands at putting up a general average, so that we might see what the prospects were for the coming match with the Miles Standish Club, and the results were very satisfactory and show that we may not be snowed under completely.

Following are the scores recorded. Average, 228; 25yds.; rifles on German ring target:

A B Coulters	241	231	240	235
L A Jordan	232	223
C L Beach	229	219
Wm. T Bullard	210	224	224	220

The members were pleasantly surprised by a visit from Frank L. Corey, one of our most active and best shooters of some months since, but who has not had an opportunity to shoot with the boys for some months. Mr. Corey tried a few strings with his .22 pistol, but was not up to his usual good form, owing to lack of practice, yet put up 80, 80 and 70 (20yds. on standard target).

Two revolver cranks had an interesting time by themselves, and for three strings it was nip and tuck as to who would pose as champion for the evening. The scores running exactly even in reverse order.

Twenty yards revolver practice, standard target:

A C Hurlburt.....	77	83	80	79	86—405
Arno Argus	80	83	77	63	—303

Cincinnati Rifle Association.

THE following scores were made in regular competition, by members of the Cincinnati Rifle Association at Four-Mile House, Reading road, Dec. 18. Conditions: 200yds., offhand, at the German ring target. Nestler was champion for the day, with the good score of 225; he was shooting in good form throughout the day. Mr. Odell seems to be getting back in his old form again, his shooting to-day comparing well with that previous to his late illness. Mr. Coleman, as a new member, is doing himself proud for one who had laid aside the rifle for a few years. Mr. Hofer set the pace for champion score early in the day, and there was a hot race to beat it by Odell and Nestler, the latter finally beating the score by one point. Payne wasn't in it to-day. Odell was high on the honor with 67. The scores:

Nestler	225	222	220	215	212
Hofer	224	208	206	199	198
Odell	222	220	217	212	211
Payne	219	218	217	213	212
Burns	209	205	196	191	186
Coleman	208	207	203	193	190
Freitag	201	185	181	180	178
Drube	192	183	176	173	...

Harlem Independent Corps.

SCORES follow for the regular gallery practice shoot:

Ring Target—H. Koch, 228, 241; A. Fegert, 230, 231; G. Thomas, 224, 218; H. Behrmann, 215, 218; J. H. Blumenberg, 208, 223; S. Baumann, 221, 208; L. Lewinson, 212, 216; A. Muller, 214, 214; A. Fenninge, 210, 215; S. Bauman, 221, 208; C. Wolf, 209, 202; L. Rokohl, 215, 195; A. Miller, 198, 212; W. Mensch, 204, 195; A. Olsen 200, 195; F. Koch 190, 191; A. Monatsberger 199, 177; E. Miehlung 171, 200; W. Haus 186, 178; F. Horn 177, 182; P. Zugner, 190, 166; E. Hilker, 147, 192; C. P. Hopf, 187, 150; E. Modersohn, 122, 191; L. Schowunel, 138, 172; J. Fey, 143, 120; F. Lanzer, 87, 76.

Bullseye Target—W. Mensch 36½, A. Fegert 39, A. Monats-berger 68, A. Rokohl 79, A. Fenninge 93, Dr. A. Muller 93½, W. Haus 94½, J. H. Blumenberg 127, E. Modersohn 128, F. Horn 145, A. Miller 148, G. Thomas 150, C. Wolf 180, E. Hilker 231, L. Lewinson 253, H. Koch 279.

Zettler Rifle Club.

SCORES are appended for the regular practice shoot held Tues-day evening, Dec. 20:

Ring target: R. Gute 1222, C. Zettler, Jr., 1215, E. H. Van Zandt 1212, O. Smith 1212, C. G. Zettler 1195, B. Zettler 1166, L. Maurer 1163, F. J. Herpers 1153, T. H. Keller 1133.

Bullseye target: H. C. Zettler 17 degrees, T. H. Keller 25½, O. Smith 27, C. Zettler, Jr., 29, C. G. Zettler 31, A. Begerow 31½, R. Gute 32, G. Ludwig 40, B. Zettler 42, F. J. Herpers 42, L. C. Buss 47½, W. A. Tewes 49, L. P. Hansen 51½, L. Maurer 72, George Schlicht 74, Geo. J. Bernius 76, A. Kronsberg 76, H. Fenwirth 98, R. Busse 118, G. H. Wiegman 178.

Rifle at San Francisco.

DEC. 19.—The various rifle clubs are this month closing up their annual medal shoots. At Shell Mound, D. B. Faktor won the champion medal in the German Schuetzen Club—twenty-four scores allowed during the year, best ten to count; score, 2211.

At Schuetzen Park, A. Strecker was the winner in the California club; score, 2247.

The National Guard have for many years done their shooting at Shell Mound Range. As the latter affords no facilities for long-range work, a new location within the city limits has been chosen. It lies south of the high hill, known as Twin Peaks, and affords room for a 1,000yd. range.

ROEEL.

Independent New York Schuetzen Corps.

THE following scores were recorded on the Zettler ranges Thurs-day evening, Dec. 22, by the above society: Gus Zimmermann 246, 248; R. Gute 244, 243; Lambert Schmidt 241, 246; F. Liegibel 241, 237; John Facklamm 235, 237; Geo. Zimmerman 234, 237; L. C. Hammerstein, Jr., 235, 235; F. A. Young 233, 237; H. Koch 234, 231; Jac Billschur 231, 232; Geo. Ludwig 223, 239; Jac Schmid 232, 228; H. J. Behrens 229, 226; Wm. Soll 224, 231; F. C. Halbe 199, 202; A. Rodler 202, 199; H. Zimmer 181, 197.

Italian Rifle Club.

At headquarters, 159 W. 23d street, New York city, Dec. 19, the following scores were recorded. All shooting offhand, at seventy-five feet, on the regular 25-ring target: Selvaggi 243, Minervini 241, Bianchi 234, Reali 233, DeFelice 223, Raimondi 222, Alfieri 217, Cassetti 204.

Trapshooting.

If you want your shoot to be announced here send a notice like the following:

Fixtures.

Dec. 29.—North Branch, N. J., Gun Club first annual midwinter shoot. H. B. Ten Eyck, Sec'y.

1905.

June 8-9.—Dalton, O., Gun Club annual tournament. Ernest F. Scott, Capt.

DRIVERS AND TWISTERS.

Club secretaries are invited to send their scores for publication in these columns, also any news notes they may care to have published. Mail all such matter to Forest and Stream Publishing Company, 346 Broadway, New York. FOREST AND STREAM goes to press on TUES-DAY OF EACH WEEK.

The programme of the Poughkeepsie (N. Y.) Gun Club's New Year's shoot, Jan. 2, provides eight target events, six at 15 targets, \$1.30 entrance, and two at 25 targets, merchandise prizes, \$2 entrance.

In the miss-and-out live-bird event at Point Breeze, Philadel-phia, on Monday of this week, Messrs. Brandt, Trent and Aiman tied on 9 and divided the money. A special programme will be provided for New Year's Day.

Mr. Howard George, of Philadelphia, won two gobblers at the all-day target shoot of the Olney Gun Club at Cedar Grove, on Monday of this week. Messrs. Charles Newcomb, Thomas Tansey and Walter Firth were also winners of the toothsome turkey.

Mr. E. J. Loughlin, Secretary, writes us as follows: "The Riverside Gun Club, of Utica, N. Y., will celebrate New Year's Day on Monday, Jan. 2, with a sweepstake and merchandise shoot, open to amateurs only. Grounds located at foot of Wash-ington street, close to all depots."

The Oklahoma City Gun Club have issued a cordial invitation to shooters to attend their one-day shoot. Jan. 2. Twelve events constitute the programme, of which four are at 20 and eight at 15 targets; entrance \$1.50 and \$2. Rose system, four moneys, will govern. Sliding handicaps. Mr. G. M. Parker is president; M. C. V. Topping is the secretary.

The Trenton Shooting Association announce that they will hold a big merchandise shoot Monday afternoon, Jan. 2. "Shooting begins at 1 o'clock sharp, for cost of targets at 2 cents each. Prizes: One punch bowl with twelve mugs, one berry set (six disks), three orange bowls, four lily bowls, and others; also poultry. Reasonable entrance. Come early and shoot through the programme. J. R. Taylor, Gen. Mgr., Trenton Shooting Asso-ciation, Interstate Fair Ground."

Unlike the Christmas Day shoot, of which high guns won, the New Year's Day shoot of the O. C. S. A., Utica, N. Y., Jan. 2, will be class shooting. There are ten programme events alter-nately 10 and 15 targets, 60 and 90 cents entrance. Total targets, 125; entrance, \$7.50. "Money divided 40, 30, 20 and 10 per cent. The proceeds of event 6 will be donated to the E. D. Fulford monument fund. It is no sweepstake event, but a handicap. The prize is a solid gold badge, value \$25. This event is open to any resident New York State shooter. Contestants are welcome to shoot for targets only, except event 6, open. Ten-gauge guns, targets only. Shells sold on the grounds." There will be a meet-ing of this Association at Bagg's Hotel, Friday evening, Dec. 30, 1904, at 7:30 o'clock, to select dates of the New York State shoot.

The Poughkeepsie (N. Y.) Gun Club sends us a communication as follows: "The arrangements for our New Year's tournament on Jan. 2 are complete, and promise to give the shooters present on that day a good time. We will use two traps, starting promptly at 10 A. M., with two squads. In this way we will be able to finish the programme early without rushing, and visitors can take the late afternoon trains home. All work will be in the hands of competent men, and we expect every detail to run off smoothly. From present indications this, the third annual tournament of the Poughkeepsie Gun Club, will be the largest attended and most important tournament held in this section of the State."

The Hamilton (Ont.) Gun Club have issued the programme of their fifteenth annual tournament and grand Canadian handicap, to be held on Jan. 17-20. This tournament is one of the best held in the Dominion, and the programme is exceptionally attractive, as follows: On the first day eight target events are provided, each at 20 targets, \$2 entrance, and of these seven respectively have \$20 guaranteed. The competition begins with a 10-live-bird event, \$5 entrance, birds extra; \$100 guaranteed, Rose system, ratios 5, 3, 2. No. 2 is at 20 birds, \$15 entrance, birds included; \$500 guaranteed; \$100 to high gun; \$400 Rose system, 5, 4, 3; surplus added; handicaps in each event, 26 to 33yds. The pro-gramme of the second and third days is much like that of the first, except that the \$500 guaranteed event is continued. On the fourth day, an event at 10 birds, \$5 entrance, high guns, and target sweeps are provided. A total of \$1,200 is guaranteed. Shooting begins at 9 o'clock. All sweeps and miss-and-outs are subject to handicap, and in target sweeps the handicaps are sliding handicaps. The officers are: President, T. Upton; Vice-President, M. E. Fletcher; Secretary, H. Graham; Treasurer, J. Hunter.

The Carleton, Mich., Gun Club announce a New Year's Day shoot, their fifth amateur tournament at targets and live birds. The date is Jan. 2. Competition begins at 9 o'clock. Cash prizes, over \$80. The target programme consists of ten events, each at 10 targets, \$1 entrance. Rose system, four moneys. Targets, 2 cents. Those who wish may shoot for targets only. Sergeant system. Live bird competition begins at 1 o'clock. Event No. 1, 5 birds, entrance \$2; three moneys, 50, 30 and 20 per cent. Event No. 2, 7 birds, entrance \$5; Rose system, four moneys, ratio 8, 5, 3, 2. Event No. 3, 10 birds, entrance \$10; four moneys, equitable system of division. Miss-and-out and ad-ditional sweeps, time permitting. You can shoot for price of birds. Traps, five King's pigeon traps. Birds, 15 cents each; all bird moneys deducted from purses. Boundary 50yds. Extra cash target prizes for shooting through programme: For making ten perfect scores, \$25; for making nine perfect scores, \$20; for making eight perfect scores, \$15; for making seven perfect scores, \$10; highest average, \$5; next, \$3; lowest, \$2.50; total, \$80.50. Revised Interstate Association rules. All standard loaded shells for sale on ground. Manufacturers' representatives are cor-dially invited to be present, but can shoot for targets only. Warm dinner served in the Matthews House. All trains on the Pere Marquette & Detroit Southern R. R. stop near the grounds. The shoot is open to all.

BERNARD WATERS.

WESTERN TRAP.

Cincinnati Gun Club.

THE attendance at the Cincinnati Gun Club shoot was small on Dec. 24, owing partly to the weather and partly to the bad con-dition of the road, which makes a trip to the grounds of uncertain length. The day was cold and rainy, and a strong wind, blowing across the traps from the left, made hard targets. By 4 o'clock it was too dark to see, and the boys quit for the day. Not much practice shooting was done. Arthur Gambell, H. Osterfeldt and Geo. Yeager start on the 26th for Grace, Miss., for a couple of weeks' duck shooting, with Dick Pooler, of Chattanooga, Tenn.

Reports from Ackley are encouraging, as he continues to im-prove very slowly.

Williams is not satisfied with being a good trap and field shot, but has lately joined the ranks of the riflemen, and is shooting with the Cincinnati Rifle Association and doing good work. Medico was on hand to-day, and finished fourth with 84. L. Ahlers is in the South, escaping the cold weather and also shoot-ing a little game. Ralph Trimble put in his appearance to-day for the first time in many weeks. As is usually the case, he finished at the top, although he shared high honors with Don Minto, each breaking 93. Don can shoot a little bit when he gets going, and tied Trimble in each of the five 20-target events. The scores follow:

One hundred-target race: Don Minto 93, Trimble 93, Barker 87, Medico 84, Herman 83, Williams 81, Block 80, Maynard 79, Falk 72.

Following are the ten best scores made in the cash prize series to date, by those who have taken part in enough contests to qualify. Gambell and Don Minto have preferred to shoot from 16yds. instead of from 19 and 21, their proper handicaps, and there-fore forfeited their interest in sharing any of the prizes. Don Minto's highest score was 46; his lowest 35. Although twenty-two shooters have taken part in the Class C, only three are able to qualify by having shot the required number of times. The final contest will be held on Feb. 4. A new series of prize contests will begin immediately after, one prize to be shot for every three months:

	Class A	Total
Gambell	46 46 45 45 45 44 44 43 43 43	444
Faran	44 44 44 43 43 43 42 42 42 42	429
Maynard	43 43 43 43 42 41 41 40 40 40	416
Medico	43 42 42 42 42 41 41 41 40 40	414
Peters	46 43 42 41 40 40 40 40 41 40	394
A Sunderbruch	46 43 43 43 42 40 40 39 35 34	405
Don Minto	42 41 41 40 39 38 38 38 37 41	395
Williams	44 41 41 40 40 39 38 38 37 36	394

Class B.	
Dick	46 45 44 43 42 42 42 42 41—420
Harig	45 44 44 42 41 41 40 40 40—417
Roll	44 44 43 42 42 39 38 38 38—406
Block	44 42 42 41 41 40 39 38 37—400
Pohlar	46 43 41 40 40 38 37 34 36—389
Ward	42 39 39 39 38 38 38 37 41—385
Falk	41 41 38 38 37 37 36 36 36—376
Pfeiffer	43 39 38 37 36 36 34 34 33—364
Bullerdick	40 39 38 38 37 36 35 33 33—363
Class C.	
Bleh	46 45 45 43 41 40 38 38 38—410
Herman	45 42 41 41 39 38 37 35 35—387
H. Sunderbruch	46 42 37 37 37 37 37 35 35—378

Commencing Friday, Feb. 10, the week following the conclusion of the present series of cash prizes, something new will be given a trial, and if it proves successful, will be continued throughout the year. A prize will be shot for every three months, instead of yearly. Mr. F. C. Tuttle, on behalf of the Peters Cartridge Co., will present the club with a handsome gold watch fob for the first prize. The following conditions will govern these contests: Contests will be held each week for fifteen weeks. Each contest to be at 100 targets. Members must compete in ten contests to qualify. Added targets will be used for a handicap. The contestant who has the ten best scores, with his handicap, will be declared the winner. Ties will be shot off. The highest possible score will be 100. Members will be allowed any one of three days on which to compete. All contestants stand at 16yds. The handicap committee may change the handicaps at any time. The handicap committee consists of Messrs. Barker, Jergens, Faran, Maynard, Van Ness, Harig and Gambell.

Welfare Gun Club.

The Welfare Gun Club, of Dayton, O., held a shoot on the afternoon of Dec. 17, which was quite well attended and was a success. The day was not an ideal one for shooting, as a strong wind was blowing directly toward the shooters, and snow was falling most of the time. Under such conditions, the scores made were very good. Monbeck lead with 55 out of 60, and broke 48 out of 50 in five events. The event of the afternoon was the team match between Peters and Barker, of Cincinnati, and two of Dayton's cracks, Oswald and Spangler. The match was shot in a driving snowstorm, and was won by the visitors with a score of 84 to 80. Spangler and Peters were high men with 43 each. The visitors from Cincy were highly pleased with their reception, and left for home happy. The Welfare boys propose to pay a visit to Cincinnati, and see if they cannot regain the honors wrested from them. One of the best-natured men in the club is Lee Counsellman. He enters all the events and loses with the same grace that he wins. If he don't break 'em, he only says, "Better luck next time," and never has any fault to find with his gun or ammunition. Oldt is another good loser, and is always sure he'll get the next one when he misses. Breene and Oswald are a couple of good joiners, and the crowd is sure to be good-humored when they are around. Capt. Spangler was squad hustler, and kept the shooters moving, so that there were no delays. There were two events at 25 and seven at 10 targets each, in addition to the team match. Spangler shot at 90 and was high man with 82, Oldt second with 70. Peters third with 71, and Barker fourth with 70. Other scores were: Pheliss (80) 64, Counsellman (85) 63, Kirby (80) 60, Monbeck (60) 55, Oswald (60) 45, Breene (20) 15, Barton (10) 5, Kost (20) 6, Kayburn (10) 6. Following are the scores in the team shoot, two men on a side, 50 targets per man.

Cincinnati		Dayton	
Peters	20 23—43	Spangler	22 21—43
Barker	22 19—41—84	Oswald	18 19—37—80

The Oswald-Spangler match was postponed for the present; this was to have been shot to-day at 100 targets per man, for \$100 a side.

Palestine Club.

The Palestine, O., Gun Club was recently organized with eighteen members. On Dec. 17 a meeting was held, when rules and regulations were adopted, and the first shoot held. Beside members of the club, a number of other shooters were present. Owing to lack of time only 25 targets per man were shot at, Herschell Jeffries being high with 19. Oliver Harter second with 18.

Engelwood (O.) Shoot.

C. Becker, of Englewood, O., gave a very successful all-day tournament on Dec. 20. There was a large attendance, twenty-eight shooters taking part in one or more of the events. Among those who came from Dayton were Messrs. Rike, Craig, Oswald Oldt, Schwind, Lindemuth, Geo. Rohrer, Horace Heikes and W. E. Kette. The weather conditions were hard, a strong wind blowing all day, and being responsible for many lost targets. There were ten 10-target events on the programme, with 50 cents entrance, and turkeys and ducks as prizes in each event. A glance at the list which follows will show that the Dayton boys went home with a good supply of poultry.

Craig and Rike tied for high gun on 81. Schwind was second with 77. Ike third with 72, and Oswald and Oldt fourth with 71 each.

First event: Old and Rike, turkey each; second Rike and Craig, turkey; Ike, duck; third, Rike and Craig, turkey; fourth, Lindemuth, Oswald, H. Heikes, turkey each; fifth, Craig, Ike, Schwind, turkey each; sixth, Craig, Schwind and Mack, turkey each; seventh, Kette, Mark and Oswald each a turkey; eighth, Mack, Rike and Oldt, a turkey each; ninth, E. Keller, Rike and Oswald, turkey each; tenth, Oswald, Rike and Lindemuth, turkey each. The scores:

Events:	1	2	3	4	5	6	7	8	9	10	Shot	Broke.

Buckeye Club.

The Buckeye Gun Club was for a long time one of the most active clubs of Dayton. Some time ago it was consolidated with the new Dayton Gun Club, and finally passed into history on Dec. 22. On the evening of this day a full representation of its membership met at the Phillips House and voted all its assets to the new club. These consisted of a considerable sum of money, club house, traps and other equipments. The meeting was most harmonious, and those present enjoyed a banquet and other pleasant diversions after the business was concluded.

At Toledo.

The Toledo Consolidated Gun Club will hold a New Year's target shoot on Jan. 2, turkeys, ducks and chickens being offered as prizes in each event.

Cardiff-Reddick Tournament.

Cardiff, Ill.—What would have been a largely attended tournament, had the weather been good, was that of the Cardiff and Reddick, Ill., Clubs, united and held at this place Dec. 19. When the opening time, 9 A. M., came it found few present, as a room with a stove was more inviting than a bleak prairie, covered with snow, over which blew a strong south wind.

The grounds used are first-class, level as a table, with north background free from any obstruction. Five live-bird traps and targets are installed. All went well, so far as the trapping was concerned. The absence of a club house, or any fire, or place to lay the guns was quite an inconvenience, yet those present stuck it out until night set in.

The forenoon was a short one, and was all taken up with target shooting. Mr. Mathison, from Wilson, was the best shot up to the last round, where he went to the bad. C. Fortier, the old-timer from Paper City, led the amateurs with 66 out of 80. Chris. Keck, the DuPont man, was high alone as a professional Tramp Irwin was looking on and assisting with a few friendly words of encouragement to those with "cold feet." Those present were: A. W. Feilers, Wing, Ill.; T. J. Fortier, Piper City, Ill.; A. Ferris, Chatsworth, Ill.; C. C. Hess, Mokenca, Ill.; E. Hess, Buckingham, Ill.; Nelson Wells, Mokenca, Ill.; Dr. Smith, Jack Kiley and Tom Riley, Reddick, Ill.; Jim Walsh, George Faulk, and John Alm, Cardiff, Ill.

Scores:	1	2	3	4	5	Shot	Broke.
Events:	15	15	20	15	15	at.	
Targets:	15	15	20	15	15		
N. Wells	9	11	16	50	36
C. Keck	10	14	17	12	14	80	67
Dr. Smith	10	13	17	10	8	80	58
G. Falk	10	9	7	12	..	65	38
C. Hess	7	12	14	50	33
A. Ferris	13	12	16	13	9	80	63
C. Fortier	10	14	16	14	12	80	66
J. Williams	5	7	6	8	..	65	26
M. Mathison	13	15	17	14	6	80	65
E. Hess	10	15	10
J. F. Reiley	6	..	2	..	35	8
T. J. Reiley	11	9	..	30	20
C. Buttler	15	8

After an adjournment for dinner and a warm-up, the live birds were trapped, and three events on the birds with feathers added interest, as such a game was needed to hold the attention of the crowd. Mathison was the only one to get 14, and he took first money in the first event, while second money went to Fortier and Ferris with an unlucky 13. Butler, Smith and Langston tied on 11 for third. In the second event, Fortier and Dr. Smith went straight; and in the miss-and-out it was Mathison and Wells who held out until the last bird in the coop had been trapped. The scores:

Fifteen live birds; \$5 entrance:	
Fortier	112101112121201—13
Ferris	222101112121201—13
Mathison	122102221112121—14
Butler	121000122101212—11
Smith	111010112101201—11
Ten live birds; \$3 entrance:	
Fortier	1112212121—10
Dr. Smith	221111211—10
Madison	1210211210—8
Hess	1100101010—4
Williams	011020012102011—9
Keck	111201101201121—12
Rieley	011001100211211—10
Langston	012220100212211—11

Miss-and-out, live birds; \$1 entrance:	
Mathison	121212
Fortier	122120
Falk	110
Smith	0
Wells	121212
Williams	111220

Mathison and Wells divided.

In Other Places.

On Saturday last the members of the Trenton, O., Gun Club met for practice. At 50 targets Baker made the score of 38; Wirtley, 35; Pfalsgraf, 31; Went, 36; Sickles, 35; H. Keer, out of 30, 21; Sellers, out of 15, 10.

It is time for the live-bird shooters to get busy with their preparations for the tournament, to be held at Detroit, Mich., on Feb. 15 and 16, which has come to be an annual affair, in connection with the Automobile and Sporting Goods Association Show. There will be good added money for the target events, which will be held first day; while the second will be given over to a 25 live-bird handicap, \$25 entrance, being the twelfth shoot for the Gillman & Barnes trophy, the emblem that carries with it the championship of the United States and Canada. Bates, of Canada, has captured it twice and he will be on hand to try a third time win to make it his own personal property. Fred Gilbert will have an eye on the same, as will others, both local and national. The gang will find this shoot an incentive to hasten back from Texas.

A friend writes from Frankfort, S. D., that the gun club at that place has not gone into winter quarters yet, but shoot weekly. A neat club house has been erected, so that a warm stove will add comfort on cold wintry days. The club is in good financial condition and had money in the treasury to pay for the building.

A New Year shoot has been given out by the Kentucky Gun Club, of Louisville, Ky., for Jan. 2, at Fountain Ferry Park. Eight events are scheduled, with a trophy for each. The Kentucky boys have held many good shoots during 1904, and are starting out right for the new year. Louisville is a lively live-bird town.

W. Walsinger, the trapshooting promoter of Ferndale, Ia., held a shoot on Dec. 23. Everybody was made welcome, and a good time was the result.

The Mattoon, Ill., "shotgun cranks" have put their heads together and the result terminated in a newly organized gun club, having eighteen members for a starter. The officers are: J. F. Mallory, President, and George Kaelberer, Secretary.

The regular weekly meeting of the Daniel Boone Rifle Club was held Friday, at their range in Muncie, Ind. Captain Stephens announces that the members are not taking much interest in the shoots.

It is with much interest that we note that gun clubs are being organized in connection with many high schools and colleges.

Learning to shoot straight will fit men for being of use to their country, should occasion arise.

In far away Arizona the trap boys had an interesting meeting Christmas Day, at Tucson, the prizes being turkeys, ducks and chickens. Besides these prizes, several novelties were introduced, which kept up the interest throughout the day. The opening gun was fired at 9 A. M., and during the day the townspeople were delighted spectators.

Fort Smith, Ark., is situated far enough south, so that the cold of the north does not hinder gatherings at the trap during winter months. The shoot held Saturday last was interesting to at least one member, who won the booby prize. Jack Jackson won the same with one target broken out of 25. At same number, H. T. James, 23; T. H. Williamson, 17; H. Omahundro, 19, were the best scores reported.

The Carleton, Mich., Gun Club will hold their fifth amateur tournament on Monday, Jan. 2. There will be liberal rewards offered in cash, and both targets and live birds will be used. Rose system of division of purses, 8, 5, 3 and 2. Twenty-five dollars will be awarded the one who makes ten perfect scores; \$20 for nine; \$15 for eight; \$10 for seven. Under these conditions it is safe to predict that but little money will be required to pay rewards.

The Detroit, Mich., Gun Club has gone into winter quarters—it will come forth when the robins nest again. The officers are Wm. Morris, President; George Stanch, Secretary; Chas. F. Kustling, Treasurer and Captain, and is a hustling captain, who keeps the boys going.

When J. E. Bobb, who runs a lunch room, won a meal ticket at Jacksonville, Ill., put up by a competitor, he was puzzled how to dispose of same.

Will Clark, of Flora, Ind., won out in the first shoot of the Flora Gun Club with a score of 17 out of 20 targets.

The McLean County Gun Club, of Bloomington, Ill., will hold a tournament Feb. 22.

Out in the Northwest, where winds are known to blow cold in the winter, the Helena, Mont., Club will hold weekly shoots. The secretary of the U. M. C. Gun Club, at Guhnrie, O. T., writes that already the club members are getting ready for an active spring campaign against the "festive" targets.

An interesting bit of news crosses the continent to the effect, that the Spokane, Wash., Club will hold a shoot on the first day of the new year. Nothing so good as starting the year properly.

It is stated that the Montana State tournament will be held at Bozeman, in the early summer.

It has been a long time since shooting matches were all the go at Kewanee, Ill., at which time the Mayor of Keitsburg, and the Mayor of Kewanee were in hot competition. So it will be news to many that a shoot at live birds and targets was held there last week.

You may expect to read reports from a new gun club that has been organized at Council Bluffs, Ia.

There is little doing in the shooting line in the West in the winter time as compared with the summer, so that it is a bit of good news, that of the formation of a new club at Crown Point, Ind.

Dan Bray, after an exciting struggle, resulting in a tie on 82, and a shoot-off on 25, lost the Denver Post trophy to Lou Reed, of Ohio, Neb., in the contest last week at Columbus. The shoot was held during a storm, and the score of 25 straight, made by Reed, was an "eye-opener." G. A. Schroeder challenged Reed for the trophy. Gus doesn't like to see it leave Columbus.

Proctor Knott is situated in the north part Minnesota, where the thermometer registers low in the month of December. While it is too cold for target work, it is not too uncomfortable to enjoy a banquet. Some twenty-eight of the club's enthusiasts were banqueted with the assistance of the wives and sweethearts, and it was a list of good things, where wit also "flowed." J. V. Gilbert, H. G. Gilderman and Dr. I. A. Roadman were speakers. C. M. Boucher was presented with the Peters trophy for 1904.

There has been announced an all-day target and live-bird tournament for Jan. 2 at the St. Louis, Mo., DuPont Park. A warm club house, such as has long been in use at this park, makes pigeon shooting enjoyable even in very cold weather.

The Windsor, Ont., boys crossed over to the Lagoon Park and met the Sandwich Gun Club, of Detroit, in a little impromptu live-bird race, and were defeated. At 25 birds, Sandwich made 22 to Windsor's 19. Some additional sweeps were shot, Jack Maroon being high man, making a 10 straight.

Mr. Burr Eaton, of Danville, Ia., held a shoot last week under unfavorable weather conditions. A. Sater broke 104 out of 120; S. Nan, 99; Frost, 83; Saden, 92; Eaton, 89; Stuge, 42 out of 80; C. Sater, 70 out of 100; Huschen, 44 out of 60; Schroeder, 28 out of 50.

McHenry, Ill., has not neglected to fall into line for 1905, and the holiday will be the occasion for a shoot. Ben Stilling is President; J. J. Barbain, Treasurer; Wm. Stoffel, Secretary; Linus Newman, Captain. Good luck to you and your friend Ben.

The Arcola, Ill., shooters are after more suppers. The last shoot resulted in Barnes' team winning, by 93 to 47. The shooters were Dr. Barnes, M. McCafferty, Sam. Cox, P. J. Goggin, O. Harris, Jess Smith, E. Watson, D. Winteringer, J. Winteringer, N. Snyder and Sam Blackwell.

It will be news to the western boys that they are "showing me" in Missouri. A new club was lately organized at Joplin, with the following members: J. J. Gittinger, R. Jordan, W. D. Gorham, J. H. Meyers, W. E. Allen, W. Mannum, J. M. Short, G. A. Shimmings, G. I. Mays. Trapshooting will be boomed, and traps will be installed.

Russell Klein was easily high man at the tournament held last week at Clarion, Ia. With cold and stiff wind he made 155 out of 165; Spencer, 145; McDowell, 132; Howell, 127; Mitchell, 127; Bromeister, 126; Yearn, 124; Meyers, 115. The merchandise prizes put up were the feature of the meeting and much enjoyed. It is reported that all present had something to show for their skill with the shotgun.

Western shooters are very glad indeed that the next Grand American will be held in Indianapolis. Some would prefer Chicago, others Kansas City, and yet some others Denver. But what was so good last year will be better, if possible, in 1905.

Dr. Lawrence, Lincoln, Ill., president of the Illinois State Sportsmen's Association, writes that the next State shoot will be held May 23, 24 and 25.

Jack Parker, the well-known Michigan trapshooting promoter, will manage the shoot at Carleton, Mich., Jan. 2, 1905.

The Peters Cartridge Company's representatives will all meet in Cincinnati the first of January. There will be much going on in their line during their stay in that city.

Expert Doings at Wilmington.

At Wilmington, Del., on the morning of Dec. 20, there was an earnest rallying of trapshooters, both local and out-of-town. All were on the qui vive to a degree which signified that there was something of interest to them far above the ordinary. There was ample cause for the animated bustling, the carrying of guns, and the journeying to the grounds of the Wawaset Gun Club, for there was present a group of the famous experts, whose high performances East, West, North, South, stand up as mountain peaks in the annals of trapshooting.

Several of these experts were members of the All-American team, which, in England a few years ago, demonstrated that one barrel is better than two barrels when man, load and gun are of the best in skill and quality. The professional visitors present were: Hon. Tom A. Marshall, captain of the All-American team aforementioned; winner of the G. A. H. in pairs or nothing; also highest chief of the Indians; in the tribe he bears the distinguished title of Chief Long Talk, an imperfect title in itself until such time as the further name, And Often, is added thereto. Mr. R. O. Heikes, "The Daddy of Them All," Indian name "Chief Bald Eagle," has recovered from his severe illness of last summer, and is shooting as well as ever, at which all his legion of friends heartily rejoice. Mr. C. W. Budd, Chief Dago, good-humored, ruddy, bright of eye, with his erstwhile raven locks lightly nipped by the frosts of a few sharp springtimes, still breaks targets with an ease and regularity which denote that shooting has become with him a confirmed habit. And also there were Mr. F. C. Riehl (Chief Piasa), Scribe of the Indians, who has festooned his belt with many trophies and high averages; Mr. F. E. Butler, shooter, diplomat and humorist; Mr. J. L. D. Morrison, renowned as a valuable contestant, where the competition is hottest; Mr. T. E. Hubby, a shooter of great achievement, chiefly in Texas; Col. J. T. Anthony, mature in years and perfect in skill, his early serious contests being in the debate at arms over some difference of opinion between "the blue" and "the gray"; Mr. Fred Gilbert, a young and rising shooter, known both as Chief Heap Talk and the Wizard of Spirit Lake; Mr. J. S. Fanning, always genial, always modestly endeavoring to do his best, which are the doings of a skillful performer; Mr. Hood Waters, of national fame and popularity, yet at present not in his best form, consequent to eye trouble from which he is convalescing; Mr. C. O. Le Compte, of Kentucky, due to recent illness, was out of form; W. Huff, of Georgia; C. B. Adams, of Iowa; H. W. Watson, of Pennsylvania; W. H. Heer, of Kansas—each and all demonstrated their skill, much to the gratification of the beholders. There were others of great fame and ability—among whom were Messrs. L. J. Squier, J. T. Skelly, the Messrs. duPont, and Ed. Banks and W. Foord, the latter two being recent contestants for the championship of Delaware, now held by Mr. Banks. Among the distinguished visitors was W. Fred Quimby, himself a shooter of skill, and of distinguished ability in business.

The weather was unfavorable for high scores. There was a dull light consequent to an overcast sky. A snowstorm interfered in the afternoon, and a stiff wind, also in the afternoon, made a serious disturbance in scores for about an hour. The Leggett trap also acted badly, as there were several delays on its account, because of readjustments.

Forty-four shooters participated in the different events, the greater part of whom shot through the programme.

Hot coffee and an abundance of lunch was a feature which evoked the hearty appreciation and active attention of the shooters. Mr. W. H. Heer was high, with 156 out of 160. Col. Anthony and Mr. Budd were second with 149. Mr. Heikes was shooting a new gun. He and Mr. Walter Huff scored 158. Mr. Ed. Banks led the home talent with 143. Mr. Skelly was next with 142. Mr. L. D. Thomas broke 23 in a nonchalant way, while it was snowing, and, finding that he could hold his own with the experts, calmly returned to his desk in the duPont office. Col. J. G. Ewing broke 23 out of 25 in two events, which also was some shooting. Mr. Hubby, journeying homeward, had to leave early to catch his train. The scores:

In the evening the Messrs. duPont, in honor of the visiting experts, gave a banquet at the Wilmington Country Club. Hosts and guests, there were twenty-six present. The head and foot of the table was in the form of a T. A profusion of holly on the table gave it a color of Christmastide. Col. J. B. Ewing acted as toastmaster, and from his right around the table to his left the guests were seated in order as follows: Messrs. Alexis I. duPont, Victor duPont, 3d, J. T. Skelly, J. S. Fanning, R. O. Heikes, Frank E. Butler, C. O. Le Compte, C. Budd, Edward Banks, Col. J. T. Anthony, Walter Huff, Eugene duPont, A. C. Barrell, E. E. duPont, W. H. Heer, J. H. Heath, Hood Waters, C. B. Adams, L. J. Squier, H. C. Watson, Fred Gilbert, J. L. D. Morrison, F. C. Riehl, B. Waters and Hon. Tom A. Marshall.

Col. Ewing, as toastmaster, officiated with infinite tact and address. He introduced each toast with a witty story, felicitous personal reference, and happy flow of clear-cut thought, which held his hearer every moment while he addressed them. Mr. Barrell, as ranking officer of the "squad," was called upon first, at a proper juncture, and he made a speech which received the hearty plaudits of the assemblage. Each one in turn was called upon to respond to a toast. Col. Anthony's theme was "The Blue and the Gray," of which he could talk feelingly and knowingly, as one in authority, inasmuch as he was on the firing line, and knew that both parties to the misunderstanding used good powder and the same powder. Mr. James T. Skelly made a very sound speech, and was tactfully useful as an assistant to the toastmaster. Mr. Frank Butler told two or three of his best stories in happy vein. He never tells a dull story, and he never tells one poorly. Mr. Edward Banks delivered an excellent speech. Mr. Hood Waters responded to a toast of the ladies, and he responded in the chivalrous, appreciative manner of a true American. Mr. Tom A. Marshall made a very interesting formal reply to a toast, and several very interesting informal replies in general. Mr. Jack Fanning's remarks were conspicuous for good sense and brevity. Mr. R. O. Heikes gave a good sportsmanlike talk on how he enjoyed himself with dog and gun after quail, as well as at the traps, and that good powder was a joy in both kinds of sport. Mr. Heer concisely proved that brevity is not the soul of wit or common courtesy. Each of the Messrs. duPont said pleasant words, which added more happiness to their guests. Messrs. Le Compte and Huff, in the gracious manner peculiar to the South, said kind words. Mr. F. C. Riehl, in his modest manner, made a short talk, and shortened the pleasure of his hearers correspondingly. A reverential toast was drunk to the absent ones, Col. Courtney, Leroy Woodard and E. D. Fulford. Others spoke in pertinent and happy vein, and without exception each expressed his pleasure in being honored with a place as guest at the enjoyable function. During the day there was nothing to mar the general good feeling, and the visitors closed the evening and wended their ways homeward in good spirits and in hearty chorus of vocal melody.

Bergen Beach Gun Club.

Brooklyn, N. Y.—There was an excellent attendance at the shoot of the Bergen Beach Gun Club, avenue N and Seventy-first street, on Dec. 13. No. 1 was the Fulford Memorial event at 25 targets. The scores follow:

Events:	1	2	3	4	5	6	Events:	1	2	3	4	5	6

Trap Around Reading.

READING, Pa., Dec. 17.—The annual live-bird shoot of the Spring Valley Shooting Association of this city, held on the Spring Valley grounds, was a success and was witnessed by a large crowd of sportsmen, friends and guests of the members. Matthias carried off the trophy and the live-bird championship for 1904 by killing 9 out of 10 birds. The birds were a fast lot, and furnished plenty of sport for the men behind the guns. The annual election of officers followed the shoot, after which supper was served in the spacious dining room in the club house, Stewart Lutz having everything in charge.

Live-bird championship, trophy shoot, 10 live birds, 28yds. rise: Augstadt*0*2112122-7 Lutz*2*21022*2-6

Trappe, Pa., Dec. 15.—The attendance at the weekly shoots of the Trappe Gun Club steadily increases and a large field of shooters faced the traps in two live-bird handicap events at 10 birds each this afternoon. The birds were a good lot and the scores creditable. A. P. Geist, of Fegleysville, shot high gun in both events, the best scores of which follow:

First handicap, 7 birds, for purse: Geist 7, Emmers 6, Knipe 5, each 30yds.; Dudley 6, Mack 6, Berth 5, Bean 5, McManus 4, Bradley 5, each 28yds.

Second handicap, 10 birds: Geist 10, Emmers 7, Knipe 6, each 30yds.; Mack 5, Bertz 5, Dudley 6, Bradley 7, Bean 5, Hoops 5, McManus 4.

Pottsville, Pa., Dec. 14.—The shooting match between Dempsey, of Greenberry, and Showers, of Fishbach, which took place at Greenberry, was won by the former, who killed 10 birds, to his opponent's 8, out of 14. The match was for \$50 a side, and each man was to have shot at 15 birds. A big crowd was in attendance and a large sum of money changed hands.

The detailed scores follow:
Dempsey1110101011101-10 Showers11001110011010-8
Allentown, Pa., Dec. 15.—The John F. Weiler Gun Club, one of the leading clubs of the Keystone State, held another interesting shooting contest to-day. The honors of the day were awarded to Charles Kramlich, who was high gun, and who won the club's medal. The scores:

Medal shoot, 25 targets: Kramlich 24, Straub 20, Snyder 17, Schleicher 22, Weiler 16.

Fritztown, Pa., Dec. 15.—The live-bird shoot held at the Farmers' Hotel, here, to-day was well attended by sportsmen from Reading, Sinking Spring, Denver and Wernersville.

Ten birds, 28yds. rise: Coldren 6, Hainly 7, Brendle 8, Sharman 7, Spatz 9, Ream 7, Klever 6, Gring 8.

Oxford, Pa., Dec. 10.—Despite the high winds, some good scores were made at the shoot of the Oxford Gun Club yesterday. Alexander was high gun by a close margin. The scores:

	Shot at.	Broke.		Shot at.	Broke.
Gifford	56	44	Westcott	53	44
Alexander	53	48	Johnson	50	41
Jebbs	54	48	Miller	39	33

R Parker, 10	19	21	20	22	82	92

Shoot-off, 25 targets: W. Newman 17, W. Matthews 18, B. Tilton 25, J. Newman 22.

Bound Brook Gun Club.

Bound Brook, N. J., Dec. 17.—Three members were present at the shoot of the Bound Brook Gun Club to-day. Two of these had an old score to settle; this was a tie left from last month between Dr. Bache and F. K. Stelle for the first silver loving cup. It was shot off miss-and-out. The Doctor won this easily, as Stelle missed his second target.

In the regular club race for this month, Dr. Bache won first and Stelle won second cup. Following are the scores:

Dr Bache, 18	11111111010101010101011—25
Stelle, 10	10110001010011000010111—23

Dr Bache, 18	1111111101010101010101011—25

F. K. STELLE, Sec'y.

Montclair Gun Club.

Montclair, N. J., Dec. 7.—Seven members enjoyed the shoot in the snowstorm this afternoon. Some very fair scores were made.

Event 1, for practice, was won by Bush, with 22 breaks to his credit. Event No. 2, 10 left-quarterers and 15 right-quarterers, was won by Crane, who broke 23, plus a handicap of 2, gave him a total of 25 and a box of shells. Event No. 3, 25 birds, for the December silver cup, went to Winslow, with a score of 24. Event No. 4, for a box of shells, also went to Winslow, with 21 breaks and a handicap of 4; total of 25. Event No. 5, went to Kendall with 25 broken birds to his credit. Scores:

Events:	1	2	3	4	5	Events:	1	2	3	4	5
Targets:	25	25	25	25	25	Targets:	25	25	25	25	25

Wallace, 5	19	21	22	24	17	Moffett	18	..	18
Winslow, 7	16	19	24	25	..						

Handicaps apply on events 2, 3 and 4 only.

Dec. 24.—This was the third successive snowy Saturday. Nine members of the club showed up and shot through some five events in the face of a strong easterly wind, which, perhaps, in part accounted for only fair scores being made.

Event No. 3 was on the December cup for best scores during the month. Mr. Wallace was high man for the day. Event No. 4 was tied for by Messrs. Wallace and Winslow, the prize, a box of shells. On the shoot-off, miss-and-out, Winslow won.

There will be a merchandise shoot on the morning of Jan. 2.

Events:	1	2	3	4	5	Events:	1	2	3	4	5

Handicaps apply on events 3 and 4 only.

Dec. 26.—The attendance at the Christmas Day shoot to-day was very good. Besides considerable preliminary practice, three regular events were run off.

Event No. 1, 25 targets, 25 cents entrance: First money went to Babcock, second to Kendall and Glaister, third to Holloway, and fourth to P. Cockfair.

Event No. 2, 25 targets; prize, silver loving cup for best scores during December: Messrs. Kendall and Webster both scored 24, thus tying Winslow for first place on scores previously made.

Event No. 3, 25 targets, prize a shooting coat, was won by Mr. Holloway, with a score of 23. Scores:

Events:	1	2	3	Events:	1	2	3

Experts at Baltimore.

BALTIMORE, Md., Dec. 21.—From Wilmington, Del., the experts journeyed to Baltimore, to give a final exhibition shoot before separating for the holiday home comings.

The exhibition was held on the grounds of the Baltimore Shooting Association. The main event was at 100 targets, in strings of 25.

The ground was covered with snow; the wind was strong and cold, and the glare was not a good kind of light for eyes intent on shooting.

There was a good attendance of the local shooters, 24 in number. The best scores were made by C. W. Budd, of Iowa, and W. H. Heer, of Kansas City. Each broke 95 out of the possible 100.

C. B. Adams, of Iowa, a topnotcher in trapshooting, was second with 93.

After the professionals had finished, twenty-four Baltimore shooters took part in one 25-target event. Lester German, J. Mowell Hawkins, Capt. James R. Malone and Hood Waters, who shot at a total of 100 targets, made 96 breaks—one better than the highest out-of-town man.
